# Medico-Legal Update

## Editor-in Chief

**Prof. (Dr) R K Sharma**

Former Head, Department of Forensic Medicine & Toxicology
All-India Institute of Medical Sciences, New Delhi-110029
E-mail: medicolegalupdate@gmail.com

## ASSOCIATE EDITOR

1. **S.K. Dhattarwal** *(Professor)*
   Forensic Medicine, PGIMS, Rohtak, Haryana
2. **Dr. Adarsh Kumar** *(Additional Professor)*
   Forensic Medicine, AIIMS, New Delhi
3. **Dr. Vijaynath V** *(Associate Professor)*
   Forensic Medicine, Vinayaka Mission Medical college, Tamil Nadu
4. **Ms. Roma Khan,** Forensic Sciences, INSAAF Mumbai
5. **Dr. Imran Sabri** *(Assistant Professor)*
   Department of Bio-Medical Sciences.College of Medicine, King Faisal University,Saudi Arabia

## INTERNATIONAL EDITORIAL ADVISORY BOARD

1. **B. N. Yadav** *(Professor)*
   Forensic Medicine, BP Koirala Institute of Medical Sciences, Nepal
2. **Dr. Vasudeva Murthy Challakere Ramaswam** *(Senor Lecturer)*
   Department of Pathology, International Medical University, Bukit Jalil, Kuala Lumpur. Malaysia
3. **Babak Mostafazadeh** *(Associate Professor)*
   Department of Forensic Medicine & Toxicology, Shahid Beheshti University of Medical Sciences, Tehran-Iran
4. **Dr. Sarathchandra Kodikara** *(Lecturer)*
   Forensic Medicine Department of Forensic Medicine, Faculty of Medicine, University of Peradeniya, Sri Lanka

## NATIONAL EDITORIAL ADVISORY BOARD

1. **Prof. N.K. Agarwal** *(Professor)* Forensic Medicine, UCMS, Delhi
2. **P.K. Chattopadhyay,** *(Professor)*
   *Forensic Sciences, Amity University, Noida*
3. **Dalbir Singh** *(Professor)* Forensic Medicine, PGIMER, Chandigarh
4. **Dr. Harish Pathak,** Mumbai
5. **J. Gargi** *(Professor)* GGS Medical College, Faridkot
6. **P.C. Dikshit** *(Professor)*
   Forensic Medicine, Jamia Hamdard Medical College, New Delhi
7. **Anil Mittal** *(Professor)*
   Forensic Medicine, Vardhman Mahavir Medical college, New Delhi
8. **Balbir Kaur** *(Professor)*
   Forensic Medicine, MM institute of Medical Sciences, Ambala
9. **Mukesh Yadav** *(Professor)* Forensic Medicine, School of Medical Sciences and research,Greater Noida
10. **T.K.K. Naidu** *(Professor)* Forensic Medicine, Prathima Institute of Medical Sciences Andhra Pradesh
11. **S. Das** *(Professor)* Forensic Medicine, Himalayan Institute of Medical Sciences Dehradun
12. **Col Ravi Rautji,** Forensic Medicine, Armed Forces Medical College, Pune
13. **Dr. Manish Nigam** *(Professor and Head)*
    Department of Forensic Medicine & Toxicology Sri Aurobindo Institute of Medical Sciences, INDORE (M.P.)
14. **Dr. Shailesh Kudva** *(Principal)*
    Rajasthan Dental College and Hospital Jaipur-302026
15. **Usmanganishah Makandar** *(Associate Professor)*
    Anatomy, AIMS, Bhatinda
16. **Dr. Pratik Patel** *(Professor and Head)* Forensic Medicine, Smt NHL Municipal Medical College Ahmedabad
17. **Basappa S. Hugar** *(Associate Professor)*
    Forensic Medicine, Ramaiah Medical College, Bangalore

## NATIONAL EDITORIAL ADVISORY BOARD

18. **Dr. Vandana Mudda** *(Awati) (Associate Prof)*
    Dept of FMT, M.R. Medical College, Gulbarga, Karnataka, India
19. **Dr. HarishKumar. N.** *(AssociateProfessor)*
    Dept.of ForensicMedicine, Sri Siddhartha MedicalCollege, Tumkur
20. **Dr. Gowri Shankar** *(Associate Professor)*
    Forensic Medicine, SNMC, Bagalkot
21. **Dr. Manjunath Badni** *(Reader)* Dept of Oral pathology Maharana Pratap college of Dentistry and Research Centre, Gwalior
22. **Dr. L.Ananda Kumar** *(Associate Professor)* Forensic Medicine, Rajiv Gandhi Institute of Medical Sciences, (RIMS), Kadapa
23. **Dr. Ramesh Nanaji Wasnik** *(Associate Professor and Head)*
    Forensic Medicine Late B.R.K.M. Govt. Medical college, Jagdalpur
24. **Dr. Sachin Sinha** *(Reader)*, Dept. of Oral Pathology & Microbiology Daswani Dental College & Research Centre, Rajasthan
25. **Dr. Sasi Kanth,** *Asst. Professor,* A.C.S.R Government Medical College, Nellore, Andhra Pradesh.

**Medico Legal Update** is a scientific journal which brings latest knowledge regarding changing medico legal scenario to its readers. The journal caters to specialties of Forensic Medicine, Forensic Science, DNA fingerprinting, Toxicology, Environmental hazards, Sexual Medicine etc. The journal has been assigned international standard serial number **(ISSN) 0971-720X.** The journal is registered with Registrar of Newspaper for India vide registration numbers 63757/96 under Press and Registration of Books act, 1867. The journal is also covered by EMBASE (Excerpta Medica Database) from 1997 and by INDEX COPERNICUS, POLAND. Medico legal update is a half yearly peer reviewed journal. The journal has also been assigned **E-ISSN 0973-1283 (Electronic version)**. The first issue of the journal was published in 1996.

# Medico-Legal Update

CONTENTS

**Volume 20, Number 3** **July-September 2020**

1. Carbamate Poisoning – An Autopsy Study ..... 1
*Jinu.M, Thankamma.P.George, N.A.Balaram, Sujisha.S.S*

2. Profile of Burn Deaths: A Study based on Postmortem Examination of Burn Cases at R.N.T. Medical College, Udaipur ..... 8
*Akhilesh Sharma, Manish Kumar Sharma, Ashish Kumar Garg*

3. Psychological Autopsy: the Psychological Assessment of the Dead Individual's Role in the Death ..... 13
*Anand Kumar Vasudevan, Hanumantha, Lynne Eccleston*

4. Legality In Hospitals- Medico-Legal Case Management ..... 19
*Ashwini Pandit, Dhwani Patel, Arushi Chawla*

5. To Assess Association of Bullous Pemphigoid and Neurological Disorders- A Clinical Study ..... 24
*Balkrishna Pralhadrao Nikam, Dhanraj D Chavan, Nischhal Shrivastava*

6. To Assess Clinical Profile of Patients with Dermatophytosis Infection ..... 28
*Balkrishna Pralhadrao Nikam, Dhanraj D Chavan, Nischhal Shrivastava, Namita Narkhede*

7. The Study of Trends and Out Come of Acute Poisoning in a Tertiary Care Hospital Khammam, Telangana; India ..... 32
*Bharath Kumar Guntheti, Kondru Laxman*

8. Correlation between various Measurements of Sternum with Stature - An Autopsy based Study ..... 40
*Bhumesh Darade, Pawan Sabale, Shailesh Mohite, Swapnil Akhade, Chaitanya Kulkarni*

9. Assessment of Depression among the Housewives of Alcohol Consuming Husbands in Selected Community Areas, Kancheepuram District, Tamilnadu ..... 46
*Bhuvana.A, Ajaykumar.P, Yaazhini.T, Dineshkumar.S, Devaki. K*

10. A Study to Assess the Knowledge on Oral Health and Self Esteem among Young Adults in Selected College, in Kancheepuram District, Tamilnadu, India ..... 51
*Gini T.R , Ashika Parveen, Sharmilavathi.A, Avinash.U, Anto Benson, Shanthi*

11. Knowledge and Attitude of Final Year Medical Students Towards Dentistry and Dental Consultation: A Questionnaire-based Study ..... 55
*Girish Suragimath, Mrunal B Mohite, Ashwinirani SR, Sameer Zope, Siddhartha Varma*

12. Consensual Sexual Intercourse among children Vs Current Legal Provisions under POCSO: A Scientific Review with Prospective Quantitative Analytical Study ..... 60
*H. S. Tatiya, A. A. Taware, H. V. Vaidya, V. T. Jadhav, A. L. Bandgar, S. B. Punpale*

13. Assessment of the Psychological Wellbeing of Elderly Residing at Pooncheri Rural Community Area in Kancheepuram District, Tamilnadu, India ..... 66
*George Fernandez A, Janagiraman N, Shalini M, Vinitha R, Metha*

14. Effectiveness of Flax Seed Pillow on Stress and Physical Parameters of Premature Infants ..... 70
*Tessy Thomas, Sujatha R*

15. A Study to Examine the Association of Health Related Behaviours and Body Mass Index among Young Adults at Selected Colleges in Kancheepuram District, Tamil Nadu, India ..... 76
*J.Sherlinblessy, G.Santhiya, E.Mohan1, Shanthi*

16. Five Year Retrospective Study of Profile of Burn Deaths from Pune Region ..... 81
*Jadhao Vijay T, Bandgar Abhijit L, Taware Ajay A, Tatiya Harish S, Vaidya Hemant V*

17. Pattern of Poisoning Cases in a Tertiary Care Centre in South India - An Observational study ..... 86
*James Rajesh J, Sampath Kumar P, Priyadarshee Pradhan, Jothi Marie Feula A, Siva Reddy B*

18. Estimation of Stature from Footprint Length ..... 91
*Janarthanan R, Muthamizh Selvan*

19. Effect of Structured Exercise Programme on Functional Mobility in Parkinson's Disease ..... 96
*Joshi Madhura S., Kanase Suraj B.*

20. A Study to Assess the Knowledge on Pubertal Changes and Menarche among Adolescent Girls Residing in A Selected Rural Community, Kanchipuram District, Tamilnadu ..... 102
*Jyothish Lal Prasad, Abishek, Aishwariya, Ananthi, Cyril Cherian, Reshma Banu, L. Lakshmi*

21. For Effective, Earlier and Simplified Diagnosis of Retinopathy of Prematurity (RoP), a Probe through Digital Image Processing Algorithm in B-Scan ..... 105
*K R N Aswini, S Vijaya Raghavan, Sreekanth NP, Manju Sree RP*

22. Effect of Early Physiotherapy for Endotracheal Intubation Induced Temporomandibular Joint Dysfunction –Experimental Study ..... 110
*Krutika Dnyaneshwar Gawade, Sandeep Babasaheb Shinde, P.B. Jamale*

23. An Observational Study on the Sexual Assault Victims in the Year 2018 at Tartiary Health Care Center of Rajasthan ..... 117
*Mahendra Singh, R.K Punia, Deepali Pathak, Shashank Sharma*

24. Mob Lynching: A New Form of Hate Crime ..... 122
*Manoj Kumar Pathak, Srishti Rai*

25. Radiological Study of Appearance and Fusion of Iliac Crest in hip bone in Bikaner Region in 14-22 Years Age Group ..... 129
*Mathur Indubala, Sajjad Hussain, Bohra Bhavesh, Sharma Yogesh, Agrawal Anjali*

26. Abortion Laws in India: Issues and Challenges in 21st Century ..... 133
*Nitesh Bhatt, Pooja Suman*

27. Effect of Core Stability And Functional Mobility Exercises on Muscle Strength after Lumbar Spinal Cord Injury ..... 138
*Neha Y. Kakade, Suraj B. Kanase*

28. A Study to Assess Effectiveness of Jacobson Progressive Relaxation Technique on Sleep Quality among Elderly in Selected Old-Age Home of Kheda District.....144
*Patel Margi, Mayavanshi Rashmika, Pandya Rutu, Prajapati Nisha, Patel Vrutta, Khristi Linus, Patel Jay*

29. Awareness of Various Forms of Treatment Approaches in Stroke amongst Rural Population.....148
*Prajakta S.Kadam, Suraj B.Kanase*

30. Effect of Multidimensional Exercise Program for Improving Balance in Traumatic Brain Injury Patients.....155
*Pranali Kakade, Suraj B Kanase*

31. Traumatic Spinal Injuries: An Autopsy Study at Tertiary Health Care Center of Rajasthan During the Year 2017-18.....162
*R.K.Punia, Sanjay Achra*

32. An Analysis of Trends of Homicidal Deaths in Western Mumbai Region .....168
*Rajesh B. Sukhdeve, Sachin S. Sonawane, Shashank Tyagi*

33. Evaluation of Perception of II Year MBBS Students Regarding A Clinical Forensic Medicine Module in a Tertiary Care Centre .....174
*Ravindra Baliram Deokar, Harish Manilal Pathak*

34. A Retrospective Study to Determine the Type of Offence Committed by the Juveniles in the Reformatory Schools of a Capital City of India .....180
*Richa Choudhury, Neeharika Mishra, Pradeep Kumar Yadav*

35. Prevalence of Addiction among Tuberculosis Patients .....185
*Richa Choudhury, Shobhit Shakya, Pradeep Kumar Yadav, Hemant Kumar*

36. A Cross Sectional Autopsy based Study of Homicidal Deaths in Vijayapura, Karnataka.....191
*Siva Kumar V, Tejas J, Shruthi. K. Sivakumar*

37. A Descriptive Study on Alleged Sexual Offenders in South Bangalore .....196
*Sujatha P. L, Ananda. K, Mandar Ramchandra Sane*

38. Pattern and Nature of Fatal Blunt Force Homicidal Injuries and Its Correlation with the Weapon.....201
*Sujith Sreenivas C*

39. Prevalence of Odontogenic Cysts and Tumors – A Clinicopathological Study .....207
*Sushruth Nayak, Asha Karadwal, Prachi Nayak, Kush Pathak*

40. A Study of Over-The-Counter (OTC) Drug Usage Pattern among the Patients attending a Medical College Hospital .....211
*Tejasvi.P.K, Magendran.J*

41. Tobacco Toxicity in Tobacco Chewers .....217
*V. Chandrasekhar*

42. Study of Temporary Trends in The Pattern of Poisonings in a Tertiary Care Hospital.....221
*V.K.Sowmithra, Magendran.J*

43. Amputation of Penis Due To Electrocution- A Case Report ..... 228
*Vedant Kulshrestha, Mohammad Amjad*

44. Towards Digital Diagnosis of Oral Cancer: A Study on Optimum Preferences of Histopathological Techniques and Features ..... 232
*Tabassum Yesmin Rahman, Lipi B. Mahanta, Anup K Das, Jagannath D Sharma*

45. Trauma to the Thoracic Cage – An Autopsy Study ..... 239
*Thankamma P. George, K. Sreekumari, Sreedevi C. S.*

46. Evaluation of the Cookies Formulated with ***Costus igneus*** Plant Material for Antidiabetic Activity ..... 246
*A. Rajani Chowdary, Raaththika R, Payala Vijayalakshmi*

47. A Study to Assess the Effectiveness of Training Program on Knowledge and Practices Regarding Advanced Cardiovascular Life Support (ACLS) among Staff Nurses in MMIMS & R Hospital ..... 253
*Alka Walia, Simaranjit Kaur, Vinay Kumari*

48. Punjabi Adaptation of WHO's Global Physical Activity Questionnaire (GPAQ) in Gurumukhi Script: A Validity and Reliability Study ..... 257
*Harmandeep Singh, Sukhdev Singh, Amandeep Singh*

49. Management of Oroantral Communication Using Double Layered Closure with Buccal Fat Pad and Buccal Advancement Flap: Prospective Randomized Clinical Study ..... 264
*Kumar Nilesh*

50. Information Booklet on Self-Care Management of Chemotherapy among gynecological Cancer Survivors at Selected Hospital, Mangalore, Karnataka ..... 269
*Shynee Paul, Jacintha Veigas*

51. Effect of Yoga Therapy on State and Trait Anxiety in Perimenopausal Women: A Non-Randomized Controlled Study ..... 273
*Abhishek Chaturvedi, Asha Kamath, Gayathry Nayak,, Anjali Rao*

52. A Clinical Study of Complicated Inguinal Hernia with Special Reference to Its Management ..... 279
*Pulin Ch Kumar, Paul Pratik*

53. A Comparative Study of Medical Termination of Pregnancy Act, 1971 with Recent Medical Termination of Pregnancy (Amendment) Bill, 2020 Through Judicial Pronouncement ..... 284
*Pyali Chatterjee*

54. Effect of Kangaroo Mother Care on Physiological Parameters of Low Birth Weight Babies Admitted in NICU ..... 290
*Pratibha Thakur, Jyoti Sarin, Yogesh Kumar*

55. Perception of Medication error among Interns and Staff Nurses in a Selected Hospital at Mangaluru- A Mixed Method Approach ..... 298
*Pavithra K, Latha S, Gincy Joseph, Sujatha.R , Jyothi Rao*

56. Knowledge of Antenatal Mothers Regarding Human Milk Banking ..... 305
*Philomena Fernandes, Sabitha Nayak*

57. A Study on Occupational Health Psychology of Employees in IT Sector in Ahmedabad City ..... 313
*Pranav Saraswat*

58. Acupressure– A Review with a Current and Future Prospective in Dentistry ..... 320
*Dharnappa Poojary, Diksha Singh, Rubina Anjum, Dieu Thuy Dao, Shailesh Kudva*

59. Does Cerclage wiring with Intramedullary Nailing in Subtrochanteric Fractures Improve the Final Outcome? ..... 326
*Rajendra Annappa, Surendra Umesh Kamath, Sunil Lakshmipura Krishnamurthy, Sharan Mallya, Krithika Kamath, Pooja Kundapur Suresh*

60. Effect of Acupressure on Anxiety among Patients Undergoing Hemodialysis in Selected Hospitals of Ambala, Haryana: A Randomized Controlled Trial ..... 332
*Jimmy Dharwal , Srinivasan.P, Kanika, Jyoti Sarin*

61. Self Esteem and Peer Group Relationship of Adolescent Children in Single Parent Families ..... 339
*Anjaly Mohan, Priya V*

62. Skin Cancer Classification Using Dermoscopic Images based on Ranklet Transform, Co-occurrence Features and Random Forest Classifier ..... 344
*Chithra Devi M*

63. Melanoma Skin Cancer Classification Using Deep Learning Convolutional Neural Network ..... 351
*S. Mohan Kumar, J. Ram Kumar, K. Gopalakrishnan*

64. Cluster Analysis for MRI Brain Tumor Segmentation ..... 356
*M. Rajmohan, M. Abraham, D. Sahaya Lenin,P. Pandiaraj*

65. Effect of Posture on Electrical Axis of Heart During Different Phases of Breathing in Normal Subjects 362
*H. Vishnu Priya, S. Krishnan, Prem B*

66. Effectiveness of Guided Imagery on Stress and Coping among Wives of Alcoholics- A Quasi Experimental one Group Pre-Test Post-Test Research Design ..... 367
*Aarti, Srinivasan.P, Manpreet Sharma, Jyoti Sarin*

67. Predicting the Existence of Brain Tumor in Mri Images by Applying FCNN ..... 375
*Sylvester Ranjith F, Parveen Sultana H*

68. Effect of Video based Teaching on Knowledge and Attitude regarding ADHD of Children among Primary School Teachers ..... 381
*Vijyeta Bhasin, Srinivasan P., Uma J. Deaver, Jyoti Sarin*

69. Illegalities and Infirmities in Implementation of 'Ex-Servicemen Contributory Health Scheme: Public Audit Findings and Other Irregularities - An Analytical Study ..... 389
*Bhupal Singh, Asha Verma*

70. Attitude of Dental Faculty on Admissions to Dental Colleges through National Eligibility cum Entrance Test (NEET) - A Knowledge, Aptitude and Perspective Survey ..... 394
*Saloni Kachhara, Deepak Nallaswamy, Subha M*

71. Difference in the Academic Performance of NEET and NON-NEET batch- A Cohort Study At Saveetha Dental College ..... 401
*Saloni Kachhara, Deepak Nallaswamy, Subha M*

72. Effect of NEET based Selection Process on the Academic Outcome of Students Pursuing Dentistry - A Cohort Study at Saveetha Dental College ..... 407
*Saloni Kachhara, Deepak Nallaswamy, Subha M*

73. Medical Device Prototype for Planter Intrinsic Muscles: A Scientific Note ..... 412
*Amit Sharma, Priyanshu V Rathod*

74. Fire Safety Related Challenges Faced by Existing Hospitals: A Review ..... 419
*Abdul Hakim Choudhary, Mohammad Kausar, Sidhartha Satpathy, D. K. Sharma*

75. Body Mass Index, Modified Bishop Score and Transvaginal Sonographic Measurement of the Cervical Length as Predictors of Successful Induction of Labour by Misoprostol ..... 426
*Basma Mohamed, Omaima Idris, Noura El-Nassery, Mazen Abdel-Rasheed, Osama Azmy*

76. In Potential Siliko Simulation of Clorogenic Acid in ***Coffea canephora*** to Transfering Macrophage Polarization of M1 in Tuberculosis Infection ..... 432
*Christina Destri , Jusak Nugraha, Muhammad Amin, Djoko Agus Purwanto*

77. Molecullar Docking of Epigallocatechin-3-gallate (EGCG) on Keap1-Nrf2 Complex Protein in Photoaging Prevention ..... 439
*Damayanti, Cita Rosita Sigit Prakoeswa, Djoko Agus Purwanto, Anang Endaryanto, Siswandono*

78. The Effect of Buzz Group Modification Method on Exclusive Breastfeeding Against Self Efficacy in Pregnant Women: A Quasi Experiment ..... 446
*Febyana Dwi Cahyantia, Lailatun Nimah, Retnayu Pradaniea*

79. Tobacco Smoke and Pregnancy Outcome: Literature Review ..... 452
*Haerani Harun, Anwar Daud, Veni Hadju, Ridwan Amiruddin, Anwar Mallongi, Rosmala Nur*

80. Identifying and Revealing Active Compound from Green Tea (***Camellia sinensis***) for Curing Systemic Lupus Erythematosus by Acting as CASPASE 1 Inhibitor ..... 457
*Herin Mawarti, Jusak Nugraha, Djoko Agus Purwanto, Joewono Soeroso*

81. Herpes Virus, Causes of Infections and Preventive Methods ..... 464
*Huynh Tan Hoi*

82. Association between Inactive-Gymnastics and Active-Gymnastics Elderly towards Cognitive Functions Measured by The Mini-Mental State Examination (MMSE) ..... 470
*Muhammad Hamdan, Raini Wisnujono, Yudha Haryono, Abdulloh Machin, Ichwanuddin*

83. The Politics of Judicial Law in the Development of the National Health Law ..... 476
*Irfan Nur Rachman, Arief Hidayat, and Lita Tyesta*

84. Pattern of Fatal IntraAbdominal Injuries in Autopsy Cases- A 3 Year Retrospective Study ..... 481
*Khaja Azizuddin Junaidi, Kashif Ali*

85. ARM Diagnosis with Distal Colostography on Anorectal Malformations ..... 486
*Naely Rahma, Bambang Seprijanto*

86. Multiplanner Measurement to the Clicked Tempromandibular Joint (Condylar Process and Articular Dick) with Conbeam Computed Tomography ..... 491
*Nameer Fadhel, Manar Abd Alrazaq Hassan, Nour Abd Alrazaq Hassan*

87. Performance of the Health Cadres in Children's Growth and Development Monitoring Program after Training in the Working Area of Public Health Services of Abiansemal II, Badung, Bali ..... 498
*Ni Wayan Armini, Gusti Ayu Marhaeni, I Gusti Ayu Surati, I Putu Suiraoka*

88. The Effect of Re-unification Education on Empathy and Multicultural Competence of Nursing-College Students ..... 505
*Myoungsuk Kim, Gie-Ok Noh, MJ Park*

89. Assessment of Health Status of Children with Cancer who Undergo Chemical Therapy ..... 511
*Kareem Ghadhban Sajem*

90. Effects of Onion Extract on Hepar Histopatology in Alloxan-Induced Diabetic Rattus Novergicus ..... 517
*Ni Komang Aprilina Widi Suputri, Ajik Azmijah, Retno Bijanti, Made Mahaguna Putra*

91. Inclusive and Sustainable Healthcare Delivery-A Public Private Participatory Model ..... 525
*Nimble O J, A.V.Chinnasamy*

92. Factors Analysis Related to the Completeness of Providing Basic Immunization in Infant Aged 12 Months ..... 531
*Hannik Rahmaningrum, Harmayetty, Deni Yasmara, Ilya Krisnana*

93. The Effect of Soot Particulate towards Vascular Cell Adhesion Molecule-1 (VCAM-1) Expression in the Mechanism of Cardiovascular System Disruption ..... 538
*Edmond Leonard, Muhammad Aminuddin*

94. The Role of Universal Health Coverage in Supporting National Family Planning Program: A Comparative Study ..... 544
*Erni Rosita Dewi, Muhammad Ardian Cahya Laksana, Nur Anisah Rahmawati, Alifia Candra Puriastuti, Budi Prasetyo*

95. A Study to Assess the Level of Knowledge on Ill Effects of Mobile Usage among Adolescents in Selected College at Kancheepuram District, Tamilnadu, India ..... 550
*Renuga S, Alfred Sam D, Dinesh.J, Keerthi.G, Parasuraman P, Vijay S, N.Thivya*

96. Learning of Patient Identification in Patient Safety Programs Through Clinical Preceptor Models ..... 553
*Roymond H. Simamora*

97. Effectiveness of Structured Teaching Programme on Pulmonary Rehabilitation among Patients with Chronic Obstructive Pulmonary Disease ..... 557
*S.Eswari, Pushpakala K.J*

98. Nicotine Adds Risk Factors to the Cardiovascular System and Increases Mortality and Sudden Cardiac Arrest ..... 563
*Salah Abd- Al kader Omran; Abstract*

99. The Effect of Abuse of Some Anabolic Steroids on Hormonal and Testicular Function in Male Rats ..... 569
*Salah M.M. Al Chalabi Rashaa F. Abdul-Lattif and Haylim N. Abud*

100. Study of a Hormonal Assay in PCOS Patients with Type 2 DM and their Correlation with Inhibin B .... 575
*Huda Hameed Hassan, Suaad Muhssen Ghazi Aufaira Shaker Nasif*

101. Estimation the Scavenging Activities of Ascorbic Acid, Uric Acid, Gallic Acid and GSH to DPPH Radical .... 581
*Ali M.A. Al-Kufaishi*

102. Histological Investigations for Cordia Myxa During the Treatment of Gastritis in Local Rabbits.... 587
*Hussein Bashar Mahmood, Ghassan A Dawood, Ali Fayadh Bargooth*

103. Frequency of Aspirin Misuse Among Hypertensive Patients in Babylon Province .... 591
*Zahraa Fattah Ghani, Oday Jasim Alsalihi , Mustafa Shakir Mahmood*

104. Estimation of Antioxidants Activity Through DPPH Inhibition Levels in Patients with Chronic HPV 16 Cervicitis .... 598
*Ali M. A. Al-Kufaishi, Lamia A. M. Al-Mashhedy, Bushra Jaber Al-Rubaie*

105. Estimation of Some Genetic and Physiological Variables of Iraqi Desert Snake ***Cerastes gasperettii*** ... 603
*Samir M. Khalaf, Haitham L. Abdulhadi, Banan R. Dabdoub, Luay H. Ali*

106. Evaluation of Soluble PD-1 and PD-L1 in Iraqi Type 2 Diabetes Mellitus (T2DM) Patients with Chronic Toxoplasmosis .... 609
*Farah E. Mohammed , Ali N. Yaseen, Muhammed A. H. Aldabagh*

107. Clinical Variants of Rosacea in Iraqi Patients .... 616
*Ahmed Abdulhussein Kawen, Hussein Abbas Al-Sultany*

108. Assessment of MR-ProADM and N-Terminal B-Type Natriuretic Peptide of Serum Levels in Patients with Heart Failure. .... 621
*Ahmad abd alraheem Ibrahem Dahy; Walaa Al-Jedda , Abbas Al-Sharifi*

109. Effects of Two Different Doses of Vitamin B2 and a Single Dose of Vitamin B12 Against Cyclophosphamide Induced Nephrotoxicity.... 627
*Waleed K. Ghanim, Nada N. Al-Shawi, Muhsin S. G. Al-Moziel1*

110. Investigating the Effect of ***Lymnaea auricularia*** (snail) Powder on Different Species of Pathogenic Bacteria .... 634
*Sally Hani Abdul-Khaliq, Nebrass Faleh Chachain, Raghad Abdulatif Abdurazaq*

111. Effects of Simvastatin and/or Metformin Administration on Lipid Profile and Reproductive Function in Adults Male Rats .... 640
*Muhsin S.G. Al_Mozie'l [1], Abbas A. Khudhair, Noora S. Ghalib*

112. Parkinson's Disease Follow Up Self-Assessment Scale.... 647
*Kifah K. Al- Ubaidy, Aiyar Shakir, Basim Abdulelah Ali*

113. Dental Caries among Mental Patients in Kerbala-Iraq in 2019 .... 654
*Yaseen, Nabeel, Al Haydari, Amer, Al Mousawi, Ali*

114. Treatment of Iraqi People with Hyperkinetic Movement Disorders by Tetrabenazine in Relation to Genetic Polymorphism of CYP450 2D6 .... 660
*Zainab A. Abbood , Shatha H. Ali Nawfal M. Sheaheed*

115. New Record of the Genus Hydrotaea Robineau-Desvoidy, 1830 (Diptera, Muscidae) from Kerbala City, Iraq ..... 667
*Haider Naeem Al-Ashbal , Rafid Abbas Al-Essa , Hanaa H. Al-Saffar*

116. Effect of Aerobic Training on Selected Cardiopulmonary Parameters in Myocardial Infarction Patients with Stroke ..... 673
*Zeezy Soliman Eraky, Nesreen Ghareb El-Nahas, Naguib Mohamed Salem, Samir Abdelfattah El-gazar, Ahmed Ali*

117. Effects of Perceived Health Condition, Gerotranscendence, and Wisdom on Successful Aging of Elders ..... 681
*Hee Kyung Kim*

118. Association of Terminal Complement Complex (TCC), Prostaglandin (PGj2) among Patient with First Episode Psychosis (Case-Control Study) ..... 688
*Rana Fadhil Obaid, Rasha Fadhel Obaid, Sumeiya Mahdi al Har*

119. Perception of Medical Health College Students Toward Mental Health ..... 695
*Wiwik Widiyawati, Ah Yusuf, Indra Fajar Ibnu*

120. The Correlation between the Characteristic of Reflux Based on 24 Hours-Multichannel Intraluminal Impedance- Ph Monitoring with the Quality of Life of Refractory Laryngopharyngeal Reflux Patients . 701
*Muhammad Amsyar Akil, Risma Sari Ayu Hasroni, Abdul Kadir, Fardah Akil*

121. Tympanogram and Audiogram Presentation after Tympanomastoidectomy Surgery Using Musculus Temporalis Fascia Profunda Graft and Composite Graft ..... 708
*Sandrianto Lande, Riskiana Djamin,Sutji Pratiwi Rahardjo*

122. Risk Factors of Lung Tuberculosis Occurence in the Working Area of Kaluku Bodoa Health Center Makassar City ..... 714
*Stang, Anwar Mallongi, Indra Dwinata, Sumarni*

# Carbamate Poisoning – An Autopsy Study

**Jinu.M[1], Thankamma.P.George[2], N.A.Balaram[3], Sujisha.S.S[4]**

*[1]Junior Consultant (Forensic Medicine) District Hospital Idukki, Kerala, [2]Assosiate. Prof, Dept. of Forensic Medicine,Govt.Medical College, Thiruvananthapuram, Kerala, [3]Prof & HOD Dept. of Forensic Medicine,Govt. Medical College, Kollam, Kerala, [4]Assist. Prof, Dept. of Forensic Medicine,Govt.Medical College, Thiruvananthapuram, Kerala*

## Abstract

Acute poisoning is a cause of both morbidity and fatality in many parts of the world. Furadan, the organo-carbamate commonly available in Kerala, being used in plantain, tea, potato and carrot farms as insecticide are usually misused as an easy source of poison for suicide. This study was carried out on Twenty nine medico legal cases, brought with history of carbamate poisoning which were brought for autopsy during the period from January 2014 to June 2015. The main objectives of the study were to study post-mortem findings in Carbamate poisoning, clinical profile in Carbamate poisoning and histopathological changes in Brain, Heart, Lungs, Liver and Kidney due to Carbamate poisoning. Males (82.8%) outnumbered females and maximum cases were of age group 51-60 yrs (27.6%). Most of the victims were taken to hospital for treatment and died after admission (58.6%). Such studies of poisoning cases will help authorities for planning, prevention and treatment of these cases

***Key Words:*** *Agriculture, Death, Furadan, Insecticide, Poisoning*

## Introduction

Agriculture had always been a part of human civilization and involved domestication of plants and animals. From the archaeological evidences it is believed to have developed around 12,000 years ago, although earlier people began altering communities of flora and fauna for their own benefit.[1]Archaeological remnants indicates that rice was a part of the Indian diet as early as 8000 BC.[2]

The Food and Agriculture Organization (FAO) has defined pesticide as any substance or mixture of substances intended for preventing, destroying, or controlling any pest, including vectors of human or animal disease, unwanted species of plants or animals, causing harm during or otherwise interfering with the production, processing, storage, transport, or marketing of food, agricultural commodities, wood and wood products or animal feedstuffs, or substances that may be administered to animals for the control of insects, arachnids, or other pests in or on their bodies. The term includes substances intended for use as a plant growth regulator, defoliant, desiccant, or agent for thinning fruit or preventing the premature fall of fruit. Also used as substances applied to crops either before or after harvest to protect the commodity from deterioration during storage and transport.[3]

The first known pesticide in history would have been sulfur dust used in Sumeria about 4500 years ago. In recorded history, nicotine sulfate extracted from tobacco leaves were used as an insecticide in the seventeenth century. During World War II, DDT (dichloro-diphenyl-trichloroethane) was the most effectively used agent against mosquitos, with high larvicidal and adulticidal properties. However, concern over its residues, magnification and ecological implications were voiced by researchers and practitioners. Above all, possibility of emerging resistance to DDT created concern among them, who advocated development of more desirable and effective substitutes. These include methoxychlor, DDD (Dichloro-diphenyl-dichloroethane), tetra-chloro diphenylethane (TDE) and others, but they also showed

Assosiate. Prof, Dept. of Forensic Medicine,Govt. Medical College,Thiruvananthapuram,Kerala
E-mail : geetharoy11@gmail.com

activity similar to that of DDT.[4]

The production of pesticides started in India in 1952 with the setting up of a plant for the production of BHC (Benzenehexachloride) near Calcutta, and India is a leading manufacturer of pesticides in Asia standing next to China and ranks twelfth globally.[5] There are 234 pesticides registered in India. Out of these, 4 are WHO Class Ia (Extremely Hazardous) pesticides, 15 are WHO Class Ib (Highly Hazardous) pesticides and 76 are WHO Class II (moderately toxic) pesticides, together constituting 40% of the registered pesticides in India.[6]

Agriculture in South India involves 127 million cultivators and 107 million agricultural laborers. Crop productivity in India mostly depends on the monsoons and as such is low and unpredictable. Monsoon-fed areas include more than 70% of the cultivated land in the country. A major chunk of the population (74.3%) is rural and 34.7% live below the international poverty level.[7] During the Green Revolution, to increase the productivity, high-yielding varieties of various crops were introduced. These varieties were significantly more susceptible to plant pests and diseases and, subsequently, the use of pesticides became more popular, increasing from 2,330 kilo ton during 1950–51 to 54,773 kilo ton in 1990–91 (Directorate of Plant Protection, 2002)[8]

The Government of Kerala has banned the sale of Red category pesticides such as Phorate, Thimet and Furadan in the State two years ago, the application of such chemicals is increasing in the state in an alarming rate as they are easily available over the counter at shops in the Kerala-Tamil Nadu border area and there are no government agencies at the border check-posts to monitor their transportation.[9] Because of the easy availability, case of accidental and suicidal poisoning by these pesticides are on the increase and most of them end fatally.

Carbamates are esters of carbamic acid with an anticholinesterase action.[10] They are used as insecticides, fungicides, herbicides, nematicide and acaricide. They are effective by contact, ingestion or inhalation or any other routes through which it can reach the body.[11,12] Their carbamoyl and thiocarbamoyl structure account for their inhibitory action on cholinesterases.[10-12] Carbamates are available as Aldicarb (temic), Carbaryl (agrovin, agoryl, bangvin 50, caravet, hexavin, kevin 50, kilex carbaryl, sevin 50, sujacarb); Carbaryl+gamma BHC(sevidol); carbofuran( agrofuron 3g, furadan 3g, hexafuran, vegfru diafuran); Methomyl (lannate); Propoxur (baygon, protox bait); Triallate (avadex).

## Material and Method

This descriptive study was conducted on all cases with history of Carbamate poisoning brought for autopsy at state medico legal institute during the study period.

The study was conducted for one and a half years duration from 1st January 2014 to 30th June 2015. General information regarding demographic profile, socioeconomic status etc. of each case were collected from relatives. During autopsy the macroscopic appearances of the organs were recorded in the proforma. Bits of tissues from brain, heart, lungs, liver and kidney were collected using sharp knife and were fixed in formalin. The tissues were processed in histokinete and embedded in paraffin wax, cut with a standard microtome and slides were prepared. After that slides were stained with eosin and haematoxylin. Microscopic study of each slide was made at this stage and all microscopic details were recorded in the proforma.

Samples were collected for chemical analysis which include-stomach and upper part of intestine with their contents, about 500g of liver and one half of each kidney. These samples were preserved in saturated saline and send to the chemical examiner's laboratory, Thiruvananthapuram for chemical analysis. Blood and urine, if available was also taken for chemical examination .The report of chemical analysis was collected and analysed for correlation with clinical findings.

The details of the hospital records were analysed with special reference to the clinical findings, laboratory investigation and period of survival. All these findings were compared with the histopathological changes noticed in the cases.

The collected data were statistically analysed in form of ratio & frequencies and compared with other studies.

## Findings

In our study out of total 29 carbamate poisoning cases 82.8% were males and 17.2 % were females. In age group analysis maximum incidence was seen in age group of 51 to 60 years (27.6%), followed by 61-70 years (17.2%).

Present study showed that majority of the cases were farmers (41.4%), followed by manual labourers (27.6%), government servants (10.3%) and housewives (10.3%). One case was a student (3.4%) and two of them were unemployed (6.9%)

Among the 29 cases studied, 31% were graduates, followed by those having plus two qualifications (20.7%) and those studied up to tenth standard (20.7%). Cases who studied up to primary school level and high school level respectively constituted 13.8% each.

Majority of victims consumed furadan along with food (82.8%), whereas the rest consumed furadan mixing it with alcohol (10.3%), with formic acid (3.4%) and with aspirin tablets (3.4%).

Majority of the victims (58.6%) were taken to hospital for treatment and died after admission, while 24.1% of them were brought dead at the emergency department and 17.2% of them were seen dead.

Among the cases studied majority of cases (62.1%) had inter personal problems, while 31% had financial crisis and 6.9% had some unknown reasons for terminating their life.

Death occurred within 12 hours in 62.1% of cases, 41.4% died within one hour of consumption of poison. One victim died on the second day and two of them died on the third day. Eight victims (27.6%) survived more than three days

Among the cases studied 41.4% were not treated, whereas the rest of them (58.6%) were treated as inpatients which included 20.7% cases who needed ventilator support.

The major presenting symptoms were central nervous system symptoms like headache, dizziness, anxiety or convulsion (62.1%) and muscarinic symptoms like salivation (62.1%), followed by sweating (51.7%) and abdominal pain (51.7%).Nicotinic symptom like muscle fasciculation were found in 48.3% of cases. Shock was observed in 24.1% of cases. Froth at nostrils was observed in 31% of cases and lacrimation in 20.7%.

Impairment of plasma choline esterases levels were observed in 11 cases (37.9%). Liver function tests were impaired in 27.6% cases and renal functions were impaired in 20.7% cases.

The results of chemical analysis revealed furadan alone in 79.3% cases. Furadan along with ethyl alcohol were detected in 10.3% cases and furadan along with formic acid were detected in 3.4% cases. In 6.9% cases no poison were detected.

Apart from generalized cyanosis and congestion which were present in all cases, the violet sandy furadan particles were found in stomach in 82.8% cases. Miosis was observed in 58.6% cases and froth at nostrils in 32% cases. Unusual smell of stomach contents were observed in 27.6% cases.

**Table 1: Distribution of post mortem findings**

| **Post-mortem appearances** | **Frequency** | **Percentage** |
|---|---|---|
| Cyanosis | 29 | 100 |
| Congestion | 29 | 100 |
| Furadan particles in stomach | 24 | 82.8 |
| Miosis | 17 | 58.6 |
| Froth at nostrils | 9 | 31 |
| Unusual smell | 8 | 27.6 |

Congestion was the major finding in liver, found in 86.2% cases. Liver was pale in 13.8% cases. 10.3% showed fatty changes, and one case each showed cirrhosis and sub capsular hemorrhage. The major microscopic change observed in liver was congestion in 86.2% cases. Foamy hepatocytes were observed in 48.3% cases. Macro vesicles were seen in 37.9% cases. Thirty one percent cases showed enlarged hepatocytes and 27.6% showed periportal fibrosis. Hepatocyte necrosis and inflammatory infiltrates were observed in 13.8% and 6.9% cases respectively.

**Table 2: Macroscopic findings in liver**

| **Findings** | **Frequency** | **Percentage** |
|---|---|---|
| Congestion | 25 | 86.2 |
| Pallor | 4 | 13.8 |
| Fatty liver | 3 | 10.3 |
| Cirrhosis | 1 | 3.4 |
| Subcapsular haemorrhage | 1 | 3.4 |

Macroscopically in 65.5% kidneys were congested. Cortical hemorrhages were observed in 48.3% of cases and prominence of cortico-medullary demarcation was observed in 37.9% cases. Pallor was observed in 34.5% cases. On histopathology examination, the major change observed was congestion in 65.5% cases. Tubular necrosis was observed in 48.3%, while 34.5% cases showed shrinkage of glomeruli. Red blood cell casts and inflammatory infiltrates were observed in 6.9% cases.

**Table 3: Microscopic findings in kidney**

| **Findings** | **Frequency** | **Percentage** |
|---|---|---|
| Congestion | 19 | 65.5 |
| Tubular necrosis | 14 | 48.3 |
| Shrinkage of glomeruli | 10 | 34.5 |
| RBC cast in tubules | 2 | 6.9 |
| Inflammatory infiltrates | 2 | 6.9 |

Photo 1: Violet sandy furadan particles mixed with stomach contents

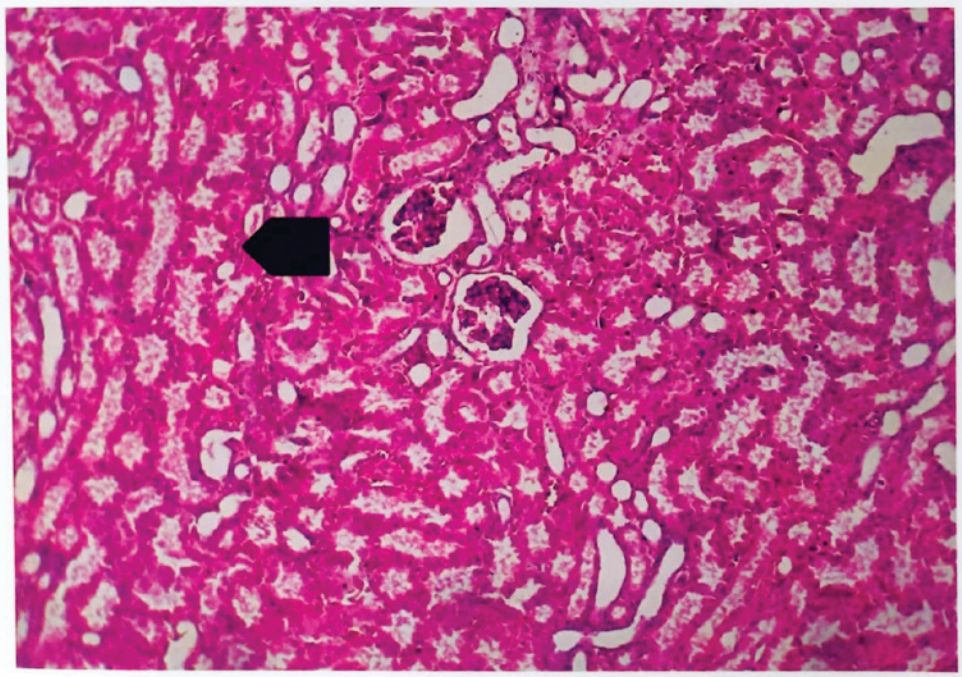

Photo 2: Microscopic picture of Kidney showing tubular epithelial damage and epithelial debris in lumen

On gross examination, heart showed congestion in 65.5% cases. Other findings observed were sub endocardial hemorrhages (34.5%) and flabbiness of myocardium (20.7%).Myocardial fibrosis (10.3% ) , myocardial hemorrhage (7%). and sub epicardial petechial hemorrhages (7%) were also observed. Congestion of cardiac muscle were observed in 65.5% cases on histopathology. Two cases (6.9%) showed myocardial hemorrhage.

**Table 4: Macroscopic findings in heart**

| Findings | Frequency | Percent |
|---|---|---|
| Congestion | 19 | 65.5 |
| Sub endocardial hemorrhage | 10 | 34.5 |
| Flabby myocardium | 6 | 20.7 |
| Myocardial fibrosis | 3 | 10.3 |
| Hemorrhage in myocardium | 2 | 6.9 |
| Sub epicardial petechial hemorrhage | 2 | 6.9 |

Lungs showed congestion in all cases. Oedema was observed in 41%, consolidation in 34.5% and emphysematous changes in 24% of cases. Microscopic examination of lungs revealed congestion in 34.5%, hemorrhage in 44.8% and oedema in 41.4% and shock lung in 24.1% cases.

Gross examination of brain showed congestion and oedema in 93% of cases. Sub arachnoid hemorrhage was observed in one case Histopathological examination of brain showed congestion in 93.1% cases and oedema in 75.6% cases.

Shock lung was not observed in cases that survived for less than 24 hours. It was observed in 7 cases, one among them survived for more than one day but died within two days, two cases survived for more than two days but died within three days and four among them survived for more than five days.

Lung consolidation was observed in 10 cases (34.4%), out of which all cases survived for more than two days. Eight among them survived more than 3 days and four of them survived more than 5 days.

Acute tubular necrosis of kidneys were observed in 14 cases (48.3%). Ten cases among them survived for more than 48 hours. It was not detected in any case that survived for less than an hour.

Sub endocardial haemorrhage was observed in 10 cases (34.4%). Among them 7 cases had gone into circulatory shock during treatment. Three of the cases with sub endocardial haemorrhage succumbed to death before reaching hospital and hence the data could not be assessed.

## Conclusion

Carbamate poisoning is acquiring the status of a special clinical entity because of its increased incidence in south India. Although Furadan is banned in kerala, the preparation is available over the counter in nearby states and is traded illegally across borders. The present study is to find out the relation between clinical, autopsy and histopathological findings in fatal cases of carbamate poisoning.

The results of present study are summerised as follows

1. It was found that 27.6% of the victims belonged to the age group of 51-60 years.
2. The majority of victims were males 82.8% and the rest were females 17.2%
3. Analysis of victims according to their occupation revealed that majority (41.4%) of them was farmers.
4. Among the victims 31% of them were graduates
5. Majority of the victims consumed furadan along with food (82.8%) and 10.3% consumed furadan mixed with alcohol
6. Most of the victims were taken to hospital for treatment and died after admission (58.6%)
7. All cases were suicidal and inter personal problems were the major triggering factor ending up in suicide (62%)
8. Death occurred within 12 hours in 62% cases where 41% died within one hour of consumption of poison

9. Major presenting symptoms were central nervous system symptoms 62.1% and muscarinic symptoms 62.1%
10. Impairment of plasma cholinesterase level was observed in 38% cases. Liver function tests were impaired in 27% cases and renal functions were impaired in 20% cases
11. The results of chemical analysis revealed furadan in 79.3% cases and no poison was detected in 6.9% cases
12. On post mortem examination violet sandy furadan particles were found in stomach in 24 cases (82.8%). Among them 12 cases had undergone stomach wash.
13. Gross examination of liver showed congestion 86.2% cases. Microscopically liver showed congestion (86.2%), foamy hepatocytes (48.3%) and macro vesicles (38%)
14. Macroscopic examination of kidneys showed congestion in 65.5% cases, cortical hemorrhages in 48% and on microscopy congestion was observed in 65.5% followed by tubular necrosis in 48.3%.
15. Heart showed congestion 65.5% cases and sub endocardial hemorrhage in 34.5% cases. Microscopy showed congestion in 65.5% cases
16. Pulmonary congestion was observed in all cases and oedema was observed in 41% cases
17. Gross examination of brain showed congestion and oedema in 93% cases. Microscopy revealed oedema in 75.6% cases

# Profile of Burn Deaths: A Study based on Postmortem Examination of Burn Cases at R.N.T. Medical College, Udaipur

**Akhilesh Sharma[1], Manish Kumar Sharma[2], Ashish Kumar Garg[3]**

*[1]Associate Professor, Department of Forensic Medicine & Toxicology, R.N.T. Medical College, Udaipur, Rajasthan, [2]Associate Professor Department of Forensic Medicine R.N.T. Medical College Udaipur Rajasthan, [3]Medical Officer, Nathdwara, Rajsamand, Govt. of Rajasthan*

## Abstract

Burn injuries are a public health problem in developing countries like India specially in females. Our objective of the present study is to know the pattern of deaths due to burns, socio etiological factors involved and to suggest preventive measures. A study based on autopsies conducted in R.N.T. Medical College, Udaipur (from 1st March 2018 to 30th September 2018) where total 780 Medico-legal autopsies were conducted during this period , out of those 86 were due to burn. 45 victims were male and 41 were female. Maximum 46 of the cases were in the 21-40 years of the age group in both genders. Most of the cases were found to be from rural area (80.23%). The most common manner of burn was accidental (74.41%) followed by suicidal burns (22.09%). Majority of victims died as a result of flame burn (74.41%) and death due to flame, major cases were females (62.5%). Majority of victims (41.86%) died with more than 80% burns and (52.32%) victims could not survive for more than 24 hours. The cause of death in (52.32%) cases was shock followed by septicemia in (32.5%).

***Keywords:*** *Burn, Incidence, Pattern of burn, Manner of death.*

## Introduction

Burns constitute a major role in mortality and morbidity in the whole world, whether accidental, suicidal or homicidal. Burn injuries are among the most devastating of all injuries and a major global public health crisis. Burns are the fourth most common type of trauma worldwide, following traffic accidents, fall from height and homicidal death. Approximately ninety percent of burns occur in developing countries, regions that generally lack the necessary infrastructure of fire safety measures and instruments to reduce the incidence and severity of burn cases in human being.

Dowry deaths in India have become a problem of great concern. Almost every day we see in the media and read in the newspapers. Cases of young women either burnt or provoked to commit suicide by the husband and in-laws for the dowry. At the same time accidental burns are very common in young women. They are more vulnerable as most of the young women spend their time in the household work especially in the kitchen.[7]

The aim of present study is to provide an analysis of burn morality across all age group, dead bodies brought in the mortuary of RNTMC, Udaipur. It investigates how to mortality is distributed across all age groups, sex, and population groups and what are the circumstances of burn mortality occurrence.[4]

## Material and Method

This is prospective study based on autopsies conducted in the Department of Forensic Medicine Toxicology, Ravindra Nath Tagore Medical College, Udaipur during 1st March 2018 to 30th September 2018. In this period total 780 autopsied were conducted, out of that 86 dead bodies were brought to mortuary with the alleged history of burn injuries. These cases autopsies

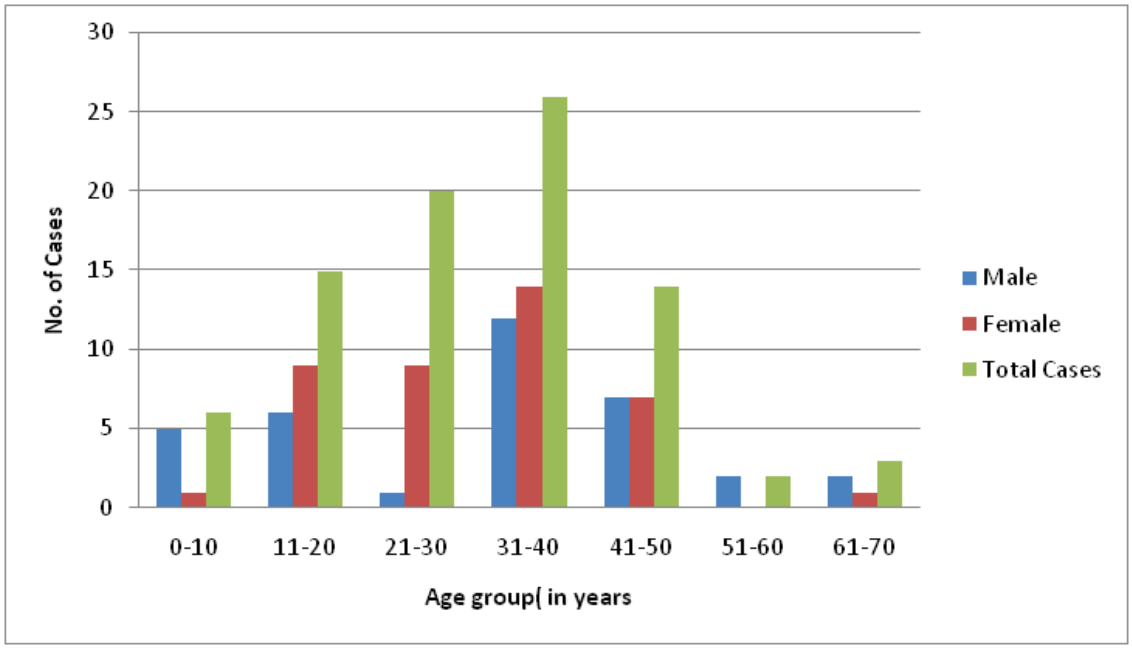
Email:drmanish1280@gmail.com

reports prepared in detail including age, gender, time of death, period of survival, percentage of burn injuries, hospital records, history recorded from the police with inquest papers, relatives of deceased and friends.

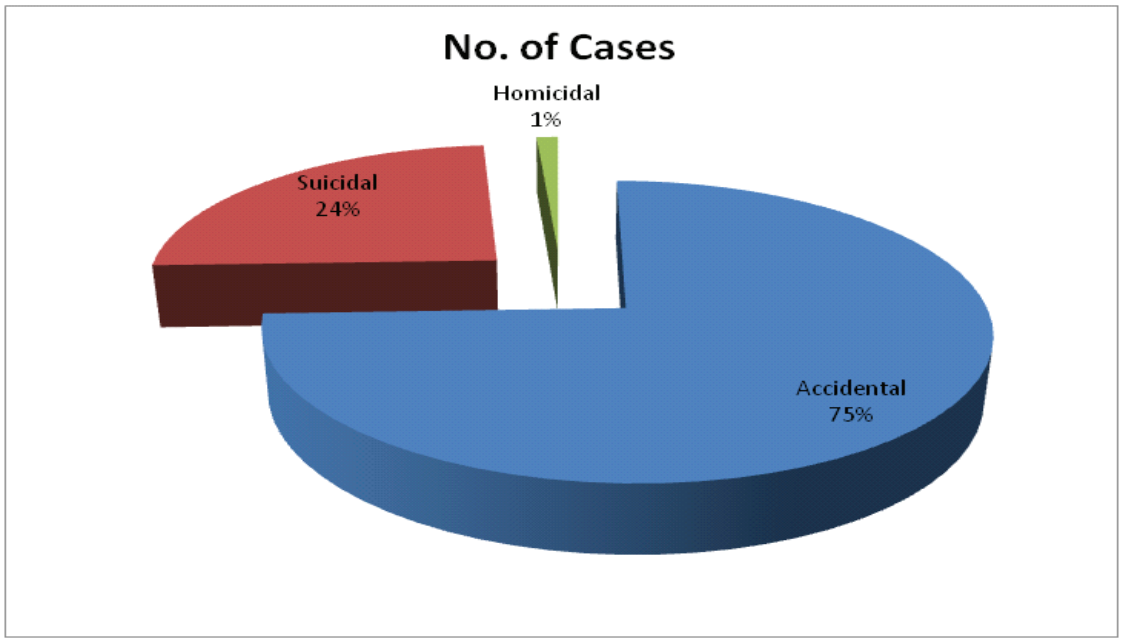
**Distribution of burn cases according to age and gender (Fig.1)**



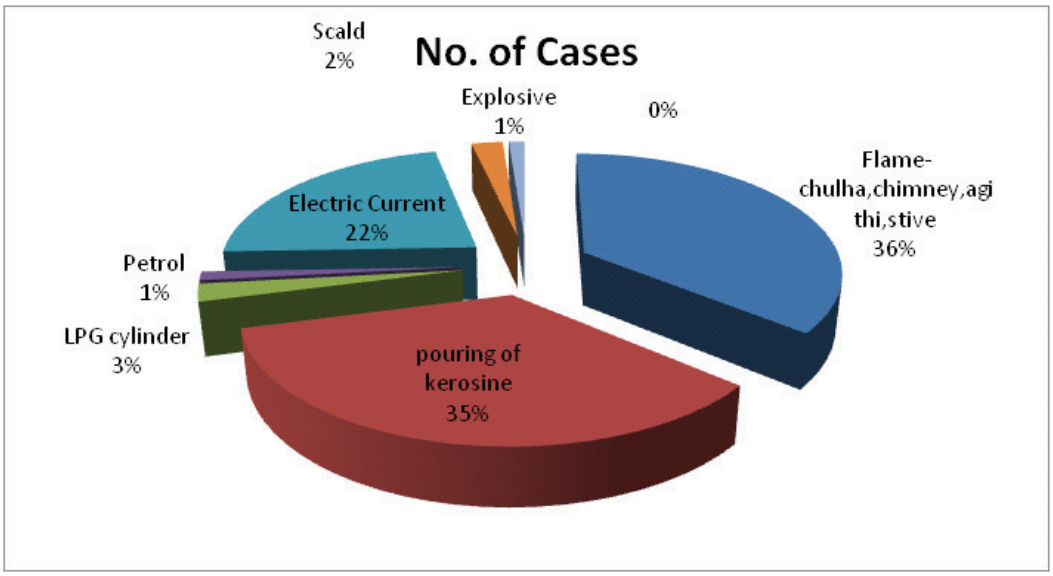
**Distribution of burn cases according to marital status (Table 1)**

| Marital status | No. of cases | Percentage |
|---|---|---|
| Married | 65 | 75.5 |
| Unmarried | 21 | 24.5 |

**Distribution of burn cases according to manner of death (Fig.2)**



**Distribution of burn cases according to type of burn (Fig.3)**



**Distribution of burn cases according to involved body surface area (Table 2)**

| TBSA% | No. of cases | Percentage |
|---|---|---|
| 0-20 | 20 | 23.3 |
| 21-40 | 04 | 4.6 |
| 41-60 | 07 | 8.1 |
| 61-80 | 19 | 22.1 |
| 81-100 | 36 | 41.9 |

**Distribution of burn cases according to duration of survival (Table 3)**

| Duration of survival | No. of cases | Percentage |
|---|---|---|
| <12hrs | 25 | 29.06 |
| 12-24hrs | 20 | 23.25 |
| 2-3days | 14 | 16.27 |
| 4-7days | 17 | 19.76 |
| >1 week | 10 | 11.62 |

## Result

In the study period total 780 medico-legal autopsies were conducted, out of total, 86 cases brought to mortuary with the alleged cause of death as burn. 45 were males and 41 were females. Male and female ratio was 1:1.1. 46 cases were in the 21-40 years of age group in both the gender. Maximum cases belong to the married category (75.5%). Majority of the cases were from rural area (80.23%). Majority of burn incidence occurred at home (80.23%). Peak incidence of electric burns occurred in rainy season. Manner wise distribution of death due to burns reveals that more number of victims died by accidental burn (74.41%) followed by suicidal burn (24.4%) and homicidal burn

(1.16%). Majority of victims died as a result of flame burn (74.41%) followed by electric burn (22.09%), scald burn (2.32%) and explosive burn (1.16%). Death due to flame burn majority of cases were female (62.5%). This study revealed that the total body surface area involved was more than 80% category in 41.86% cases. Majority of death due to burns in victims were more due to shock (66.2%) followed by septicemia (32.5%) and complications (1.16%). Majority of victims died due to burn admitted in hospital were (83.7%). Majority of burn incidence occurred during 9 p.m. to 4 a.m. (45.3%) followed by 1 p.m. to 8 p.m. (31.4%) and 5 a.m. to 12 p.m. (23.3%).

Most of the burn deaths occurred at indoor places and were preventable by reasonable precautions. Most effective ways to prevent these burn accidents are mass public education programme regarding safety measures in household environment and industries, first aid education of burn injuries should be part of elementary education. All buildings and industries should be equipped with all fire safety instruments.

## Discussion

In the present study, there is slight predominance of male victims on females and majority of them were in the reproductive age group 21-40 years. Most common manner of the burn was accidental, followed by suicidal and homicidal. similar in an earlier study of government medical college and hospital Chandigarh and PDU Medical college Rajkot, it was observed that most burn death occurred in the age group of 21-40 years.[7] In other study of deaths from burn in Faisalabad, most common age group in females was 20-29 years and in males 30-39 years.[8]

In our study maximum cases belongs from married category and majority of burn incidence occurred at home. Similar study reports of Ranchi 78.6% burn cases were married[10] and in Chandigarh study majority of burn cases were married and belong from rural area.[11]

Manner wise distribution of deaths due to burn was accidental followed by suicidal and homicidal. In other study of Rajkot most common manner of death was accidental followed by suicidal and homicidal and in Memochoubi et al study most of death due to burn were accidental.[2,7] In study of Masud U et al .most of burn cases died due to homicidal burn (59%).[8]

Majority of victims in my study died due to flame burn (74.41%) followed by electric current (22.09%), scald burn (2.32%) and explosive (1.16%). Females died due to exposure of flame burn cases were (62.5%). In similar study of death from burn in Faisalabad most of cases were of flame burn, in Indore study most common agent of burn injuries were flames.[8,12]

41.86% cases involved more than 80% body surface area in my study which is similar to Memchoubi et al study.[2]

Most common cause of death is shock in 66.2% cases in present study which is similar to other study of Mishra et al from 01 January 2013 to 31 December 2013[9] and the fire is both a blessing and scourge to the mankind study of Mangal HM et al 55.33% victims died within 24 hours of incidence due to shock.[7] Majority of burn incidence occurred in late night (9 p.m. to 4 a.m.).[7,9]

## Conclusion

In the present study, there is male predominance slight higher than female, with the majority of burn cases are between 21-40 years of age. Flame and accidental burns were the most common mode of burn injuries involved. Most of burn injuries occurred at homes and were preventable by reasonable efforts and fire safety measures. Our study clearly indicated that shock was the most common cause of death. Main factor of high rate of burn injuries in society are social factors. Most important step in reducing the burn incidence is through mass education programme, simple safety instructions and adopting measures regarding fire safety. Government, non-government organizations and doctor community are needed to concentrate in the fire safety programme. Burn prevention programmes need to be launched in country especially in rural areas. In cold climate, fire safety measures should be followed in special manner to prevent burn injury accidents.

# Psychological Autopsy: *the Psychological Assessment of the Dead Individual's Role in the Death*

**Anand Kumar Vasudevan[1], Hanumantha[2], Lynne Eccleston[3]**

*[1]Professor and Head, Department of Forensic Medicine & Toxicology, Sri Muthukumaran Medical College Hospital and Research Institute, Mangadu, Chennai, India, [2]Assistant Professor, Department of Forensic Medicine & Toxicology, ESIC Medical College & PGIMSR, KK. Nagar, Chennai, India, [3]Ex-Coordinator, Forensic Psychology Program, University of Melbourne, Australia*

## Abstract

This article deals with the psychological assessment of equivocal death. As an investigator it is important to possess the knowledge of the cause and manner of the circumstances surrounding any suspicious death. The authors of this study have explored in detail the procedures involved in the equivocal death investigations and protocols followed during the conduct of the interview by the investigators. However, the psychological autopsy report has certain guidelines to be prepared and needs to be evaluated in-depth before any conclusions is to be drawn. To be politically correct, this paper will leave no stone unturned in terms of psychological assessment of the deceased role in the death.

***Key words:*** *Psychological autopsy, Equivocal death, and Investigations.*

## Introduction

"*Human consciousness is an unusual template of experience and emotions" – Unknown*

In every instance of death, a physician must distinguish both the cause and mode of death. The cause of death is defined as "the original underlying medical condition which initiates the lethal chain of events culminating in death"[20], Its is the duty of the medical examiner, coroner, and law enforcing authorities, to determine the mode of death in all violent and suspicious death investigations. There are times when physical evidence and evidence found in autopsy does not reveal the mode of death. This is known as equivocal death. Equivocal deaths often involve questions that surface around suicide, homicide, accidental or some natural deaths. Those deaths that fall under the category of "undetermined" are based on what is found at the scene of crime and autopsy, but which frequently require a closer "psychological" investigation and examination. The psychological autopsy was developed as a further post mortem investigative tool that aids in the determination of the person's death. The psychological autopsy is a retrospective construction of a decedent's life initiated to get a better understanding of his death. It is used to determine the victim's psychological intent, using interviews and examination of documents to reconstruct the behaviour, personality, lifestyle, habits and history of the victim prior to death[15]. The concept and technique of the psychological autopsy was developed by Dr. Edwin S. Shneidman who defined the psychological autopsy as:

"*A behavioural scientific impartial investigation of the psychological (motivational, intentional) aspects of a particular death. It legitimately conducts interviews (with a variety of people who knew the decedent) and examines personal documents (suicidal notes, diaries, and letters) and other materials (including autopsy and police reports) that are relevant to the role in the individual's death*"[19]**.**

In general terms, it is used to determine the state of mind, and to identify the personality of the deceased at the time of death in order to clarify the mode of death[7].

### Indications for psychological autopsy

Applications of the psychological autopsies are most commonly used when a case is controversial whether suicidal or accidental. What appears, as suicide could be murder, what seems to be murder could be culpable homicide, what resembles a culpable homicide could in fact be an accident? What is apparently an accident can

turn out to be a case of suicide[4]. For instance, a pedestrian walking out in front of a moving vehicle – to determine whether it was an accident or intentional? Drug ingested deaths also raises questions, whether the drug was taken accidentally (overdose), or purpose of self–destructive behaviour, or was administered by someone else. Firearm related deaths require looking into the history of the individual, was the person obsessed with weapons, or careless in handling weapons, defect of the firearm itself and queries continue till the conclusions are derived.

Typical equivocal deaths may be when a child who commits suicide aged between five to nine, then the next task is to determine whether the child is psychologically capable of committing suicide, or in single vehicle accidents when the car leaves no skid marks, or hangings where there is the possibility of the death having resulted from an autoerotic asphyxia, or sexual asphyxia (sexual fantasies derived from hypoxic states) gives us erroneous conclusions whether suicidal or accidental[11]. For example, suicide by drowning there is likely to be an orderly scene, hats, or handbags left behind, with clothing folded, or if it is a woman wearing a night dress sometimes to keep stones in the pockets for two reasons, firstly to drown faster and secondly, the dress does not float exposing her body in an obscene manner. A drowning due to homicide involves the presence of unexplained injuries and disturbances in a scene of crime, to determine the person was dead or alive when he reached the water is investigated by weeds or plants present in the hand, held firmly due to cadaveric spasm, and study of diatoms present in the body[16], in case of accidental drowning victim's pocket article may contain a trip planner, which suggests the victim did not predict his death. In falls from height cases, the cause of death is due to the multiple injuries sustained by the impact of hitting the ground, but the mode of death may not be certain. The occurrence could have been an accident, may be the victim tripped, or it may have been intentional or the victim has been pushed out. Especially, if the physical evidence has no significance and absence of witnesses. Therefore, further investigation is needed to determine the mode of death in equivocal cases.

The term Psychological autopsy is related to two types of investigations:[10]

1) Understanding the psychosocial factors that have contributed to the death.

2) To assist in the forensic determination of the manner of death.

For these criterions to be fulfilled some objectives are necessary:[3]

a) Medical history and history of events surrounding the death.

b) Details of scene of crime.

c) The quality of autopsy.

**Behind the scene of equivocal death investigation**

Role of the medical examiner in the investigation:

The medical examiner, who is the forensic pathologist defines the cause of death, provides details about the manner and circumstances of death and the results of a medico-legal autopsy. It is the job, or privilege of the forensic pathologist who acts as a medical detective, to probe, investigate and record the truth. The prime function of the medical examiner is medico-legal certification of the manners of death, when it is straightforward in "typical" cases, while complex in "equivocal" cases[12]. The medical examiner's responsibility for certifying the manner of death has important legal, social, medical and research implications[12].

**Role of the investigators:**

An investigator in the death team investigation includes the magistrate/coroner, medical examiner, psychologist, psychiatrist, a psychiatric social worker, or a police investigating officer and other law enforcement authorities. As psychological autopsy aids as an investigative tool which is at the outer edge of professional knowledge and practice in that it requires an application of skills, experience, and training to assess a variety of factors including the behaviour, thoughts, feelings, and relationships of an individual who is deceased[12]. Therefore, the interview with the family, friends, co-worker, relatives, neighbours, physicians and other acquaintances to prepare a psychological autopsy report are carried out mainly by the mental health professionals and behavioural science investigators, the possible reason for this, is the limited training and exposure of medico legal officials in the psychological aspects of equivocal death. For reasons that the coroner or magistrate has minimized background in medicine or psychology, moreover the medical examiner also receives most of the training in pathology and forensic science techniques with little formal training in

psychological aspects of death[12].

Primary goals of these mental health professionals and behavioural scientists are:[18]

a) To determine the mode of death.

b) Reasons for death at that particular period of time.

c) Assessment of lethality (suicide).

d) Psychotherapeutic value to the survivors.

**Protocol to conduct an equivocal death interview**

a) Ethical considerations concerning the interview, is of prior importance, the integrity of the deceased must be respected. There may be issues that the deceased or his or her family does not want revealed or facts that requires special handling. It is the responsibility of the interviewer to maintain the code of ethics in relation to the deceased.

b) History of the actual events must be reviewed, later the interviews of family members, friends, relatives, colleagues at work/school, neighbours, physicians, priest, acquaintance and eyewitnesses, should be conducted.

c) Approaching the informant to conduct an interview is an important consideration, the informants are contacted by mail and later a phone call, to avoid contact refusal rate[1]. The time interval between the death and the interview will influence the quality of information, for instance, day or weeks etc. degrade memory traces.

d) It is important to avoid harming the survivors. Sometimes they may not be ready for an interview, so the interviewer has to be flexible and ready to re-schedule the interview. If someone refuses to participate, that decision should also be respected and no feelings of guilt should be placed on them.

e) The interviewer should establish mutual respect and confidence, with the informant, and ensure confidentiality and anonymity, and also obtain an informed consent before the investigation[2].

f) The interviewer must have experience in dealing with situations of varying degrees and possess knowledge of the state of mental health of the interviewee, who may be in immense emotional crisis (shock/grief)[13].

g) The skills of interviewing includes, proper language, clear, listening more than speaking, no threatening questions, no repetitions, avoid loaded questioning and more than one informant in a single interview[18].

h) The interviewee may have motives of giving exaggerated information or concealing facts, or give pertinent information to protect the image of the victim and family. False information also can be given due to lack of memory or it may be intentional. Therefore is important to explain to the interviewee the significance of the information they are providing. It is the role of the interviewer to be able to assess distorted or irrelevant information[13].

i) The interviewee's reactions should be evaluated and the interviewer should possess skills and knowledge of the bereavement process and support for the family and friends during investigation[14].

j) The interviewee's opinion and reactions to the interview can be obtained by asking them to complete a brief questionnaire at the end of the session.

**Salient features in an equivocal death interview**[7]

1) Description of the deceased: the personal views about the deceased.

2) Period of association with the deceased: how long they know the deceased, how often they see each other, type of relationship between them.

3) Any changes noticed in behaviour or emotional distress associated with the deceased.

4) Any problems noticed by the interviewee, or have discussed with them.

5) Observed or expressed mental status of the deceased to situation of depression and stress.

6) Recent changes physically observed: pain, signs of illness, fatigue, tension, or loss of appetite, changes in sleep pattern, insomnia, wakes up throughout the night.

7) The interviewee's reasons behind the death: what would have probably happened and why.

Other sources:[5]

- Suicide note: This plays an important role to solve the whole issue if it is proved that the deceased had written the suicide note (verified by a forensic

document examiner), the contents and language (specific references to suicide or morbid content). Suicide note also plays as an experimental control for the mental health professionals in interviewing process, when they are not disclosed about the evidence, and to derive their opinion to provide an estimate of validity[17].

o Personal documents: Letters (family, friend, relatives, or acquaintances), dairies, videos, and literature read recently and in past (morbid content), emails, threats notes or messages received recently, bills, tickets, and pornographic collections if any.

o Medical records: Visits to physicians, medical illness, addiction, family history of illness, whether under medications.

o School records: Information such as change in academic performance or absenteeism, conduct and character in general

o Military records: Reveals education and training background, areas of deployment, promotions, efficiency and obsession for weapons.

o Employment records: Performance, conduct, alibi of work and absenteeism.

With the above mentioned information, a psychological autopsy report is produced, and later reviewed by the death investigation team to determine the mode of death[6]. The psychological autopsy is considered ultimately to be an expert opinion; therefore it depends on the accuracy of the data collected from the interviews, examination of relevant documents and other materials. Therefore the interviewee's probabilities and limitation to science should be noted[15].

**Guidelines To Prepare The Psychological Autopsy Report**

These are general guidelines that should or might be useful in preparing a psychological autopsy report and should be used only when there is an absolute indication[5,6,8,10].

1) Identifying information for victim

2) Details of the death

3) Crime scene evidence

4) Medical autopsy report

5) Background/outline of victim's history

5a. Development history

5b. Medical history

5c. Psychiatric history

5d. History of previous suicidal attempts

5e. Substance abuse history

5f. Financial history

5g. Employment history

5h. Educational history

5i. Marital history

5j. Sexual history

5k. Legal history

5l. Family history

5m. Military history

6) Death history of victim's family

7) Description of the personality and life style of the victim

8) Description of last days of life

9) Assessment of intention

10) Reaction of the informants to victim's death

11) Rating of lethality of suicidal intension

I. Lethality: absent/low/medium/high

II. Rating: 0-8

III. Statement: First degree - high rating 6-8

Circumstance is certain for suicidal death.

Second degree – medium-rating 4-6

Impulsive Vs unplanned act.

Third degree – low-medium rating 0-3

Remote possibility of suicidal death.

**Evaluation of psychological autopsy report**

The psychological autopsy report provides detailed information about the death using various sources including the autopsy report, medical records, relevant

documents and information gathered from interviews with key informants. These sources and information provided is to be clearly documented for evaluation and its potential validity. The behavioural scientist and other mental health professionals would be expected to provide more systematic details about the important psychological stages in the person's thought processes e.g. motivation and personality, to deliver a formal evidence for the conclusion. Actually there is no well developed conceptual or theoretical basis for deriving conclusions from various sources of information, due to lack of standardised technique or specific procedure in conducting the psychological autopsy which may serve as areas of potential weakness. From the assumption that people known to the deceased can furnish details of both the historical and recent activities and behaviour of the deceased, the information may be distorted or biased, the informant can deny, conceal or suppress valuable information necessary for the evaluation.

Therefore, circumstances surrounding death are given important consideration; including pre-existence of a stressor in some form of debilitating life circumstances is usually a precursor to suicide. Increasing rate of suicide by firearms can be due to the increasing availability of the lethal agent[6], there are cases of poisoning seen more often in farmers, or drug toxicity in personnel who work in medical and other health services. The crucial concept for defining suicide is intention. A major purpose of the psychological autopsy is to clarify the pre-mortem intensions of the deceased[15]. Previous suicidal attempts or depression provides a prima facie evidence for suicide as opposed to accidental death. In this context, rating of lethality plays an important role. The crime scene investigation has an active participation in the evaluation regarding the circumstances surrounding death for an accidental case a precise reconstruction of events is absolutely necessary, in case of homicide, the investigator should keep in mind that any individual, when accused of a crime, will tell a tale favourable to themselves. Murder will be painted to look like self-defence, for instance, and manslaughter to resemble an accident. Some suspects can be further be subjected to polygraph, of which validity is of concern in court of law.

The investigators should not base their opinions on police reports and other forms of documentary evidence, as they are incomplete, or because the police are primarily interested in determining whether a homicide has been committed and also psychological autopsies evaluation should not rely on depositions alone[9]. Here, the investigator is merely interpreting a prior set of facts rather than predicting future behaviour based upon the limited facts available before assessment. The final judgement as to the mode of death is based upon a review of all the know facts and circumstances; including the magistrate/coroner's report, forensic medical report, police reports, crime scene analyst reports, and the psychological reconstruction[19]. Finally, to analyse and conclude to a specific answer in equivocal death circumstances, are dependent on the objectives to remove the bias from the conclusions that may be encountered in suspicious death or ambiguous fatalities, and to facilitate the expansion of knowledge so that people may learn from the tragedy and, hopefully, be cautious and reduce the chances of similar occurrence in future.

## Conclusion

Psychological autopsy is most often used in cases of suspected suicide or homicide in an attempt to reconstruct the personal life and character of the deceased, to uncover hidden secrets that may help to give family members peace of mind and also plays a role in many legal suits, malpractice suits, and insurance claims, including criminal investigations. This article has covered in-depth inquiry of psychological assessment involved in analysing the procedures of psychological autopsy that has become a valuable tool in the investigation and, at times, resolution of questionable and equivocal death cases. Despite the weakness of the evidence and procedures used in this technique, mental health professionals face problems while reconstructing a psychological autopsy in both in civil and in criminal matters, when questions can be raised to the mental state of the deceased prior to death. Therefore, it is important to establish the value that the report may add to the proceedings, and that includes the admissibility of psychological autopsies as evidence in court hearing which will also be expected to vary from case to case, in terms of understanding the application of rules of evidence and concerning the scientific basis for the technique.

# Legality In Hospitals- Medico-Legal Case Management

**Ashwini Pandit[1], Dhwani Patel[2], Arushi Chawla[3]**

*[1]Assistant Professor (MBA-Hospital & Healthcare Management), Institute of Management & Training, Gujarat Forensic Sciences University, Gandhinagar, [2]Assistant Professor, [3]Postgraduate Student (Forensic Odontology), Institute of Forensic Sciences, Gujarat Forensic Sciences University, Gandhinagar*

## Abstract

The growing number of legal issues in various fields and specialties in the current era has been no different in the healthcare sector. The complexity associated with such issues has been the major concern of practicing doctors/healthcare professionals. In this article, an attempt has been made to focus the legalities in the field of medicine with an emphasis on the Indian set up and existing Laws governing such actions. The article comprises of medico-legal case management, awareness and prevalent practices among the health care professionals especially among those who are directly or indirectly involved with the treatment of patients. As far the awareness is concerned regarding a procedure, the documentation and various other medico-legal issues were studied in detail. Also, various aspects of medico-legal cases admitted in the hospital.

***Keywords:-****Medico-legal, Medicine, Law, MLC case management*

## Introduction

The health profession is taken into account to be one amongst the noblest professions within the world. The application of medication is capable of rendering noble service to humanity provided ordinary care, sincerity, efficiency, and professional skill is observed by the doctors. However, today, the patient-doctor relationship has nearly diminished its fiduciary character and has become additional formal and structured. The law, like medicine, is an inexact science. One cannot predict with certainty an outcome of cases many a time. It depends on the actual facts and circumstances of the case, and also the personal notions of the judge concerned who is hearing the case. The axiom "you learn from your mistakes" is too little honored in healthcare. The best way to handle medico-legal issues is by preventing them[1]. The survey deals with various aspects of medico-legal cases admitted in the hospital. The medical professionals need scientific knowledge, technical skill, moral understanding of profession and awareness about the relevant laws of the land. Primarily doctors but also on other ancillary and administrative staff of the hospital have several ethical and legal obligations in the performance of their duties.

## Methodology

The material for the present study is comprised of information gathered from the medical professionals- Physicians, medical administrators, members of hospital ethical committee, who were directly or indirectly engaged in treatment and care of various kind of medico-legal case management. This study was carried out at five hospitals. The method used was interview with the concerned staff . The questions were designed to know the standard of knowledge and skill, practical application, customary practices, in their hospital as it may or may not be within the control of the doctors and ancillary staff. Appropriateness in documentation in case-files, record keeping, care of preserving material of evidence of medico-legal cases for purpose of the law as per guidelines of regulatory authorities. Also, lawyers and judicial officers were consulted to gain information for the same.

## Discussion

Not only medical professionals but also various private medical institutions are usually apprehensive in dealing with MLC, for, according to them, an MLC (Medico-legal Case) implies a lot of disputes, unwanted burden, rough speaking police officials, inordinate hours in the court, unrelenting defense counsels, etc. Because of this fear-factor, they either try to avoid the cases or try to get rid of them as soon as possible. With these improper understanding of the implication of the cases,

they invite mistakes, deliberation, which may land them in trouble. Members of the medical profession are liable to be called upon to give medico-legal assistance in varied circumstances and situations by police and law. Like any other witness, the medical practitioner is also bound to answer truly all questions posed to him in the court of law. The law usually requires reliable evidence of facts and authoritative opinions. Thus, a doctor has not only to play a vital role struggling to save the life of the patients or relieving their sufferings but also has to fulfill the required minimum formalities on medico-legal aspects in each case.

**Medico-Legal Case**

A medico-legal case is a case of injury/ illness/death of the subject where the attending doctor, after eliciting history and examining the patient, thinks that some investigation by enforcement agencies is important to ascertain and fix responsibility for the case in accordance with the law of the land. It may be described as a case of injury or ailment, etc., in which investigations by the law enforcing agencies are essential to fix the responsibility regarding the causation of the said injury or ailment. The doctor is ought to do everything possible to resuscitate the patient and make sure that he's out of danger. All legal formalities stand suspended till the patient is out of danger. This has been clearly exemplified by the Honorable Supreme Court of India in Parmananda Katara Vs Union of India.Every doctor is bound to provide medical aid to the victims irrespective of the cause of the injury; he cannot take any excuse of allowing the law to take its course.

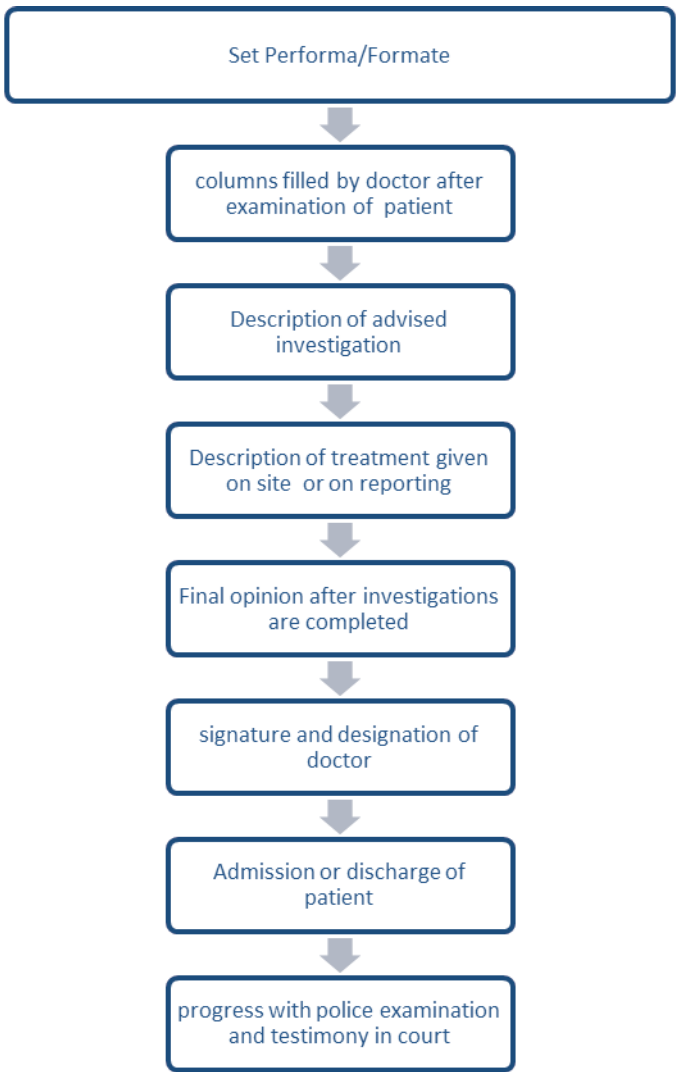

**Fig.1.1 Medico-legal Case process**

**Receiving MLC**

A Doctor will receive a Medico-Legal Case in any of the four situations:

• A case is brought by the police for examination and reporting or order of the Court for medico-legal examination.

• The person in question was already attended by a doctor and MLC was already registered in a previous hospital and the person is now referred for expert management/advice.

• When the patient himself expresses his intention to register a case against the alleged accused.

• By the doctor himself after eliciting history and examining the patient, if he feels so that the case in accordance with the law of the land. In such state of affairs, the doctor has to utilize his medical knowledge and judgment to decide whether the case should be treated as MLC or not, especially when the history is not fully concealed, either by the patient or his relatives/ friends, due to some motive.

**Brought Dead Cases**

In all the brought dead cases wherever casualty duty officer is extremely satisfied after taking history and researching the records present, that the death was natural, he may not label them as medico-legal strictly at his discretion. In the death certificate form against the column of the cause of death one should write "NOT KNOWN BROUGHT DEAD" In no case, it should be mentioned that cause of death should be determined after post mortem.[2] A Doctor making MLC is a mere legal formality even in brought dead cases. It is practically impossible to diagnose the cause of death on external examination, history, etc. It is for the police being law enforcing personnel to decide whether it is natural or unnatural death or to submit for Post mortem examination to rule out.

**Documentation of an MLC**

Documentation is completed in duplicate in a set Performa (as per Hospital policy) with a ball-point pen, in clear and legible handwriting and incomplete words without using abbreviations. Cutting/ overwriting etc. should be avoided as much as possible and all corrections should be properly initialed. Abbreviations of any sort should be avoided. Separate Performa may be available for medical examination, an examination of drunkenness, etc. All columns are filled up fastidiously and by the identical Doctor who had examined the patient. Each MLC is given a recent MLC number consecutive. The details are completed there itself, leaving no provisions as to be completed later on. Investigations advised and found to be entered Treatment given at the site or on reporting. The opinion to be recorded in the MLC sheet, if an opinion cannot be given, under observation be given and signed by the doctor with name written in block letters. The Final opinion is given by the same doctor making MLC in the original MLC sheet. After all, investigations are completed. After completion, the Doctor must sign and mention his/ her full name below it with designation and Police constable on duty should be informed in each case. After registration of a case as MLC henceforth all documents and registration forms bear identical MLC number as well as the discharge slip. The patient is admitted or discharged with recommendation be entered into the case sheet. The doctor examining the patient should complete the MLC sheet before leaving the hospital.[3] All MLC X-rays be kept in the department as evidence for a court of law. Special samples were taken to be entered into the MLC sheet. If the patient is dead or died when handed over to the police for post mortem and not to relatives, A copy of the MLC sheet is handed over to the police for further investigation against his signature and belt number on the copy.

**Collection and preservation of samples**

When a Medico-legal case is received by a Hospital, preservation, and collection is the prime concern of the hospital. The following samples are collected-Gastric lavage, Vomitus in poisoning cases, Blood in Alcoholic/ poisoning cases/drug abuse/ or for DNA test (preserve in Refrigerator/ or in common salt),Clothes in Assault/ Injury/Firearm/Burn cases, Nail clippings in Assault/ Rape cases Pellets/Bullet etc. if recovered, Vaginal swabs/ smears /Pubic hairs in Rape cases, Swabs from firearm entry wounds, Urine for pregnancy test in Rape cases, Undergarments, Swabs from Glans penis in Rape/ Unnatural sexual offences[4].Any other exhibit e.g., a bottle of poison, tablet or weapon if recovered should be properly labeled and sealed. Sample seal to be given and the endorsement of a sample of the seal should also be made in MLR.

**Dying Declaration**

A dying declaration or statement created by the

person on the verge of death on the cause of his death or on to any of the circumstances of the transaction that resulted in his death, such a statement, oral or in writing, made by the deceased to the witness is a relevant fact and is admissible in evidence, provided it has been created by the deceased while in a fit mental condition as certified by the attending doctor. A Doctor should intimate the police for calling the Magistrate to record the declaration. If there's no time the attending doctor ought to record the dying declaration in presence of police[5].

**Examination of MLC Cases**

It is advisable that a lady doctor should examine a woman, or, wherever this is not possible, a female attendant/nurse should be present during the examination. If a case is referred from another hospital where medico-legal case sheet has been prepared, the findings are attached to the same without making fresh MLC. If the date of incidence is delayed and the patient brought late, the present findings are to be entered in MLC.

**Admission and Discharge**

Whenever a medico-legal case is admitted or discharged, the same should be informed to the nearest police station at the earliest. It is better to tell the police through the casualty of the hospital wherever the medico-legal register is typically maintained and necessary entries may be made in it. While discharging or referring the patient, care should be taken to see that he/she receives the Discharge Card/Referral Letter, complete with the summary of admission, the treatment given in the hospital and also the directions to the patient to be followed when discharged[6]. Failure to try and do therefore renders the doctor accountable for "negligence" and "a deficiency of service". If the patient is not serious and can take care of him, he may be discharged on his own request, after taking in writing from him that he has been explained the doable outcome of such a discharge which he is happening on his own against medical advice. Police have to be informed before the said patient leaves the hospital.

**Abscond/Death of Medico-Legal Case**

In case an individual admitted as a medico-legal case expires or absconds, inform the police immediately. Send the body to the hospital mortuary for preservation, till the legal formalities are completed and the police release the body to the lawful heirs. Request a medico-legal Postmortem examination, providing a copy of the death summary. Do not issue a death certificate before post-mortem even if the patient was admitted[7]. The dead body should NEVER be released to the relatives; it ought to solely be handed over to the police.

**Copy of MLC to Individuals Other Than Police**

A medico-legal report could be a report given by a professional and is of confidential nature and isn't a public document. As such the accused or respondent is not entitled to get a copy of the same during the investigation of the case. In such cases, a no-objection certificate should be obtained from the police authorities investigating the cases, before a copy is supplied. In some cases, the police ask for a medico-legal report after the case has been discharged or expired. It is irregular to issue a medico-legal report on the MLC in such cases. The police, however, can ask for any specific information (including the details of injury), which may be supplied to them from a record of such case. If needed a fresh MLC to be made recording the present findings, after re-examining the patient on a new date.

**Medical Testimony of Doctor In The Court Of Law**

Do not misrepresent documents/medical literature in the Court of Law. When evidence is read into the record of a trial, only that portion of the document, which validates the information being discussed need to be read aloud. One paragraph or even one part of a paragraph may be all that is necessary to substantiate the point you are making. When a document is cut in a manner, which lends the quoted passage a meaning other than what would be derived from a more complete reading, you are misrepresenting the document[8].

**Final Opinion**

Final opinion is to incline on the original MLC sheet by the identical doctor preparing record reckoning on investigation findings or treating physician in admitted case. Final opinion in MLC to be given by the hospital where it had been made after obtaining a case summary from a referred hospital. After discharge of the patient or death the MLC record to be sent to MRD for preservation. The doctor needs to give a witness in court as an expert witness if summoned by the Honorable Court. At that point he could manufacture the case record or final opinion ahead of the magistrate.

## Conclusion

Medico-legal cases have to be forbidden properly, following the latest prevailing guidelines. Even if due guidelines/procedures are not followed or not available, these cases pose no problem if one uses proper caution and due care and attention, while dealing with them. Proper documentation, Timely data, an organized and thorough examination together with all relevant investigations and referrals, etc. are all that is necessary to see such cases completed successfully.

**Conflict of Interest**- Nil

# To Assess Association of Bullous Pemphigoid and Neurological Disorders- A Clinical Study

**Balkrishna Pralhadrao Nikam[1], Dhanraj D Chavan[2], Nischhal Shrivastava[2]**

*[1]Assistant Professor, [2]PG Resident, Department of Dermatology, Krishna Institute of Medical Sciences Deemed to be University, Karad*

## Abstract

**Background:** Bullous pemphigoid is an immunobullous disease which affects the elderly. The present study was conducted to assess association of Bullous pemphigoid and neurological disorders.

**Materials & Method:** The present study was conducted on 125 cases of pemphigoid. Parameters such as name, age, gender, clinical features, etc were noted. The medical history, neurological diseases and medications used by the patients were recorded.

**Results:** Out of 125 cases, 65 were in males and 60 were in females. Common neurological disorders were dementia seen in 15, stroke in 12, Hemorrhagic stroke in 6, Parkinson's disease in 14 and epilepsy in 5. The difference was significant ($P< 0.05$). There was positive correlation of dementia, stroke and Parkinson's disease with Bullous pemphigoid ($P< 0.05$).

**Conclusion:** Authors found that positive correlation of dementia, stroke and Parkinson's disease with Bullous pemphigoid.

***Key words:*** *Bullous pemphigoid, Dementia, Parkinson's disease.*

## Introduction

Bullous pemphigoid is an immunobullous disease which affects the elderly. The incidence of BP has been estimated to be 4.5 to 14 new cases per million per year. The prevalence is shown to be increasing in some studies.[1]

Bullous pemphigoid (BP) is an autoimmune subepidermal blistering skin disorder which occurs mostly in the elderly.[2] It is associated with circulating autoantibodies against hemidesmosomal proteins BP180 (BPAG2) and BP230 (BPAG1) in the dermoepidermal junction. Clinical features of this disease include subepidermal blisters on urticarial plaques, erythematous, or noninflamed skin. It occurs mostly on the flexural aspects of the limbs and on the trunk. BPAG2 is a transmembrane protein that has a long extracellular domain and is associated with synapse stabilization in the central nervous system. BPAG1 is an intracellular protein which belongs to the plakin family.[3]

The role of BPAG1 is to connect the intermediate filament, microtubule, and microfilament cytoskeletal networks with each other and to cell membrane sites. They are also known as scaffolds for signaling proteins that modulate cytoskeletal dynamics. Different isoforms of BPAG1 have been found: BPAGI-e in the skin, BPAG1-a in the nervous system, and BPAG1-b in the striated muscle.[4]

There is growing evidence to suggest an association between BP and a range of neurological disorders including dementia, cerebral stroke, Parkinson's disease, cerebrovascular disease, multiple sclerosis, epilepsy, and polyneuropathies. While the immunological mechanisms have not been fully elucidated the association between BP and neurological disorders may be due to immune responses arising from cross-reactivities of skin auto antibodies with BP antigens or their isoforms that are known to be expressed in brain and neuronal tissue.[5] The present study was conducted to assess association of Bullous pemphigoid and neurological disorders.

## Materials & Method

The present study was conducted in the department of Oral Medicine & Radiology. It comprised of 125 cases of pemphigoid. Ethical clearance was obtained from institutional ethical committee. All patients were informed regarding the study and written consent was obtained.

Parameters such as name, age, gender, clinical features, etc were noted. The medical history, neurological diseases and medications used by the patients were recorded. Data thus obtained were subjected to statistical analysis. P value less than 0.05 was considered significant.

## Results

**Table I Distribution of cases**

| Total- 125 | | |
|---|---|---|
| **Gender** | **Males** | **Females** |
| Number | 65 | 60 |

Table I shows that out of 125 cases, 65 were in males and 60 were in females.

**Table II Neurological disorders**

| Neurological disorders | Number | P value |
|---|---|---|
| Dementia | 15 | 0.05 |
| Stroke | 12 | |
| Hemorrhagic stroke | 6 | |
| Parkinson's disease | 14 | |
| Epilepsy | 5 | |

Table II shows that common neurological disorders were dementia seen in 15, stroke in 12, Hemorrhagic stroke in 6, Parkinson's disease in 14 and epilepsy in 5. The difference was significant (P< 0.05).

**Table III Correlation of Neurological disorders and Bullous pemphigoid**

| Neurological disorders | R value | P value |
|---|---|---|
| Dementia | 0.321 | 0.04 |
| Stroke | 0.314 | 0.01 |
| Hemorrhagic stroke | 0.982 | 0.12 |
| Parkinson's disease | 0.412 | 0.05 |
| Epilepsy | 0.824 | 0.54 |

Table III shows that there was positive correlation of dementia, stroke and Parkinson's disease with Bullous pemphigoid (P< 0.05).

## Discussion

Several mechanisms have been postulated to explain the association between bullous pemphigoid and neurological disorders. Firstly, in terms of immunology and inflammation, neuronal isoforms of BP180 and 230 antigens lead to cross reactivity between the skin and the brain.[6] This process is further facilitated by damage to the blood-brain barrier due to the neurological disorder. Systemic inflammation involving the T helper 1 and T helper 2 immune responses has also been found in bullous pemphigoid as evidenced by elevated serum levels of cytokines.[7]

Clinical manifestations include pruritus and urticated, erythematous lesions which later develop into large, tense subepidermal blisters and mucosal involvement. An association of bullous pemphigoid with neurological diseases such as stroke, dementia, Parkinson's disease, epilepsy, amyotrophic lateral sclerosis, syringomyelia and multiple sclerosis has been reported.[8] The present study was conducted to assess association of Bullous pemphigoid and neurological disorders.

In this study out of 125 cases, 65 were in males and 60 were in females. Chen et al[9] conducted a retrospective case-control study involving 43 patients with bullous pemphigoid and 43 age-, sex- and ethnicity-matched controls. There was a statistically significant association between bullous pemphigoid and neurological disorders

in particular for dementia. Although stroke was more common among patients with bullous pemphigoid, this association was not statistically significant with OR of 1.9 and adjusted OR of 2.1. Similarly both ischaemic stroke and hemorrhagic stroke were more common. Other neurological disorders more common among patients with bullous pemphigoid were Parkinson's disease and epilepsy. Dyslipidaemia was significantly less common among patients with bullous pemphigoid.

We found that common neurological disorders were dementia seen in 15, stroke in 12, Hemorrhagic stroke in 6, Parkinson's disease in 14 and epilepsy in 5. Yang et al[10] in their cross-sectional study, 87 patients with BP were enrolled. Out of 87 patients with BP, 17 (19.5%) had at least one neurological disease. Cerebrovascular accident (CVA) was the most common neurological disease that was seen in 7 patients (8.0%) in the case group and 4 (2.1%) in the control group. The incidence of CVA was significantly different between BP patients and the control group ($P$ = 0.022). Dementia was observed in 6 patients in the case group (16.8%) and 2 (1.0%) in the control group. The incidence of dementia was significantly different between BP patients and the control group ($P$ = 0.008). In this study, the incidences of Parkinson's disease ($P$ = 0.830), epilepsy ($P$ = 0.067), and multiple sclerosis ($P$ = 0.326) were not statistically significant between the two groups.

We found a positive correlation of dementia, stroke and Parkinson's disease with Bullous pemphigoid ($P< 0.05$). Langan et al[11] retrospectively assessed 183 patients with BP and 348 age- and sex-matched controls for neurological disorders. Overall, there was a highly statistically significant association between BP and neurological disorders. These included dementia, Parkinson`s disease, stroke and other neurological disorders but not Alzheimer`s diseases, which was more common among patients in the control group.

Texeira et al[12] observed that neurological disorders which cause central nervous system inflammation or degeneration were related to BP and the association was strongest between multiple sclerosis and BP (13). Indeed, an association between multiple sclerosis and BP has also been observed in several other reports. Interestingly, other conditions such as dementia, Parkinson's disease, epilepsy, stroke, schizophrenia, schizotypal and delusional disorders, as well as personality disorders also revealed a statistically significant association with BP.

## Conclusion

Authors found that positive correlation of dementia, stroke and Parkinson's disease with Bullous pemphigoid.

# To Assess Clinical Profile of Patients with Dermatophytosis Infection

**Balkrishna Pralhadrao Nikam[1], Dhanraj D Chavan[2], Nischhal Shrivastava[2], Namita Narkhede[1]**

*[1]Assistant Professor, [2]PG Resident, Department of Dermatology, Krishna Institute of Medical Sciences Deemed to be University, Karad*

## Abstract

**Background:** The distribution of dermatophyte infections and their causative agents varies with geographical region. The present study was conducted to assess clinical profile of patients with dermatophytosis infection.

**Materials & Method:** The present study was conducted on 86 patients of both genders. In all patients, a through clinical examination was performed. The skin specimen was taken for histopathological examination.

**Results:** Out of 86 patients, males were 34 and females were 52. Type was T. corporis in 24, T. cruris in 14, T. manuum in 2, T. unguium in 13, T. Faceii in 12, T. capitis in 11 and T. pedis in 10. The difference was significant (P< 0.05).

**Conclusion:** Dermatophytosis is common in skin disorder seen all age groups especially adults. Most common was T. corporis followed by T. cruris and T. manuum.

***Key words:*** *Dermatophytosis, Skin, Geographical.*

## Introduction

Dermatophytoses is a superficial infection caused by a group of fungi, dermatophytes. The distribution of dermatophyte infections and their causative agents varies with geographical region and is influenced by a wide range of factors, such as type of population, climatic factors, lifestyle, migration of people, cultural practices and socioeconomic conditions, incidence of peculiar comorbidities and drug therapy.[1]

Dermatophytes comprise of three major genera, Trichophyton, Microsporum and Epidermophyton, of the class hyphomycetes and division deuteromycota. They are keratinophilic in nature and have the ability to colonize keratinized non-living tissues such as skin, hair and nail in human and animals. The infection spreads easily by direct contact from infected humans and animals or through fomites.[2]

The infection is common world-wide with higher prevalence in tropical countries. The dermatophytoses infection is commonly referred as ringworm due to the appearance of the lesion. Despite the increasing incidence of recurrent dermatophytosis, information on the extent of the burden in our country is scarce.[3]

Dermatophytosis is currently a disease of worldwide importance and a public health problem in many parts of the world particularly in developing countries.[4] Although the disease hardly causes death, it is a common refractory infection deleteriously affecting the quality of life via social stigma and upsetting day-to-day activities.[5] Large population size, low socioeconomic status, inadequate health facilities, and exchanging of foot-wears, clothes, and barber shop materials among people in developing nation have been recognized as potential risk factors for the proliferation of the disease.[6] The present study was conducted to assess clinical profile of patients with dermatophytosis infection.

## Materials & Method

The present study was conducted in the Department of Dermatology, Krishna Institute of Medical Sciences Deemed to be University, Karad.

It comprised of 86 patients of both genders. The study was approved from institutional ethical committee. All participants were informed regarding the study and written consent was obtained.

Data related to participants such as name, age, gender etc. was recorded. In all patients, a through clinical examination was performed. The skin specimen was taken for histopathological examination. Results thus obtained were subjected to statistical analysis. P value less than 0.05 was considered significant.

## Results

**Table I Distribution of participants**

| Total- 86 | | |
|---|---|---|
| **Gender** | **Males** | **Females** |
| Number | 34 | 52 |

Table I shows that out of 86 patients, males were 34 and females were 52.

**Table II Type of dermatophytosis**

| **Type** | **Number** | **P value** |
|---|---|---|
| Tinea corporis | 24 | 0.01 |
| Tinea cruris | 14 | |
| Tinea manuum | 2 | |
| Tinea unguium | 13 | |
| Tinea faceii | 12 | |
| Tinea capitis | 11 | |
| Tinea pedis | 10 | |

Table II shows that type was T. corporis in 24, T. cruris in 14, T. manuum in 2, T. unguium in 13, T. Faceii in 12, T. capitis in 11 and T. pedis in 10. The difference was significant (P< 0.05).

## Discussion

The epidemiology of dermatophytoses in developed countries has also exhibited notable changes over the past decades as a consequence of variation in some environmental conditions, and the distribution of the etiological agents usually reflects the changing clinical patterns of dermatophytoses.[7] Some species of dermatophytes are endemic in certain parts of the world and have a limited geographic distribution. T. soudanense, T. gourvilii and T. yaoundii are restricted to Central and West Africa. T. concentricum is confined to islands in the South pacific.[8] The present study was conducted to assess clinical profile of patients with dermatophytosis infection.

In this study, clinical profile of patients with dermatophytosis infection was assessed.

We found that out of 86 patients, males were 34 and females were 52. Type was T. corporis in 24, T, cruris in 14, T. manuum in 2, T. unguium in 13, T. Faceii in 12,

T. capitis in 11 and T. pedis in 10.

Mahajan et al[9] conducted a study in which one hundred and fifty patients with recurrent dermatophytosis were enrolled. Recurrent dermatophytosis was seen in 9.3% of all patients with dermatophytosis in this study. Trichophyton mentagrophytes was the most common species identified (36 patients, 40%) samples followed by T. rubrum (29 patients, 32.2%). In−vitro antifungal susceptibility testing showed that the range of minimum inhibitory concentrations (MIC) on was lowest for itraconazole (0.015–1), followed by terbinafine (0.015–16), fluconazole (0.03–32) and griseofulvin (0.5–128) in increasing order.

Lakshmanan et al[10] conducted a study in which Tinea capitis was the predominant clinical manifestation consisting of 48.1% of the cases. Among 153 patients with tinea capitis, 73.2% were in the age group of 1-14 years. Of 318 study participants, 213 (67.98%) were found to be positive for dermatophytosis microbiologically. Out of 164 fungal isolates, 86 were dermatophytes and 78 were non-dermatophyte fungi. Among 86 dermatophytes, T. violaceum represented 38.4% of dermatophyte isolates and 89.7% of the isolates were recovered from tinea capitis. Of 76 non-dermatophyte molds, Aspergillus spp., Scytalidium dimidiatum, and Cladosporium spp. were the most common isolates, respectively.

Senthamilselvi et al[11] found that out of total 150 subjects, most common clinical type of dermatophytosis, identified in our study, was tinea corporis in 53 (35.3%) subjects followed by tinea cruris in 34 (22.6%) subjects. 134 (89.3%) subjects were tested positive by direct microscopy (KOH mount) and 69 (46.0%) by culture. Highest KOH mount positivity was seen in patient suffering from tinea corporis (94.3%) followed by tinea cruris (94.1%).

Pathania et al[12] found that the most frequent clinical forms were tinea unguium (39.2% of the total dermatophytoses), tinea corporis (22.7%) and tinea pedis (20.4%). There was a predominance of women for tinea unguium and corporis and of men for tinea pedis and especially tinea cruris. T. rubrum was the prevalent causative agent, implicated in 64% of total cases, followed by M. canis (14%) and T. mentagrophytes (10%). In parallel with this changing pattern, the frequency of isolation of T. rubrum has shown a continuous increase during the last 35 years, whereas a progressive decline of the etiological role of T. violaceum, M. canis and even more of E. floccosum has been noted.

## Conclusion

Dermatophytosis is common in skin disorder seen all age groups especially adults. Most common was T. corporis followed by T. cruris and T. manuum.

**Ethical Clearance**- Taken from Institutional Ethical committee

**Source of Funding**- Self

# The Study of Trends and Out Come of Acute Poisoning in a Tertiary Care Hospital Khammam, Telangana; India

**Bharath Kumar Guntheti[1], Kondru Laxman[2]**

*[1]Professsor, Dept. of Forensic Medicine & Toxicology, Mamata Medical College, Dr Kondru Laxman,*
*[2]Associate Professor, Maheshwara Medical College, Chitkul, Pattancheru, Telangana*

## Abstract

**Background and Objective:** It is important to know the trends, nature, sevesrity and outcome of acute poisoning cases in order to take up appropriate planning, time lapse, first aid and recovery. This study is to assess the trends and outcome of acute poisoning cases in a tertiary care hospital in Khammam.

**Materials and Methods:** This is a retrospective study conducted in a tertiary care hospital attached to a medical institution in Khammam. The study includes 126 cases and data regarding age, sex, time elapsed after intake, circumstances of poisoning, name of the poisonous substance, chemical type, duration of hospitalization, severity and outcome collected in the Proforma.

**Results:** Incidence was common among 21-30 yr. old married Hindu male laborers from rural background belonging low socioeconomic classes with only primary education. Majority of the incidents occurred in the victim's home during the day time. Maximum number of cases were encountered during the Rainy season and in the month of November. Organophosphorus insecticides and poisoning by snake bite were the commonest types of poisoning. Majority of the acute poisoning cases were hospitalized within one hour of toxic exposure. Maximum number of patients stayed in hospital for up to 7 days and recovered. Family problems and financial problems were the most common reasons behind poisoning. Overall mortality was found to be 3.05% and 38 cases succumbed to the poisoning.

**Conclusion:** Poisoning was common in young males. Maximum number of cases encountered in Rainy season. Organophosphorus insecticides and poisoning by snake bite were the commonest types of poisoning. Majority of the acute poisoning cases were hospitalized within one hour of toxic exposure. The overall mortality was substantially high, mainly contributed by self-poisoning with insecticides. Early care in a tertiary care center may help to reduce mortality in India.

## Introduction

Poisoning both accidental and intentional were significant contributors to mortality and morbidity throughout the world According to WHO, three million acute poisoning cases with 2,20,000 deaths occur annually. Of these 90% are of fatal poisoning and occur mainly in developing countries particularly among the agricultural workers[1]. Acute poisoning forms one of the commonest causes of emergency hospital admissions. Pattern of poisoning in a region depends on variety of factors, such as availability of the poisons, socioeconomic status of the population, religious and cultural influences and availability of drugs. In India, it has been estimated that about 5 to 6 persons per lakh of population die due to poisoning every year.[1] The most common cause of poisoning in India and other developing countries is pesticides. OP compounds are readily available, relatively cheap and have a rapid, lethal action even in smaller doses. Therefore, they are

**Corresponding Author:**

widely used as suicidal poisons.[2]

The mortality and morbidity in any case of acute poisoning depends upon a number of factors such as the nature of the poison, dose consumed, availability of medical facilities, treatment by qualified persons and time interval between intake of poison and provision of medical help.

The main objective of the present study was assessing the pattern and outcome of acute poisoning cases admitted at a tertiary care hospital and to know the nature and severity of poisoning in order to take appropriate preventive measures.

## Materials and Method

Present retrospective study was conducted in a tertiary care hospital attached to a Medical College in Khammam for a period of one year from October 2017 to August 2018. The study included 126 cases of various acute poisoning due to various poisons /drugs /chemicals. Data regarding profile, domicile pattern, type of poison, manner of poisoning, seasonal trends, motive behind poisoning, name of poisonous substance, chemical type, duration of hospitalization, severity, time elapsed after intake and outcome were collected in the Proforma. All data were documented, analyzed and interpreted with previous studies. In our study the age above 14 years onwards cases were studied.

## Aims and Objectives

To assess the trends and outcome of acute poisoning cases in a tertiary care hospital in Khammam.

To know the nature, severity and outcome of acute poisoning cases in order to take up appropriate preventive measure.

## Observations and Discussion

- In the present study, the overall mortality was found to be 3.05%. The reasons observed were delay in admission to hospital, improper management of the patient, nature of poison, dose consumed, availability of medical facilities and time interval between intake of poison and medical treatment and lack of information regarding the poison and its antidote. Similar observations were made by other studies.[1-3].

- In our study 59 [46.82%] patients were of 21-30 years followed by 28[22.22%] patients of 31-40 years and 22[17.46%] patients were less than 20 years of age and least 10[7.93%] were from 41-50 years age group. In age of above 60 years, 3 cases were reported. These results were consistent with studies conducted by others. [2-4] Exposure to social, economic, domestic, occupational pressures, early marriages and inability to cope with the post marital pressures especially in rural areas are important factors.

- In the present study, 71[54.34%] patients were male as compared to 55[43.65%] females thus giving a male to female ratio of 13:10**.** Similar patterns were observed by other studies.[2-5] Males are more exposed to stress and occupational exposure compared to females and have easy accessibility to the agrochemicals due to more involvement in agricultural work. This is the main reason for the disparity.

- In our study**,** 87[69.04%] patients were from rural background and in comparison, only 30.95% of the people were from urban background. These results were similar to other studies.[5] Pesticides were the main choice by the victims as these are easily available in rural areas.

- In this study, 92[73.01%] of the victims were Hindu while 20[15.87%] were Muslim and 4 [11.11%] were Christian. Similar results were obtained by studies conducted by others reseachers.[6]

- In this study, we observed that the acute poisoning was most commonly seen in married men [51/40.47%] and women [31/24.60%] while unmarried people were 38[30.15%]. Which could be due to variable income of agriculture workers who come across various stressful situations in their life. This finding is similar with the study done by others.[4-6]

- In our study, severe acute poisoning cases were more likely to occur in low income people [80/63.49%] when compared to middle class [38/30.15%] and people of high socio-economic status [8/6.34%]. Similar observations were noted by others.[5,6]

- We observed that in most cases, poisoning victims

had only primary education [55/43.65%] followed by secondary education in 37[29.36%] cases only 18[14.28%] were graduates while 16[12.69%] were illiterate. This consistent with other studies.[5,6]

- In our study, majority of acute severe poisoning cases were seen in laborers [56/44.44%] followed by house wives [31/24.60%] and farmers [20/15.87%]. Similar findings were made by other studies.[5-7] chart no.1.

- In this study, 82[65.07%] patients consumed poison during the day **(**6 am -6pm) while 44[20.63%] of them consumed it at night (6pm-6am). The consumption during evening hours could be explained as people usually meet at homes after working hours and discuss about their problems leading to frustration resulting in them taking the extreme step. Same observations were noted by other studies.[7,8]

- In the present study**,** 86 [68.25%] victims consumed poison at their home while 22[17.46%] did it at their work place18 [14.28%] of them in a remote place. These were consistent with other studies.[7,8,9] Chart no. 2

- Seasonal trends of acute poisoning: Most of the cases were reported in Rainy season [52/41.26%] followed by Winter [41/32.53%] and Summer [33/26.19%]. The increased incidence during the rainy season could be attributed to increased availability of pesticides, frustration resulting from the loss of crops as a result of excessive or inadequate rains. Similar trends were observed by other studies.[7-9] Chart no.3

- In the present study on acute poisoning cases, it is seen that the Organophosphorus insecticides account for 47[37.30%] cases and poisoning by snake bite for 18[14.28%] cases. There is a rapidly increasing trend in the incidence of OPC poisoning over the last few years due to easy availability and uncontrolled sale and use of these agents. Due to greater exposure in fields, there is a great risk of posing by snake bite especially in rural agriculture workers and laborers. Similar results were reported by various studies conducted by other authors.[6-10] Chart no.4

- In our study, out of this insecticide group, carbamate was responsible in 13 [10.31%] cases followed by organochlorine compounds in 10 [7.93%] cases. The difference in the type of poisoning seen within the country may be due to the difference in the pattern of use and availability of pesticides in various parts of the country. This is consistent with other wokrs.[7-10]

- In the present study, 98[77.77%] patients consumed the poison with suicidal intent while in 26[20.63%] cases, the exposure was accidental. However, in 2[1.58%] cases, the intention was homicidal. Similar observations made by others.[7-13] It appears that the easy availability of OPC, low cost coupled with their faster and more effective action probably makes it a favorite poisoning agent for suicidal purpose. It was seen on psychiatric assessment that majority of the suicidal cases were associated with reactive depression. Accidental poisoning especially with kerosene was more common in alcoholics and was observed in 8[6.34%] cases.[7-13] In our study, snake bites were responsible for accidental poisoning in 18[14.28%] cases as this region has more snakes and agricultural population. These results were consistent with other researchers.[7-13]

- In our study, 64[50.79%] of the acute poisoning patients were hospitalized within the first one hour of toxic exposure while 32[25.39%] of them were admitted between 1-3 hrs. However, 20[15.87%] of them were brought in less than 6 hrs. after toxic exposure. The remaining 10 patients were hospitalized between 6 hours to 24 hours of toxic exposure. The early reporting to the hospital after poisoning had greatly affected the case of fatality and similar observations were made by previous works.[10-14] chart no.5

- In present study, 88[69.84%] patients consumed highly toxic and fatal dose of poison whereas 38 [30.15%] patients consumed mild toxic and fatal dose of poison. There is a variability of symptoms and signs depending on the nature of the compound, amount consumed, absorption, time gap between exposure and presentation to the hospital. Similar outcomes were also observed in other studies.[13,15]

- In the present study, a rather high 106 [84.12%] patients received first aid while 20[9.52%] people did not receive first aid as they were close to the hospital and were brought immediately. Similar findings were made by others.[12-16] Regarding role of first aid, it plays an important role in mortality and morbidity.

- 60[47.61%] patients had to stay in hospital up to 7 days while 24[19.04%] stayed in the hospital for 3 days 24 [19.04%] patients had to stay only for one day in hospital. However, in two poisoning cases, patients had to stay in hospital for more than 30 days. These were consistent with studies conducted by others.[14-18]

- In this study, 88[69.84%] recovered as they reached hospital within 3 hours and were managed properly.

- Delay in transfer of the patients from remote places to hospital leads to delay in treatment which may cause more damage to their organs and lead to death. This was seen in 38[30.15%] cases. Overall mortality in the present study is 3.05%. Same outcomes were obtained by other studies.[18-20]Among the total deaths, reported majority of them arrived at hospital after 3 hours. Mortality due to poisoning depends on various factors including age, toxicity of the poison, amount consumed, health status of the patient, early hospitalization and proper management. Cause of death was refractory hypotension with severe metabolic acidosis and respiratory failure along with secondary complications.

- In the present study, the most common causes were family problems seen in 52 [41.80%] cases followed by financial problems in 30[23.80%] cases. The motives depend on the variety of factors such as economic crisis, stress, rain dependent agriculture, natural calamities etc. Unemployment, chronic illness, quarrels and love failure were the other contributory factors in suicides. It was seen from our study on psychiatric assessment of all suicidal attempt cases that majority of cases were associated with acute stress reaction. Similar findings also observed by other studies.[20-22] chart no.6

- Alcohol presented as an associated inebriant in 28 cases may explain the fear of death in these people. These were similar to other researchers.[20-22]

**Preventive Measures**

The changing trends of poisoning need proper health care policy planning for early proper diagnosis and effective treatment of such cases.

Strict rules must be followed regarding sale of pesticides.

## Conclusions

- The overall mortality is 3.05%.

- Most of the victims were married Hindu Rural Laborers of low socio-economic groups.

- Most of them consumed poison at home in the evening hours during monsoon.

- The trends of acute poisoning cases indicated that Organophosphorus insecticides and poisoning by snake bite were the commonest types of poisoning.

- It was seen on psychiatric assessment, that majority of the suicidal cases were associated with reactive depression, consumed the poison with suicidal intent.

- Majority of the acute poisoning cases were hospitalized within one hour of toxic exposure after receiving first aid.

- Maximum number of patients stayed in hospital for up to 7 days and recovered.

- In the present study, family problems and financial problems were the most common reasons behind poisoning.

# Correlation between various Measurements of Sternum with Stature - An Autopsy based Study

**Bhumesh Darade[1], Pawan Sabale[2], Shailesh Mohite[3], Swapnil Akhade[4], Chaitanya Kulkarni[5]**

*[1]Ex. Junior Resident, [2]Associate Professor, [3]Professor and Head, Department of Forensic Medicine, Topiwala National Medical College, Mumbai, [4]Assistant Professor, Department of Forensic Medicine and Toxicology, All India Institute of Medical Sciences, Raipur, India, [5]Chaitanya Kulkarni, Assistant Professor, Department of Forensic Medicine and Toxicology, Government medical College, Akola, India*

## Abstract

The sternum is of crucial significance while estimating body stature. Dwight, in the late 19th century, discussed potential use of the sternum for estimation of the stature. Various researchers have shown that the sternum may be of use in stature assessment merely when long bones are not obtainable. The study was conducted to analyse the correlation between the stature and various measurements of the sternum. The posterior curved length, length of manubrium, length of mesosternum and length of sternum were measured in 300 adult sterna. The mean length of a cadaver (Stature) was observed to be greater in males (162.34 ± 8.03 cm) as compared to females (156.53 ± 8.50 cm). A positive moderate correlation (R ranging from 0.332 to 0.647) was observed between various measurements of sternum with stature in both the genders. Sternal length shall be considered as a better parameter over other sternal measurements for estimating the stature. However the application for utilizing the sternum for stature estimation should be restricted to the population sample for and from which they have been developed.

***Keywords:*** *Stature estimation; sternum; posterior curved length of sternum; forensic anthropology.*

## Introduction

Estimation of stature is an essential component in the estimation of an individual's identity from mutilated or dismembered or fully skeletonised remains in forensic casework. Karl Pearson (1899) and thereafter Trotter and Gleser (1952) derived regression equations for estimating the stature using long bones which are being used worldwide for a long period of time.[1,2] A number of other bones like skull, metacarpals, metatarsals, scapula, lumbar vertebrae and sacrum have also been used for the estimation of stature.[3,4,5,6,7,8] The osseous skeleton of the sternum is the structure which is observed to resist the effects of putrefaction and decomposition for a long period of time.

The sternum is of crucial significance while estimating body stature. Dwight, in the late 19th century, discussed potential use of the sternum for estimation of the stature.[9] Various researchers have shown that the sternum may be of use in stature assessment merely when long bones are not obtainable. Recent studies have led to the development of regression equations for the estimation of stature in several different population groups. Menezes RG et al.[10,11] and Singh J et al.[12] have assessed the usefulness and the importance of macerated sternum in the estimation of stature in two different Indian adult populations.

The present study was conducted to analyse the correlation between the stature and various measurements of the sternum and to derive regression equations for the estimation of stature in males and females.

## Materials and Method

This study was conducted after the ethical clearance from institute's ethics committee for academic research projects in deceased that were subjected to medicolegal

autopsy at a post-mortem centre attached to a medical college in Mumbai, India. The deceased aged 18 years and above, of either sex without trauma to sternum were included in the study. During the study period from November 2014 to August 2016, 300 adult sterna were examined. Primary data, in each case, was collected from the inquest report and hospital indoor paper records in admitted cases.

During the autopsy, the deceased was put in a supine position on a flat, hard-surfaced autopsy table, with the knee and hip joints extended, and the neck and feet in a neutral position after breaking the rigor mortis. The cadaveric length (stature) was measured from the vertex up to the heel using a steel measuring tape. After removing the sternum from the thoracic cage, the sternal margins that articulate with the cartilages of the first seven pairs of ribs were carefully dissected. The soft tissue was scraped and measurements were taken using a measuring tape. The posterior curved length of the sternum (PCL), length of manubrium (M), length of mesosternum (B), length of sternum (S) were noted keeping the bone on a flat surface. The xiphoid process was not taken into consideration in the present metric study to measure the length of sternum because of the high variability of its length.[13]

Study parameters were described using descriptive statistics like mean, standard deviations and p-values. The correlation between the various measurements of the sternum and stature analysed by calculating Pearson's correlation coefficient, coefficient of determination and standard error of estimate using SPSS v16.0 (SPSS, Inc., Chicago, IL).

## Results

In the study, 300 adult intact sterna were examined, 150 (50%) were of males and 150 (50%) of females. The mean age of males was 43.83 ± 14.93 years and that of females was 39.98 ± 18.92 years. A p-value of 0.0518 indicates no significant difference between the mean age of males and females. The mean length of a cadaver (Stature) was observed to be greater in males (162.34 ± 8.03 cm) as compared to females (156.53 ± 8.50 cm). The mean of all the sternal measurements was greater in males as compared to females except that of the length of manubrium (M). P-value <0.05 in all parameters indicates a significant difference in sternal parameters between males and females **(Table 1).**

| | S | 0.417 | 0.173 | 0.168 | 7.319 | =0.232×S +129.83 | <0.0001 |
| Female | PCL | 0.628 | 0.394 | 0.390 | 6.639 | =0.481×PCL+ 91.525 | <0.0001 |
| | M | 0.569 | 0.323 | 0.319 | 7.016 | =1.037×M + 108.786 | .000033 |
| | B | 0.561 | 0.315 | 0.310 | 7.062 | =0.567×B+ 106.779 | <0.0001 |
| | S | 0.647 | 0.418 | 0.414 | 6.506 | =0.468×S +129.93842 | <0.0001 |

R- Pearson's correlation coefficient

$R^2$ - Coefficient of determination

SEE - Standard error of the estimate,

aX+b -'a' is the regression coefficient of slope or independent variable (sternal lengths), 'X' is the sternal measurement and 'b' is the regression coefficient of intercept/or dependent variable (stature).

Positive moderate correlations were observed for posterior curved length of the sternum (PCL), mesosternal length (B), sternal length (S) and manubrial length (M) with stature in males and females. The correlation coefficient (R) was observed to be higher in females than that in males for all sternal measurements. In males better correlations for PCL (R = 0.424) and sternal length (R = 0.417) were found than that of length of manubrium (R = 0.332) and length of mesosternum (R = 0.380) with significant p values. In females better correlations for PCL (R = 0.628) and sternal length (R = 0.647) were found than that of length of manubrium (R = 0.569) and length of mesosternum (R = 0.561) with significant p values **(Table 2).** Simple linear regression analysis was done for the different sternal lengths to derive regression formulae for estimation of stature. The $R^2$ (Coefficient of determination) and standard error of estimate (SEE) were calculated to assess the significance of a regression as shown in **Table 2.** $R^2$ determines the degree of association of correlation that exists between sternal measurements and the stature, higher the value of $R^2$, better the regression equation as a predictive device. The SEE estimate measures the accuracy of the estimated figure, smaller is its value, better will be the estimates.

## Discussion

The mean length of male cadavers (162.34 ± 8.03 cm) was observed to be more as compared to that of females (156.53 ± 8.50 cm). The study population, sample size and mean length of cadaver (Stature) observed in the other Indian studies is charted in **Table 3**. The mean length of male cadavers observed by Singh J et al.[12], Menezes RG et al.[10,11], Ranjith Raj VP et al.[14] and Saraf A et al.[15] is comparatively on the higher side than that observed by Tumram NK et al.[16], Baraw R et al.[17] and in the present study. The mean length of female cadavers is observed to be relatively similar in all the studies except that of Saraf A et al.[15] **(Table 3).**

**Table 3 - Study population, sample size and mean length of cadaver (Stature) observed in the Indian studies.**

R - Pearson's Correlation Coefficient, *Measurements include xiphoid process.

Menezes RG et al.[10,11] observed a higher correlation coefficient and a lower standard error of the estimate for regression models in macerated and dried sterna. Singh J et al.[12] obtained a correlation coefficient value of 0.316 for males and 0.328 for females for regression models which were based on the sternal length taken from dry bone specimens. Saraf A et al.[15] in their study observed that the stature correlated best with the combined length of sternum, among males (R=0.894), females (R=0.859) as compared to manubrium and mesosternum. All these studies[10,11,12,15] suggested that stature can be estimated from sternum with reasonable accuracy and also concluded that sternum may be of vital importance for stature estimation if long bones are not available. Yonguc G et al.[18] in Turkey observed moderate to strong correlation (R ranging from 0.372 to 0.850) and suggested that the sternal lengths can be used for estimation of sex. They also stated that a sternum is a useful tool for estimating stature when other skeletal bones are not available **(Table 4).**

Baraw R et al. [17] in their study measured PCL of the sternum in fresh and dry samples of the sternum and observed correlation coefficient of 0.872 and 0.610 respectively. They concluded that PCL of sternum acts as an alternative to estimate stature in Delhi population. Ranjith Raj VP et al.[14] observed a correlation coefficient of 0.9410. They concluded that the length of the sternum is a strong correlating factor to the stature of South Indian adolescent male population and it is useful for anthropologists and medico-legal experts for stature estimation. Baraw R et al.[17] and Ranjith Raj VP et al.[14] observed strong correlation coefficients in their study while in both the studies the sternal measurements were taken including the xiphoid process which has high variability in its length.[13] However, Marinho Let al.[19] reported a correlation of 0.329 on fresh sterna sample in a male which also includes the xiphoid process. They also argued that sternal length has inadequate forensic value and comparatively low dependability in determining stature from mutilated human skeletal remains, either skeletonised or fresh **(Table 4).**

Tumram NK et al.[16] derived linear regression equations by measuring manubrium, mesosternum and the total sternal length. The regression model provided a correlation coefficient of 0.55. The study concluded that sternal length in relation to body stature shows a moderate positive correlation and relatively low reliability in estimating stature, and has limited forensic value.

In the present study, positive moderate correlation (R ranging from 0.332 to 0.647) was noted between PCL of the sternum, sternal length, manubrial length and mesosternal length with stature in both the genders. Sternal length is the most significant predictor for stature among male gender and female. However, the accuracy of prediction is higher among females compared to males [R2=41% vs 17%]. The PCL of the sternum showed correlation coefficient of 0.424 in males and 0.628 in females, it was 0.872 in the study of Baraw R et al.[17] including the xiphoid process **(Table 4).** Overall all the sternal lengths display relatively moderate correlation coefficients with stature and relatively high standard errors of estimate in regression analysis **(Table 2)**.

## Conclusion

Many researchers have shown that the sternum may be of use in stature assessment merely when long bones are not obtainable. Sternum carries ethnic variations, in view of gross population variation in metropolitan cities; the observations derived from multiple studies are of meagre significance. The application for utilizing the sternum for stature estimation should be restricted to the population sample for and from which they have been developed. Sternal length shall be considered as a better parameter over posterior curved length, the length of manubrium and length of mesosternum for estimating the stature if at all being used.

**Source of Funding**-None

**Ethical approval**: The study was conducted after the ethical clearance from Institute's Ethics Committee for Academic Research Projects vide approval letter number ECARP 2014-57. All procedures performed in studies involving human participants were in accordance with the ethical standards of the institutional and/or national research committee and with the 1964 Helsinki declaration and its later amendments or comparable ethical standards.

**Conflict of interest statement:** The authors have no affiliation with any organization with a direct or indirect financial interest in the subject matter discussed in the manuscript.

## Abstract

Assessment of depression among the housewives of alcohol consuming husbands in selected community areas, Kancheepuram District, Tamil Nadu. Aim of the study is to Assessment of depression among house wives. The objectives are to determine the level of depression among house wives of alcohol consuming husband, to find out the association between the level of depression with their selected demographic variables of the house wives of alcohol consuming husband.169 samples are selected by purposive sampling techniques. Data collected by using Beck's Depression scale.

The data collected period was for one week. The collected data was tabulated and analyzed. Descriptive and inferential statistical were used. The results are majority 53% of house wives having depression and Minority 47% of house wives did not having depression.

Assessment of demographic variables regard to Factors associated with the level of depression among the demographic variables, Family type,family monthly income ,Frequency of consuming alcohol,Variables like Age,Educational status of wife, Educational status of husband, Employment status of husband,Problem after alcohol consumption,Physically abuse after consumption of those Demographic variables doesn't has significant association.

***Keywords:*** *Assessment, Depression, Alcohol, Wife and Level.*

## Introduction

Alcoholism, now known as alcohol use disorder, is a condition in which a person has a desire or physical need to consume alcohol, even thought it has a negative impact on their life. Alcohol misuse also contribute to poor performance at school, and work, Family problems, unprotected sex, violence and depression. There are a considerable number of anecdotal reports This women faced social, emotional, physical, mental health, also violence and anxiety. The alcoholic addiction of the husband can create significant mental trauma and physical health problems to the and research findings that women's were getting married to alcoholics husbands. wife.[ 9)]

According to the **NATIONAL INSTITUTE OF ALCHOL ABUSE AND ALCOHOLISM**, It state the problems for spouse - Marital conflict, Infidelity, Domestic violence, Unplanned pregnancy, Financial instability, Stress , Jealousy and Divorce. These wives suffer from various stressors due to their husband's alcohol dependence.[(8)]

According to **TIMES OF INDIA 2017** Tamilnadu is one of the high alcohol consuming state 47.4% men in rural areas and 46% men in urban areas .In **INDIA** 30% population consumes alcohol. In global states report to the **Worldwide** 6.2 litres of alcohol is consumed per person in the age of 15,15+ and older. The most negatively affected spouse and children of alcoholic. However less attention has been focused on them so far. [(7).]

The wives of the alcoholics are an 'Unknown Universe' in Indian Society. Clinical work and some research suggest that partner responses to drinking may either facilitate or hinder treatment acceptance and

recovery efforts. Hence the reason for taking up this study is justify.[6]

## Objectives

- Determine the level of depression among house wives of alcohol consuming husband.
- To find out the association between the level of depression with their selected demographic variables of the house wives of alcohol consuming husband.

## Research Methodology

Research methodology deals with the description of the methods and different steps in collecting and organizing data from the investigation. It includes description of the research approach, research design, setting, population, sample and sample size, the sampling technique, sampling criteria, development and description of the tool, data collection procedure and the plan or analysis in the study.

**Sampling Criteria**

**Inclusion Criteria**

- Who are available at the time of data collection.
- Who can read and write tamil

**Exclusion Criteria**

- Who are not willing to participate in study.
- With existing mental illness.

**Method of Data Collection:**

In this present study the researcher distributed the demographic variables proforma and standardized Becks depression scale to the samples. Each sample will take 30 minute to completion of the data. Data collection period was for one week (from 23-4-2019 to 28-04-2019) at community area(poonjeri and payanoor) in that 169 Housewives.

## Data Collection Procedure

The written informed consent was obtained from the parent and guardian as well as from the study participants. Permission letter was obtained from the HOD of Mental Health Nursing department, HOD of Community Health Nursing department, Community area, UG Committee and Human Ethical Committee.

Descriptive statistics like frequency distribution, percentage and inferential statistics like chi square was used to analyze the data.

**Research tool**

There are Two Section (A&B) Section A consist of self-Structured Questionnaires to assess demographic variable & Section B Standardized Beck's Depression scale (short form) to assess the Depression among housewives of alcohol consuming husbands. It consist of 15 questions

**Scoring Pattern:**

## Result

The study finding revealed that,

In previous study Assessment of Depression among the housewives of alcohol consuming husbands Shows that,

- Vishal A Shah, prakashbehere, KK Mishra (2017) conducted a cross section controlled study on Psychiatric Morbidity among Spouses of Men with Alcohol Dependence in Maharashtra. The sample size 50. data were collected electronically on the GMHAT-PC. A computerized clinical assessment tool. The results of the study shows,Anxiety (16%) and depression (36%) were higher in wives of alcohol-dependent men. Stress was higher (6%) in cases as compared with controls (4%). When comparing diagnosis and age-wise distribution, depression was higher in cases (28%) as compared with controls (14%) in age group of 31 to 40.(5)
- Nitasha Sharma, Sunith Sharma, santhiyaghai, deepikakumara,dharmaveersingh et al(2016) conducted a study on living with an alcoholic partner problem faced and coping strategies used by wives of alcoholic client .Descriptive research design was used .sample size was 30.The problems were identified using a non standardized 17 item structured questionnaire while coping in wives of alcoholics was assessed using standardized tool. The result shows that most highly reported were the emotional problem and least reported were the problem of physical violence.(4)
- In this study shows majority of the people 53% of the women having depression and 47% of women did not having depression.

Regard to age: 73(44%) of the wife belong to the age 31-35 years, 53 (30%) above 35 years, 36 (22%) of them 26-30 years, 7 (4%) of them 22-25 years, Regard to educational status of wife: 92(55%) has completed primary education, 43 (25%) has completed higher

education, 26 (15%) are graduates and 8 (5%) are illiterate, Regard to educational status of husband:76 (45%) has completed primary education, 64 (38%) has completed higher education, 20 (12%) are graduates and 9 (5%) are illiterate, Regard to family type:116 (69%) of them is nuclear, 48 (28%) of them f is joint, 3 (2%) is extended and 2 (1%) is others, Regard to employment status of the husband: 152(90%) of them are employed and 17 (10%) are unemployed, Regard to years of consuming alcohol:47 (80%) of the husband consuming for 1-3 years, 55 (33%) of them less than a year, 18 (11%) of them for 3-7 years and 16 (9%) of them above 7 years, Regard to family monthly income: 66 (39%) are Rs. 10,001-15,000, 58 (34%) are Rs.15,001-20,000, 32 (19%) are above Rs. 20,000 and 13 (8%) are Rs.5000-10,000, Regard to frequency of consuming alcohol: 59 (35%) of them consuming alternatively, 53 (32%) drink weekly, 38 (22%) drink daily, 19 (11%) drink occasionally, Regard to problems in home after consumption of alcohol:110(65%)has no problems after consumption of alcohol and 59 (35%) has problem in home after consumption of alcohol, Regard to physical abuse after consumption of alcohol: 128 (76%) of the wives are not abused and 41 (24%) of the wives are abused.

## Disscussion

It shows,And Factors associated with the level of depression among the demographic variables, Family type, family monthly income ,Frequency of consuming alcohol ,Variables like Age, Educational status of wife, Educational status of husband, Employment status of husband, Problem after alcohol consumption, Physically abuse after consumption of those Demographic variables doesn't has significant association.

## Conclusion

This chapter deals with the discussion of major findings of the study . The study findings were presented based on objectives. Discussion of the findings under three main sections viz. Determination of the level of depression, assessment of association of demographic variables with level of depression.

# A Study to Assess the Knowledge on Oral Health and Self Esteem among Young Adults in Selected College, in Kancheepuram District, Tamilnadu, India

**Gini T.R[1] , Ashika Parveen[1], Sharmilavathi.A[1], Avinash.U[1], Anto Benson[1], Shanthi[2]**

*[1]M.S, B.I, B.Sc (Nursing) III[rd] Year Students, [5]Professor Medical Surgical Nursing Department, Chettinad College of Nursing, Chettinad Academy of Research and Education, Rajiv Gandhi Salai , Kancheepuram District, Tamil Nadu, India*

## Abstract

"A study to assess the knowledge on oral health and self-esteem among young adults in selected college, Kancheepuram district, Tamil Nadu, India". The objectives are to assess the knowledge on oral health among college students and to assess the self-esteem among college students and to correlate the knowledge on oral health and self-esteem among college students and to associate the knowledge on oral health and self-esteem with selected demographic variables among college students. The convenience sampling was used to select 100 young adults. The data collection tools were validated and reliability was established. The data was collected from the students in selected college. The collected data was Tabulated and Analysed. The results revealed that Majority of young adults were female 53% and 43% were males. Majority of young adults were in78% got information through mobile phone 9% were got information through newspaper 8% of young adults got information through television and 5% of young adults get information through health professionals.

Present study result shows that Mean score of knowledge was 24.58 and mean score of self-esteem was 28.18. There was statistically mild positive correlation was found between the level of knowledge and the level of self-esteem. There is no statistically significant association between selected demographic variables and the level of found knowledge. There is an statistically significant association found between frequency of brushing and frequent rinsing of mouth and level of self-esteem and there is no statistically significant association found between demographic variables.

***Key Words**: Oral health,Self Esteem,Young Adult,Knowledge.*

## Introduction

The holistic view of health, which is widely accepted today, sees human life as a total system. The world health is etymologically related to the word - wholeness. Holistic health implies that all aspects of the total system of an individual are in balance with each other. Children are the priceless resource and a nation which neglects them does so at its peril[1].

Adolescence is the critical time period when skills and attitudes of individuals are taking shape. Due to fast physiological changes going down in a young person, a consciousness and magnified interest concerning one's own body develops.The body image will bring a way of fun, pride, timidness or maybe unhappiness. Knowledge about the prevalence and frequency of different types of dental problems and the need for treatment is important. (2)

It is an amount hard-to-please important adjustment to the physical and social changes that distinguish childhood behaviour from adult behaviour. The stage of puberty brings in anumberofphysicalandphysiologicalchanges. Theperiodofadolescencenotonly brings physical changes but also psychological changes that make the child a qualitatively different person. These changes affect the personality and adjustment in later life.(3)

The youth population is burgeoning in some countries, and in these areas and elsewhere adolescents are confronting new situations and threats to their present health, moving towards a future in which their health status is likely to be compromised. The health, education and social sectors are called upon to devise, test and make wider use of effective new approaches, including operational, social science and community-based research, clinical studies and longitudinal surveys focused on adolescents and youth. Often slow to recognize the essential value of the inter-sectorial approach in meeting the needs of the population, public health institutions in particular need to provide services and train personnel to make sure that no juvenile person slips through the cracks in health care(4).

Apart from the impact on biological process standing, poor dental health can even adversely have an effect on speech and vanity. Dental diseases impose both financial and social burdens as treatment is costly and both children and adults may miss time from school or work because of dentalpain[5].

The dental problems more common among adolescents are Dental caries, Malocclusion, Periodontal disease, Bimaxillary proclination, Fractured teeth, Missing teeth, Discoloration of teeth. The causes can be poor oral hygiene, infection, lifestyle, accidents (6)

The impact of oral diseases, pain, suffering, impaired function and reduced quality of life, is both extensive and expensive. Most of the time managing of such problems is beyond the resources of many developing countries. Dental diseases are widely prevalent, more so in the developing countries like India. Dental health education is an integral part of dental health services and has been provided in various settings like dental office and dental institutions, school and other educational institutions(7).

Dental diseases are widely prevalent, more so in the developing countries like India. Dental health education is an integral part of dental health services and has been provided in various settings like dental office and dental institutions, school and other educational institutions (8).

No matter the temporal order of the physical changes that come about throughout adolescence, this can be a amount during which physical look unremarkably assumes preponderant importance. Both girls and boys are known to spend hours concerned about their appearance.(9)

Issues of oral health revolve almost exclusively around dental caries and it is very important in developing countries like India. Dental caries incidence begins within the permanent teeth at concerning six years with the eruption of central incisors and initial molars. Among kids five to eleven years more matured, twenty sixth have older one or additional lesions in permanent teeth; this proportion will increase to sixty seven among adolescents twelve to seventeen years of age.(10)

A longitudinal study was conducted to assess the extent of dental anxiety among young adults. Data were collected from 697 youngsters whose age is from 16 to 19 yrs. The study results showed that women expressed 7.73 % anxiety which was more than in men 6.78%.(11)

The psychological problems touching folks that should agitate the loss of a tooth, in addition as make a case for however this loss will have an effect on the standard of life. The most important impact of tooth loss is on |he looks and social relations element of quality of life as a result of folks cannot modification their appearance with missing teeth.(12)

A study found that once subjects went through associate some 20-minute long interview with associate queried that they believed had an occasional opinion of them, their vanity was markedly lower after the interview. Poor physical appearance leads to a lowered opinion by others, which logically leads to lower popularity and lack of popularity may undermine self-esteem and self-confidence.13

Adolescents (10-19 years) form a large section of population – about 22.5 %, that is, about 225 million. They are living in diverse circumstances and have diverse health needs (Census 2001). (14)

The largest and the most important group that may be reached by health education is found in the school system.15

## Materials and Method

A Quantitative, Evaluative research approach was appropriate for the study.Non interventional descriptive research design was most appropriate for the study. The

participants of the study will be selected by convenient sampling technique. The sample size 100 who fulfil the sampling criteria.

Age from 18 years to 25 years, Both male and female gender who are willing to participate in the study and who understand Tamil and English were included in the study. Those who are not willing to participate in the study and not available at the time of data collection were excluded from the study. Standardized administered questionnaire was used to elicit demographic variables and self-esteem scale was used to assess level of knowledge on oral health and self-esteem among young adults and score was interpreted as follows 88-120 high self-esteem ; 57-88 moderate self-esteem ; 24-56 low self esteem .

## Finding and Discussion

**Knowledge:**

The majority of young adults (65 %) were in age group of 18 to 20 years ,46% were 3rd year ,(63%) were religion Hindu ,85% were in source of drinking water purified water, 87% were belongs to non-veg , 78% were in get information through mobile phone.

There is no statistically significant association between selected demographic variables and the level of found knowledge.

**Selfesteem**

76% of young adults had average level of knowledge where as 24% of them had good knowledge on oral health among young adults 26%, 54% and 20% had low, moderate and high level of self-esteem respectively.

There is an statistically significant association found between frequency of brushing and frequent rinsing of mouth and level of self-esteem and there is no statistically significant association found between demographic variables.

**Table 1 : Distribution and Association of Knowledge on oral health and self Esteem with selected demographic variables among college students.**

| S.N | Variables | Frequency & Percentage | Knowledge $\chi 2$ | Self Esteem $\chi 2$ |
|---|---|---|---|---|
| | | | | |

**Table 2 :- Correlation between Knowledge on Oral Health with Self Esteem**

| Aspects | Mean | SD | γ value |
|---|---|---|---|
| Knowledge | 24.58 | 5.115 | 0.5115* |
| Self Esteem | 28.18 | 10.722 | |

Mean score of knowledge was 24.58 and mean score of self-esteem was 28.18. There was statistically mild positive correlation was found between the level of knowledge and the self esteem among young adults.

## Conclusion

Present study was conducted to assess the knowledge on oral health andself -esteem among young adults. The results found that there was statistically mildpositive correlation was found between the level of knowledge and the level of self- esteem and also reveals that there is an statistically significant association found between frequency of brushing and frequency rinsing of mouth and level of self -esteem .therefore investigator concluded that oral hygiene practices among young

adults are not following the oral hygiene because of lack of time to go for dental check-up.

**Self-Esteem.**

**Ethical Clearance:** Ethical clearance was obtained from institutional human ethical committee chettinad academy and education. Formal written permission obtained from hospital authorities. Consent was obtained from each participants after explaining the procedure.

# Knowledge and Attitude of Final Year Medical Students Towards Dentistry and Dental Consultation: A Questionnaire-based Study

**Girish Suragimath[1], Mrunal B Mohite[2], Ashwinirani SR[3], Sameer Zope[4], Siddhartha Varma[5]**

*[1]Professor and HOD, Department of Periodontology, School of Dental Sciences, [2]Intern, School of Dental Sciences, [3]Reader, Department of Oral Medicine and Radiology, School of Dental Sciences, [4]Reader, Department of Periodontology, School of Dental Sciences, [5]Reader, Department of Periodontology, School of Dental Sciences Krishna Institute of Medical Sciences Deemed To Be University, Karad*

## Abstract

**Background:** Several studies have reported poor awareness and knowledge of dental problems among the medical students. There is lack of literature assessing the knowledge and attitude of medical students about dental consultation. Hence there is need to explore the knowledge of medical students towards dentistry and dental consultation.

**Aim:** The aim of the study was to assess knowledge and attitude of final year medical students towards dentistry and dental consultation

**Material and Method:** This cross-sectional study was carried out among 130 final-year medical undergraduate students studying in Krishna Institute of Medical sciences. A self-administered, close ended structured questionnaire was used to assess the knowledge and attitude of medical students towards dentistry and dental consultation.

**Results:** The knowledge of final year medical students about dentistry was found to be average. The majority of the students responded positively for dental consultation. The attitude of students towards dentistry showed somewhat negative response.

**Conclusion:** Based on the findings of our study, medical curriculum should include dental health and disease related topics to improve the knowledge and attitude of undergraduate medical students. Interdisciplinary collaboration among medical and dental fraternity will benefit the patients at large.

***Key words:*** *Awareness, dental consultation, knowledge, medical students*

## Introduction

Oral health maintained by thorough oral hygiene practices plays a pivotal role in maintenance of good oral and general health. Plaque and calculus (tartar) are the main etiological factors for gingival and periodontal diseases.[1] Plaque contains an array of microorganisms, which initiates an inflammatory response in the periodontal tissues. The inflammation which appears locally in the periodontium, leads to collagen destruction, alveolar bone loss progressing to tooth mobility and sometimes tooth loss. The inflammatory mediators and cytokines released during this inflammation can enter systemic circulation and can initiate or aggravate disease process elsewhere in the body.[2] The two way relationship between oral health and systemic diseases like cardiovascular diseases, diabetes mellitus and pregnancy outcomes has been documented in literature.[3] It is important to control and treat oral and periodontal diseases, so as to reduce the systemic complications, as oral diseases especially periodontal diseases have an impact on systemic health.[4] The prevention and treatment of oral disease is the most acknowledged and efficient method of ensuring oral health.[5]

Medical practitioners and medical students tend to neglect the importance of oral health and its maintenance.[6] Medical practitioners treat only the medical condition and do not emphasize on the oral hygiene and health. The need for medical practitioner to participate in oral health promotion is highly essential in India, as majority of the population are deprived of basic dental and medical facilities. Medical education should incorporate dental diseases and conditions, so that medical student is well versed with oral diseases and refer the patients to dentist for further treatment. With this background, the present study was designed to assess knowledge and attitude of medical students towards dentistry and dental consultation.

## Materials and Method

This cross-sectional study was carried out among final-year medical undergraduate students of Krishna Institute of Medical sciences Deemed to be University (KIMSDU), by using close ended, self-administered structured questionnaire. The students completed the questionnaire under the supervision of a research assistant through one to one interview and the completed questionnaires were collected immediately. Ethical clearance was obtained from institutional ethical committee before commencing the study (Ethical clearance code: KIMSDU/IEC/09/2016). An informed consent was obtained from all the participants before enrolling them into the study. Sample size for the study was estimated using power statistics came to 72, and for convenience sake we have collected data from 130 students present during the data collection period. The study was conducted during the period April 2018 to June 2018 at KIMSDU.

Students who were willing to participate and gave a written informed consent were included in this study. Students having barrier in communication and unwilling to participate in study were excluded.

The structured questionnaire was designed after detailed review of relevant literature to assess the knowledge and attitude of the medical students. The questionnaire consisted of 20 close ended validated questions, out of which 12 assessed the knowledge and eight question assessed attitude.

The Statistical analysis was carried out using Statistical Package for the Social Science software (SPSS Inc. released 2007, SPSS for Windows, Version 16.0, Chicago). Descriptive statistics like mean and percentage were used to analyse the data.

## Results

A total of 130 final year medical students participated in the study; 72 (55%) males and 58 (45%) females. The students were in the age range of 21 to 23 years with mean age of 21.6 years.

Out of the 20 questions in the questionnaire, 12 questions assessed knowledge and eight questions assessed the attitude of the students. (Table 1)

When the students were asked about whether it is necessary to consult dentist every six months, majority of them (78%) responded yes. Forty four students believe that dental procedures are painful. Hundred students said that they had neglected dental pain. Ninety six students believe that dental procedures are not as important as medical procedures. Ninety four students think that medical doctors can treat dental problems. Sixty four students think dental education is just restricted to the teeth. Eighty three students agreed to refer the patients for dental consultation. Ninety seven students believed that dentistry is not as important as medical education. Forty students ignored dental procedures due to fear of pain during dental treatment. Ninety students believed that dental procedures are time consuming. Eighty eight students think that knowledge about dentistry should be included in medical curriculum. Seventy seven students were not aware that ignorance of dental problems can cause medical problems. Hundred and ten students were aware of medical emergency during dental procedures. Fifty five students believed in the myth, that cleaning of teeth can lead to mobility of teeth. Forty two students responded that they suffered from halitosis or bad breath. Eighty seven students agreed that dentist can treat medical problems. Fifty three students felt that dental treatments are mostly unnecessary. Twenty seven students believed that dental treatments are expensive. Ninety nine students thought dental treatment will improve general health. Seventy nine students were unaware that dental treatments are necessary before planning any major medical/surgical treatment.

The knowledge of final year medical students towards dentistry was average and majority of the students responded by giving a positive response for dental consultation. The attitude of students towards dentistry showed somewhat negative responses.

**Table 1: Questionnaire used and the responses in number (percentage).**

| Sr. no | Questions | Yes | No |
|---|---|---|---|
| 1 | Do you think it is necessary to consult a dentist after every six months? | 101 (78%) | 29 (22%) |
| 2 | Do you think dental procedures are painful? | 44 (34%) | 86 (66%) |
| 3 | Have you ever neglected a dental pain? | 100 (77%) | 30 (23%) |
| 4 | Do you think dental procedures are not important as medical procedures? | 96 (74%) | 34 (26%) |
| 5 | Do you think MBBS doctors can treat dental problems? | 94 (72%) | 36 (28%) |
| 6 | Do you think dental education is just restricted to a tooth? | 64 (49%) | 66 (51%) |
| 7 | Would you refer a patient for dental consultation? | 47 (36%) | 83 (64%) |
| 8 | Do you believe dentistry is not as important as medical education? | 97 (75%) | 33 (25%) |
| 9 | Do you think you are ignoring dental procedures due to fear of dental treatment? | 40 (31%) | 90 (69%) |
| 10 | Do you think dental procedures are time consuming? | 90 (69%) | 40 (31%) |
| 11 | Do you think that knowledge about dentistry should be included in MBBS curriculum? | 88 (68%) | 42 (32%) |
| 12 | Are you aware that ignorance of dental problems can cause medical problems? | 53 (41%) | 77 (59%) |
| 13 | Are you aware of any medical emergency during dental procedures? | 110 (85%) | 20 (15%) |
| 14 | Do you believe in myth that cleaning your teeth can lead to mobility of teeth? | 55 (42%) | 75 (58%) |
| 15 | Do you suffer from halitosis or bad breath? | 42 (32%) | 88 (68%) |
| 16 | Can dentist treat medical problems? | 87 (67%) | 43 (33%) |
| 17 | Do you feel dental treatment is mostly unnecessary? | 53 (41%) | 77 (59%) |
| 18 | Do you believe that dental treatments are expensive? | 27 (21%) | 103 (79%) |
| 19 | Do you think dental treatment will improve general health? | 99 (76%) | 31 (24%) |
| 20 | Are you aware that dental treatments are necessary before planning any major medical surgical treatment? | 51 (39%) | 79 (61%) |

## Discussion

Oral health maintenance is a part of general health for all the individuals. Oral diseases not only affect the oral cavity but also have implications on many systemic diseases. The effect of oral and periodontal infections has been documented in many conditions like coronary heart disease (CHD) and CHD–related events such as angina, infarction, atherosclerosis and other vascular conditions; stroke; diabetes mellitus; preterm labor, low birth weight delivery, and preeclampsia; and respiratory conditions such as chronic obstructive pulmonary disease.[7] The medical professionals are the first to encounter the patients, the suggestions and remedies rendered by them makes the patient aware of their problems as well as strategies to prevent its recurrence. The majority of oral diseases are largely preventable when detected during beginning of the disease and treatment is rendered through early intervention.[8]

The medical doctors play an important role in oral health awareness and maintenance through their advice and education of the patients.[9] Medical professionals should have a thorough knowledge and understanding of etiopathogenesis of oral and periodontal diseases and various treatment options available to cater the same. This element becomes very significant in Indian population, as majority of the subjects live in rural areas and are unaware about the importance of oral hygiene and health.

The knowledge of the final year medical students in our study was average and the students had a negative attitude towards dental consultation. More than two third of the our study subjects thought that it is necessary to visit dentist every six months, which is not in agreement to the findings reported by Oyetola EO 2016, this difference can be attributed to negligence towards dental care in Nigerian medical students.[10]

In present study many students thought that dental treatments are painful and they avoided treatment due to fear of pain. These results are in disagreement to the previous study which reported very few medical student had fear of dental pain and majority of the students didn't undergo treatment due to lack of time. Author also reported that large number of medical students agreed for patient referral to dental clinic for treatment of dental problems. These findings are not in accordance to the results of our study, which may be due to lack of exposure to dental problems and their treatment in medical students of the current study.

Neela P K et al found more than fifty percent of their study participants were aware about impact of dental diseases on systemic health.[11] These results are not in agreement with present study wherein sixty percent medical students were unaware about the correlation between dental diseases and systemic health. This justifies that there is a strong need for creating awareness about importance of dental health among the medical students.

Large number of study participants thought that knowledge about dentistry should be included in the medical curriculum. These findings are in agreement with a study conducted by Zhang S et al among the medical and dental students in Hong Kong.[12]

In current study more than 30% of medical students reported that, they suffered from halitosis or bad breath. This result are in accordance to study conducted by Andhare MG et al among dental and medical undergraduate students in Beed District of Maharashtra.[13] This may be due to perception of halitosis is subjective and not objective.

A study in dental and medical students of Eastern India reported that majority of the medical students thought dental treatments are expensive,[14] these results are in accordance to the current study.

**Limitations:** The study was conducted in final year medical students in just one medical college and the results obtained cannot be applied to all the medical colleges. Larger sample size including different medical students in different medical colleges from different parts of India, should be carried out to generalise the statement.

**Recommendations:** The medical students should be educated about dental health, its maintenance and its implication on systemic health. Their behaviour and attitude can be modified by incorporating certain curriculum changes like, compulsory dental clinical postings during their undergraduate course.

Additionally, oral health check-up and dental consultation should be made mandatory during general

health check-up, so as to help all the patients in maintenance of good oral and general health.

## Conclusion

The result of this study indicates that the knowledge regarding dental problems among final year medical students was average, but the attitude of the medical students was negative in regards to certain questions. The medical education should stress upon dental problems and collaboration with dentist for treatment of dental problems for better health of the patients.

# Consensual Sexual Intercourse among children Vs Current Legal Provisions under POCSO: A Scientific Review with Prospective Quantitative Analytical Study

**H. S. Tatiya[1], A. A. Taware[2], H. V. Vaidya[3], V. T. Jadhav[2], A. L. Bandgar[1], S. B. Punpale[4]**

*[1]Assistant Professor, [2]Associate professor, [3]Senior Resident, Department of Forensic Medicine and Toxicology, BJGMC and SGH, Pune,[4]Professor, Department of Forensic Medicine and Toxicology, SKNMC, Pune*

## Abstract

**Background:** Prevention of Children from Sexual Offences (POCSO) act criminalizes all acts of sexual intercourse and does not differentiate acts of consensual sexual intercourse from provisions of the said act. **Aim:** To find incidence and demography of victims and accused in cases of consensual sexual intercourse registered as cases of alleged sexual assault under POCSO **Material and Method:** Current study was conducted at B J Government Medical College Pune on alleged cases of sexual assault brought for examination during November 2015 to September 2017, with cases of female child with history of consensual sexual intercourse being the inclusion criteria. **Result:** A total of 174 (32.58%) cases of consensual sexual intercourse was examined with the majority being from the age group of 16-17 years (36.78%). Out of 174 cases, 24 were pregnant. In all only 02 were completely illiterate. Among accused majority were from the age group of 22-24 years (40.23%). **Conclusion:** Consensual sexual intercourse among children is known and different entity and should be treated separately from the purview of POCSO, but should also maintain the letter and spirit of the law.

***Keywords:*** *Consensual sexual intercourse, POCSO, child autonomy, teenage pregnancy.*

## Introduction

Historically, child sexual abuse (CSA) has been a hidden problem in India, largely ignored in public discourse and by the criminal justice system. However, the movement, spearheaded by Ministry of Women and Child development, led to the enactment of new legislation called the protection of Children from Sexual Offences (POCSO).[1]

Under POCSO act, the numbers of CSA cases registered for the year 2014 were 8904 which rose to 14,913 in year 2015.[2] In a shocking revelation, a government-commissioned survey in the year 2005 has found that more than 53 percent of Indian children are subjected to sexual assault, i.e. 4 out of every 10 persons.[3] A recent report on the census data of 2011 indicated that in India one in six women were married before they were 18 years of age, of which 17.5% (6.5 million) women had been married within four years before when the census was conducted.[4] Thus there are possibly 6.5 million (and growing) potential lawsuits, under POCSO. But, all sexual acts described under POCSO, are without exception, considered to be criminal offences if they involve, a 'victim' under the age of 18 years. Adolescence years are the age of exploration and development. In this stage, children develop sexually. Considering all sexual activity, even if they are done with consent, under POCSO they are considered a crime.[1]

Article 12 of United Nations Convention on the Rights of Child (UNCRC) states: "States Parties shall assure to the child who is capable of forming his or her views the right to express those views freely in all matters affecting the child, the views of the child being given due weight in accordance with the age and maturity of child."[5] Thus consensual sexual intercourse of a child becomes a controversial issue for implementation of the POCSO act.[1]

Hence present prospective study is conducted to highlight this issue quantitatively, to find the incidence of such cases of consensual sexual intercourse in children and its burden on the existing legal system.

## Material and Method

The present study is a prospective, quantitative, analytical study conducted at B J Government Medical College and Sassoon General Hospitals, Pune from November 2015 to September 2017 after obtaining permission from the institutional ethical committee. All female child cases, victims of alleged sexual assault brought for medical examination of age less than 18 years, who had given the history of voluntary sexual intercourse, were included in the study after obtaining the appropriate and valid consent. All other cases were excluded.

After taking a detailed history from victims and on perusal of supportive documents submitted by investigating authorities, relevant information about consent for sexual intercourse, age of menarche, pregnancy, and educational status were recorded in predesigned proforma. This information was then statistically analyzed using Microsoft excels software and presented in the form of diagrams and tables.

## Observation and Result

During the study period total, 948 victims of alleged sexual assault were brought for medical examination. Out of these 571 (60.23%) were of age less than 18 years and 534 (56.23%) had given consent for examination. Out of this, 174 (32.58%) cases were included in the present study as per the inclusion criteria. (Diagram 1)

When details of consent given for sexual intercourse were taken into consideration the total 174 (32.58%) victims mentioned the history of voluntary and consensual sexual intercourse. The majority of them were of age group 16-17(36.78%) followed by 17-18(29.31%). The minimum age of menarche was 11 years and the maximum is 16 years with the average age of menarche as 12.7 years. In all 170 cases (97.70%) were falling within the age group of 13-18 years. (Table1)

Out of 174 cases, 24 cases (13.80%) became pregnant. Amongst these pregnant females majority were from age group 16 -17 years (41.67%) followed by 17-18 years (29.16%) with percentage within 13-18 years age group as 100 percent. (Table 2)

Considering educational status 127 (72.99%) were still studying with the majority being in secondary school (77.95%) and 45 (25.86%) had left education with the majority during secondary schooling (80%); while only 02 (1.15%) were illiterate and never went to any educational institution. (Table 3)

Demography of the accused in these cases showed that the majority were from the age group of 22-24 years (40.23%) followed by 25-27 years (21.84%) and 19-21 years (20.11%). In all total 110 (63.22%) individuals were falling within the age group of 16-24 years. (Table4).

**Diagram 1: Diagram showing distribution of cases under various sections.**

## Discussion

The current study cannot be compared directly, in a quantitative fashion, to other studies done on the subject of Child sexual abuse, as, to the best of our knowledge none of the previous studies have elaborated data regarding cases of consensual sexual intercourse in children.

From the present study, it is very much clear that 32.58% of cases fall within the category of consensual sexual intercourse and are cases in conflict with provisions of POCSO, and are probably a burden on the legal system as well as on medical profession. Here we wish to quote a case reported by Sujata Aryakar and Aarathi Chandrashekhar, where 15 year old girl willingly eloped with and married a 22 year old man.[6] In the same case, the Special court judge rejected the notion that the human body of a person under 18 years is the property of the state, whereby it can restrict individual autonomy. While ruling, the judge held that criminalizing such behavior would not serve the purpose of the enactment.[1] On the other hand, Arya and Chaturvedi pointed out that criminalizing sex below 18 years will prevent the school counselors and doctors to provide safe sex advice or treat the effects of unsafe sexual practice.[7]

Considering the demography of the accused in the present study, it is worth mentioning that the age group 22-24 years was most involved and affected followed by age groups of 25-27 years and 19-21 years. Shocking 63.22% of individuals were falling within the age group of 16-24 years. This again highlights the issue of the working adult healthy population of the state being victimized of legal provisions of POCSO.

Considering the literacy 72.99 % of affected girls were still studying while 25.86% had left education. The majority of the population among both groups was from the secondary standards of the school. As adolescent sex education being given primarily for age groups of 10-19 years in India, [8] current study raises doubt on standards and contents of sex education being imparted to these children.

The incidence of pregnancy among these girls was 13.80%, with the majority were from age group 16 -17 years (41.67%) followed by 17-18 years (29.16%), incorporating 100% within 13 to 18 years of age. Complications arising from pregnancy and unsafe abortions are a leading cause of death among women aged 15-19 years, with 20% of the group experiencing child before 17 years of age, with pregnancies often closely spaced.[9] This now raises the issue of awareness about outcomes of teenage pregnancy in these age groups and again questions the methodologies adapted to educate these girls under sex education.

Madras High Court in a present ruling in June 2018 stated, " Any consensual sex after the age of sixteen or bodily contact or alleged acts could be excluded from the rigorous provisions of POCSO act and sexual assault could be tried under more liberal provisions which can be introduced in the act, differentiating sexual assault and teenage relationship." Judge further observed, " In cases where age of girl is below 18 years, even though she is capable of giving consent, being mentally matured, unfortunately, the provisions of POCSO act get attracted, if such a relationship transcends beyond platonic limits, catching up with the so called offender of sexual assault, warranting a severe imprisonment of seven/ten years."[10]

This thus raises the question of criteria evolved for determination of the age of consent for sexual intercourse. We could not find any scientific guidelines on which maturity of a girl can be decided concerning the age at which she can give consent for sexual intercourse. Secondly raising the age of consent for sexual intercourse from 16 years to 18 years does not seem to depend on any scientific measures but it merely seems to be the result of public outcry and political pressure.[11] Surprisingly different countries have different ages for the consent of sexual intercourse. (Table 5)[12]

The letter and spirit of law, which defines a child as anyone less than 18 years of age, is to protect children from sexual abuse, but at the same time, there is need of amendment in POCSO concerning cases of consensual sexual intercourse, again to protect these tender aged adolescent lovers and to respect child autonomy. There is also a need to change or to vigilantly monitor, contents, methodology and standards of sex education in adolescents. On the other hand, scientific principles should be laid down simultaneously, to determine the appropriate age of consent for sexual intercourse considering physical, social, sexual, and psychological

parameters.

## Conclusion

Cases of consensual sexual intercourse in the present study accounted 32.58% of the population with the majority from age group of 16-17 years (36.78%), while majority of accused falling within age group of 22-24 years (40.23%), elaborating need to understand and differentiate consensual sexual intercourse of child from provisions of POCSO.

# Assessment of the Psychological Wellbeing of Elderly Residing at Pooncheri Rural Community Area in Kancheepuram District, Tamilnadu, India

**George Fernandez A[1], Janagiraman N[1], Shalini M[1], Vinitha R[1], Metha[2]**

*[1]B.Sc (NURSING) Student, [2]Nursing Associate Professor, Chettinad College of Nursing, Chettinad Academy of Research and Education,Tamilnadu, India*

## Abstract

A descriptive Study on Assessment of the psychological wellbeing residing in pooncheri rural community area in kancheepuram (dist.), Tamil Nadu India. The objectives are to assess psychological wellbeing of elderly people. To find out the association between levels of psychological wellbeing of elderly people and selected demographic variables of elderly people. The sampling technique was non-probability, purposive sampling technique with 111 samples of elderly people and WHO standardized psychological wellbeing scale were used to assess psychological wellbeing of elderly. The demographic variables Performa, were used to collect data. The data collection tools were validated and reliability was established. The data collection for the main study was done. The collected data was tabulated and analyzed, using descriptive and inferential statistics. Majority of elderly 71.2% had adequate, 28.8% had moderate wellbeing, There no poor wellbeing. The psychological wellbeing mean value is57.34.

***Key Words**: Elderly, Wellbeing, rural community area, psychological wellbeing scale .*

## Introduction

Aging is an unavoidable developmental phenomenon bringing along several changes in the physical, psychological, hormonal and social conditions. Age has been viewed, as a problematic period of one's life and this is correct to some extent. Aged become increasingly dependent on others. As a man grows, his reduced activities, income and consequent decline in the position of the family and society make his life more vulnerable. (1)

The population expectation made by the UNESCO indicates that the percentage of the aged above 60 are likely to go up from 7.1 percent in 1991 to 12.3 percent in 2025 in India alone. Therefore, need to be paid proper observation to the quality of life of older persons. In almost all the countries of the world, elderly women be more numerous than elderly men. Rapid aging trends present new provocation to the government, families and the elderly themselves.(2)

The difficulty of elderly females has become a social problem in Indian society. The changes in the demographic structure during the last few decades in developing countries have made the aged socially more noticeable section. Moreover, modern society has faced a vast modification due to breaking up of the joint family system, technological upraising and attitude of the younger age group towards old age. All these have move on to the problems of the elderly, particularly women. The economic insufficiency of the nuclear family is resulting in the neglect of its members. The traditional roles are slowly being replaced with unimportant roles after retirement. (3)

The problems consummate by elderly are more acute, who are economically dependent solely on the families. In the advancing age, when the aged loose friends, power influence, job status, income, health, etc. bring a host of problems connected to physical, economic, social and psychological aspects. The elderly is a essential phase where the physiological, psychological and socio-cultural changes in the elderly present to developing anxiety.(4)

Modernization and globalization have disintegrated the Indian family system and elders are forced to stay in old age homes. In some cases, elderly members of relatively rich families or aged persons who have nobody to look after takes shelter in old age homes. The elderly lives in these homes merely in terms of existence to complete the last phase of the lives. (5)

Elderly is generally the chronological age, a universal phenomenon and a challenge to everyone, who reaches it irrespective of occupation, skill or learning. The world is rapidly aging: the number of people aged 60 and over as segment of the universal population will double from 11% in 2006 to 22% by 2050. As per the WHO recommendation people 60-74 years of age are called elderly and those between 75 and 85+years of age as old. By then, there will be older people than children (aged 0-14) in the population for the first time in human history. (6)

## Objectives

· To assess the Psychological wellbeing of elderly.

· To find out the association between psychological wellbeing of elderly with the selected demographic variables.

**Hypothesis:**

· **H1:** There was significant level of Psychological wellbeing among Elderly.

· **H 2:** There was significant association between Psychological wellbeing with their selected demographic variable.

## Research Methodology

In this study Quantitative research approach and, Descriptive research design adopted. Non-experimental descriptive research design was used for the present study. Standardized WHO Psychological wellbeing scale was used to assess the psychological wellbeing of elderly and Structured questionnaire to assess demographic variables of Elderly Peoples residing in a selected rural community area who fulfills the given criteria were selected as a sample.

**Sampling Criteria:**

**A. Inclusion Criteria**

The inclusion criteria were as follows:

· Elderly sample who living in a selected community area.

· Elderly with the age group 60 years and above

**B. Exclusion Criteria**

The exclusion criteria as follows:

· Elderly who are having mental illness.

· Elderly who are not willing to participate.

**Method of Data Collection:**

In this present study the researcher distributed questionnaires to the samples. The samples were instructed to fill the data. Each sample took 30 min for completion of their data. Data collected over a period of one week(from 22-4-2018 to 27-4-2018).The convient sampling technique adopted. The data was collected in pooncheri village, kanchepuram district tamilnadu, India the total sample is 111. Among the total samples 51 were male and 60 were female.

**Research Tool:**

There are Two sections (A&B) in Research tool, in Section A consist of Self structured questionnaire consists of 9 questions to asses demographic variables& Section B consist of WHO psychological wellbeing scale consist of 18 items and consists of serious of statements reflecting the six areas of psychological wellbeing autonomy, environment, mastery, personal growth, positive relation with others, purpose in life and acceptance.

| **SCORING & INTERPRETATION:** | |
|---|---|
| **SCORE** | **LEVEL OF WELLBEING** |
| 61-90% | Adequate knowledge |
| 31-60% | Moderate knowledge |
| 18-30% | Poor knowledge |

## Data Collection Procedure:

The written informed consent was obtained from the research participants. Permission letter was obtained from the HOD of Mental Health Nursing, UG committee and Human Ethical committee.

Formal permission obtained from the management and the department of community medicine.

Descriptive statistics like frequency distribution, percentage, mean, standard deviation & inferential statistics like chi square used to analyse the data.

Collected data tabulated and analysed.

**Frequency and percentage distribution of Psychological wellbeing of elderly**

| S.NO | Level of Wellbeing | Frequency | Percentage |
|---|---|---|---|
| 1 | Adequate | 79 | 71% |
| 2 | Moderate | 32 | 29% |
| 3 | Poor | 0 | 0% |

**(N=111)**

## Result

The study findings revealed that,

Ø In previous study on assessment of Psychological wellbeing result shows that;

The study investigated the effect of intergeneration social support on the subjective well-being of 429 elderly participants. Results suggested that intergeneration social support, self-esteem, and loneliness were significantly correlated to subjective well-being. Structural equation modeling indicated that self-esteem and loneliness partially mediated the effect of intergeneration social support on subjective well-being. These findings provided insights into the effect of intergeneration social support on the subjective well-being of the elderly**,(Qian Tian Sep 9 , 2014)**

Relationship with children and the psychological well-being of the elderly Litha Almira, Lathifah Hanum, Adhityawarman Menaldi the study is results showed no correlation between the positive qualities of the relationship and psychological well-being ($r=0.092$, $p>0.01$). However, the negative qualities of the relationship were negatively correlated with psychological well-being ($r=-0.335$, $p<0.01$) This study employed convenience sampling and to reach 102 elderly participants.

**Our study** result reveals that in assessing the level of wellbeing showed that the mean score 57.34, mean % 64% and standard deviation 6.59 Psychological wellbeing of elderly. Maximum score for Psychological welleing were Adequete 79(71%), moderate32(29%).

Distribution of demographic characteristics of elderly said that the majority elderly was in the age group of 60-65 years 50(45%), most of elderly was female 60 (54%), majority of elderly got the primary education 51(46%), most of the elderly people previous occupational status was daily wage workers 44(40%), majority of the elderly was Hindus 94(85%). The language spoken by the elderly was Tamil 108(97%), they are living in the nuclear family93(108%), majority of the people having own house85(77%) and the less number of elderly getting pension21(19%).

## Discussion

Psychological wellbeing and the association factor in our study shows that:

The findings of the study revealed that there showed that there is significant association between the demographic variable (P=< 0.005)and the gender and language, there is no significant association between

demographic variables and psychological wellbeing among elderly in age, education, previous occupational status, religion, family, type of house and are they getting any pension.

## Conclusion

On the basis of research, we concluded the Psychological wellbeing is majority of the elderly is have adequate wellbeing and minority of elderly having moderate wellbeing.

# Effectiveness of Flax Seed Pillow on Stress and Physical Parameters of Premature Infants

**Tessy Thomas[1], Sujatha R[2]**

*[1]Professor & HOD, [2]MSc Nursing Student, Department of Child Health Nursing, Nitte Usha Institute of Nursing Sciences, Nitte University, Paneer, Derlakatte, Mangalore, Karnataka*

## Abstract

**Introduction :** As per WHO report in 2018, every year, 15 million babies are born prematurely, the leading cause of child deaths under age five every year. Many survivors of preterm birth face a lifetime of disability, including learning disabilities and visual and hearing problems.

**Purpose of the study:** To find the effectiveness of a flaxseed pillow on stress and physical parameters in premature infants.

**Methodology :** An evaluative two group pretest post-test approach selected for the study. Premature infants selected by a purposive sampling technique and applied with a flaxseed pillow. All the infants were observed two times per day for five consecutive days from the day of recruitment. Stress and Physical parameters obtained and analyzed to find the effectiveness of the intervention.

**Results:** Out of 34 Premature infants, 17 (50%) underwent flax seed pillow treatment, and remaining were the control group. Independent sample t-test results showed that there is a significant difference (pre-post) in the stress score between the experimental and control group. The paired t-test result revealed that there is a difference ($p< 0.05$) in the stress score among the experimental groups for all five days.

**Conclusion:** An increasing number of premature birth is one of the most significant issues faced by the country today. Many developmental care interventions provided to preterm babies, which are cost-effective care and help these vulnerable in their phase of prematurity. Flaxseed pillow was effective in reducing the stress of premature infants in the NICU.

***Keywords:*** *Intensive Care Units, Neonatal, Low Birth Weight, Infant, Premature, Flax, Seeds*

## Introduction

A premature baby is one born before 37 completed weeks of gestation. Prematurity refers to the inability of the infant who is born before the usual gestational period to adapt to extrauterine existence in comparison to the survival rate in mature infants. Prematurity usually carries a high rate of morbidity and mortality unless optimal care is given to maintain life. Prematurely born infants face multiple challenges and obstacles on their path to continued growth and development, and they struggle to adapt to the unnatural environment of the Neonatal Intensive Care Unit (NICU). Some challenges are directly related to differences between the environment of the uterus and in the NICU. The unexpected stressors from various stimuli, individually or in combination, can cause pain and lead to fatigue. In this hostile environment, the premature infant is forced to use more of limited resources to cope with the environment rather than to grow and develop.

Prematurity is a stage where infants find it difficult to adapt to the external noxious environment of the tertiary care unit, where they are exposed to continuous stressors of the external world. Premature infants experience an environment that is rife with a negative touch. These stressors got a detrimental effect on the growth of the

ORCID Number- 0000-0003-3942-0849

premature infant since these infants have difficulty in adapting to life outside the uterus as a result of immature body systems.

Developmental care is an approach that uses a range of medical and nursing interventions that aim to decrease the stress of premature infants in NICU. The developmentally appropriate care for the premature neonate enables the growth and development to its maximum.[1]

Researchers studied the effects of neuro developmental sensory stimulations and they documented weight gain and early discharge, as a result of these sensory enhancement interventions.[2]

As a result of the literature investigations, the researcher recognized that an opportunity existed to explore the effectiveness of a new, inexpensive, low technology developmental intervention that is a flaxseed pillow. Application of flax seed pillow reduces the stressors and improves the stability of premature infants, which helps in the effective utilization of resources for growth and development, resulting in weight gain. Flaxseed pillow uses natural, tiny, flat, smooth seeds that give the pillow the flexibility to form to any shape. Because of the seed's oil content, the pillows keep the heat or cold for up to 2 hours. When heated and applied to the body Flax Seed Pillows release a comforting, moist heat. These are very beneficial in soothing sore and tight muscles, Produce a calming effect and help curb insomnia, Act as warming pads - they heat cold hands and feet. It also helps poor circulation & calms the mind. Flaxseed pillow refers to a pillow that is filled with flax seeds used under the scapula of babies in order to rejuvenate the body by providing continuous warmth and a massaging effect when the seeds slide over one another during the body movements.

The study aims to assess the effect of a flaxseed pillow on stress and physical parameters in premature infants.

## Method

An evaluative approach with the Pre-test Post-test control group design, which is quasi-experimental, was adopted. The research proposal was placed in the Institutional ethics committee and obtained permission. (NUINS/CON/NU/IEC/ 2014-15 dated 26/09/2014). In this study, Premature infants who are medically stable, born between the gestational age of 32 to 36 weeks, who does not require any other support, except warmer, IV fluids or/and full enteral feedings were included. Premature infants who are falling above 90th percentile & below the 10th percentile in the growth chart require surgery or respiratory support, and any genetic anomalies and congenital malformations infants excluded from this study.

**Data collection tools**

The data was collected by demographic proforma for mother and premature infants, Premature infant stress behavior assessed by observation checklist, and weight

a) Demographic Proforma for premature infants comprised of Gestational age, Gender, Order of birth, Birth weight, the weight of the baby for five consecutive days, Time of discharge, and duration of hospital stay.

Demographic Proforma for mother includes age, type of delivery, indication for preterm delivery, medical conditions present during the antenatal period, administration of any medications during the antenatal period.

b) Premature infant stress behavior observation checklist used to assess the level of stress. The observation checklist for the study developed based on a theory called the Synactive theory of infant development, which is proposed by Dr. Als. The disorganized behavior of the premature infants in various subsystems (autonomic/ physiological, motor behaviors, state behaviors, self-regulatory behaviors) of the Synactive theory of newborn behavioral organization and development. It includes motor changes like,(flexion of arms and legs, arms salute etc), autonomic changes (color changes, breathing and heart rate variations etc), states behavior (gaze averting, staring, etc), and self-regulatory behavior (change in position, grasping, sucking).[3]

The observation checklist consists of 18 parameters under these subsystems, which describes a premature infant "s behavior in NICU, classified into organized and disorganized behavior. The score indicates the stress of premature infants. The maximum score is 18, and the minimum score is 1. Nine subject experts of nursing tested the content validity and relevance of the checklist. The reliability items in the tool were summed up and the total stress score of the day obtained. Then the intraclass correlation the coefficient was calculated, which was 0.715, and the p-value is 0.009, which weighs the reliability of the tool 0.85.

c) Calibrated infant weighing machine used to measure weight (kilogram).

**Data Collection Process**

In the NICU, the premature infants born between the age group of 32-36 weeks of gestation were selected by purposive sampling. The purpose of the study explained to the parents, and confidentiality was assured and informed written consent taken. Demographic Proforma was filled initially after that each premature infant was observed for 1 hour, and pretesting is done by filling the observation checklist by the researcher. The premature infants divided into two groups, experimental and control group consisting of 17 subjects each. After the pretesting, the experimental group received 30 minutes of flax seed pillow treatment, whereas the control group did not receive it. The flaxseed pillow is kept over the upper back of the babies( over the scapula). After the treatment for the experimental group, both the groups were subjected to a post-test for 1-hour observation with an observation checklist. The experimental group received five consecutive days of treatment with a flaxseed pillow and control group without a pillow. Each subject was weighed all the five days and the weight on the discharge day, and the duration of hospital stay also recorded

## Data Analysis

The collected information summarized by using descriptive statistics. ( Frequency, Percentage, Mean & Standard deviation) .

The effectiveness of flaxseed pillow on stress and physical parameters assessed by using Paired "t" test.

Chi-square & Fisher "s exact test used to find the association between the selected demographic variables with physical parameters and stress.

The difference in duration of hospital stay, physical parameters, and stress between the subject with flax seed pillow treatment and without treatment compared by using independent "t" tests. The level of significance for this study is 5%.

## Results

**Description of sample characteristics**

About 18(52.9%) of premature babies are males, and female babies are 16 (47.1%). Most of the premature babies 24(70.6%) belong to the gestational age group of 32-34 weeks, and only 10 (29.4) among 34 premature infant belongs to 34-36 weeks of gestation. Among 34 premature infants, 15(44.1%) were second-born, 10(29.4%) were firstborn, 7(20.6%), and 2(5.9%) were third and fourth born, respectively.

About 15 (44.1%) of the mothers of preterm infants are in between the age group of 25-29 followed by 13 (38.2%) are in 20-24, 3(8.8%) are in <20, 2 (5.9%) of them in 30 to 34 and only 1 person (2.9%) in 35-40 years. Around half of the deliveries were normal 18 (52.9%), others were LSCS 10(29.4%), Vacuum 4(11.8%), and only 2 (5.9%) were forceps delivery. Premature rupture of the membrane was the most common cause for preterm delivery 8(23.5%); the second cause is fetal distress, which constituted 6(17.6%). Placental abnormalities 4(11.8%) and pre-eclampsia 4(11.8%) were the third common cause, which is followed by multiple pregnancies 3(8.8%). Two of the common diseases present during the antenatal period were Hypertension 8(23.5%) and Gestational Diabetes mellitus 7(20.6%). Mothers with other diseases like Oligohydramnios, Polyhydramnios, and Cardiac conditions constituted about 3(8.8%), 4(11.8%), and 3(8.8%), respectively. Among 34 mothers, 8 (23.5%) of them were on regular medication for medical conditions.

**Table:- 1 The effectiveness of the flaxseed pillow on stress and physical parameters within the groups by using the Paired "t" test. n = 34**

| Within Group comparison | Day | Mean difference | t value | P value |
|---|---|---|---|---|
| Experimental group | Day 1 | 2.03 | 4.81 | <0.001* |
| | Day 2 | 2.85 | 7.45 | <0.001* |
| | Day 3 | 2.00 | 4.57 | <0.001* |
| | Day 4 | 1.76 | 3.95 | <0.001* |
| | Day 5 | 1.47 | 4.92 | <0.001* |

***Cont ...*** **Table:- 1 The effectiveness of the flaxseed pillow on stress and physical parameters within the groups by using the Paired "t" test.**

| | | | | |
|---|---|---|---|---|
| Control group | Day 1 | 0.35 | 0.98 | 0.339 |
| | Day 2 | 0.02 | 0.08 | 0.935 |
| | Day 3 | 0.82 | 2.69 | 0.016* |
| | Day 4 | 1.00 | 3.51 | 0.003* |
| | Day 5 | 0.38 | 1.04 | 0.311 |

(* significant)

It is evident that the calculated t values are more than the table value on all the five consecutive days of the experimental group and the p values are < 0.001 on all the five days. It indicates that a flaxseed pillow is effective in reducing the level of stress among premature infants at a 5 % level of significance.

**Table 2:- The difference in the level of stress between the experimental and control group in each day respective of the intervention. (Independent sample t-test)** n = 34

| **Day** | | **Mean difference between the experimental and control group** | **t value** | **P-value** |
|---|---|---|---|---|
| Day 1 | Pre | 1.08 | 1.69 | 0.105 |
| | Post | 2.76 | 4.81 | < 0.001* |
| Day 2 | Pre | 0.61 | 1.00 | 0.322 |
| | Post | 3.44 | 6.02 | < 0.001* |
| Day 3 | Pre | 1.55 | 3.58 | < 0.001* |
| | Post | 2.73 | 5.17 | < 0.001* |
| Day 4 | Pre | 1.52 | 3.63 | < 0.001* |
| | Post | 2.29 | 4.21 | < 0.001* |
| Day 5 | Pre | 2.11 | 4.16 | < 0.001* |
| | Post | 2.11 | 4.16 | < 0.001* |

The data presented in table 2, shows that except the baseline measurements of day 1 (t = 1.69) and day 2 (t = 1) calculated values are more than the table value 2.04, also the p values are < 0.05. Hence there is a difference in stress level between experiment and control group at a five percent level of significance except day 1 and day 2. Hence

the null hypothesis (H01) for stress is rejected, and the research hypothesis (H1) for stress is accepted.

## Discussion

The findings of the present study show that premature rupture of the membrane was the common cause for preterm delivery 8(23.5%); the second cause is fetal distress, which constituted 17.6%. Placental abnormalities 4(11.8%) and pre-eclampsia 4(11.8%) were the third common cause, which is followed by multiple pregnancies 3(8.8%).The finding is supported by the study conducted on Epidemiology of preterm premature rupture of fetal membranes (PPROM) at the University Teaching Hospital, Lusaka which shows premature rupture of the membrane is the common cause of preterm births. [4]

Similar findings can be seen in various studies which showed that PROM is associated with 30-40% of preterm deliveries and is the identifiable leading cause of preterm delivery.

The present study showed that 29 (85.29%) mothers of premature infants among 34, had medical illness during the antenatal period like Gestational Diabetes Mellitus 7 (20.6%), Hypertension 8 (23.5%), Oligohydramnios and cardiac conditions 3 each (8.8%), Polyhydramnios 4 (11.8%) and other conditions 4 (11.8%) respectively. The present study also shows that two of the common diseases present during the antenatal period were hypertension 8(23.5%) and Gestational Diabetes mellitus 7(20.6%).

The present study is supported by the study findings on hypertension which showed that hypertension is the most common medical disorder of pregnancy and is reported to complicate up to 1 in 10 gestations and affects an estimated 2,40,000 women in the United States every year.

Findings of a study done in Western Australia on antenatal risk factors also support that hypertension (13.3%) and gestational diabetes (8.2%) are the two common diseases that exert risks on the antenatal period. This finding reveals that whenever a mother is in the high-risk pregnancy, she is most likely to deliver a premature infant.[5]

In the present study, results showed that in the experimental group the mean score of stress before keeping flax seed pillow was higher compared to the score after the treatment with a flaxseed pillow for the five consecutive days. This study is consistent with the findings where the flaxseed pillow is used as a new developmental approach.

This study is supported based on the efficacy of another study on the soothability of preterm infants, which is done in the US, where the preterm infants are soothed after the treatment with a flaxseed pillow.[6]

This study does not show any statistical differences in weight gain and duration of hospital stay between experimental and control group. This may be due to the small sample size and duration of flax seed application. Even though there is no marked difference, still the treatment could establish one day difference in duration of hospital stay and 0.4 g of weight difference between the experimental and control group.

Similar result found in a study where, Infants in the treatment group also gained more weight in the first 3 weeks of life and spent more time awake. Discharge weights and length of stay at hospital did not vary between the two groups.[7]

From the above findings, the researchers felt that developmental care techniques like massage and tactile stimulation had got a beneficial effect on stress behaviors. It is also evident that flaxseed pillow, which is a similar developmental care measure like massage and tactile stimulation, has got a stress-reducing effect on the hospitalized premature infants because flaxseed pillow provides a similar tactile stimulation as that of massage on the body of premature infants when the infant is placed over the pillow.

The limitations of this study were data collected from only one NICU, the researchers recruited only AGA babies and the study assessed only a few parameters of the subsystems of the Synactive theory of newborn behavior and development.

The implications of the study are nurses working in NICU should be able to recognize the stress cues or stress responses of the preterm babies to decrease the duration of hospital stay, and the nurses are responsible for providing education to parents of preterm infants regarding their management at home, inculcating the developmental care measures.

## Conclusion

An increasing number of premature birth is one

of the most significant issues faced by the country today. To help these vulnerable people in their phase of prematurity nursing profession has come with many developmental care interventions were preterm babies are provided the best possible cost-effective care to fight against their prematurity. Flaxseed pillow was effective in reducing the stress of premature infants in the NICU. Such research studies should be encouraged and continued so that the neonatal nurse and caregivers are made aware of the developmental care for premature infants for complete growth and development.

# A Study to Examine the Association of Health Related Behaviours and Body Mass Index among Young Adults at Selected Colleges in Kancheepuram District, Tamil Nadu, India

**J.Sherlinblessy[1], G.Santhiya[1], E.Mohan1, Shanthi[2]**

*[1]IIIrd Year B.Sc Nursing Students, [2]Guide and Co-investigator, Professor, Medical Surgical Nursing Department, Chettinad College of Nursing, Chettinad Academy of Research and Education, Rajiv Gandhi Salai, Kanchipuram district, Tamil Nadu, India*

## Abstract

A observational study to examine the association of Health related behaviours and Body mass index among young adults at selected colleges in Kanchipuram District, Tamil Nadu, India''. The objectives were to examine the lifestyle practices and Body mass index among young adults at Kanchipuram district, Tamil Nadu and to find out the association between lifestyle practices and BMI with demographic variables. The convenience sampling was used to select 100 young adults. The data collection tools were validated and reliability was established. The data were collected by self-administered questionnaire. The collected data was Tabulated and Analyzed. Descriptive and Inferential statistical methods were used. The study shows that of the higher frequency of 18-24 years (96%) and lower frequency of 20-24 years (4%). In Gender, Male is lowest frequency (28%) and Female is the highest frequency (72%). There was significant association between the knowledge and the selected demographic variables.

***Keywords*** *:Health related behaviour, Body mass index, Young Adults.*

## Introduction

Majority of Indian population lives in rural areas mainly depending on agriculture for their livelihood and carry out more physical activities than urban population, who are accustomed to sedentary lifestyle1. Diet is a component of lifestyle, which plays an important role in the development or prevention of overweight and obesity.Young people brought up in rural areas lead a healthier life style compared to their peers in big cities[2]. Physical activities changed as a result of increased television watching, spending more time on computer or mobile and spending less time on outdoor sports.The dysregulation of energy consumption and expenditure related to inappropriate dietary habits and lack of exercise increases the prevalence of both overweight and obesity[3].

Young people form precious human resources in every country. However, there is considerable ambiguity in the definition of young people and terms like young, adolescents, adults, young adults are often used interchangeably. World Health Organization (WHO) defines 'adolescence' as age spanning 10 to 19 yr, "youth" as those in 15-24 yr age group and these two overlapping age groups as "young people" covering the age group of 10-24 yr4. Adults include a broader age range and all those in 20 to 64 yr5. Adolescence is further divided into early adolescence (11-14 yr), middle adolescence (15-17 yr), and late adolescence (18-21 yr)6. Individuals in the age group of 20 - 24 yr are also referred to as young adults7. The National Youth Policy of India (2003) defines the youth population as those in the age group of 15-35 yr8.

Population aged 10-24 years accounts for 373 million (30.9%) of the 1,210 million of India's population with every third person belonging to this age group. Among them, 110 and 273 million live in urban and rural India, respectively. Males account for 195 million and females 178 million, respectively9. As per the National Sample Survey (NSS), (2007-08) 32.8 per cent of this group attend educational institutions and 46 per cent (2004-05) are employed[10].

Obesity can arise in early years due to irregularity in diet , lack of exercise and addiction.The young students who live away from home in hostels are more prone tohave unhealthy lifestyle. Unhealthy diet and physical Inactivity at younger ages are the two main risk factors that have been associated with raised blood pressure ,blood glucose , abnormal blood lipids , major chronic disease like ischemic heart disese , cancer , and diabetes. India is encountering a dual burden of under nutrition over nutrition due to monetary factors and education of the people of society. There are many factors which influence BMI among adolescents and young adults. Thus ,the present study was done to assess the Health behaviour and BMI among students of a Nursing college in Chennai.

## Resaerch Materials and Method

Research Approach:

A research approach is a frame work or guide used for the planning, implementation and analysis of the study . It also involves the plan to investigate the phenomenon under study.

Quantitative descriptive approach.

Research Design:

The research design is the master plan specifying the methods and procedures for collecting and analyzing the needed information in a research study.

A sample of 100 students was selected for the study by using convenient sampling method. The instruments used for data collection were structured questionnaire's to determine height, weight and BMI.

The investigator plan to collect the data for the period of one week. Prior permission and consent was obtained from the Hindu mission college of nursing.

Chi-square test was used to find out the association between demographic variables of health related behaviour and body mass index.

Research Setting:

A research setting is a physical social and cultural site in which the researcher conducts the study.

The present study was conducted at Hindu mission nursing college, Tamilnadu, India.

Population

Population is the aggregation of all units in which a researcher is interested in other words , Population is a set of people or entities to which the result of a research are to be generalised .

Data related to lifestyle practices and body mass index among young adolescents was obtained from Hindu mission college students .

The population of the study is college students.

Sample :

Sample is a representative unit of a target population , which is to be worked upon by the researchers during their study. In other words sample consists of subsets of units which comprise the population selected by the researcher to participate in the research project.

The sample are the students who are fulfilling the sampling criteria.

Sample Size : Sample size was 100. N-4pq/d.

Sample Techniques

Sampling Criteria:

A) Inclusion criteria.

The study include the college students including aged between 18-24 years.

§ Who are willing to participate in the study.

§ Who can understand Tamil and English language.

B) Exclusion criteria.

§ who are not willing to participate in the study. Those

§ Those who are absent on the day of data

collection.

SELECTING AND DEVELOPEMENT OF THE STUDY INSTRUMENT

SECTION A:Demographic Variables such as .

SECTION B:

PART a: Anthropometric Measurement (Height ,weight and BMI) with the help of the stadiometer and weighing scale.

PART b: Structured life style Questionnaire to assess the young adults health related behaviors.

Scoring Interpretation:

## Data Collection Method

Data collection was done after the approval of ethical committee. The investigator approached and got permission from principal college of nursing to collect the baseline data to Weight was recorded for each girl and boy with school uniform, with the each girl/boy standing erect without any support and without shoes using an electronic weighting scale to an accuracy of 0.1 Kg. Height was taken with the help of a stadiometer after removing the footwear with the subject standing erect and heel and occiput touching the upright rod to the nearest 0.5cm. Weight was measured to nearest 100gms. Using the weight and height, Body mass index (BMI) was calculated in Kg/m2, for each girl and boy using standardized CDC BMI chart for boys and girls. Based on age and sex specific BMI centiles, the children were classified as overweight (≥85th centile) and obese (≥95th centile) and non-overweight and non-obese (<85th centile) .Initial data was collected on demographic and clinical variables and then structured Lifestyle questionnaire was given to the group.

**Ethical Consideration:**

· Departmental clearance obtained from Department Of Medical Surgical Nursing, Chettinad college of Nursing.

· U .G committee clearance will be obtained from U.G committee.

· Institutional Ethical Committee clearance will be obtained from CARE.

· Formal permission will be obtained from the authority of the selected college Authority.

· Informed consent will be obtained from the study samples.

FINDINGS

The study findings are categorized as:

SECTION A : Describe the frequency and percentage of demographic variables

SECTION B: Association of demographic variables with the lifestyle practices and body mass index

SECTION C: Distribution of Correlation between the lifestyle practices and body mass index.

SECTION - A

Frequency Percentage of Demographic Variables In Lifestyle Practices And Bmi Among Young Adolescents

Majority of young adolescents were in age group of 96% in 18-20yrs and only 4% takes place in 21-23yrs.

· 7In Gender , female takes place of 72% more than males of 28% .

· Distribution of percentage in undergraduate students of each year is 24%in I year,34%in II year,36% in III, 6%in IV year.

· Residency of student in hostel is 41% and dayscholar is 59%.

· Source of information were available through Health professionals is 36%,Mass media is 40% and relatives/ friends is 24%. Dietary habits of non-vegetarian is 91% more than 9 % of vegetarian

SECTION B: Association of demographic variables with the lifestyle practices and body mass index

Describes that in age group 18-20years in underweight is 35% ,normal is 51% and overweight is 10%, in 21-23years underweight is 0%,normal is 3% and overweight is 1%.

· Distribution of gender in underweight for male is 15%,normal is 13%and overweight is 0% and for female in underweight is 20%,normal is 41% and overweight is 11%.

· Hostellers in underweight is 13%,normal is 23% and overweight is 5% and dayscholars in underweight is

22%,normal is 31% and overweight is 6%.

· Dietary habits of adolescents to vegetarian in underweight is 3%,normal is 4%and overweight is 2% and in non-vegetarian in underweight is 32%,normalis 50%and overweight is 9%.

**SECTION - C**

**TABLE 1- Correlation between lifestyle practices and Body mass index .**

| VARIABLES | MEAN | STANDARD DEVIATION | CORRELATION (r2) |
|---|---|---|---|
| Practice | 5687 | 56.87 | O.O2 |
| BMI | 2018.7 | 20.187 | |

TABLE 1 shows that there is a statistically mild positive correlation occurs between the lifestyle practices and body mass index.

## Conclusion

All health behaviours exhibited independent associations with lifestyle practices and body mass index. Frequent consumption of vegetables and fruits, breakfast and dinner with family and regular physical activity were positively associated with good levels of lifestyle practices and BMI , while frequent consumption of junk food , not meeting sleep recommendations, and overweight and obesity were negatively associated lifestyle practices and BMI achievement.

# Five Year Retrospective Study of Profile of Burn Deaths from Pune Region

**Jadhao Vijay T[1], Bandgar Abhijit L[2], Taware Ajay A[1], Tatiya Harish S[2], Vaidya Hemant V[2]**

*[1]Associate Professor, [2]Assistant Professor, Department of Forensic Medicine and Toxicology, BJGMC, Pune, Maharashtra, India*

## Abstract

A burn is an injury which is caused by application of heat or chemical substances to the external or internal surfaces of the body, which causes destruction of the tissues. The magnitude of deaths due to burns is so large in our country that India is the only country in the world where fire is classified among the fifteen leading causes of death. The purpose of this study is to analyze profile of burn deaths in the Pune region of Maharashtra. In the present study among the 1710 burn deaths, females (70%) are more commonly affected than males (30%). Young adults (21–40 yrs) are commonly involved in fatal burns as this is most active group of population. In present study majority cases happened in summer season and were accidental in nature while suicidal deaths were present in significant number. Flame burns comprised of 80% of the cases followed by scald 13%. In 78% of cases more than 50 % of total body surface area was involved while complications like Septicemia (66%) was commonest cause of death.

***Key Words:*** *Burn deaths, Pune region.*

## Introduction

A burn is an injury which is caused by application of heat or chemical substances to the external or internal surfaces of the body, which causes destruction of the tissues; thermal deaths are those which results from the effects of systemic and/or localized exposure to excessive heat and cold [1]. Thermal burns and related injuries are major cause of death and disability. Even in developed countries more than two million individuals annually are burned seriously and require medical treatment[2]. The magnitude of deaths due to burns is so large in our country that India is the only country in the world where fire is classified among the fifteen leading causes of death[3]. The prognosis of the burn injuries depends more upon the extent of body surface involved than upon degree/depth of the burns, which is traditionally determined by the rule of nines[4]. Burns are injuries produced by the application of dry heat such as flame, radiant heat or some heated solid substance to the surface of the body; while scald is moist heat injuries produced by 5. Most of the deaths from burn injuries occur from shock within 24-48 hours; death due to toxaemia usually occurs within 4-5 days6. The purpose of this study is to study and analyze epidemiology with respect to age, sex, season and manner of death wise variation of burn deaths, also further study in detail for agent responsible for burns, percentage of total body surface area burned and cause of deaths in the Pune region of Maharashtra and to compare them with other studies.

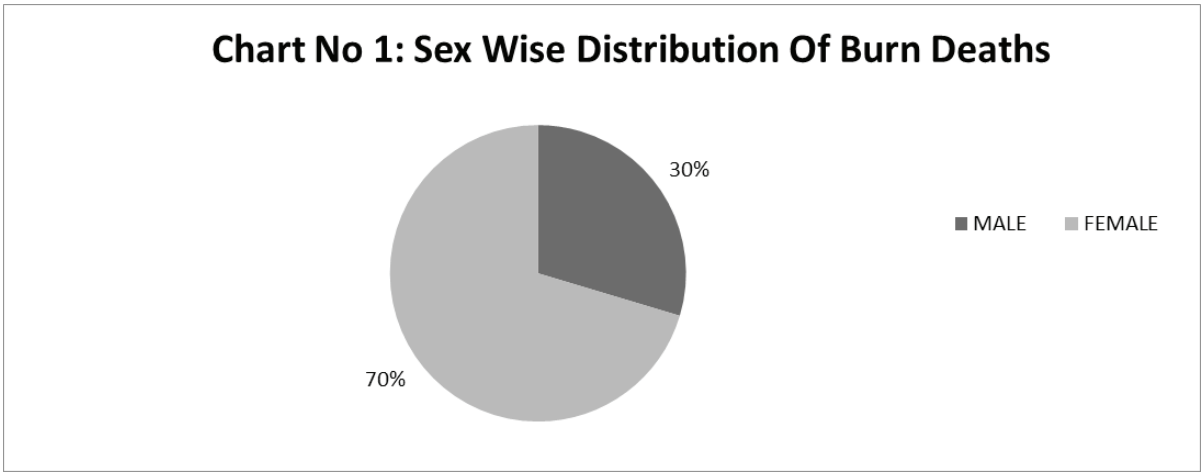
## Material and Method

In the present study, the medicolegal autopsies conducted between January 2015 to December 2019 at B.J. Government Medical College and Sassoon General Hospital, Pune, Maharashtra are analyzed retrospectively. Necessary information for the study is gathered from Police inquest report, hospital treatment records and discussion with the relatives, friends, and neighbors of the victims. The cases are studied to know the incidence of burn deaths with respect to age group, sex, and seasonal variation, further studied for manner of death, agent responsible for burns, percentage of total body surface area burned and cause of death wise variation of burn deaths.

## Observations and Discussion

During the study period total 1710 medicolegal autopsies in burn deaths were conducted at B.J.

Government Medical College and Sassoon General Hospital, Pune.

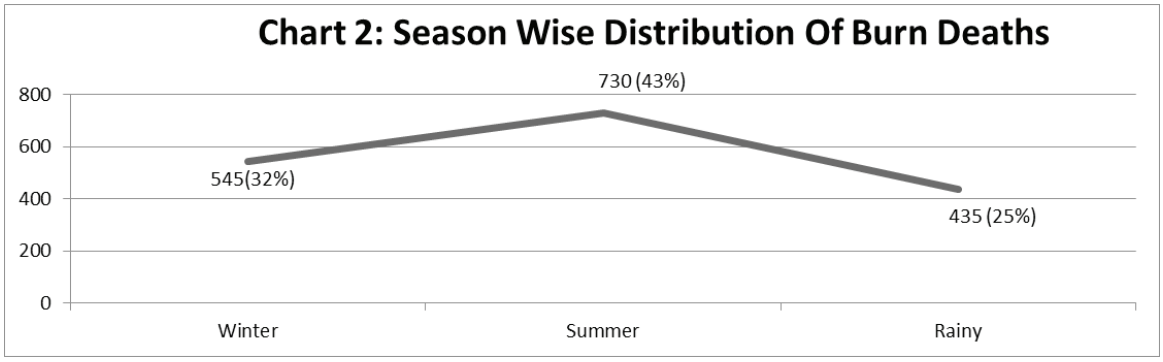


In the present study, females (1185) i.e. 70% were more commonly affected than males (525) i.e. 30% (Chart 1); similar findings were observed by Batra et al3, Ambade et al6 and Subrahmanyam M7; this can be explained by in India females being largely involved in domestic kitchen work that too at a very young age, with kitchen related activities place them at high risk of fatal burn accidents and also in our developing country child marriages and heinous dowry system being still prevalent likely leads to depression- suicide deaths and homicidal dowry deaths by burning incidents. The studies carried out in other developed countries showed male predominance like that in Japan 8, China9, Singapore 10 and South Korea 11 and which may be explained by the fact that because of rapid industrialization in these countries, male become more susceptible to fatal burns at work place.

**Table 1: Age Wise Distribution of Burn Deaths**

| **Age group of deceased** | **Burn deaths** |
|---|---|
| 0 to 10 years | 148 |
| 11 to 20 years | 150 |
| 21 to 30 years | 475 |
| 31 to 40 years | 292 |
| 41 to 50 years | 234 |
| 51 to 60 years | 70 |
| 61 to 70 years | 186 |
| More than 70 years | 155 |
| Total deaths | 1710 |

In the present study, highest number of deceased belonged to age group of 21 to 30 years, followed by 31 to 40 years (Table 1).These findings are consistent with studies conducted by Ambade et al6, Subrahmanyam M7 and Singh D et al12 this can be attributed to the fact that age group 21–40 yrs belongs to young adults, which are commonly involved in fatal burn accidents in India as it is the most active group of population so more likely to be exposed to stress and family violence and burns may occur while working where awareness and adequate safety measures are not in place.

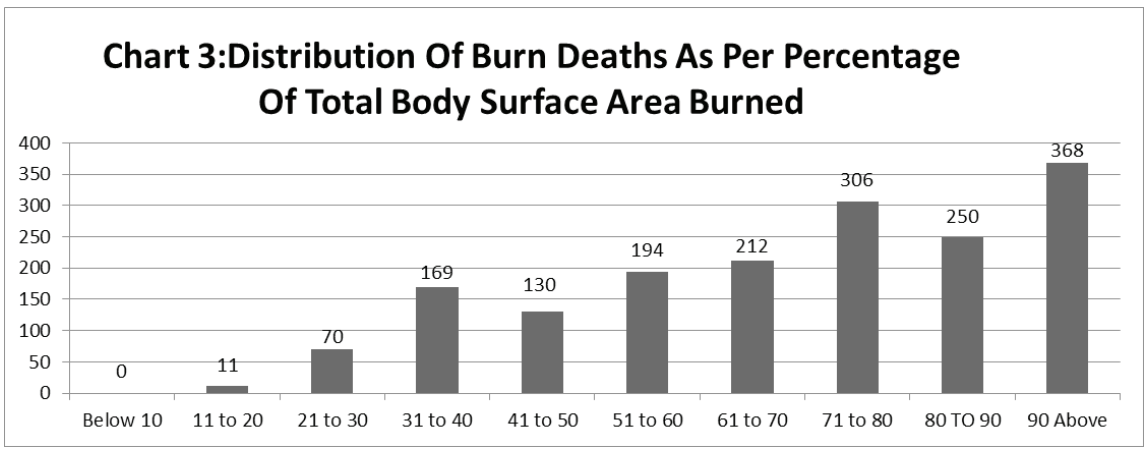


In the present study, when the burn deaths were analyzed in accordance with season, majority of cases 730 were in summer days followed by 545 in winter and then lowest 435 in rainy season (Chart 2).

**Table 2: Manner Wise Distribution of Burn Deaths**

| Manner | Accidental | Suicidal | Homicidal | Total Deaths |
|---|---|---|---|---|
| Burn deaths | 1308 | 326 | 76 | 1710 |

In present study out of 324 burn deaths, majority cases i.e. 1308 (79%) were Accidental deaths while 326 cases were Suicidal and 76 cases were Homicidal in nature (Table 2). These findings are consistent with studies conducted by Batra et al4, Ambade et al5, Singh D et al6 and Subrahmanyam M7, this maybe because of frequent exposure to cooking, inadequate knowledge of handling high pressure stoves, too much demand of work leading to hurried job and accidents, the cooking activities involving fire associated with wearing of loose synthetic material leads to accidental burns. Suicidal and homicidal deaths were more common in married females. The reason for this may be old custom of dowry and marital disharmony which compel the married females either to commit suicide or they may be killed by their in-laws and husband.



In the present study, it is observed that in 1330 cases (78%) more than 50 % of total body surface area was involved while in 380 cases (22 %) it was less than 50% (Chart 3); this is consistent with studies conducted by Mangal HM et al13, Zanjad NP et al 14 and Chawla R et al15, which showed 77.34%, 84.4% and 86% cases respectively for surface burns more than 50% of total body area. It suggest that as the percentage of total body surface area burned involved goes on increasing the mortality rate in the patients increases.

**Table 3: Responsible Agent Causing Burn wise distribution of Burn deaths**

| Agent Responsible For Causing Burn | Number of Burn deaths |
|---|---|
| Flame | 1368 (80%) |
| Scald | 216 (13%) |
| Electric | 114 (6%) |
| Chemical | 12 (1%) |
| Total deaths | 1710 |

In the present study, flame burns comprised of 1368 (80%) of the cases, followed by scald 216 (13%) and electric burns 114 (6%) while chemical burns were observed in 12 cases (Table 3). These findings are consistent with studies conducted by Batra et al4, Ambade et al5, Singh D et al6 and Subrahmanyam M7.

**Table 4: Cause of death wise distribution of Burn deaths**

| Cause of death | Number of Burn deaths |
|---|---|
| Shock (Hypovolemic or Neurogenic) | 112 (34%) |
| Complications like Septicemia | 212 (66%) |
| Total deaths | 1710 |

Immediate cause of death in burns is due to primary or neurogenic shock, secondary shock can cause death within 24 to 48 hours While after about 3-4 days toxaemia, septicaemia, acute renal failure, respiratory complications, thromboembolism causes death and after one week multiple factors comprise are sepsis, nutritional deficiencies, gangrene, etc. come in picture1. In present study, shock was cause of death in 112 numbers of cases while in majority of cases ccomplications like Septicemia were commonest cause of death. Similar findings noted by the studies conducted by Batra et al4, Ambade et al5, Singh D et al6 and Subrahmanyam M7 , Bangal et al16 and Gupta el[17] .

## Summary and Conclusion

The present study can be summarized and concluded as; burn deaths are presented in significant number in day to day medicolegal autopsies. Among burn deaths, females are more commonly affected than males. Young adults (21–40 yrs) are commonly involved in fatal burns as this is most active group of population. In present study majority cases are Accidental and Suicidal deaths are present in significant number. It was found that flame burns caused majority of the cases, followed by scald while as the percentage of total body surface area burned involved goes on increasing the mortality rate increases and complications like Septicemia were commonest cause of death. The results of this study suggest a strong relationship between particular age

group and sex affected, manner of death, different causes of deaths; while focusing on these, attempts can be made to strategies therapeutic directions, medical and social interventions quite rightly to save life from burn deaths.

# Pattern of Poisoning Cases in a Tertiary Care Centre in South India - An Observational study

**James Rajesh J[1], Sampath Kumar P[2], Priyadarshee Pradhan[3], Jothi Marie Feula A[4], Siva Reddy B[5]**

*[1]Assistant Professor, Department of Forensic Medicine, Sri Venkateshwaraa Medical College Hospital and Research Centre, Puducherry, [2]Professor and Head, [3]Professor, Department of Forensic Medicine, Sri Ramachandra Medical College and Research Institute, Chennai, [4]Senior Resident, Department of Physiology, Jawaharlal Institute of Postgraduate Medical Education & Research, Puducherry, [5]Professor and Head, Department of Forensic Medicine, Sri Venkateshwaraa Medical College Hospital and Research Centre, Puducherry*

## Abstract

Poison is any substance which when administered, inhaled or ingested is capable of causing deleterious effects on the human body. This prospective study was carried out involving 353 cases of poisoning admitted in Sri Ramachandra Medical College & Research Institute Porur, Chennai, during the period of June 2014-June 2015. The demographic details were acquired from the patient, relatives, friends or the investigating officer and by going through the medical records and the inquest report. In the current study the maximum cases were in the age group of 20-29 years and the incidence decreased as the age increases and it was evident that the incidence of poisoning is more in case of females when compared to males. The material of maximum abuse was T.Alprazolam (10.8%), followed by Rat Killer poison (9.6%), and followed by Snake Strike (8.8%), Organo Phosphorus Poisoning (8.5%), and Multiple Tablet Overdose (8.2%). 78% consumed poison intentionally and are suicidal in nature, as no cases of homicidal poisoning were reported in the study group, rest of the 22% of cases, were of accidental in nature. Mortality wise analysis showed that dead cases count 13 in number which accounts to 3.5% of all poisoning cases.

***Key Words:*** *Pattern of poison, economic poisons, poisoning causes, outcome of poisoning*

## Introduction

Poison is any substance which when administered, inhaled or ingested is capable of causing deleterious effects on the human body.[1] The substances that are used to control insects, weeds, fungi, bacteria, rodents, predatory animals, or other pests are termed as economic poisons.[2]

According to the World Health Organization (WHO) data released in the year 2012, the poisoning deaths were estimated to be 193,460 worldwide. Of these deaths, 84% were reported in low and middle income countries. In the same year, poisoning was also reported to cause a huge loss of around 10.7 million disability adjusted life years (DALY).[3] It is also estimated that deliberate ingestion of pesticides contribute to 370,000 deaths each year. 3 The incidence of poisoning in India is among the highest in the world, which is estimated that more than 50,000 people die every year from toxic exposure. [4]

In India organophosphorous compounds form the largest bulk of pesticide poisoning. [4] The trend of poisoning has shown a change due to introduction of newer pesticides under different classes. Poisoning is a medico - legal, epidemiological, social problem, which is alarming and a constant threat to the society. To encounter this problem in a given area, knowledge about the poisons, their clinical aspects will not be sufficient. Various aspects of pattern of poisoning in that particular

area is necessary, so that the law enforcing agencies, government and health departments can successfully bring down the poisoning incidence. With this broad view in mind, this study was carried out involving the data pertaining to all cases of poisoning admitted in Sri Ramachandra Medical College & Research Institute between the period of June 2014 to June 2015.

## Materials and Method

**Source of Data**

This prospective study was carried out involving 353 cases of poisoning admitted in Sri Ramachandra Medical College & Research Institute, Sri Ramachandra University, Porur, Chennai, during the period of June 2014 to June 2015. The study was approved by scientific and ethics committee of the institute.

**Inclusion Criteria**

· All cases of poisoning either suicidal or accidental, both directly admitted and referral cases during the period of June 2014 – June 2015.

· Snake Strike and Scorpion stings.

· Domestic as well as Commercial Poisoning.

**Exclusion Criteria**

· Cases without proper diagnosis (undetermined).

· Outside cases brought to SRMC mortuary with history of poisoning.

## Methodology

The demographic details were acquired from the patient, relatives, friends or the investigating officer and by going through the medical records and the inquest report. Among the admitted cases, if some turn out to be fatal, post mortem examination was done and in that the stomach was examined for any peculiar odour and the mucosa was also examined. The routine viscera which includes the entire stomach and a small part of intestine with its contents, part of liver, half of each kidney, blood (10-30 ml), urine (30-50 ml) if possible were sent to forensic science laboratory for further evaluation. Preservatives used were super saturated solution of sodium chloride for viscera and 10mg/ml Sodium fluoride for blood and urine. All the data collected were complied and analyzed statistically using SPSS software version 15.

## Observaton & Results

Distribution of study population based on age and gender is mentioned in table 1. The minimum age affected was 1 year old and maximum age affected was 80 years. Mean age of the study population was 28 years. Incidence of poisoning was also reported to be more in case of females when compared to males. Distribution of poisoning based on time of day (Annexure 1) and manner of poisoning is mentioned in Table 2, which shows that the frequency of poisoning is more in the evening and suicidal poisoning is more common. Among the type of poisoning Tab. Alprazolam is the most common agent used. Out of total 353 cases, death was reported in 13 cases (3.7 %) as shown in table 4.

**Table 1: Distribution of Study population based on age and gender (n=353)**

| **Age ( years )** | **Frequency (%)** |
|---|---|
| 1 – 9 | 39 (11.0) |
| 10 - 19 | 57 (16.1) |
| 20 – 29 | 127 (36.0) |
| 30 – 39 | 55 (15.6) |
| 40 – 49 | 34 (9.6) |
| 50 – 59 | 27 (7.6) |
| 60 – 69 | 9 (2.5) |
| 70 – 79 | 4 (1.1) |
| 80 - 89 | 1 (0.3) |
| Gender | Frequency (%) |
| Male | 160 (45.3) |
| Female | 193 (54.7) |

**Table 2 : Distribution of Study population based on the time and Manner of poisoning (n=353)**

| **Time** | **Frequency (%)** |
|---|---|
| Morning | 96 (27.2) |
| Afternoon | 96 (27.2) |
| Evening | 110 (31.2) |
| Night | 51 (14.4) |
| | |
| Manner | Frequency (%) |
| Suicidal | 275 (77.9) |
| Accidental | 78 (22.1) |

**Table 3: Final outcome of poisoning cases (n=353)**

| **Final Outcome** | **Frequency ( % )** |
|---|---|
| Alive | 237 (67.1) |
| Dead | 13 (3.7) |
| Refereed to other hospitals | 103 (29.2) |

## Discussion

The total number of cases admitted in Sri Ramachandra Medical College and Research Institute from June 2014 to June 2015 was 26,190 cases, out of which 4,498 cases were Medico-Legal Cases (MLC). Among the MLC, poisoning accounts for 353 cases. As the institute is a tertiary care centre, the numbers of cases are more when compared to most of the other studies to which this research work is compared.

In the current study age-wise distribution of poisoning cases revealed that the maximum cases are in the age group of 20-29 years and the incidence decreased as the age increases (Table 1). The minimum age affected was 1 year old and maximum age affected was 80 years. Mean age group for poisoning is 28 years. Young adults are affected more as they are more exposed to stressors like job, marital issues, financial problems etc., Sex-wise distribution of poisoning cases revealed that out of the total 353 cases, 160 cases i.e (45.3%) were males and 193 cases i.e (54.7%) were females and it is evident that the incidence of poisoning is more in case of females when compared to males (Table 1).

Poison wise distribution reveals among the 353 cases, the material of Maximum abuse was T.Alprazolam (10.8%), followed by Rat Killer poison (9.6%), and followed by Snake Strike (8.8%), Organo Phosphorus Poisoning (8.5%), and Multiple Tablet Overdose (8.2%). Materials which are least used were mainly house hold items such as bleaching powder, match stick, nail polish and apart from it substances such as diesel, cracker powder, crude oil, datura, and allopathic medicines were also used (Table 3). In 15 cases, the material consumed was not known and some 7 cases reported with unknown Bite. This clearly indicates that from the old trend of pesticide poisoning, tablet overdose has occupied the place of it. This can be due to two reasons. One, as the hospital is a tertiary care centre with most of the cases who are admitting here belong to a middle to higher socio-economic status, their common source or affordable poison are the tablets. Among the tablets alprazolam tops the list. The second reason is the easy availability of the tablets and the strict laws on pesticide purchase. The second new entry to the list is the rat killer, which now comes in paste containing yellow phosphorus in it. These two are the new materials used for poisoning which was not found in any of the studies

which we came through. In most of the studies like that of mani et al, which revealed that organophosphorous compounds are the most commonly consumed poison in both sexes during the study period. Similar study carried out by Bharath K Guntheti Udaypal Singh 5 stated that insecticide poisoning was the commonest poison (77.86%) in which organophosphorous was the common compound (74.10%) followed by organochlorines (2.39%) and carbamates (1.39%). Study conducted by Ramanath K.V. Naveen Kumar H.D 7 reported that pesticide poisoning in 57.5% cases is more common followed by bites (Snake bite/Bee sting) 13.6%. Study conducted by, Dr. Gargi.J, Dr. Hakumat Rai, Dr. Ashok Chanana, Dr.Gurmanjit Rai et al 9 stated that Aluminium phosphide poisoning is commonest 38.23% followed by Organophosphorous compounds 17.64%. Study conducted by Tejas Prajapati, Kartik Prajapati, Rakesh Tandon, Saumil Merchant 11 revealed that the most common was pesticides (33.9%), followed by household chemicals (26.8%). Study conducted by, Subash Vijaya Kumar, Venkateswarlu.B, Sasikala.M, and Vijay Kumar.G 12 reported that pesticide poisoning 29.55 % is the commonest followed by bites (snake, scorpion, unknown bite) 26.83%. Study conducted by Vinay B shetty. Gurudatta S Pawar., Inamadar. P.I.,13 reported that the commonest type of poisoning was with organophosphorous compounds (73.14%). Study conducted by Ansam F Sawalha., Waleed M Sweileh., Maysoon T Tufaha. and Dua Y Al-jabi. 15 reveals that animal envenomation (72.5) was the commonest type of poison. "Use it to Dye not to Die" A study conducted at Sri Venkateswara Institute of medical sciences (SVIMS University) Tirupati – Andhra Pradesh.14 indicates that hair dye poisoning is the new emerging suicidal poisoning more so in case of females with a male female ratio of (1 : 2.4). But in our study, we didn't have even a single case of hair dye poisoning.

Manner of poisoning reveals that majority of the cases, 78% consumed poison intentionally and are suicidal in nature, as no cases of homicidal poisoning are reported in the study group, rest of the 22% of cases, are of accidental in nature.

Till date, hanging is the most common method of committing suicide but poisoning is on a new trend. Apart from really committing suicide, poisoning nowadays is mainly used as a method to threaten people of committing suicide. Studies conducted by, Dr. Gargi.J, Dr. Hakumat Rai, Dr. Ashok Chanana, Dr.Gurmanjit Rai etal 11, Unnikrishnan B, Singh B, Rajeev A6, Vinay B shetty. Gurudatta S Pawar., Inamadar. P.I 15, have also reported that suicidal poisoning is more common than homicidal poisoning. In the study conducted by, Ramanath K.V. Naveen Kumar H.D 10,

In our current study mortality wise analysis showed that Dead cases count 13 in number which accounts to 3.5% of all poisoning cases. Out of 13 cases, Paraquat and rat killer (Yellow Phosphorus) caused death of 3 persons each, followed by Organo – phosphorus compound, snake strike, unknown poisoning caused death of 2 persons each and oleander 1 person. Study conducted by Bharath K Guntheti Udaypal Singh 5 reported that overall mortality rate was 17.33%. Overall mortality rate in the study conducted by Shoaib Zaheer.M, Aslam.M, Vibanshu Gupta, Vibhor Sharma and Shadab Ahmad Khan 15 was found to be 14.4%. Overall mortality rate in the study conducted by Unnikrishnan B, Singh B, Rajeev A was 5.7% 5 and the overall mortality rate in the study conducted by, Tejas Prajapati, Kartik Prajapati, Rakesh Tandon, Saumil Merchant 12 was reported to be 18.6%.

## Conclusion

- Poisoning is more common among the adult age group, with a mean of 28 years.

- Poisoning was more common among females when compared to males.

- In the context of poisoning, the most common and an emerging trend change is from pesticides to tablets. T.Alprazolam leads the way with maximum incidence followed by Rat Killer poison, snake strike, Organo Phosphorus poisoning , and multiple tablet overdose .Household items like bleaching powder, match stick, nail polish and other products like diesel, cracker powder, crude oil, Datura, and allopathic tablets are also in increasing trend.

- 78% of cases are suicidal whereas 22% were accidental in manner and 3.5% of death was reported from our study

- Paraquat was the deadliest poison with both free radical action along with the corrosive action causing death of 3 out of 6.

- Rat killer (Yellow Phosphorus – paste form) and oleander are equally dangerous.

- As attempts to commit suicide are on the rise, identifying the cause and treating the suicidal tendencies

due to psychological issues is vital in prevention of further attempts. Hence, in our institution all cases of suicidal poisoning (those who survived) were referred to the department of psychiatry and psychiatric counseling was given to all the cases of suicidal poisoning.

# Estimation of Stature from Footprint Length

**Janarthanan R[1], Muthamizh Selvan[2]**

*[1]Assistant Professor, Department of Forensic Medicine, Vinayaka Mission's Medical College & Hospital, Karaikal,*
*[2]Assistant Professor, Department of Forensic Medicine, Mahathma Gandhi Institute of Medical Sciences and Research, Pondicherry*

## Abstract

The human foot is studied for various reasons in forensic departments, by anthropologists, anatomists etc. Footprints are of immense value in a crime scene in establishing the personal identity and in a potential link between the perpetrator and the scene of crime. Identification of a person is of prime and foremost importance in both civil and criminal cases. Time is a critical factor in crime scene investigation, so rapid identification of suspect is very important. Here, in our study, the aim is to estimate the stature of individuals based on their footprint lengths among the students (Both male and female students between the age group 18 to 22 years) 50 male and 50 female students, studying in Rajarajeswari Medical College and Hospital, Bengaluru. that the footprint length help us in estimating the stature of an unknown individual which will be helpful in investigation of various crimes. Also not much difference is statistically noted in the stature estimated by right and left footprint length in both the sexes.

***Keywords:*** *Stature; Foot print length; Identification.*

## Introduction

To establish the identity of a person if alive or expired is called identification of a person. The Latin word, 'idem' known as "the same"1 is from which the word identification has its origination. Determination of identity of a person in case of emergency disasters like bomb blast, hurricane, train wreck, flight fall, earthquake etc. will not be an easy task for an autopsy surgeon to rectify the clarification of identity of a person from an amputated body part.2 stature, in the pharmacological aspect is also important for to determine the nutritional range and for the estimation of pharmacokinetic measures of a person. The identification of a male or a female is made easier if the stature of a person is determined in any sort of investigation to determine the identity of a person.3

**Corresponding Author:**
**Janarthanan R**
Assistant Professor, Department of Forensic Medicine, Vinayaka Mission's Medical College & Hospital, Karaikal – 609 609.

## Aims and Objectives of the Study

To estimate the stature of individuals based on their footprint lengths

## Material and Method

Materials used are as follows:

1. Printers black ink,
2. Non- breakable glass plate,
3. White sheets,
4. Roller,
5. Pencil,
6. Measuring scale,
7. Measuring tape,
6. Calculator and
7. Proforma.

Collection of Footprints

Both male and female students those who are studying in Rajarajeswari Medical College and Hospital,

Bengaluru -560074, between the age group 18 to 22 years will be included in the study. The consent of those students will be obtained in a pre-designed and pre-tested pro-forma consisting the objectives of the students after explaining them the aim and objective of the study.

A glass plate of 24x24 inches cleaned and smeared uniformly with painters ink will be kept on the floor.

The students after washing and drying their feet will be asked to stand on the smeared glass plate first and then, on two separate white sheets so that prints of right foot and left foot will be transferred on these white sheets separately. In this way footprints of all the individuals will be recorded. The footprint length will be measured from the heel to the tip of extension of longest toe.

Then all the students will be asked to stand bare foot and erect on the floor with their heel and occiput attached to the wall where markings for measuring height are already made. The students will be asked not to move the head. A thin plate is kept horizontally at the vertex of the head. Then the height will be measured from heel to the horizontal thin plate. Height of the individual will be measured in cm to the nearest mm.

The data collected is analyzed statistically by using descriptive statistics, namely percentage and standard deviation. The results will be predicted using SPSS version 20, if required, using leniar regression equation for stature estimation and to assess the co-relation between the footprint length and stature, Pearlson's correlation coefficient method will be adopted.

PLACE OF STUDY: Rajarajeswari Medical College and Hospital, Bengaluru-560074.

DURATION OF STUDY: 1 year and one month.

SAMPLE SIZE: 100 students(50 males and 50 females)

**Inclusion Criteria**

1. Both male and female students who are studying in RajaRajeswari Medical College and Hospital, Bengaluru-560074 between the age group 18 and 22 years.

2. Students of both sexes.

3. Age group between 18 years to 22 years.

**Exclusion Criteria:**

1. Students other than the age group 18 to 22 years.

2. Students with any abnormality of foot/lower limb.

3. Students with any spinal abnormality.

4. Students with any endocrinal disorders.

## Sampling Method

Convenient sampling method.

## Results

**Table-1: Correlation between Right Foot Print Length, Left Foot Print Length and Stature in Male Students**

| Variable | N | Mean ± SD | Range | Cor. Coeff. r-value | Reg. Coeff. b-value | Reg. Equation |
|---|---|---|---|---|---|---|
| RFPL<br>Actual Ht | 50<br>50 | 24.7±1.25<br>173.5 ± 6.64 | 22.3–28.0<br>156 – 196 | + 0.659 | 3.49 | Ht = 86.89+ 3.49 (RFPL) |
| LFPL<br>Actual Ht | 50<br>50 | 24.8±1.29<br>173.5±6.64 | 21.6–28.6<br>156 – 196 | + 0.0652 | 3.34 | Ht =90.15 + 3.34 (LFPL) |

RFPL = Right Footprint Length LFPL = Left Footprint Length

Ht = Height Comparing Right Footprint Length and Left Footprint Length P - 0.0

Table no.5 represents the height of 50 male students and the co-relation between the right and left foot print length.

The average of the right footprint is slightly larger than the left.

A relavant co–relation between the right footprint with stature (r = 0.659) and the left footprint length with stature (r = 0.0652). The difference in co-relation coefficient is statistically significant (p- 0.000). To determine the stature based on any given right or left footprint length can be made with this significant co-relation.

When one such right footprint length is given, the stature can be estimated by the regression equation.

Ht = 86.89+ 3.49 (RFPL)

When one such left footprint length is given, the stature can be estimated by the regression equation.

Ht =90.15 + 3.34 (LFPL)

**Table-2: Correlation between Right Foot Print Length, Left Foot Print Length and Stature in Female Students**

| Variable | n | Mean ± SD | Range | Cor. Coeff. r-value | Reg. Coeff. b-value | Reg. Equation |
|---|---|---|---|---|---|---|
| RFPL<br>Actual Ht | 50<br>50 | 22.3±1.125<br>157.78±6.65 | 19.8-24.9<br>144-172 | +0.761 | 4.426 | Ht = 58.93+4.42 (RFPL) |
| LFPL<br>Actual Ht | 50<br>50 | 22.2±1.1<br>157.78±6.65 | 19.8-25<br>144-172 | +0.747 | 4.438 | Ht = 59.08+4.43 (LFPL) |

RFPL = Right Footprint Length LFPL = Left Footprint Length

Ht = Height

Comparing Right Footprint Length and Left Footprint Length P - 0.00

Table no.6 represents the height of 50 female students and the co-relation between the right and left foot print length.

The average of the right footprint is slightly larger than the left.

A relavant co–relation between the right footprint with stature (r = 0.761) and the left footprint length with stature (r = 0.747). The difference in co-relation coefficient is statistically significant (p- 0.000). To determine the stature based on any given right or left footprint length can be made with this significant co-relation.

When one such right footprint length is given, the stature can be estimated by the regression equation.

Ht = 58.93+4.42 (RFPL)

When one such left footprint length is given, the stature can be estimated by the regression equation.

Ht = 59.08+4.43 (LFPL)

## Discussion

Stature can be estimated from many parameters of the body parts, also the researches were made on them by many researchers. But very few researchers estimated stature from footprint length. Researchers did their work for footlength in both sexes but for the footprint length is rare. Our study is on both sexes of both right and left footprint length to estimate stature from it.

But in the study done by Devesh VO (2006)4, Danborno B (2008)5 and Vidya CS6, the footprint is lengthier in men than the women which is of same results as our study.

In our study, the footprints of both the foot in both sexes gives the height of an individual approximately for each foot and this is also seen the study made by Theodoros B Grivas7 (2008).

Our study gives the regression equations for both the

footprint length by which the height can be determined whereas the stature from the known footlength only can be determined by a regression formula in the study made by Abraham Philip8 .

In our study, only the length of the longest toe to the tip of the sole is taken to give the height of the student whereas in the work done by Jaydeep Sen (2008)9

The girls are less in height and they have length of their foot also little short than the boys. Also he stated that there is a good relationship which is significant between the height and the length and the breadth of the individuals foot.($P<0.01$).

Separate regressions equations were developed for both the footprints of both the genders in our study similarly, a study which was done only on males which had significance in the footlength and height with a $P < 0.001$ by Raju M10 (2009)

Also a similar research results were noted among the individuals of Uttarakhand region by Deopa Deep11 (2010)

## Conclusion

Though the stature and the relationship with their body parameters differ from region, culture nutrition etc., the relationship between foot length and stature is reliable. Still there will be difference in the results in different regions for the same reasons.

The formula concluded in this study is not of cent percent result giving but an approximate stature can be estimated from a person's footprint. Also the people with the mentioned exclusion criteria in this study, their stature cannot be estimated from this formula.

# Effect of Structured Exercise Programme on Functional Mobility in Parkinson's Disease

**Joshi Madhura S.[1], Kanase Suraj B.[2]**

*[1]Intern, BPTh Student, Faculty of Physiotherapy, KIMSDU, Karad, Maharashtra,*
*[2]Associate Professor, Department of Neuro Physiotherapy, KIMSDU, Karad*

## Abstract

**Background:** Parkinson's disease is common movement disorder seen in neurological practices but the management and diagnosis is quite challenging. Physical rehabilitation is commonly used to improve the health condition and relieve the symptoms along with the pharmacological treatment.

**Aim and Objectives:** 1.To find the effect of structured exercise programme on functional mobility in Parkinson's disease. 2. To evaluate the motor and non-motor symptoms present in Parkinson's disease. 3. To find the effect of structured exercises on functional mobility in Parkinson's disease.

**Material and Method:** Study was carried out in Department of Neuro physiotherapy, KIMSDU, Karad. Assessments include Unified Parkinson's Disease Rating Scale [UPDRS] and Hoehn and yahr scale for Parkinson's disease. Subjects participated in their respective interventions for 6 weeks. Statistical analysis was done using instat software. Paired t test was used to calculate the response.

**Result:** The study included twenty patients were recruited for the study. Out of which 14 were male (70%) and remaining 6 subjects were female (30%). This is analyzed that outcomes which are clinically significant were Hoehn and yahr scale of functional mobility in Parkinson's disease (P value: < 0.0001 and t test: 8.904) and Unified Parkinson's Disease Rating Scale II and III (P value: < 0.0001 and t test: 10.282). Significant improvement was observed with the outcome measures used for the study.

**Conclusion:** Physical exercises can contribute effectively in improving the functional mobility in Parkinson's disease and can help to maintain the physical fitness.

***Keywords:*** *Parkinson's disease, physical exercises, structured exercises, functional mobility*

## Introduction

**Definition:**

Parkinson's disease (PD), a progressive neurodegenerative disorder, is manifested by a loss of dopaminergic neurons from the substantia nigra pars compacta there by disrupting the basal ganglia circuitry.[1] It was first described in 1817 by a physician named James Parkinson as shaking palsy[2], it is one of the chronic diseases associated with aging, as well as risk factors such as exposure to drugs, head trauma, pesticides and drugs (cocaine, heroin)[3]

**Prevalence:**

The incidence and prevalence of PD increases with advancing age, present in 1% of people all over the age of 65 years.[4] PD is twice as common in men than in women in most populations.[4] The clinical hallmarks of the disease include rigidity, bradykinesia, tremor, and loss of postural control.[5] It is a complex disorder with wide reaching implications for patients and their families.[6] The management of Parkinson's disease is traditionally centered on drug therapy, but even with optimal medical

**Corresponding author:**

management, patients still experience a deterioration of body function, daily activities, participation, and decline in mobility.[6] The motor impairment in PD patients caused by bradykinesia, rigidity, tremor, and postural instability accelerates the decline in functional capacity, especially when associated with decreased activity and with a sedentary lifestyle.[7]

Along with postural instability gait alterations, with consequent impairment in balance increase the risk of falls. Moreover, another 2 typical features are also present: Festinating gait or festination is referred to the patient's sudden acceleration as an attempt to keep their center of gravity between their feet in order to compensate for their flexed posture.8 Freezing of gait (FOG) is defined as a sudden stop in the patient's gait, often with legs trembling in place and the sensation of being "glued" to the floor.[8]

This symptom manifests more frequently while turning, when the path gets changed or more narrow, in a diagonal direction, when dealing with obstacles and other stressful situations or just before reaching the destination.[8]

Subjects affected by PD also experience several non-motor symptoms, such as autonomic dysfunctions (dysphagia, constipation, urinary incontinence, sexual dysfunction, orthostatic hypotension) cognitive impairment, dementia, depression (which affects 30 - 40% of patients), anxiety, sleep disorders and decreased olfactory sense. More immediate effects include improved motor performance, cognitive and functional ability.[1]

An estimate of the stage and severity of the disease can be made using a staging scale. The most widely used in clinical practice and research trials is the Hoehn-Yahr classification of disability Scale.[9]

Physical rehabilitation plays important role in the maintenance and improvement of mobility, transfers6, posture, and balance in PD patients.[7] These mobility deficits are difficult to treat with drugs or neurosurgery.10,11Different modalities of non-pharmacological treatment such as physiotherapy (P), walking, running, strength training (ST), functional exercises, and whole body vibration significantly reduced the risk of falls and improved motor performance, balance and gait,[10] and executive functions.[7]

Available data in the literature indicate that any rehabilitation protocol has to focus on: cognitive movement strategies, cueing strategies, and improved physical capacity and balance.[8] Different training programs for PD patients have been designed and evaluated but only specific training strategies tailored and individualized for each patient, may produce improvements in gait speed and stride length, decrease motor and balance symptoms and improve quality of life.[8]

Community-based strength and fitness programs, auditory cueing from metronomes, and visual cues, combined therapy programs that incorporate cues, stretches, functional training, gait and balance training, and relaxation exercises have all been found to be effective for improving movement.[12]

Improving physical capacity with aerobic training, strength and flexibility exercises may reduce symptoms as well as improve the patient's general well-being and quality of life.8 Resistance training can produce functional improvement in gait and may, therefore be useful as part of physical rehabilitation.13 Progression of PD generates socioeconomic and occupational hazards.14 Physical exercise has demonstrated a reduction in mortality rate in individuals with PD and, albeit modestly, a protective effect for PD risk.

Till date there are many neurophysiological techniques devised for body functioning but there is no fixed protocol for recovery so we can try to device a particular protocol as it is required for functional independence and better quality of life.

This could be the baseline source for different treatment pattern in Parkinson's disease. And improvement in the clinical characteristics can be seen.

## Aims and Objectives

**Aims:**

- To find the effect of structured exercise programme on functional mobility in Parkinson's disease.

**Objectives:**

- To evaluate the motor and non-motor symptoms present in Parkinson's disease.
- To find the effect of structured exercises on

functional mobility on various stages of Parkinson's disease.

## Material and Methods

1. Type of study : experimental study

2. Study design : pre and post

3. Place of study : KIMSDU

4. Sample size : supposed to be 30

N= 4sd2 /(x×£)2

N= Sample size

SD= Standard deviation

x= Mean

N= 4(3)2

(3*0.4)2

= 36

1.44

= 25

Calculating the error, minimum 20 sample size.

5. Study duration : 6 months

6. Inclusion Criteria:

1. Subject diagnosed with Parkinson's disease

2. Subjects have impairments in functional mobility following Parkinson disease

3. Both sex

7. Exclusion Criteria:

1. Neurological ill patients other than Parkinson's disease

8. Material required:

1. Assessment chart

2. Writing material

3. Computers and online accessing

9. Outcome measures :

Hoehn and yahr scale for Parkinson's disease

Unified Parkinson's disease rating scale II and III

Procedure:

Subjects taken for my study were those who were diagnosed with Parkinson's disease.

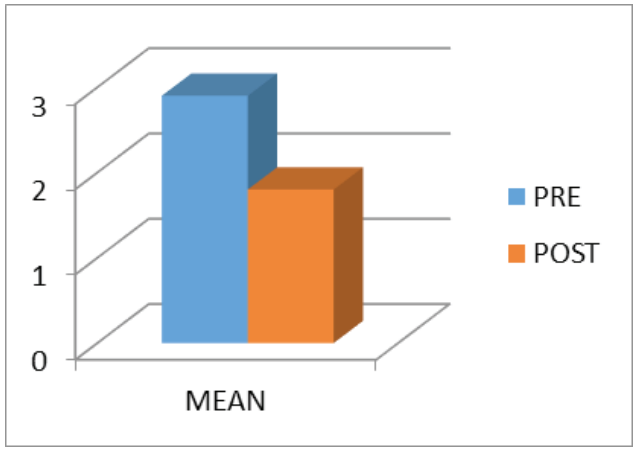
Subjects underwent detail assessment to fulfill the inclusion and exclusion criteria. Once the subject fulfilled criteria, they were explained about the study and detail information was given to them and consent was taken. Assessment was taken with the appropriate outcome major and pre-test will be done. 6 week exercise protocol will be given and follow-up for progression will be done. Later, again post-test will be done and result will be taken.

## Findings

Out of 20 patients, there is a more no. of male survivors than female. (Table1). Pre and post assessments done with Hoehn and yahr scale for disability and UPDRS (Table 2 and 3 respectively).

Table1: Gender distribution

| GENDER | TOTAL |
|---|---|
| MALE | 14(60%) |
| FEMALE | 6(30%) |
| Total | 20 |



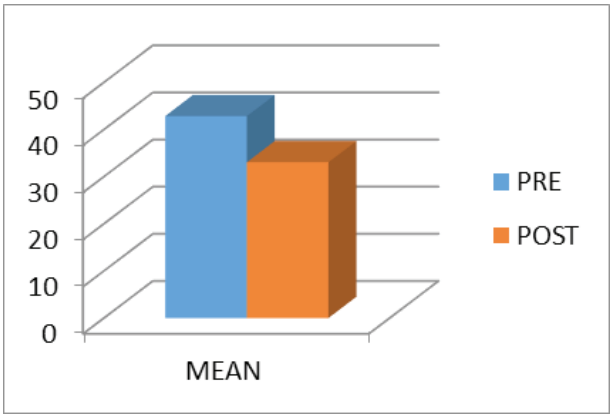
**GRAPH 1: PRE AND POST TEST WITH HOEHN AND YAHR SCALE**

**Table 2: HOEHN AND YAHR SCALE (FOR FUNCTIONAL MOBILITY)**

| | PRE TEST | POST TEST |
|---|---|---|
| Mean ± SD | 2.9±0.9679 | 1.8±1.005 |
| t test | 8.904 | |
| P value | < 0.0001 | |
| Significance | Extremely significant | |

**Interpretation:**

The above table and graph shows post training there was extremely significant improvement noted according to the p values.



**GRAPH 2: PRE AND POST TEST WITH UPDRS**

**Table 3: UPDRS SCALE (FOR FUNCTIONAL MOBILITY)**

| | PRE TEST | POST TEST |
|---|---|---|
| Mean ± SD | 42.85±24.11 | 33.05±22.46 |
| *t* test | 10.282 | |
| P value | < 0.0001 | |
| Significance | Extremely significant | |

**Interpretation:**

The above table and graph shows post training there was extremely significant improvement noted according to the p values.

Table 2 and 3 shows that extremely significant improvement is observed according to the p values.

## Discussion

This study "Effect of structured exercise programme on functional mobility in Parkinson's disease" was conducted to find the effect of structured exercise programme on functional mobility in Parkinson's disease. The clinical hallmarks of include rigidity, bradykinesia, tremor, and loss of postural control. It is a complex disorder with wide reaching implications for patients and their families. It increases the dependency of the patient, reduces efficiency and social participation and also affects the self-esteem.

The objectives of the study were to evaluate the motor and non-motor symptoms present in Parkinson's disease and to find the effect of structured exercises on functional mobility in Parkinson's disease.

The study was conducted with 20 subjects. Out of which 14 were male and remaining 6 were female subjects. Prior consent was taken from them. The interventions were carried out for 5 days per week for 6 weeks. The outcome measures for this study were Hoehn and yahr scale for Parkinson's disease, Unified Parkinson's disease rating scale

Pre and post tests were done using the outcome measures for assessing functional mobility in Parkinson's disease. The progression of PD leads to an increasing inability to perform daily activities, loss of independence, and a decreased quality of life, and it generates socioeconomic and occupational hazards. Progress of Parkinson's disease is multidimensional as many systems of body gets involved step by step. This mainly includes musculoskeletal, neurological systems. With every stage, clinical signs go on changing which makes rehabilitation challenging. Every feature needs to be addressed as they are closely associated with one another. Therefore physiotherapy treatment also needs to be reevaluated and changed every now and then.

The study, Comparison of strength training, aerobic training, and additional physical therapy as supplementary treatments for Parkinson's disease: pilot study conducted by Carvalho A et al, showed that strength training and aerobic exercise training in patients with PD are associated with improved outcomes in disease symptoms and functional capacity.

Structured programmes have been shown very effective results on various disoders like stroke. Different components like gait training,15 hand training 16with structured exercises have been shown to have better outcomes.

Also, previous study, Parkinson's Disease and Resistive Exercise: Rationale, Review, and Recommendations done by Michael J. Falvo, MS et al (2007) was aimed to establish the rationale for efficacy of resistive exercise in individuals with PD and concluded that available resistive exercise intervention have increased the muscle strength. Exercise program aimed at improving range of motion combined with activity-related (e.g., gait or balance) exercises, improves ADL functioning. Furthermore, it is plausible that, in PD, a strength-training program increases muscle power. Structured exercise programme given to subjects received range of motion exercises, strengthening exercises, stretching, balance training, gait training, exercises to improve functional capacity and activities of daily living. This study shows that these structured exercises showed significant improvement in the outcome variables concluding that it improves quality of subjects with Parkinson's disease. This was confirmed using statistical analysis by using 'Paired t- test.

Hoehn and yahr rating scale of Parkinson's disease: Mean ± SD score for pre and post test was, 2.9± 0.9679 and 1.8 ± 1.005 respectively. Post training, extremely significant improvement was noted with functional mobility. P value: < 0.0001 t test: 8.904

Unified Parkinson's disease rating scale II and III: Mean ± SD score for pre and post test was, 42.85±24.11and 33.05±22.46 respectively. Post training, extremely significant improvement was noted with functional mobility. P value: < 0.0001 t test: 10.282

These results demonstrate that pharmacological treatments along with physical exercises may promote better results for symptoms such as rigidity and bradykinesia. Repetitive exercises and training can help in improving functional mobility. The task was made more complex by setting a time limit and increasing the intensity of exercises.

And so, this study showed significant clinical improvement in functional mobility, indicating that prescribing exercise with controlled intensity, duration, and frequency may improve the physical health of patients with PD.

## Conclusion

Structured exercises on basis of recovery pattern and stages plays an effective role in improving functional mobility in Parkinson's disease thereby improving quality of life.

# A Study to Assess the Knowledge on Pubertal Changes and Menarche among Adolescent Girls Residing in A Selected Rural Community, Kanchipuram District, Tamilnadu

**Jyothish Lal Prasad[1], Abishek, Aishwariya[1], Ananthi, Cyril Cherian[1], Reshma Banu[1], L. Lakshmi[2]**

*[1]IV year B.Sc Nursing Students, DR. L. Lakshmi, Professor, Chettinad College of Nursing, Chettinad Academy of Research and Education, Kelambakkam, Kanchipuram dist, Tamilnadu, [2]Dean, Sathyabama College of Nursing, Sathyabama Institute of Science & technology, Jeppiaar Nagar, Rajiv Gandhi salai, Semmanchery, Kanchipuram District*

## Abstract

A study was conducted to assess the level of knowledge on menarche and pubertal changes among adolescent girls residing in a selected rural community. The objectives were to assess the level of knowledge of adolescent girls among menarche and puberty, to find out the association between the level of knowledge on menarche and puberty with selected variables like age, educational status, occupation, and income status .

The sampling technique is non probability convenient sampling technique with the sample of 50 adolescent girls. A Questionnaire was formulated, and used to assess the level of knowledge. The collected data was tabulated and analyzed. Descriptive and inferential statistics were used.

The results were 11% adolescent girls were having adequate knowledge and 33% adolescent girls were having moderately adequate knowledge and 6% of adolescent girls were having inadequate knowledge. So, it shows that more teaching programme to be implement to promote knowledge and hygiene among the adolescent girls. So such research studies will help to increase the knowledge level of the adolescent girls leading to improvement in quality care thereby reducing the mortality rates of reproductive tract infections.

***Key words:****. Assess , Knowledge , pubertal changes, menarche and adolescent girls.*

## Introduction

Embrace and naturalize Your cycle as a way of nurturing a healthy relationship within yourself as a woman."

- clavel-chapelon F ( 2002)

Puberty is a transitional period between childhood and adulthood, which includes the process of rapid growth, development, and maturation in terms of physical, psychological, biochemical, and social conditions. Transition through puberty often begins with the development of external secondary sexual characteristics, which appear as breast enlargement and pubic hair growth in girls. Growth acceleration and peak height velocity occur early in puberty, whereas menarche, the onset of menstrual bleeding[1].

Menarche is actually the last stage in a complex series of biological developments related to puberty It marks an important point in life for the female adolescent, as it symbolizes the entrance into woman hood 5.Menarche is the first menstrual cycle or menstrual bleeding, in the female human; it is often considered as the central event of female puberty as it signals possibility of fertility[4].

**Corresponding Author:**
**Jyothish Lal Prasad ,**
B.Sc. (Nursing) IVYear, Chettinad College of Nursing, Chettinad Academy of Research and Education, Kelambakkam, Kanchipuram district, Tamilnadu,
Email id: jyothishprasad96@gmail.com.

In females, menarche is the major landmark of puberty, which usually occurs between 13 and 18 years of age, despite regional and ethnical. Unlike other gradual pubertal changes, menarche signals a dramatic transition from girlhood to womanhood and is recognized as an important transitional point in women's lives .Although menstruation is a natural phenomenon, major psychological changes start with menarche[3].

## Objectives

l To assess the level of knowledge of adolescent girls among menarche and puberty

l To find out the association between the level of knowledge on menarche and puberty with selected variables like age, educational status, occupation, and income status .

## Research Methodology

Research approach used for the study was Non-experimental evaluative approach. The research design is descriptive research design was adopted for conducting the present study. The study was conducted at a selected village Kanchipuram District, Tamil Nadu with the population of adolescent girls, available in the age group of 13-18 years.The sample size was 50 and Non-probabality sampling technique was used to select the adolescent girls for conducting the study

Selection and Development of Study Instruments

It consisted of two sections.

1. Demographic data of the subjects

2. Structured questionnaires.

PART 1: Demographic variables

It consisted of demographic variables of adolescent girls such as Age, type of family, education, number of siblings, education about puberty

PART 2: Structured interview schedule on knowledge regarding puberal changes and menarche

It consisted of 14 objective type questions. Each question consisted of 4 options. This was framed to assess the level of knowledge on pubertal changes and menarche among adolescent girls

Scoring and Interpretation of the Tool

Structured questionnaires consist of 14 items. The total attainable score was 14. The cut off score was 8. Higher the cut off score indicates greater the knowledge level of pubertal changes and menarche

**Data Collection Procedure**

The data collection was done for one week at Selected village, Kanchipuram District, Tamil Nadu. Structured questionnaire was used to assess the knowledge level of pubertal changes and menarche. The researchers collected the demographic data and structured questionnaire (SQ) by conducting confidential data of the participants.

## Data Analysis

The data analysis was done using descriptive and inferential statistics. Descriptive statistics like frequency, percentage and mean. Chi-square test was used to find out the association between the pubertal changes and menarche with selected personal information sheet of the pubertal changes and menarche. Collected information on demographic data of pubertal changes and menarche among adolescent girls and Structured questionnaires (SQ) in the form of demographic data of adolescent girls. Descriptive and inferential statistical were used. The mean value is 207 and the standard deviation is 15.62

## Study Findings

Findings of the study were presented based on the objectives

Objective-I: To assess the existing level of knowledge on pubertal changes and menarche among adolescent girls.

Overall mean and SD of adult women related to knowledge aspects were calculated. Adequate knowledge level was 11%, moderate knowledge was 33%, inadequate knowledge level was 6%

From the above discussion, it showed that the mean scores and standard deviation of knowledge aspect has shown a significant difference in the pre test and post test scores.

Objectives II: To associate the existing level of knowledge on pubertal changes and menarche

The association between demographic variables in

relation with the knowledge aspects of adolescent girls, the findings show that there was no association between demographic variables such as age of adolescent girls, food pattern, educational status, total number of siblings, type of family and source of knowledge

## Conclusion

The number of adolescent girls having moderate knowledge were 33%, inadequate knowledge were 6% and adequate knowledge were 11% and overall mean in knowledge aspects of adolescent girls on pubertal changes and menarche SD of 15.62 . So, health care professionals must organize mass health education programmes about pubertal changes among adolescent gir

## Abstract

Eyes are the most vital sensory organ, which stimulates light and helps us to visualize the colorful world around us. Its internal structure is extremely minute and complex with various layers and chambers present. Retina and its layers, is the most important part of an eye that helps in viewing the objects. In certain ailments, if retina gets affected, the vision becomes challenging and may even lead to permanent blindness. One of such vision threatening diseases, affecting the infants is Retinopathy of Prematurity (RoP). Here, various latest, authentic methodologies and tools used for the diagnosis and management of RoP are reviewed and a novel algorithm has been proposed to measure the percentage deviation of retinal health with respect to prior ultrasonic B scan image. Also, to classify the level or stage of RoP based on the location and severity noticed in the ultrasonic B scan images. The proposed architecture and design would be effective and simplified and enable the Ophthalmologists for earlier and accurate diagnosis of RoP in infants.

***Key words:*** *Retinopathy of Prematurity (RoP), Retinal health, Stage of RoP, Diadic transformation, Ultrasonic B scan images*

## Introduction

Sarvendriyanam Nayanam Pradhanam, means Of all senses, eye is the most vital says Ayurveda, which matches with the principles of modern medicine. It is the sensory organ that makes our life bright by stimulating the sense of vision. The anatomy of human eye is very minute and protected well by its own walls and structures. Out of all the eye structures, the retina which is situated at the dorsal side of the eye is responsible to receive the light and converts it into neural signals which are recognized by the brain. The lens situated at the anterior end focuses light on to the retina. In simple terms, the retina can be compared with an image capturing sensor in our latest day's digital cameras. The retina comprises of blood vessels, nerve fibers, rods and cones, etc which are distributed along the 10 different layers. As the retina plays a pivotal role in the image capturing and analysis, any variation in the structure and/or function of the retina and its layers may lead to complicated vision difficulties and may even cause blindness. The major diseases affecting the eye, especially the retina and its layers are generally termed as Retinopathy. Retinopathy of Prematurity (RoP) is one of the most common congenital disease affecting preterm babies and found challenging to prevent artificial blindness.

Retinopathy of Prematurity, formerly known as retrolental fibroplasia (RLF) is a progressive, vaso-proliferative, preventable disorder, chiefly observed in preterm new born infants (born within 30 weeks). The infants born with low birth weight (less than 1500gms) are also prone for getting affecting with RoP. The changes and the irregularities in the accumulation of blood vessels increase as an individual grow and may end up causing vision threatening abnormalities, if left untreated. Now-a-days, with advancements in the field of medicine and technology, the rate of survival of premature infants is increasing. Simultaneously, RoP has emerged as one of the primary causes of preventable childhood blindness.

However, the complications of the disorder like visual morbidity can be reduced or avoided with an

early, exact diagnosis followed by an efficient, timely treatment. The presence and prevalence of RoP, if any can be assessed by an Ophthalmologist by performing a simple screening test within a few weeks after the child's birth. With the advent of the latest non-invasive imaging techniques, the evaluation of RoP has become simpler. The plus disease in RoP is characterized by very severe vascular abnormalities, dilation of rational retinal blood vessels, tortuosity or diffusion of blood vessels, etc. The International Committee for RoP classification has stated that the earlier prognosis of RoP can be specifically analysed by identifying the demarcation line or ridge formation in the retinal blood vessels.

The observation of infants dilated pupil with an indirect ophthalmoscope, telescreening using RetCam digital imaging device, Ultrasound scan, Fundus imaging, etc are the most commonly used diagnostic tests for the study of RoP. A few of the latest treatment modalities include low weight gain proportion, WINROP algorithm, indirect laser photocoagulation, cryotherapy, etc.

## Materials

### Literature Survey and Outcomes:

In the cases of RoP, changes and irregularities in the accumulation of blood vessels increase as an individual grow and may end up causing vision threatening abnormalities, if left untreated. Now-a-days, with advancements in the field of bio-medical technology, the rate of survival of premature infants is increasing. Simultaneously, RoP has emerged as one of the primary causes of preventable childhood blindness. However, the complications of the disorder like visual morbidity can be reduced or avoided with an early, exact diagnosis followed by an efficient, timely treatment. The presence and prevalence of RoP, if any can be assessed by an Ophthalmologist by performing a simple screening test within a few weeks after the child's birth. With the advent of the latest non-invasive imaging techniques, the evaluation of RoP has become simpler. The plus disease in RoP is characterized by very severe vascular abnormalities, dilation of rational retinal blood vessels, tortuosity or diffusion of blood vessels, etc.

The amount of tortuosity is evaluated by formulating a One Dimensional Differential Geometrical Curvature Characterization Method. From the identified retinal images, vessel networks and their individual boundaries are extracted as planar curves. After segmentation, the computation of differential curvature is carried out at segment level and also at vessel level for distinctive vessels. The testing and validation of this method has been carried out on the accessible, local and public datasets and it has been observed that the blood vessels with appreciable amount of tortuosity have a notable variation in the curvature, on comparing with the normal blood vessels[1].

The retinal blood vessel system is analysed and a fully automated model is proposed based on morphological segmentation so that the available binary images help to analyse the blood vessel structure. The regions where the blood vessels are suppression are identified with better response to stimulus and strengthened segmentation that withstands changes in the environment with unfavourable image criterion. So, the data which is a set of 22 images obtained from RetCam 3, comprising the information about the vascular system are anticipated under a lesser contrast. Also, for this model, a comparison in testing and analysis are made with respect to selected segmentation methods, which depends on objective criteria[2].

Till now, most of the automatic or semiautomatic tools used to diagnose RoP have focused on assessing the Plus Disease, by identifying the vascular abnormalities in the retina. A few has focused on methodologies that help in identifying the stage of the disease. As the principles and tools used in Deep Neural Networks are proven to be efficient in computer vision, medical imaging, it has given a scope to design a system for an automatic diagnosis of RoP. In this work, the architecture of Convolutional Neural Networks has been proposed. For every examination, it features the identification of the presence of RoP and its severity, if it is present. By analyzing the severity and the progression of the disease, RoP cases are is classified as mild and severe cases. In this proposed architecture, a feature aggregate operator connects 2 sub-networks. From the fundus images, the sub network 1 extracts the high level features. Aggregator operator fuses the extracted features from various images and feeds as an input to the sub network 2, so that the class or stage can be anticipated. RetCam3 is used in imaging, training and evaluating the large data sets. This model is proven to be efficient in demonstrating the classification of RoP disease accurately[3].

A tool is proposed for easier diagnosis of stage of RoP and also to locate the affected region in the eye. The input images for this proposed tool are taken from RetCam and the output is represented as a reading on 1

to 9 scales. By analysing the same, the stage and zone of RoP can be ascertained. As this tool is easy to operate, nurses or paramedical staff need not depend on the specialist for assessment of the disease.[4]

In the cases of RoP, the growth and development of retinal blood vessels is cluttered or unsystematically arranged which would result in causing retinal scar or even retinal detachment in some extreme cases. The stage at which the disease has been diagnosed, the tortuosity index helps to assess the asperity of the disease. It is considered that higher the tortuosity index, greater the chances for the diagnosis of plus disease, which would lead to Aggressive Posterior RoP. Also, it is required to have an expertise in Retinopathy and Ophthalmology to diagnose the condition and assess the stage of the disease. As we lack this especially in the rural areas of the developing countries, a lot many children are left unnoticed till they become completely or partially blind. Keeping this end in view, if the gap between the patient and the specialist doctor is reduced, more number of children will be benefitted. Based on the individual's condition and essentiality, the appointments, treatment plans can be scheduled. More people would be made beneficial with this advancement in technology[5].

Plus disease in the case of RoP usually, an Ophthalmologist, who is specialised in retina related ailments does a clinical examination to the child and assess the parameters through a Fundus image. It represents the vascular structure of the eye, which can be compared with respect to the features of Gold Standard Image, which needs an expertise. In developing countries, most of the rural areas suffer from lack of specialist doctors, where computer aided systems help to diagnose the disease at the earliest. In this paper, Curvature based method has been developed to measure the delineation of retinal blood vessels using COSFIRE filters and calculation of tortuosity, which has found effective with 0.88 sensitivity and 0.94 specificity as a result on its observation of 35 set of images[6].

The effective segmentation followed by precise visualisation of retina's vascular curvature is important to understand the health of retina in infants suffering from RoP. But, in case of infants the fundus is of low contrast compared to adults, which makes the segmentation difficult by using, the available computer based retinal image analysers. To overcome this, the blood vessel networks can be fused by a guided filter and mathematical morphological techniques can be applied. The modified mathematical morphological closing operation which is being used in post processing technology helps to identify and analyse the thin and small blood vessels in the output after segmentation. The information and values extracted after segmentation helps in the earlier diagnosis of RoP7.

**Proposed Methodology & Instruments for Research:**

The ultrasonic B scan is considered as a diagnostic tool for the assessment of RoP condition. For this study the best quality images captured by Sonomed Escalon's, Master-Vu B-Scan (Model No: MV5600) are used. It is a portable devise, which can be connected to a PC, laptop and can be used as a bed side imaging system also. By activating the probe at different positions on the closed eyes, the miniscule anatomy of the eye can be visualized on the monitor inter-phased with the probe. The 12MHz frequency handheld, soft touch transducer probe sends the sonic waves with virtually no sound and captures the still images or continuous video clips which can be viewed as separate frames also. As it is sensitive even for smoother touches, more pressure need not be exerted while scanning. Hence, reduces the compression of cornea. Time varying gain control is adopted to trace out near, medium and far gain fields. While performing the brightness based B scan, the amplitude based A scan image can also be visualized simultaneously. Special tools are available for variable zoom, pan and selection of specific area, brightness and contrast control, on-screen annotation, etc. Sectoral scanning method is used where frame rate id 30 fps (max), and gray scale levels are 256. For an improved penetration, acoustic output can be adjusted by achieving the scan depth 0f 30-60mm. The possible electronic and clinical resolutios are 0.015mm (max) and 0.1mm respectively. The captured images are saved as .jpg or .bmp formats and video clips captured are saved as .wmv up to 100 frames. The precision in terms of distance and angle is 0.046mm and ½ degree respectively.

The software has a license to be installed in multiple computers or laptops and so, more number of ophthalmologists can use a single machine for easier screening. The database of every patient can be entered and saved separately, which enables patient's privacy protection. Its clinical accuracy is +-0.1mm, electrical accuracy is +-0.32mm, lens database is 1600 and an increment of lens calculation is in 0.25D. The formulas like Binkhorst, Regression II, Holladay, Hoffer Q,

Haigis, etc are available for the calculation of intraocular lens power. Latkany myopic regressions, latkany hyperopic formula, Aramberri Double K are used for post refractive IOL calculation.

**Sample B Scan Images:**

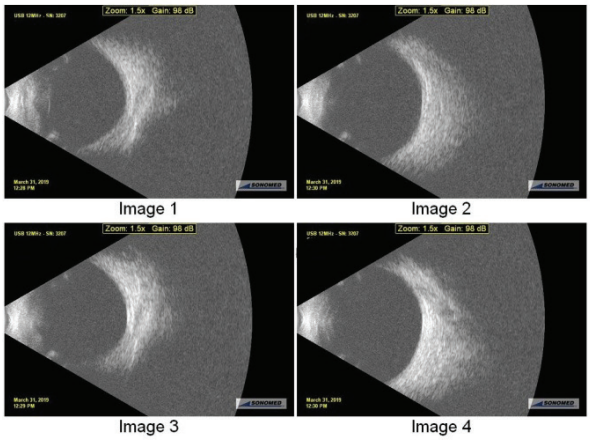

**Image A: A few hard Exudates are found in both OD & OS (Right & Left Eyes) respectively**

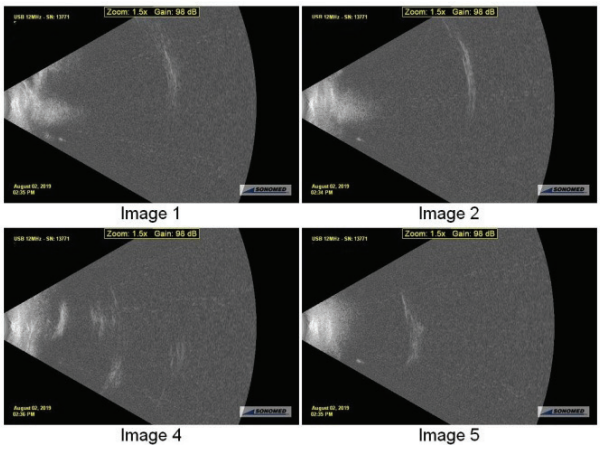

**Image B: The Retinal Structure is Not Formed Completely:**

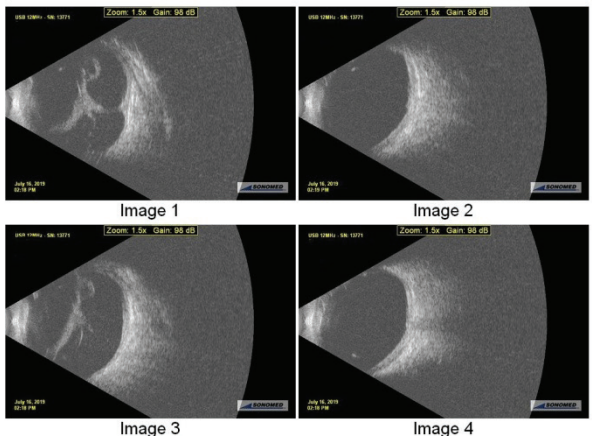

**Image C: Symptoms of Retinal Detachment are in OD (right eye) and OS (left eye) is almost norma**

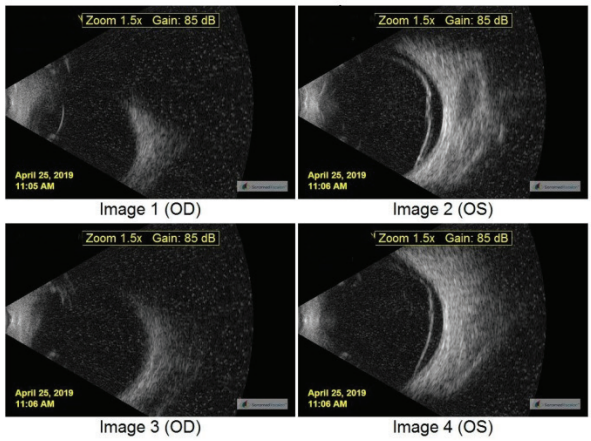

**Image D: Tractional retinal Detachment is noticed**

## Conclusion

The sample images are subjected to the morphologies in-line with algorithm proposed and found that it has a promising scope in attaining the accurate measurement of the percentage deviation of retinal health with respect to prior Ultrasonic B scan image and also to classify the level or stage of the RoP based on the location and severity noticed in the Ultrasonic B scan. The method would be implemented in real time application so that better diagnostic facility can be provided to infants. The Ophthalmic health of the future generation can be protected for a brighter society.

**Acknowledgement:** I would like to render my whole hearted gratitude and regards to the management, doctors, Optometry department and Clinical Research team of Sreedhareeyam Ayurvedic Research & Development Institute, Sreedhareeyam Ayurvedic Eye Hospital and Research Centre, Koothattukulam, Kerala for their constant support and providing me with the data and knowledge bank required as per the research needs. Also, my thankfulness to the Doctors and Members of Institutional Ethics Committee for their acceptance and valuable suggestions, enabling me in taking forward the research work, in-line with the current needs and trends of the society.

**Ethical Clearance:** The Ethical Clearance is approved by "Institutional Ethics Committee" of Sreedhareeyam Ayurvedic Research & Development Institute, Koothattukulam, Kerala on 23rd November 2019.

**Conflict of Interest:** The authors do not have any conflict of interest.

**Source of Funding:** There is no external agency

funding for this research. It is self-funding research.

# Effect of Early Physiotherapy for Endotracheal Intubation Induced Temporomandibular Joint Dysfunction –Experimental Study

**Krutika Dnyaneshwar Gawade[1], Sandeep Babasaheb Shinde[2], P.B. Jamale[3]**

*[1]Intern, Faculty of Physiotherapy, [2]Associate Professor Department of Musculoskeletal Sciences, [3]Professor, Department of Anesthesia , Krishna Institute of Medical Sciences Deemed To Be University Karad, Maharashtra, India*

## Abstract

**Objectives:** To determine the effect of early physiotherapy in endotracheal intubation induced temporomandibular joint dysfunction (TMD) and to compare the effect of Early Physiotherapy interventions and Conventional treatment (CT) in TMD in Endotracheal Extubated patients.

**Method:** An experimental study was carried out in 40 endotracheal extubated subjects diagnosed with TMD. The subjects were random allocated to Group A as Experimental group receiving early physiotherapy and Group B as Conventional group receiving routine treatment for 14 days. The outcome measures used were American Academy of Orofacial Pain(AAOP) Questionnaire, Visual Analogue Scale (VAS), Physical Assessment tool, Range of motion of TMJ, Tenderness over oro-facial muscles.

**Results:** The Results obtained shows that both the groups showed significant improvement in the outcome variables and therefore aids with early correction of dysfunction.Within Group Analysis showed statistically more significant improvement in all outcome measures for group A .VAS ($p < 0.0001$), ROM for all 4 motions ($p<0.0001$), Auscultation test=95% improvement. Provocation test =95% improvement, Tenderness =95%. However only,AAOP Questionnaire was not significant for group B (p value>0.001).

**Conclusion:** We found that those early physiotherapy interventions showed significant improvement in the outcome variables concluding that it improves TMJ mobility and reduces pain. It can be further concluded that conventional treatment can be more efficacious if combined with early physiotherapy interventions.

***Key words:*** *Temporomandibular Joint Dysfunction, physiotherapy, endotracheal intubation, orofacial pain.*

## Introduction

Temporomandibular Dysfunction (TMD) is a group of orofacial disorders affecting Temporomandibular joint (TMJ), and its associated structures[1] TMD has multi-factorial etiologies [2]. One of the etiological factors suggested as contributing to TMD is micro-trauma including forceful intubation [3].

In Emergency settings sometimes endotracheal intubation (ETI) is performed by resident doctors and Nurses. ETI induced micro-trauma has been proved a predisposing factor for TMD in few published case reports and systematic review articles. During this maneuver, anaestheologist attempts rotation and translation of the TMJ. ETI in the ICU is a potentially hazardous procedure, most commonly due to failing oxygenation and unstable hemodynamics during emergency intubations [4]. During this technique, harm may occur to the TMJ apparatus due to greater forces being applied either with laryngoscope, or manually

in process of completion of intubation. Complications noted in the cited case reports and studies include brief or permanent jaw locking, disc dislocation, muscle pain and facial pain [3]. Though little studied, the deleterious effect of ETI on TMJ dysfunction is largely established [3]. Difficult Airway society Guidelines states 5 to 10% prevalence of TMD post extubation.

Noninvasive managements prove to be the first option for 85 to 90% of TMD patients. [5]. Systematic reviews and meta-analysis produce evidence that physiotherapy interventions are more beneficial than other treatment modalities in the management of TMD for pain reduction and improving ROM. Large scale superior quality experimental studies with a standard management protocol are desired to establish whether physiotherapy is actual and has potent therapeutic value in management of TMD. However there are no studies that reported interventions with Early Physiotherapy Intervention EPI for ETI induced TMD [5].

## Method

After approval of Institutional Ethics committee this experimental study was conducted in Krishna Hospital, Karad. The primary objective of this study was to find effect of early physiotherapy interventions on temperomandibular Joint dysfunction in endotracheal extubated patients. The samples were 40 endotracheal extubated (ETE) patients in which ETI was done by Resident doctors and Nurses. Both genders, age 20 to 50 years, diagnosed with TMD in screening session were included in the study. it was using American academy of orofacial pain questionnaire and detailed physical Assessment.According to the inclusion criteria, ETE who were intubated after abdominal surgery, Cardiac Surgeries and for airway diseases (ARDS, Pneumonia) were selected. No specific duration of ETI was taken into the consideration. In all selected samples ETI duration was ranged between 3 to 15 days. Patients with head neck surgeries, neurological surgeries, tracheostomy and laryngeal mask were excluded. The patients who showed maximum positive responses for the assessment were selected.ETE patients having TMD deficits on screening were randomly allocated by using random allocation software into two groups. Group A was experimental and Group B was conventional (CT). Both Group A and Group B had 20 subjects each. Group A received a set interventional treatment protocol for 14 days. Group B was given conventional treatment including routine chest physiotherapy, medical and nursing care. Both the groups received physiotherapy under observation of concern intensive care and ward physician. Between groups comparison was done by applying 'UnPaired t-test' to pre and post treatment values of both group for all outcome measures.

**1. Maximum Protection Phase:(0-7 Days) Pain Management**

| | |
|---|---|
| Day 1 | Patient and Relative Education. [5] Diaphragmatic Breathing Program.[5] |
| Day 2-3 | 1) Kinesiotape: V-shape extended to inferior border of jaw muscles and to anterolateral aspect of neck.[8] 2) Cryotherapy: Crushed ice wrapped in towel .Circular Pattern. 2 to 4 times a day. Maximum 8 times to minimum once a day. 10 to 15 min ideal duration.[7] 3)Soft Tissue Techniques: Extra oral Massage: Intra Oral Trigger Point Release[6] |
| Day 4-5 | 1) Patient education (Tentative Removal of Ryles Tube).[5] 2)Electrophysiological Modalities: Ultrasound: Dosage: Continuous at a frequency of 1Mhz and intensity of 1.0-1.25 W/cm for 3 mins over TMJ.[8]3) Soft Tissue Mobilization: For temporalis, masseter, medial pterygoids, and lateral pterygoids muscles. Can be done using one digit or multiple digits to contact myofascial trigger points. Can be applied unilaterally or bilaterally.[6] |
| Day 6-7 | 1)control of Jaw Muscles and Joint Proprioception: Recognition of resting position of the jaw. Teach controlled opening and closing of jaw. Mirror for reinforcement.[7]<br>2)Stretching Techniques: Passive stretching: Placing layered tongue depressors between central incisors, and then gradually work to increase the amount of layers far enough to insert the knuckles of index and middle fingers.[8] |

2. Moderate Protection Phase (8 to 10 days). To increase Restricted Range of Motion.

| | |
|---|---|
| Day 8-10 | 1) Joint Manipulation Techniques. Unilateral Distractions. Bilateral Distractions. Anterior Glide. Medial and Lateral Glide. Dosage: 1 to 3 sets of 10 reps. [6]<br>2) Active Exercise Program. Tongue position at rest. Teeth Apart. Nasal Diaphragmatic breathing. Tongue up and wiggle. Strengthening. Touch and Bite.(Proprioceptive re-education) Neuromuscular Control. Isometric Exercises.[5] |

3. Minimum Protection Phase (11 to 14 days).

Aim: Strengthening.

Day 11-14 1) Resistive Exercises.[7] 2)Proprioceptive Neuromuscular Facilitation .[7]

Group B: Conventional Treatment [5].

Medical, Nursing care and Chest Physiotherapy.

**Results:** . A total of 100 ETE patients fulfilling the inclusion criteria were screened by anesthetist and physiotherapist . 52 patients were found to be diagnosed with TMD. Out of which 6 did not agree to participate, 4

on discharge terminated the treatment and 2 had severe complications. Remaining patients were found majorly to present with atleast one sign or symptom of TMD. The patients who showed maximum positive responses for the assessment were selected.

Between the group comparison.

A) AAOP Questionnaire (Between the group)

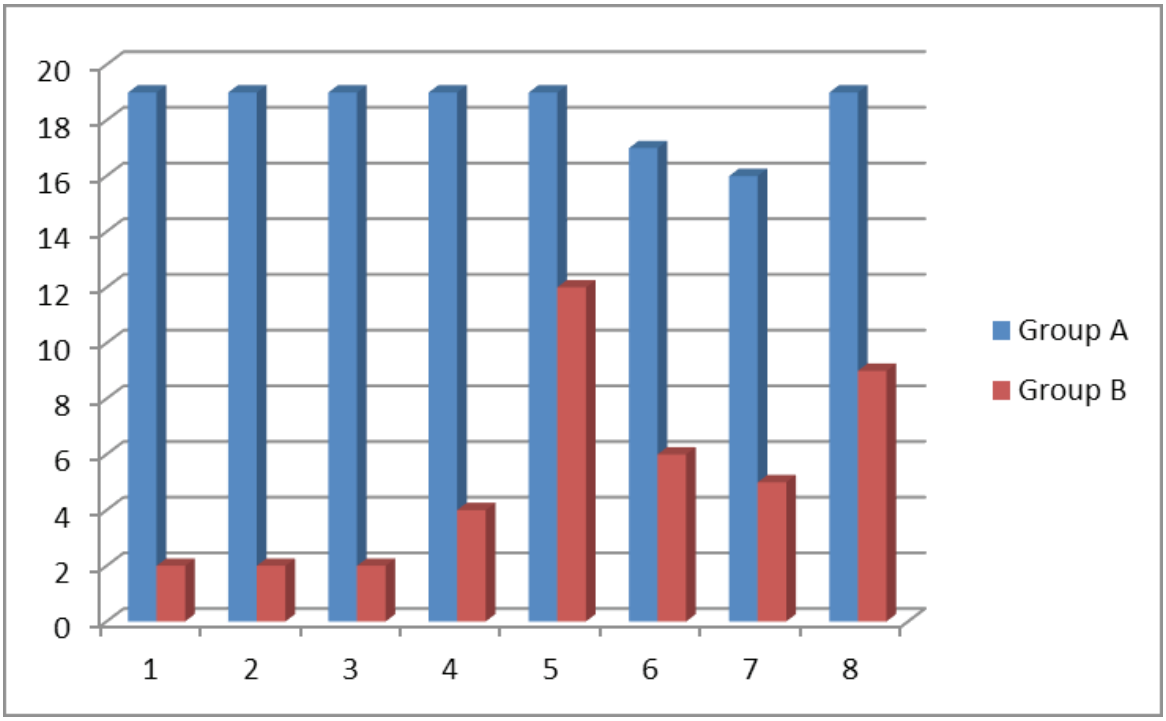

**Figure no.1 The Between group comparison of AAOP Questionnaire .**

Interpretation: The above Graph shows comparison between the groups. The graph shows difference in the post training values between the group. AAOP questionnaire showed significant association between pre treatment and post treatment answers in both groups. Association between Pre and Post signs and symptoms of TMD in Group A =p value<0.0001 proved statistically significant. Group B =p value>0.0001 proved statistically non-significant.

B) Visual Analogue Scale (On Activity)

Table 2: Between the group comparison- VAS (On Activity) according to the p values.

| **Group** | **Group A** | **Group B** | **t value** | **p value** | **Significant** |
|---|---|---|---|---|---|
| Pre training | 3.35±1.46 | 3.50±1.27 | 0.345 | 0.731 | Not Significant |
| Post training | 0.80±0.83 | 1.95±1.19 | 3.538 | 0.0011 | Very Significant |

C) TMJ goniometry

Table 3: Between the group comparison- Goniometric Measurements,

| **PARAMETERS (PRE)** | **t value** | **p value** | **Remarks** |
|---|---|---|---|
| Mouth Opening | 1.04 | 0.305 | Not significant |
| Left Lateral Movt | 0.558 | 0.305 | Not significant |
| Right Lateral Movt | 0.941 | 0.352 | Not significant |
| Protrusion | 1.83 | 0.073 | Not significant |
| PARAMETERS (POST) | t value | p value | Remarks |
| Mouth Opening | 6.35 | 0.093 | Significant |
| Left Lateral Movt | 4.28 | 0.093 | Significant |
| Right Lateral Movt | 4.76 | 0.481 | Significant |
| Protrusion | 7.88 | 0.628 | Significant |
| PARAMETER(POST) | | GROUP A | GROUP B |
| Mouth Opening | | 41.5±3.3 | 34.8±3.36 |
| Left Lateral Movt | | 8.9±0.64 | 7.8±0.95 |
| Right Lateral Movt | | 8.45±0.75 | 7.2±0.89 |
| Protrusion | | 6.95±0.51 | 8.3±0.57 |

D)Tenderness:

Table 4: Between the group comparison- Tenderness in different Muscle Groups

| | **POST** | | **POST** | |
|---|---|---|---|---|
| | **YES** | **NO** | **YES** | **NO** |
| Temporalis | 1 | 19 | 5 | 15 |
| Masseter | 1 | 19 | 8 | 12 |
| Medial Pterygoids | 1 | 19 | 9 | 11 |
| Lateral Pterygoids | 1 | 19 | 16 | 4 |

Physical assessment which includes VAS, Tenderness, Ascultation provocation test also showed similar results. Goniometric measurements showed significant improvement in both. Mouth opening was the most improved

parameter noted in Group A with mean value 41.4 mm. VAS showed statistically significant improvement with reduction in pain levels with p value <0.001.Group A showed reduction in pain with mean value of 3.35 ±1.46 to 0.80±0.83 . Group B showed reduction in pain levels with mean value of 3.50 ±1.27 to 1.95±1.19. Auscultation and provocation test showed improvements in both groups. Group A showed significant results in both with 95 % improvement .Group B showed a relatively less improvement with 80 % and 75% respectively. Group A showed 95% improvement in tenderness reduction in all muscle groups. The results for group B were 75%, 60%, 55%, 20% improvement in tenderness at masseter, temporalis, medial and lateral pterygoids respectively.

## Discussion

In general the major goal of this study was to correct ETI induced TMD by improving functional TMJ mobility and relief of pain. Both groups were effective in correction of TMD, EPI proved more efficacious. In the present study it was found that majority of subjects experienced pain and tenderness. Also present study signifies that ROM, pain, tenderness showed combined improvement which interprets the fact that muscle hyperactivity might be cause of dysfunction post extubation. In course of treatment, patients experienced a significant reduction in intensity of pain in both groups. In a previous study by David Smekal it was found that, occurrence of TMD is common with stomatological treatment in which the mouth is in widened position. The same study concluded early treatment not only corrects disturbances but helps prevents further worsoning and chronicity. Previous studies propose ETI as a risk factor for TMD. Previous studies state in individuals with a report of prior symptoms, there is an increased reporting of symptoms which continues for as long as 2 weeks post operatively [3].

Female Gender (75%), increasing age (50%) and emergency ETI (75%) are predisposing factors for transient TMD pain following ETI. In a case report, Michael D. Martin found similar predisposing factors for occurrence of TMD post extubation.[3] In a study by C.B. Battistella Muscle related conditions encompass largest subtype among various disorders grouped under TMD [5].Presence of Masticatory muscle tenderness is found to be more in age group of 31-50 years and more among females. The most frequent trigger points were found in temporalis, followed by masseter, medial and lateral pterygoids. Considering the critical condition of the patients after surgery, AAOP questionnaire proved to be more feasible. More affirmative answers were found for questions 4,5,6,7 for both groups which support the results of myogenic subtype been more prevalent owing to nature of the questions [3] .Question 4 resulted in positive findings, regarding presence of joint noises. Statistically significant improvement was noted in reduction of sounds in both groups with 95 % and 80 %. Limitation of mouth opening on pre treatment was found in both groups (<30mm).In previous studies a limited mouth opening of <40 mmm was noted. The smaller improvements in group B can be attributed to findings in previous study, interincisal distance assessment was related with pain at 7 day, but association at 14 days was not significant [3].

Treatment protocol was in various phases and used symptom specific approach which is lacking in group B which might be a responsible factor for more marked improvement in group A. Additionally there is no published study that specifically focuses on treating TMD with EPI alone in ETE patients. Also, some studies state using more treatment modalities simultaneously prove more efficacious.Clinical profits of physiotherapy management are widely described both in literature and TMD textbooks. Although it is generally believed that these treatments are effective in reducing pain and restricted function, with a short term efficacy, any physiotherapy treatment is better than no treatment. In last few years, several studies have demonstrated different results regarding the effect of Physiotherapy treatments in management of TMD. Early physiotherapy interventions are a valuable treatment option. Treatments which are easily accessible, low cost effective and reversible should be given priority [11]. Evidences for application of carefully controlled therapeutic exercise program for chronic joint disorders like Rheumatoid arthritis are also well established[12].However, only a few studies have investigated its effectiveness for treating dysfunction post stomatological treatments. Additionally there is no published study that specifically focuses on treating TMD with early physiotherapy interventions alone in endotracheal extubated patients. This study has addressed this gap of knowledge and has contributed to the evidence that early physiotherapy interventions may also be an additional asset for improving dysfunction in endotracheal extubated patients.

This study has some limitations. In particular some limitations are due to small sample size. Moreover, future studies should evaluate a longer follow up time and also

compare the study value in different stomatological treatments (molar tooth extractions, orthodontic interventions, dental implants). Furthermore, we also suggest the addition of supplementary interventional methods to get a more comprehensive knowledge and improve efficacy level of the study.

Conclusion: We found that EPI showed significant improvement in TMJ mobility and orofacial pain relief.

# An Observational Study on the Sexual Assault Victims in the Year 2018 at Tartiary Health Care Center of Rajasthan

**Mahendra Singh[1], R.K Punia[2], Deepali Pathak[3], Shashank Sharma[1]**

*[1]Senior Demonstrator, [2]Senior Professor, [3]Associate Professor (Forensic Medicine) SMS Medical College, Jaipur*

## Abstract

**Introduction:-**Sexual assaults are inhuman crimes against individual as well as the whole society. This study was thus initiated to obtain statistical pattern of sexual assaults pertaining to analyze various aspects including socio-demography and victim assailant relation, other relevant factors.

**Materials and Method:-**

**Inclusion Criteria :**-all the victims/sexual offence survivors examined at SMS Medical College, Jaipur during 1st January 2018 to 31st December 2018

**Exclusion Criteria:-** all the alleged cases of sexual offence whom consent could not be obtained.

**Results:-** total 60 cases were studied. The mean age of the victims in present study was 20.98 years. 73.33% victims were from urban regions. 50% victims were educated. 70% victims in the present study were married. Most common place of commission of the crime was the victim's own home (46.67%) . 43.34% victims reported within one week time period from the incidence. 88.33% victims were assaulted by a single person. 76.67% victims were assaulted by familiar persons. In 51.67% cases, the victim had been assaulted multiple times. In 85% cases, there was peno-vaginal intercourse. 71.67% cases had no injury in the present study. 3.33% victims got pregnant after the sexual assault.

**Conclusion:-** Females of reproductive age group were the most common victims in the present study. Familiar persons committed the crime in most cases and victim's home was the most common site of occurrence. There was delayed reporting of the crime in most cases which was the main reason for loss of vital trace evidences.

**Suggestions:-** Strict adherence to protocols for medical examination of victims of sexual assaults should be mandatory. Sex education should be provided to school students of teenage to increase awareness regarding medical and legal issues related to such events to increase the reporting of this crime.

***Key Words:-*** *sexual offences, Hymen, victim, accused, POCSO.*

## Introduction

Sexual assaults are inhuman crimes directed against individual as well as the whole society1. Sexual offence may be associated with physical violence also2. No age or gender stands bar to this crime3. Rape is usually under-reported crime experienced by women in all sections of the society and obtaining an accurate measurement of sexual assault is a challenge4. Sexual assault, a form of sexual violence, often used synonymously with rape, could include anything from touching another person's body in a sexual way without the person's consent to forced sexual intercourse - oral and anal sexual acts, child molestation, fondling and attempted rape. The Prevention of children against sexual offences act (POCSO ACT, 2012)5,6 has been added as well as

Email Id – rkpunia86@gmail.com

section 375 IPC and 376 IPC amendments have been done to combat any form of sexual intentions directed against children and females irrespective of gender. Multidisciplinary approach is required for investigation of these cases7

This study was thus initiated to observe the pattern of sexual assaults pertaining to analyze all aspects including socio-demography and victim assailant relation, other relevant factors and further recommendations.

## Materials and Method

1. Total 68 victims of sexual assault reported at Department of Forensic Medicine, SMS Medical College and attached Hospitals, Jaipur included as Hospital Based observational study universe

2. 60 Victims of sexual assault/ relatives who consented were included for study. Out of them there were 53 survivors and 07 non survivor victims who suffered fatal injuries in the incident.

3. Only two male victims of sexual offence were reported at SMS hospital during the study period (03.33%), The number of female victims among study group population have been reported to be 96.66%

4. All the cases were interviewed on socio demographic profile and relevant factors according to the proposed Proforma. The medico-legal examination for bodily injuries and genital examination for rape was conducted along with the doctors preparing the medico-legal reports.

5. Continuous variables were summarized as mean and standard deviation whereas nominal/categorical variables as proportion. Chi-square test was used for analysis of nominal categorical variables. Statistical analysis was conducted using Medcalc 16.4 versions software

## Observations

1. Out of 60 total case 44 victims(73.33%) were from urban region and rest 26.67% victims from rural status. the majority of victims were unmarried being 70% and married being 30%. majority of victims (50%) were adequately educated, secondary or higher as per their age & Only 25% victims (15 out of 60) were educated below secondary education and 25% of them totally illiterate. Majority of victims in the present study were students (35%) followed by housewives (23.34%). hymen was recently torn in 15% cases and old insignificant tears in 65% cases. The hymen was intact in 13.33% cases. The total number of cases with ruptured hymen was 80% .Two cases of sexual assault got pregnant after the assault (03.33%) .

2. In 85% cases in the present study natural sexual intercourse offence was committed whereas there were 08.33% cases of unnatural sex booked under Section 377 of the Indian Penal Code, 1860 (peno-oral sex in 03.33% cases and peno-anal sex in 5% cases). In rest 6.67% cases there had occurred touching, fingering etc. to the external genitalia.

**Table : 1: Distribution of Victims according to Age and Gender**

| Age Group (Years) | Male | Female | Total (%) |
|---|---|---|---|
| 0-5 | 0 | 05 | 05 (08.33%) |
| 6-<18 | 02 | 20 | 22 (36.67%) |
| 18-49 | 0 | 31 | 31(51.67%) |
| > 50 | 0 | 02 | 02 (03.33%) |
| Total (%) | 02 (03.33%) | 58 (96.67%) | 60 (100%) |

**Table 2: Alleged place of incidence of sexual assault**

| **Alleged place of incidence** | **Total (%)** |
|---|---|
| Home | 28 (46.67%) |
| Neighborhood | 12 (20%) |
| Hotel | 05 (08.33%) |
| Home of assailant | 05 (08.33%) |
| Unknown | 03 (05%) |
| Office/ factory | 02 (03.33%) |
| Fields | 02 (03.33%) |
| Variable Multiple | 02 (03.33%) |
| School | 01 (01.68%) |
| Total | 60 (100%) |

**Table 3: TIME Gap between incidence of sexual assault and Medico-legal examination**

| **Time Period** | **Total (%)** |
|---|---|
| Same day | 03 (05.00%) |
| 2nd day | 09 (15.00%) |
| 3rd day | 05 (08.33%) |
| 4th day | 02 (03.33%) |
| 5th-7th day | 07 (11.67%) |
| 1-4 week | 05 (08.33%) |
| 1-6 month | 14 (23.34%) |
| >6 month | 15 (25.00%) |
| Total | 60 (100%) |

**Table 4: Distribution of cases of sexual assault according to number of Assailants**

| **Number of Assailants** | **Total (%)** |
|---|---|
| One | 53 (88.33%) |
| Two | 03 (05%) |
| Three | 04 (06.67%) |
| Total | 60 (100%) |

**Table 5: Relation between victims and the Assailant**

| Relation to Assailants | Total (%) |
|---|---|
| Neighbor | 16 (26.67%) |
| Stranger | 14 (23.34%) |
| Close Friend | 08 (13.33%) |
| Co-worker or Senior at Job | 08 (13.33%) |
| In Law relatives | 05 (08.33%) |
| Relative or Friend of Relative | 04 (06.67%) |
| Husband | 03 (05%) |
| Father or Paternal Uncle | 02 (03.33%) |
| Total | 60 (100%) |

**Table 6: Distribution of cases of sexual assault according to the presence or absence of Genital and/ or Bodily injuries**

| Sn | Genital Injuries | | Bodily Injuries | | Total |
|---|---|---|---|---|---|
| | Present | Absent | Present | Absent | |
| 1 | | YES | | YES | 46 (76.67%) |
| 2 | | YES | YES | | 8 (8.33%) |
| 3 | YES | | | YES | 3 (5%) |
| 4 | YES | | YES | | 9 (15%) |

## Discussion

1. Female out-proportionate the male in number as victim of sexual offences. The mean age of the victims in present study was 20.98 years. Majority of the victims in the present study were between 18 to 49 years of age (51.67%) followed by 6 to 18 years of age (31.67%). There were 08.33% victims who were less than five years of age.

2. 46.67% victims were sexually assaulted in their own homes in the present study followed by next 20% sexual assaults in neighborhood. Other common sites of occurrence of these crimes were hotels (08.33%) followed by fields and offices (03.33% each); and, in 5% cases the place of assault remained undetermined owing to drugging of the victim or death of victim.

3. In the present study, only 5% victims had reported the crime on the same day. Another 15% had reported on second day, 08.33% on third day and rest 15% between fourth to seventh days.

4. In 88.33% cases the victims had been assaulted by a single offender. In five percent cases there were two assailants and rest 6.67% cases were gang rape cases. Seven victims were killed after the episode of sexual assault (11.67%). 76.67% victims knew their assailants in the present study and 23.33% victims were assaulted by strangers. Amongst the known offenders, neighbors were the most common assailants (34.78%) followed by close friends and coworkers (13.33% each). Relatives or their acquaintances comprised the remaining 30.44% cases

5. In 41.66% cases the crime had occurred only once and was reported. 51.67% victims suffered multiple times before reporting the crime.

6. In the present study, there was no injury at all in 71.67% cases. There were isolated bodily (extra-genital) injuries in 08.33% cases and isolated genital injuries in 5% cases. 15% victims had both genital as well as extra genital injuries.

## Conclusion

Sexual violence against women and children is a major public health issue. Females of reproductive age group were the most common victims in the present study. Most commonly affected ages were 17 and 22 years.

Familiar persons committed the crime in most cases and victim's home was the most common site of occurrence.

In majority of cases, there was no evidence of forceful sexual intercourse but still opinion of penetrative sexual assault was concluded in 45% cases.

There was delayed reporting of the crime in most cases which was the main reason for loss of vital trace evidences. This is also indicative of underreporting of this crime owing to social stigma.

Strict adherence to protocols for medical examination of victims of sexual assaults should be mandatory along with the development of a referral system to with fully equipped expert medico-legal teams for examination. sex education should be provided to school students of teenage to increase awareness regarding medical and legal issues related to such events to increase the reporting of this crime.

Suggestions:-

- DES prophylactic therapy as post coital drug should be adviced1

# Mob Lynching: A New Form of Hate Crime

**Manoj Kumar Pathak[1], Srishti Rai[2]**

*[1]Professor and Head, [2]Research Scholar, Forensic Medicine, Department of Forensic Medicine, Institute of Medical Sciences, Banaras Hindu University, Varanasi, India*

## Abstract

Lynching is a form of extrajudicial execution by hanging carried out by mob, which is functioning independently of local police and law enforcement authorities. Indian also faced Indian WhatsApp lynching, which are a spate of Mob-related violence and killing following the spread of rumours, primarily relating to child-abduction and organ harvesting, via the WhatsApp message service. They fall under the category of organised hate crimes. According to the source from internet, it has been observed a rise in mob lynching cases related to cow vigilantism by over 10%. It is important to note that India does not have one comprehensive parliamentary law on mob lynching. Strong provisions of law and speedy convictions in mob lynching cases will act as deterrence for the society.

***Keywords:*** *Lynch, WhatsApp lynching, cow vigilantism, child lifters*

## Introduction

The origin of the word "lynch" are obscure, but it likely originated during the American Revolution. The verb comes from the phrase "Lynch Law" a term for a punishment without trial. Two Americans during this era are generally credited for coining the phrase: Charles Lynch and William Lynch. [1]

Lynching is a form of extrajudicial execution by hanging carried out by mob, which is functioning independently of local police and law enforcement authorities.[2] However, now a days it has become a wider term and may be defined as an act or a series of act by a group of people which forms an unlawful assembly, takes law in their own hands and commit crime against an individual or a group of individual to impose their own extra judicial punishments. In India lynching reflects, internal tensions between ethnic communities, communities sometimes lynch accused or suspicious convicts. There have been numerous lynching in relation to cow vigilante violence in India since 2014 mainly involving Hindu mobs lynching Indian Muslims and Dalits.[1]

**Corresponding Author:**
**Dr. Manoj Kumar Pathak,** Professor and Head, Forensic Medicine Department of Forensic Medicine, Institute of Medical Sciences, Banaras Hindu University, Varanasi-221005, India: Mobile No.9450179177: Email- drmanojpathak@gmail.com

Indian also faced Indian WhatsApp lynching, which are a spate of Mob-related violence and killing following the spread of rumours, primarily relating to child-abduction and organ harvesting, via the WhatsApp message service.

Mob violence, vigilant justice and outbreaks of mass panics have a long history in India, but they have tended to be localized events. What differentiates the Indian WhatsApp lynching of 2017-2018 is that social media has enabled acts of violence to be filmed and shared across the country in such a way to build upon and perpetuate an atmosphere of fear and misinformation that instigate further violence in unconnected locations. For example, video of a lynching in Karnataka has been linked to a spate of violent lynching in Maharashtra.[3]

What is lynching?

Lynching is a type of non-justifiable homicidal hanging. It is difficult for a single assailant to carry it out. Lynching is an extrajudicial execution carried out by a mob by hanging without a fair trial.[4]

They fall under the category of organised hate crimes. Now-a-days it has got a wider meaning and also

includes acts of violence by a mob against a person or a group of people whom they suspect of having done an act which the group of people do not approve it. In this process they take law in their own hands and do not wait for a fair trial to be conducted.

Causes of Mob Lynching in INDIA

- Rise of cow vigilante
- Silence of political class
- Rumours of child lifters [5]
- For personal enmity
- In cases of sexual violence

What the statistics say:

**TABLE: 1: Cow related violence in India [source: internet]**

| Year | Incidents | Victims | Death | Major assaults | Minor injuries | Gender | |
|---|---|---|---|---|---|---|---|
| | | | | | | M | F |
| 2012 | 1 | 2 | 0 | 0 | 2 | 100% | |
| 2013 | 2 | 1 | 0 | 0 | 1 | N/A | N/A |
| 2014 | 3 | 11 | 0 | 11 | 0 | 100% | |
| 2015 | 13 | 49 | 11 | 34 | 4 | 95% | 5% |
| 2016 | 30 | 67 | 9 | 40 | 18 | 75% | 14% |
| 2017 | 43 | 108 | 13 | 64 | 31 | 85% | 9% |
| 2018 | 31 | 57 | 13 | 17 | 27 | 93% | 3% |
| 2019 | 10 | 45 | 4 | 14 | 27 | 88% | 13% |

**Cases:**

A software professional from Hyderabad was lynched while three of his friends including a Qatar national were thrashed by a mob which suspected them to be child-kidnappers, at Kamalnagar in Bidar district of Karnataka.

The victim was a 32 year male, who is married and has a two-year-old son. He was an employee of Google in Gachibowli and was a resident of Errakunta on the outskirts. According to his family members, he and his friends including the Qatar national had gone to Murki village in Bidar to attend a function at a friend's place. The group was travelling in a car and stopped near a government school for a break in the Kamalnagar police station area.

"one of them had brought chocolates from Qatar and offered them to some children who were coming out of the school. Villagers who saw this tried to catch them but the group noticed them and tried to flee. They were stopped by a mob at another village and assaulted," victim's younger brother said.[6]

Muslim man was attacked by a mob in Kharsawan district of Jharkhand on the suspicion of theft on June 18. He was beaten up mercilessly for over 18 hours before being handed over to the police. He succumbed to his injuries at a local hospital on June 22. The victim has been identified as 24-year-old male. Several videos of the Jharkhand mob lynching have gone viral since the incident. In one of the videos, a man is seen hitting the victim with a wooden stick as the latter begs him to let

him go. Another video showed the victim being forced to chant "Jai Shri Ram" and "Jai Hanuman".

On the night of June 18, he left his village for Jamshedpur with two men. Aurungzeb Ansari, a Jharkhand-based activist, has claimed that the victim was unaware where the two men were taking him. Ansari told HuffPost India that the victim was manipulated to go with them. While the two men fled the crime scene, the mob caught the victim and started beating him up. "Ghar mein ghusega [You will enter the house?]," one of the men is heard asking the victim. The victim is, however, heard denying the charges and said that the two other men did and he was asked to wait near the motorcycle. "I did not know anything," he said. Towards the end of one of the videos, one of the men asks him to chant "Jai Shri Ram" and "Jai Hanuman".[7]

2016 Jharkhand mob lynching refers to the case of lynching of two Muslim cattle traders by allegedly Cattle-Protection Vigilantes in Balumath forests in Latehar district in Jharkhand on 18 March 2016. The attackers killed 32 years old man and 12 years old boy who were found hanging from a tree. According to Jharkhand police, preliminary investigation revealed that the two were on their way to a cattle market in Chatra district. They had at least eight oxen with them, which they intended to sell. They were reportedly caught by a group of people in the early hours, beaten to death and hanged. According to villagers, there were communal clashes over beef eating in the area three months ago. Police stated the murder was aimed at looting money and cattle. Police arrested 5 people and are looking for three others, also said to be involved in the murders. One of the accused has links to a local Gau Raksha Samiti (an outfit for protection of cows). [8]

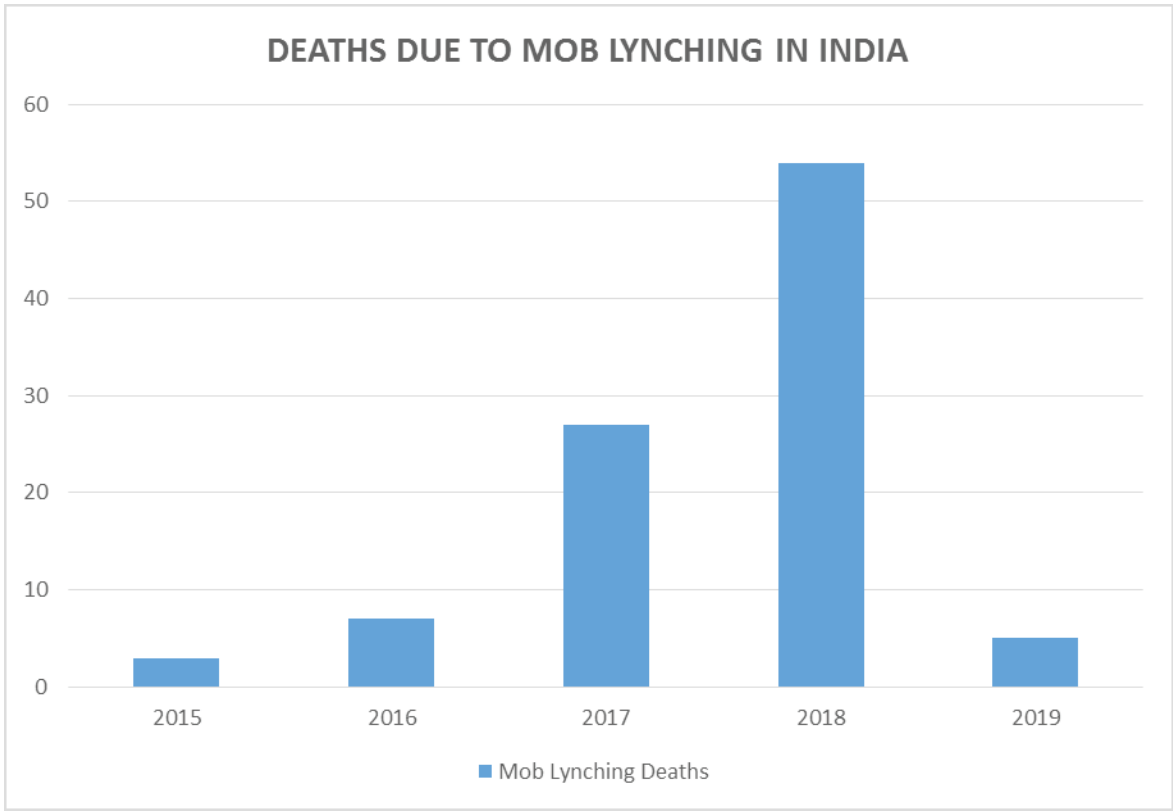

**FIGURE: 1; Source: Google Images**

Laws on mob lynching:

Laws that already exist and may aid in the lynching cases

CrPC 129: Any Executive Magistrate or office in charge of a police station or, in the absence of such officer

in charge, any police officer, not below the rank of a sub-inspector, may command any unlawful assembly, or any assembly of five or more persons likely to cause a disturbance of the public peace, to disperse; and it shall thereupon be the duty of the members of such assembly to disperse accordingly.

If, upon being so commanded, any such assembly does not disperse, or if, without being so commanded, it conducts itself in such a manner as to show a determination, not to disperse, any Executive Magistrate or police officer referred to in Sub-Section (1), may proceed to disperse such assembly by force, , for the purpose of dispersing such assembly, and, if necessary, arresting and confining the persons who form part of it, in order to disperse such assembly or that they may be punished according to law[9].

IPC 302: Punishment for murder.—whoever commits murder shall be punished with death, or 1[imprisonment for life], and shall also be liable to fine. [10]

IPC- 304: Punishment for culpable homicide not amounting to murder: imprisonment for life, or up to 10 years and also fine. " provided that if death is caused to a girl or a women, the accused committing such homicide shall be punished with imprisonment for whole life and shall also be liable for fine which may extend to two lakh rupees.[11]

Guidelines laid down by Supreme Court

A three-judge bench of Chief Justice Dipak Misra and Justices A.M. Khanwilkar and D.Y. Chandrachud also urged Parliament to frame a special legislation to tackle the problems posed by vigilante squads and said that until then the guidelines would stand the force of law.

**The guidelines**

• The states shall designate a senior police officer not below the rank of police superintendent as nodal officer in each district. These officers will set up a task force to be assisted by one DSP-rank officer for taking measures to prevent mob violence and lynching. The task force will gather intelligence reports of people likely to commit such crimes or who are involved in spreading hate speeches, provocative statements and fake news

• The state governments shall immediately identify districts, sub-divisions and villages where instances of lynching and mob violence have been reported in the recent past. The process of identification should be done within a period of three weeks from the date of the judgment

• The nodal officer shall hold regular meetings (at least once a month) with the local intelligence units in the districts and station house officers to identify tendencies of vigilantism and mob violence.

• The director-general of police or the home department secretary shall hold regular review meetings (at least once a quarter) with all the nodal officers and state police intelligence heads

• All police officers will have to ensure the dispersal of mobs that have a tendency to cause violence or lynch in the garb of vigilantism or otherwise

• The DGP shall issue a circular to the SPs on police patrolling in sensitive areas

• The central and state governments should broadcast on radio, television and other media platforms, including the official websites of the home department and the state police, that lynching and mob violence will invite serious consequence

• The police shall register FIRs under Section 153A of the IPC (promoting enmity among people) and/or other relevant provisions against the perpetrators

**Remedial measures**

• Despite the preventive measures taken by the state police, if it comes to the notice of the local police that an incident of lynching or mob violence has taken place, the jurisdictional police station shall immediately lodge an FIR

• It shall be the duty of the station house officer to immediately intimate the nodal officer in the district who shall, in turn, ensure that there is no further harassment of the family members of the victim(s)

• The investigation in such offences shall be personally monitored by the nodal officer, who shall be duty-bound to ensure that the investigation is carried out effectively and the charge sheet filed within the statutory period

• The cases of lynching and mob violence shall be specifically tried by designated courts in each district. Such courts shall try cases on a day-to-day basis. The

trial should preferably be concluded within six months.

Deterrent punishment

• The trial court must ordinarily award the maximum sentence under the provisions of the IPC

• The courts may, on application by a witness or by the public prosecutor, take such measures as it deems fit, for protection and for concealing the identity and address of the witness

It is important to note that India does not have one comprehensive parliamentary law on mob lynching. In 2017 K.T.S Tulsi introduced a draft bill in Rajya Sabha. But the bill has never been debated upon and has not been passed till date.

Some of the bills that have been passed regarding mob lynching are:

U.P combating of mob lynching bill.

[not passed yet]

As per the available data from 2012 to 2019, 50 incidents of mob violence have taken place in Uttar Pradesh. Of around 50 victims, 11 have died. Twenty-five of these were cases of major assault, including those by cow vigilantes (Gau-Rakshak). The Uttar Pradesh Law Commission has submitted a draft Bill recommending up to life imprisonment for mob lynching crimes.

The chairman of the Commission, Justice (retd.) AN Mittal submitted the report on mob lynching, along with the draft Bill to Chief Minister Yogi Adityanath.

The Commission said the existing laws were not sufficient to combat lynching and asserted that there should be a separate law to tackle them. It suggested a punishment ranging from seven years in jail to life imprisonment for the offence.[13]

The Rajasthan Protection from Lynching bill.

Rajasthan Legislative Assembly on August 6, 2019, passed a bill against mob lynching and honour killing in the state.

• The anti-mob-lynching bill proposes imprisonment up to seven years and a fine up to Rs. 1 lakh in case of the victim suffering simple injuries.

• The convicts will get jail terms up to 10 years and a fine of Rs. 25,000 to Rs. 3 lakh in case of an assault by mob or victim suffering serious injuries.

• In case of victim's death, the Rajasthan Protection from Lynching Bill, 2019 provides for life imprisonment and a fine from Rs. 1 to 5 lakh to those convicted in cases of mob lynching.[14]]

The West Bengal (Prevention of Lynching) Bill

The legislation, which has provision for the death sentence, says "nodal officers" will be appointed to "monitor and coordinate prevention of lynching". It proposes a jail term from three years to life for those involved in assaulting and injuring a person. The Bill, while defining terms such as "lynching" and "mob", says the West Bengal Lynching Compensation Scheme may be framed under this Act.[15]

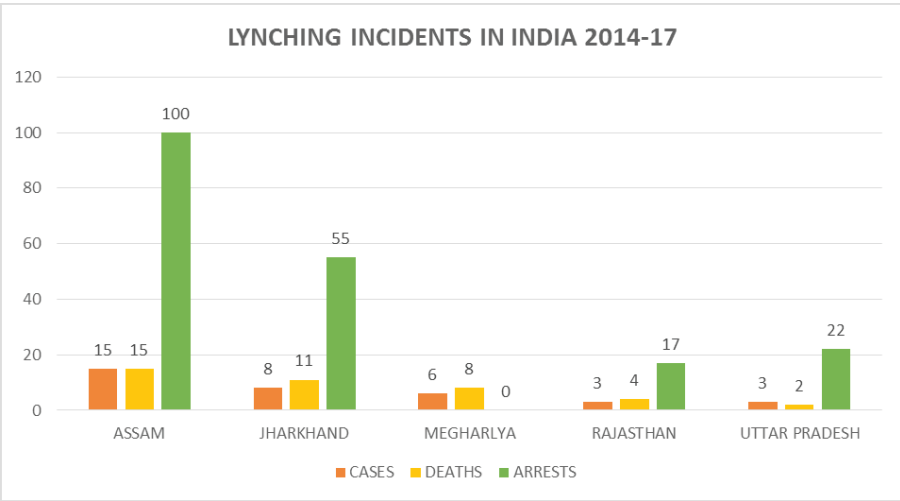

**FIGURE: 2; Source: Google Images**

## Conclusion

Mob lynching is a type of organised hate crime conducted by a crazy mob. People should have empathy towards such crime and not the apathy attitude. Government should address this issue very seriously at least in states where the incident rate is very high on priority basis. It is necessary to have separate law in the IPCs to address lynching and honour killing crimes as there are no specific laws to address these crimes. If necessary separate and new sections should be incorporated in the IPC as there is a new and separate section to deal with acid attack cases i.e., section 326A and 326B. It is unfortunate that this crime is ignored from government's end till date. Strong provisions of law and speedy convictions in mob lynching cases will act as deterrence for the society.

# Radiological Study of Appearance and Fusion of Iliac Crest in hip bone in Bikaner Region in 14-22 Years Age Group

**Mathur Indubala[1], Sajjad Hussain[2], Bohra Bhavesh[3], Sharma Yogesh[4], Agrawal Anjali[5]**

*[1]Associate Professor& HOD, [2]Assistant Professor, Department of Forensic medicine and Toxicology, PCMS & RC, Bhopal (MP), [3]Associate Professor & HOD, Department of Forensic medicine and Toxicology, Jhalawar Medical College, Jhalawar (Rajasthan), [4]Professor & HOD, Department of Forensic Medicine and Toxicology, RNT Medical College and Hospital, Udaipur (Rajasthan), [5]PG final year, Department of Forensic Medicine and Toxicology, Bhopal (MP)*

## Abstract

Correct age determination has of great importance in legal prosecution. The principle means, which enable one to form a fairly accurate opinion about age of an individual are general physical development, dentition, secondary sex characters and ossification of bones. Among them Radiological examination of ossification process is most accurate than any other method up to 25 years of age.

This study involves radiological examination of Pelvis (AP view) of 169 individuals for the study of age related appearance and fusion of ossification center of Iliac Crest in the individuals of age group of 14-22 years of both male and female in S P Medical college, Bikaner, Rajasthan.

***Keywords:*** *Age Estimation, Iliac Crest, X- Rays.*

## Introduction

Estimation of reasonably accurate age, plays an important role in civil/criminal cases like personal identification, fixing of criminal responsibility, judicial punishment i.e. in cases of rape, kidnapping, criminal abortion, attempted or evident murder, theft, burglary, dacoity and in various schemes of Social Welfare department i.e. Employment, attainment of majority, marriage contract etc.

Various workers suggest that there is a variation in age estimation, not only in country to country but also in different states of India, so Survey Committee12 (1964) while reporting on medico legal practice in India has recommended to the government to encourage Zone wise study for the problem of determination of age.

## Material and Method

This study is carried out in the Department of Forensic-Medicine and Toxicology in association with radio- diagnosis department of S.P. Medical College and Hospital, Bikaner. The subjects are selected randomly from various schools, from neighborhood of various faculty members and staff as well as cases attending the OPD of the Forensic-Medicine Department of P.B.M. Hospital, Bikaner. The persons selected for study were grouped as per their stated age, viz.:- 14-15years, 15-16 years, 16-17 years, 17-18 years, 18-19years, 19-20 years, 20-21years and 21-22 years. Here age 14-15 years means person of 13 years or more but below 14 years. Age, as stated by them is further confirmed by secondary school certificate, any document reflecting their exact age or entry in their school record.

Selection Criteria for inclusion of person in present study:

C) They should be living in Bikaner region for more than 5 years.

D) They should be free from any physical disability or endocrinal anomaly.

E) Person should have accurate record of their date of birth.

F) Informed expressed verbal consent of the subjects was taken before proceeding to their physical, dental and radiological examination.

Radiological Criteria for epiphyseal fusion –

The union is taken as complete when the:

a) Diaphyseo-epiphyseal space is completely obliterated and become bony in architecture and density.

b) There is continuity of the periosteum between epiphysis and diaphysis with no notching at the periphery of epiphyseal line.

c) Presence or absence of epiphyseal scar (a white, transverse line) has been disregarded in this connection and considered as recent complete union.

For generalization, fusion in more than 75% cases is relied upon as complete fusion. Radiological data of appearance and fusion of ossification center of Iliac Crest were reduced to table, of various age groups. Data thus obtained finally, were analyzed and compared with published work of various Indian and foreign workers.

Observation

In Boys - The appearance of the ossification centre of iliac crest was observed earliest at the age of 14 year, 4 months and 4 days in our study. The appearance of the ossification centre of iliac crest was observed in 90% of cases in age group 15-16 years, in 100% of cases in age group 19-20 years and above. Average age of appearance of iliac crest is 15-16 years in our study. Complete fusion of iliac crest was observed earliest at the age of 16 year, 2 months and 10 days in our study. Complete fusion of iliac crest was observed in 90.91% of cases in age group of 20-21 years. Average age of fusion of iliac crest was 20-21 years in boys in our study. Age of oldest subject not showing complete fusion of iliac crest was 21 years, 8 months and 19 days in our study.

**Appearance and Fusion of the Centre of Iliac Crest in Boys**

| S.No. | Age (Yrs) | No. of cases | Appearance | | Partial Fusion | | Fusion | |
|---|---|---|---|---|---|---|---|---|
| | | | No | % | No | % | No | % |
| 1 | 12-13 | 12 | - | - | - | - | - | - |
| 2 | 13-14 | 9 | - | - | - | - | - | - |
| 3 | 14-15 | 7 | 1 | 14.28 | - | - | - | - |
| 4 | 15-16 | 10 | 9 | 90 | - | - | - | - |
| 5 | 16-17 | 17 | 17 | 100 | 3 | 17.65 | 1 | 5.88 |
| 6 | 17-18 | 25 | 20 | 80 | 2 | 8 | 4 | 16 |
| 7 | 18-19 | 19 | 18 | 94.73 | 7 | 36.84 | 6 | 31.57 |
| 8 | 19-20 | 10 | 10 | 100 | 2 | 20 | 6 | 60 |
| 9 | 20-21 | 11 | 11 | 100 | 1 | 9.09 | 10 | 90.19 |
| 10 | 21-22 | 12 | 12 | 100 | 1 | 8.33 | 11 | 91.67 |

In Girls - The appearance of the ossification centre of iliac crest was observed earliest at the age of 15 year, 1 month and 1 day. The appearance of the ossification centre of iliac crest was observed in 100% of cases in age group 15-16 years and above. Average age of appearance of iliac crest was 15-16 years in girls in our study. Complete fusion of iliac crest was observed earliest at the age of 15 year, 1 month and 1 day in present study. Complete fusion of iliac crest was observed in 100% of cases in 19-20 years of age group and above in girls.

Average age of fusion of iliac crest in girls was 19-20 years in our study. Age of oldest subject not showing complete fusion of iliac crest was 18 years, 5 months and 10 days in present study.

**Appearance and Fusion of the Centre of Iliac Crest in Girls**

| S.No. | Age (Yrs) | No. of cases | Appearance | | Partial Fusion | | Fusion | |
|---|---|---|---|---|---|---|---|---|
| | | | No | % | No | % | No | % |
| 1 | 12-13 | 8 | - | - | - | - | - | - |
| 2 | 13-14 | 2 | - | - | - | - | - | - |
| 3 | 14-15 | 2 | - | - | - | - | - | - |
| 4 | 15-16 | 4 | 4 | 100 | - | - | 3 | 75 |
| 5 | 16-17 | 6 | 6 | 100 | 2 | 33.33 | 3 | 50 |
| 6 | 17-18 | 19 | 19 | 100 | 11 | 57.89 | 4 | 21.05 |
| 7 | 18-19 | 10 | 10 | 100 | 7 | 70 | 1 | 10 |
| 8 | 19-20 | 5 | 5 | 100 | - | - | 5 | 100 |
| 9 | 20-21 | 4 | 4 | 100 | - | - | 4 | 100 |
| 10 | 21-22 | 8 | 8 | 100 | - | - | 8 | 100 |

## Discussion

In Female: In our study we observed the average age of appearance of ossification centre of iliac crest in female at 15-16 years of age, which is consistent with the observation of the study of Nagi Abdul Wahab Abdulla1 et al (Yemen), Alok Kumar4 et al (Kanpur) and Yatiraj Singi[15].

In our study we observed the average age of fusion of the ossification centre of iliac crest in females at 19-20 years, which is consistent with the observation of the study of Nagi Abdul Wahab Abdulla1 et al (Yemen) also with observation of Chandresh Tailor[13] (Surat) and as stated by RK Sharma10, Nagesh Kumar Rao8, Krishan Vij14 and VV Pillay[7] in their textbooks .

In Male: In our study we observed the average age of appearance of ossification centre of iliac crest in male at 15-16 years of age. The finding in our study is consistent with the observation of the study of Alok Kumar4 et al (Kanpur) and Apurba Nandy6 they observed that it is 16 years of age and also consistent with Grant's Anatomy2, a standard textbook of anatomy, who stated that it is 16 years of age.

In our study we found the average age of fusion of the ossification centre of iliac crest in males is 20-21 years, which is consistent with the observation of the study of Pardeep Singh, RK Gorea11 who conducted study at Patiala, Punjab and also as stated by N.Reddy9 in his textbook, that it is 20-21 years of age also is consistent with the observation of Memchoubi Ph.5 who observed that it is 20 years of age and it is also consistent with the age as stated by PC Dikshit3 in his textbooks.

## Conclusion

Average age of appearance of the ossification centre of iliac crest observed at 15-16 years in boys in our study in Bikaner region.

Average age of fusion of iliac crest observed at 20-21 years in boys in our study in Bikaner region.

Average age of appearance of the ossification centre of iliac crest observed at 15-16 years in girls in our study in Bikaner region.

Average age of fusion of iliac crest in girls observed at 19-20 years in our study in Bikaner region.

Findings of our study are again giving the strength to the workers and Survey Committee12 report, as they suggest to the government to encourage Zone wise study for the problem of determination of age. This study is an attempt which may be a valuable aid to a forensic practitioner to give the approximate age certificate in medicolegal cases.

# Abortion Laws in India: Issues and Challenges in 21st Century

**Nitesh Bhatt[1], Pooja Suman[1]**

*[1]Assistant Professor, Department of Law, Banasthali Vidyapith, P.O. Banasthali Vidyapith*

## Abstract

India is a nation which requires societal awakening in ample of affairs. The progress of a nation isn't solitary indomitable by fiscal eminence nevertheless by the in general wellbeing of its populace and consequently, being a "developing country" necessitate communal development. There is prevalent ignominy enclosed to abortion in the nation. The abortion law in India restrain the "reproductive autonomy" of women and the provisions of the Act are being violative of the provisions of Constitution of India. Women subsequent to passing of MTP Act are also performing unsafe abortions which have adverse effect on their wellbeing. For that reason the legal status of abortion law need to be altered according to the current scenario. The research paper intended at scrutinizing the Act and suggestion that the legislature ought to uphold while amending the present Act.

***Keywords:*** *Abortion, Right to life, Health, Fundamental right, MTP Act, POSCO Act,*

## Introduction

Abortion has at all times been and prolongs to be a tremendously litigious subject. Whether one must be allowed by law to have an abortion, if yes, beneath what conditions? Secondly, how does the law construe the human rights of an unborn child? Based on this the humankind is alienated into two fractions i.e. pro-life and pro-choice. India may be termed as pro-life country as the termination of pregnancy was pictured by the legislature in only certain cases as prescribed in the MTP Act, 1971. By providing legal status to the unborn child a conflict between the "reproductive autonomy" of the pregnant and "right of life" of unborn is being created.

The Constitution is preeminent law to oversee the entire country. The Indian Constitution doesn't explicitly perceive the fundamental right of "reproductive autonomy". Be that as it may, Article 21 of the Constitution of India ensures a fundamental right to life and individual freedom. The articulation life in this Article implies an existence with human nobility and not simple endurance or creature presence. It is of broad magnitude to wrap "reproductive autonomy" in it. The Hon'ble Apex Court is performing magnanimous work of construing the Constitution.

### Evolution of Abortion

Till the late 1800s, females in Western region of Europe and the U.S. endow with abortion of each other without any legal restraint. In the late 1900s abortion was restricted in most of the country since at that period it was very treacherous procedure finished with rudimentary means, hardly any antiseptics and high mortality rate.

Since abortion was dangerous and were killing a lot of women, shielding women from the danger of abortion was the prerequisite and to restricting them to traditional childbearing role. In past abortion was termed as sin or was well-thought-out a form of evil doing of morality4. In the late 1800s, when the birth rate of whites were breaking down, the U.S. government asked white country conceived lady to have children and cautioned to keep the birth rate and demise rate equivalent. Early ventures private undertaking enterprise relied upon women for voluntary domestic workers, little paid tedious workers, and reproducer5. With the lacking of lawful abortion, woman commences it complicated to oppose the restriction of their role. During the 1890s, specialists rough that there were 20, 00,000 abortion each year in the U.S., Ladies who are resolute not to bear undesirable pregnancy have always begin a few methods to endeavour to terminate pregnancy. Frequently, they have turned to dodgy, some of the time lethal techniques, such as embeddings sewing needles, coat holders and like material into the vagina and uterus to prematurely end the pregnancy. During the 1960s, energized by the social

equality and hostile to anti-violence movement, ladies started to battle more vigorously for their privileges. The quickly developing women's movement took the banned subject of abortion to the network. Ladies walked and mobilized and convince for abortion to stipulate.

Recently, March for life an organization that started a protest in Washington D.C. which is hurriedly scattering in numerous countries of different continents. This movement is begun to go up against induced abortion on both ethical and radical ground and support its lawful prevention. The movement is acknowledged as the right to life and is also called the right to life movement. This anti-abortion movement turn out to be politically vigorous and bestow to setback of the case Roe v. Wade. Again on 22, September, 2019 thousands of individuals march for banning abortions in Slovakia the argued that "A human being is human being in spite of its size" and "Who kills an unborn child kills the future of the country".

**State failure to provide health care**

The Hon'ble Apex Court has upheld that Art. 21 of the Constitution oblige positive duty on the State, the scope of Art. 21 further enlarged; in this the court held that the government possesses responsibility to provide sufficient medical support to each person and work for welfare of the common public. Additionally Art. 21 impose compulsion on the state, the state is required to defend and preserve the right of all persons26. As it is held that right to safe abortions flow from right to health envisage in Art. 21 of the Constitution, the state hold a duty to provide adequate medical support to pregnant lady who wants to end the pregnancy.

The MTP Act was passed by the legislation with the purpose to reduce the occurrence of illegitimate abortion and ensuing maternal mortality and morbidity. But then also as claimed by the report of The lancet global health in 2017 Dec named as "The incidence of abortion and unintended pregnancy" in India, in the year 2015 it submitted that out of 15.6 million abortions in the year 2015 73% were performed through medical method abortion outside health facilities, 22% happened in health facilities and out of 73% abortion performed outside medical facilities 5% were done by means of unsafe method.

The Indian spend on Nov 5, 2017 had submitted that 56% of abortion in India are unsafe and 8.5% of all maternal deaths in India are caused due to unsafe abortion and 10 women die each day because of the ground of unsafe abortion performed by themselves. Also, half of the abortion performed is unsafe and incomplete and is increased from 30% to 50% in the preceding five years. It also accounts for a shortfall of 76.3% in obstetricians and gynaecologists weigh against their necessity at Community Health Centres. Private medical facilities are costly, and economically out of the reach of a large number of women. A both public and private health facility refuses women terminating pregnancy outside the approved 20-week gestational period.

According to the report submitted the lancet global health it roughly outlined that near about half of the pregnancy is unintended, usually most of them end up in abortion. Also disallowing a woman who wanted to abort may have negative developmental and socioeconomic effects on the exiting child.

Also, the National family health survey-4 figured that approximately most of abortions as a lot of 52% were provided private health facilities 20% in private and 26% were done by women themselves.

The Handbook on Medical Methods of Abortion to develop admission to New technologies for Safe Abortions by Ministry of Health and Family Welfare, Government of India dated January, 2016 records that a significant yet prevalent cause of maternal mortality in the country is unsafe abortion Accounting for approximately 8 % of all maternal deaths, it is the third-largest cause of maternal morbidity in the country and thus an area requiring focussed attention.

The WHO has repetitively solicited legal endorsement of abortions to guarantee the better corporal protection of women. The countries where abortion law is liberal, maximum abortion are performed in a safe situation as compared to developing nations with relatively strict abortion laws.

**Whether MTP Act clashes with POSCO and PC-PNDT Act?**

POSCO Act - Consent of legal guardian is required for termination of pregnancy of a minor under POSCO Act. All sexual activity beneath 18 years of age is matter to legal scrutiny. As a consequence, if any pregnant minor girl wants any sort of medical assistance then the doctor is required under law to report the matter to

concern authorities. This parameter under POSCO Act works contradictory with the MTP Act where the doctor is under obligation not to disclose the personal identity of abortion seeker. The outcome of this confliction is that the pregnant minor if fright from disclosure her identity have no other option other then hunt for unregistered, unregulated and at the end of the day unsafe abortions because safe facilities turn her away.

PC-PNDT Act - The PCPNDT Act disallows the sex-specific demonstration of foetus removal. This is a result of sonography and other development innovation being contorted to choose the sex of the unborn girl and end it ahead of time in instances of unborn female child. The contradiction that arises in the way of doctors conducting safe and sound abortions is the PC-PNDT. This Act aims a criminalizing sex determination at the time of ultrasound and tackles the scourge of female foeticide.

**Issues of abortion in the eyes of judiciary**

Abortion after the limit specified in the MTP Act i.e. 20 weeks is subject to judicial scrutiny and Hon'ble Apex Court and High Courts have discretionary power whether to allow or to dismiss the plea seeking abortion. As every individual is being different, the courts have pronounced distinctive verdict by scrutinizing different risk factors in every case. The Courts should do liberal interpretation as MTP is a welfare statute and imperative consideration should be given to the legislative intent behind making this Act.

Hon'ble Apex Court and High Court in several cases has directed the centre for amendment in MTP Act in the following cases-

In Anusha Ravindra vs U.O.I29, which is being sub judice in Apex Court, the Court issued notice to the centre for frame suitable medico-legal guidelines for urgent and safe medicinal facilities including abortion past 20 weeks in unusual cases.

At present in the case of Swati Agarwal and others vs U.O.I[30], which is sub judice in the Apex Court, The Apex Court has issued notice to the centre for decriminalization of abortion and affirmation of the right of absolute independence of women to make decision-related to reproductive right.

Again on 26, May, 2019 P.I.L was filed by Amit Sahni in Delhi High Court which is sub judice, asking the Court for extension of termination of pregnancy limit from present 20 weeks to 24 weeks. Scrutinizing that it required scientific reflection, Delhi High Court issued notice to the centre and National Commission for Women looking for their response to PIL seeking extension of time limit for abortion on a women's will to 24 or 26 weeks from current 12 week[31].

0n April 24, 2019 The Madras High Court issue notice to Centre and State governments looking for their reply in matter extension of period for abortion expressing that this issue needs urgent response as amendment is required[32].

The Courts are taking a scientific loom in the direction of technologically advanced prenatal diagnosis for the assessment of foetus health. As it has been resolute previously that the foetus becomes a "life" after 20 weeks and at the same time, it is only after 18 weeks that foetal abnormalities can be monitored and can be trapped in tests.

## Conclusion and Suggestions

Adolescent Pregnancy-If not terminated, pregnancy can be a cause of leaving school of adolescent girls which is a violation of their right to education under Art. 21A of the constitution of India. Based on their consequent lower education achievement, they may have less ability and opportunity meant for employment, frequently maintains succession of poverty, pregnancy diminish future retribution of girls.

The legislation is deficient in recognizing the rights of the rape victim's child. Even though the Hon'ble Apex Court has stated that every child is legitimate only parents can be Illegitimate but then also they don't have equal rights as weigh against to a legitimate child, in no personal law right of inheritance is being given them. The legislation if denies to terminate pregnancy after 20 weeks then should implement laws to protect their rights. As Allahabad High Court has acknowledged inheritance rights of a child born out of rape in the property of his biological father but held that it isn't feasible judicially to put down any rule for inheritance by a minor who is born as a consequence of rape. Such effort by Court would amount to legislation by judicial verdict41.

The discrimination between a married and unmarried woman in case of termination of unwanted pregnancy is also a violation of Art. 14 of the Constitution of India as there is no nexus of discrimination. A pregnant woman

should be stated as a pregnant woman regardless of her status as "married" or "unmarried".

As Art. 21 of the Constitution obliges positive duty on the State, the state should appoint more doctors in public health care centre as women especially in rural areas can't afford private doctors and due to which terminate pregnancy by using unsafe methods. In public health care centre, the facilities need to be urgent up-gradation to provide safe and timely abortion to women seeking it.

Basic sex education should be given to every woman to know her reproductive rights; the state should mandate schools to add a subject of sex education as a lack of knowledge in women is one of the causes of unsafe abortion.

There is a need to add medicines in national essential medicine list as medicine are very costly that a large number of women can't afford it.

The gestation limit should be increased from 20 to 24 or 26 weeks as due to advancement of science deformities in the foetus can be detected in late pregnancy.

People with disabilities are vulnerable as due to many barriers still exist in India and India has to cover a long distance to become disabled-friendly nation so, not allowing to terminate pregnancy in late stage of pregnancy if, detected any deformity is just putting a burden on parents. State although have enacted many laws in favour of disabled person then also fails to provide security to them.

The Bombay High Court rightly states that the state if, the rape victim wants, should at the time of pregnancy give the child to abortion or allow her to terminate the pregnancy42.

# Effect of Core Stability And Functional Mobility Exercises on Muscle Strength after Lumbar Spinal Cord Injury

**Neha Y. Kakade[1], Suraj B. Kanase[2]**

*[1]Intern BPT, Faculty of Physiotherapy, KIMSDU, Karad, Maharashtra, [2]Associate Professor, Department of Neurosciences Physiotherapy, Faculty of physiotherapy, KIMSDU, Karad, Maharashtra*

## Abstract

**Background:** Many studies suggest that when people are confined to wheelchair, central neuropathies such as spinal cord injury usually reduce strength of core muscles and corresponding functional abilities for standing and reaching. Studies that have aimed to compare different strategies to improve functional capacity or stability have produced controversial results. Furthermore such studies have focused solely on individual component. In contrast, the present study describes the effect of core stability as well as functional mobility exercises on muscle strength after lumbar spinal cord injury.

**Aim:** To analyze the effect of core stability and functional mobility exercises on muscle strength after lumbar spinal cord injury.

**Methodology:** 25 patients with lumbar spinal cord injury were recruited on a volunteer basis. Ethics approval was obtained from Institutional ethical committee, KIMSDU. The purpose and procedure of the study was explained to each participant before giving their consent to participate in the study. Neurological levels and impairment scales were determined according to the American Spinal Injury Association (ASIA) standards. Descriptive statistics such as percentages, mean, and standard deviation were used for data analysis.

**Result:** The p-value for each component is <0.0001 and is extremely significant. For each variable of the study (muscle groups) the post assessment values were more than pre assessment values. The intervention used in this study produced significant improvement in core strength and lower extremity strength of participants after lumbar spinal cord injury.

**Conclusion:** Core stability and functional mobility exercises improve muscle strength in lumbar spinal cord injury patients.

***Keywords:*** *Lumbar spinal cord injury, core stability, functional mobility, physiotherapy.*

## Introduction

The spine is an inherently unstable structure as the osteoligamentus lumbar spine buckles under small compressive loading.[1] Paralysis of the muscles below the level of the injury can lead to limited and altered mobility, self care, and ability to participate in valued social activities.[2] Disabilities related to spinal cord injury vary according to the degree of damage, and the damaged spinal segments or nerve fibers.[3] Mechanism of the injury that can cause damage to the vertebrae with a resultant damage to the cord is usually a hyper flexion with rotation movement. Extension with rotation is less likely to cause damage to the cord.[4] Injury to the lumbar spine usually results in paraplegia or paraparesis.[5,6] Spinal cord injuries are typically divided into 2 categories: complete injuries and incomplete injuries. The international standards for neurological classification of spinal cord injury (ISNCSCI) defines a complete injury as having no sensory or motor function in the lowest sacral segments (S4 and S5). An incomplete injury is classified as having no motor and/or sensory function below neurological level including sensory and/or motor function at S4 and S5.[7]

Immediately following an acute injury to the spinal cord there is a stage of spinal shock. After the stage of

spinal shock has passed the various neurological deficits starts manifesting which commonly consists of the following: motor and sensory deficits, spasticity usually increases during first six months after spinal injury and reaches a plateau by the end of first year.[8]

A critical role of spine musculature is to stiffen the spine in all potential modes of instability. Active control of spinal stability is achieved through the regulation of force in surrounding muscles. Trunk extensors, flexors, and lateral flexors provide spinal stability during every dynamic movement. So, there is an important need to have balanced muscular control.[9] Proper timing and coordinated efforts of these muscles are important for spinal stability.[10]

Core stability describes the ability to control the position and movement of the central portion of the body to allow optimum production, transfer and control of force and motion to the terminal segments in the integrated activities.[11] Functional capacity has been studied as one important aspect of activity of daily living. Different functional training methods have been assessed for their effectiveness in improving functional capacity; [12.13] however, no definitive conclusions have been reached with regard to the type of functional training that is most effective.[13] Some studies have found that strength training can increase functional capacity,[14,15] even with only modest gains16 or gains in a few measures.[17] Nevertheless, most studies that have been conducted focuses only on singular elements i.e. few studies that have been conducted focuses only on core stability while other studies focuses only on functional mobility for improving functional capacity in patients with spinal cord injury. Studying the effectiveness of combination of two elements i.e. core stability and functional mobility exercises in lumbar spinal cord injury patients could provide different interpretation about the utility of core stability and functional mobility exercises to improve strength and functional capacity.[18] Therefore, the purpose of this study is to evaluate the effectiveness of core stability and functional mobility exercises on muscle strength in lumbar spinal cord injury patients.

## Material and Methodology

This study aimed to evaluate the effect of core stability and functional mobility exercises on muscle strength after lumbar spinal cord injury. This was an experimental study. The study was conducted in Krishna institute of medical sciences 'Deemed to be' University, Karad. 25 patients with lumbar spinal cord injury were recruited on a volunteer basis. Sample size was calculated with the help of formula $N=4SD2/(x\times£)^{2}$. Ethics approval was obtained from Institutional ethical committee. The participants were recruited according to the inclusion and exclusion criteria. The criterion for inclusion in the study was 1. Patients with history of American spinal Injury impairment scale (AIS) grade C and D SCI. 2.Both male and female participants. The exclusion criterion from the study was neurological illness other than lumbar spinal cord lesion. A written consent was taken from each participant to voluntarily participate in the study. Each participant was explained about the purpose and procedures of the study. Once the informed consent was taken, detailed information was gathered, assessments were done with appropriate outcome measure and pre test was done. Depending on pre assessment evaluated strength, a six week core muscle strengthening exercise protocol was given and follow-up for progression was done after 2, 4 and 6 weeks. Later again post test was done and descriptive statistics such as percentages, mean, standard deviations and paired t test were used for data analysis and were recorded in order to derive the conclusion. All statistical analyses were performed with instat software.

## Statistical Analysis and Result

Descriptive statistics were performed for all variables (i.e., muscle strengths). Pre and post assessments of the selected participants were done. Arithmetic mean, standard deviations, paired t –test and p-value were calculated for each outcome measure.

**Table no.1 Strength of muscle post intervention:.**

| Sr. no. | Muscle groups | Mean | | SD | | Paired t-value | p-value | Interference |
|---|---|---|---|---|---|---|---|---|
| | | Pre | Post | Pre | Post | | | |
| 1. | Hip flexors | 2.280 | 4.440 | 0.8907 | 1.261 | 8.035 | <0.0001 | Extremely significant |
| 2. | Hip extensors | 2.480 | 3.920 | 1.112 | 1.288 | 4.793 | <0.0001 | |
| 3. | Hip abductors | 2.400 | 3.640 | 1.000 | 1.075 | 4.656 | <0.0001 | |
| 4. | Hip adductors | 2.480 | 3.920 | 0.8718 | 1.152 | 5.192 | <0.0001 | |
| 5. | Knee flexors | 3.200 | 4.560 | 0.8699 | 0.9129 | 5.283 | <0.0001 | |
| 6. | Knee extensors | 3.080 | 4.840 | 0.7024 | 0.9434 | 9.508 | <0.0001 | |
| 7. | Ankle dorsiflexors | 2.120 | 3.480 | 0.8327 | 0.9626 | 6.834 | <0.0001 | |
| 8. | Ankle plantar flexors | 2.680 | 3.800 | 0.4761 | 0.7071 | 7.716 | <0.0001 | |
| 9. | Great toe extensors | 2.160 | 3.520 | 0.8505 | 1.085 | 5.911 | <0.0001 | |
| 10. | Trunk flexors | 1.680 | 3.200 | 0.6272 | 0.7638 | 14.905 | <0.0001 | |
| 11. | Trunk extensors | 1.560 | 3.200 | 0.5066 | 0.7638 | 14.421 | <0.0001 | |
| 12. | Side flexors | 1.880 | 3.560 | 0.5831 | 0.6000 | 15.087 | <0.0001 | |
| 13. | Trunk rotators | 1.640 | 3.160 | 0.5686 | 0.6245 | 14.905 | <0.0001 | |

The post assessment values of each study variable (muscle groups) are more than the pre assessment values. The mean difference of pre assessment values is -1.508. The mean difference of post assessment values is -0.172

**Table no.02 : strength of lower extremity muscles and core muscles of body in male subjects.**

| Males | Mean | SD | Paired t-value | p-value | Interference |
|---|---|---|---|---|---|
| Pre | 2.098 | 0.2762 | 15.489 | <0.0001 | Extremely significant |
| Post | 3.331 | 0.4612 | | | |

The post assessment values of mean and SD of overall core and lower extremity strength of male participants are more than the pre assessment values. The mean difference is -1.234.

**Table no.03 : strength of lower extremity muscles and core muscles of body in female subjects.**

| Females | Mean | SD | Paired t-value | p-value | Interference |
|---|---|---|---|---|---|
| Pre | 1.852 | 0.2969 | 6.891 | <0.0001 | Extremely significant |
| Post | 3.409 | 0.6149 | | | |

The post assessment values of mean and SD of overall core and lower extremity strength of female participants are more than the pre assessment values. The mean difference is -1.558.

## Discussion

This study aimed to analyze the effect of core stability and functional mobility exercises on muscle strength after lumbar spinal cord injury. Core stability is the ability of lumbopelvic hip complex to prevent buckling and to return to equilibrium after perturbation.[19] Functional mobility is the manner in which people are able to move around in the environment in order to participate in the activities of daily living.20 Weakness is the most obvious impairment that inhibits people with SCI from performing motor tasks. [21]

In this study 25 patients were recruited according to the inclusion and exclusion criteria, in which 13 were male participants and 12 were female participants. Manual muscle test was performed on each subject for thirteen muscle groups (hip flexors, hip extensors, hip abductors, hip adductors, knee flexors, knee extensors, ankle dorsiflexors, ankle plantar flexors, great toe extensor, trunk flexors, trunk extensors, side flexors and trunk rotators) in standardized position.22 Muscle strength was graded on a scale from zero to five using six weeks of interval.23 We evaluated the pre test and post test assessment values for manual muscle testing in the selected participants.

Depending on the pre assessment values a six week core stability and functional mobility exercise protocol was given and follow up for progression was done after 2, 4, 6 weeks interval. In the initial phase of treatment galvanic current was given to trunk and lower extremity muscles with the frequency as tolerated and passive range of motion exercises to trunk and lower extremity muscles which initiated flicker of contractions.24 Denervated muscles are incapable of contraction except by direct stimulation of the muscle fibers by suitable electrical means.[25] Once the initiation of contractions was achieved electrical stimulation with the help of faradic current to motor nerves of spine and lower extremity was used. Innervated muscles contract in response to a demand for activity provided the demand is sufficient.[24] Once the patient was able to do active contractions, active assisted range of motion exercises were initiated. Once the power of contraction has been regained, the muscles were strengthened progressively until maximum function was obtained.[25] Strengthening of trunk and lower extremity muscles was done with isometric strengthening program. A person requires a progressive resistance training program in which the load is appropriately and progressively increased. Such training is often best performed within the context of a functional skill, provided the principles of progressive resistance training can be maintained.[26] Varieties of methods which were used for providing resistance are pulleys, free weights, weight cuffs and theraband.25 Resistance training increases muscle strength by making muscles work against a weight or force.[27] Bed mobility exercises were used to improve functional mobility of the participants.[25] After all this procedure the post test assessment values were evaluated.

Richardson et al. proposed that lumbar stabilization exercise increased the stability of the spine and posture while performing functional postures and movements.28 Panjabi reported that lumbar stabilization exercise, a muscle strengthening exercise for the deep muscle group, plays an important role in providing dynamic stabilization in the segments stability, and useful for decrease in spinal functional disorder.[29] Specific transverse abdominal muscle strengthening along with the conventional treatment shows speedy recovery than the only conventional therapy when given at the acute and sub-acute stages of traumatic spinal cord injury.[30] The present study also found improvements in lower extremity muscle strength as well as functional capacity after performing core stability and functional

mobility exercises. The post test results derived that the stabilization exercises used in this study produced significant improvement in muscle strength in the lumbar area thereby improving functional capacity and muscle strength in the lower extremity.

## Conclusion

Core stability and functional mobility exercises improve muscle strength in lumbar spinal cord injury patients.

# A Study to Assess Effectiveness of Jacobson Progressive Relaxation Technique on Sleep Quality among Elderly in Selected Old-Age Home of Kheda District

**Patel Margi[1], Mayavanshi Rashmika[1], Pandya Rutu[1], Prajapati Nisha[1], Patel Vrutta[1], Khristi Linus[1], Patel Jay[1]**

*[1]Final year B.Sc. Nursing Students, Dinsha Patel College of Nursing, Nadiad, Gujarat*

## Abstract

The aim of study is to improve sleep quality of elderly by providing Jacobson progressive technique in which Quantitative approach was adopted with Pre-experimental one group pre-test post- test. Study was conducted in selected old-age home of Kheda district. 30 Sample was selected by Non-probability purposive sampling technique. The Study instrument used by researcher consisted two sections i.e. demographic profile and Pittsburgh sleep quality index. Reliability of the tool was 1.00 with the help of coefficient-correlation Karl Pearson formula. Pilot study was conducted among 3 samples and the study was found feasible. After two weeks of pilot study final study was conducted. Descriptive and inferential statistics was used to analyse the data obtain was tabulated analysed and interpreted in terms of objective of the study. Average score of post test was 0.966 with standard deviation 0.96. Researcher applied t- test for comparison between pre-test and post-test. Calculated t-test vales corresponding to this comparison were 4.52 and table value were 2.05 ($p<0.05$). T Calculated value is more than T Tabulated value hence the Research hypothesis (H1) is accepted and null hypothesis is rejected (H0). So, it reveals that a Jacobson progressive relaxation technique is effective to improve sleep quality among elders.

## Introduction

Ageing is a physiological process that begins at birth. This biological inevitable process has health related, social, cultural and economic dimension. Ageing is not an illness but the increasing number and severity of the health problems and declining functional abilities are among the potentiality life changing problems of ageing. People experience many changes in physical, mental and social aspects as they age.

Old people are big support for family because they are our base and having better experiences then new age people. Old people know about the society very well and they are the strength of the family. So, do not let them to old age home keep them in family because in this age they need family support and care. Elderly needs smile a kind, polite word, attention and love that they really crave for one of the physical changes in elderly is in the characteristics of their sleep. Changes in sleep duration, pattern and quality occur with ageing.

The difficulty of falling asleep, maintaining sleep, sleep fragmentation, Getting up too early in the morning and more day sleeps are the other changes that occur in elderly with ageing.01 Elderly needs about 7 to 8 hours of sleep normally.

Jacobson progressive relaxation technique is an one type of therapy that focuses on tightening and relaxing of specific muscle groups in sequence and also helpful to relieve stress, anxiety, tension, fatigue and depression. Jacobson relaxation technique was invented by American physician Dr. Edmund Jacobson in the 1920 at Harvard University.2

## Material and Method

Research approach: Quantitive research Approach. Research design: Pre- experiment Pre- experimental one group pre-test post- test. Research setting: selected old-age home of Kheda district by use of Pittsburgh sleep quality index. Sampling technique: Non-probability purposive sampling technique. Sample size was 30. The Study instrument used by researcher consisted two sections i.e. demographic profile and Pittsburgh sleep quality index.

**TABLE No.:1 SCORING SYSTEM OF SLEEP QUALITY**

| Sr.no. | Quality Of Sleep | Score |
|---|---|---|
| 01 | Very Good | 0 |
| 02 | Fairly Good | 1 |
| 03 | Fairly Bad | 2 |
| 04 | Very Bad | 3 |

This tool was validated by 8 experts from nursing field. Reliability of the tool was 1.00 with the help of coefficient-correlation Karl Pearson formula. Pilot study was conducted among 3 samples and the study was found feasible. After two weeks of pilot study final study was conducted. Descriptive and inferential statistics was used to analyse the data obtain was tabulated analysed and interpreted in terms of objective of the study.

## Review of Literature

Philippe Voyer et al (2005) conducted this study was to determine the prevalence of insomnia and its associated factors in nursing home residents. A cross-sectional study ($n$ = 2332) was conducted among seniors living in long-term care facilities. The findings indicate that 144 (6.2%) participants had an insomnia disorder according to DSM-IV criteria, 17% displayed at least one symptom of insomnia, and more than half of the subjects were benzodiazepine users. According to multivariate analysis, psychological distress (adjusted odds ratio = 1.51) and disruptive behaviours (adjusted odds ratio = 2.10) were the only factors associated with an insomnia disorder among this population. In conclusion, insomnia is a fairly important problem, as a symptom or a syndrome, among elderly people and deserves attention from caregivers. Alternative interventions to benzodiazepine drugs, which are suited to long-term care residents while tailored to these specific care settings, should be developed.3

Won-Hyoung Kim (2008) This study investigates the prevalence and socio-demographic correlates of insomnia by considering a community sample of elderly individuals in South Korea. A face-to-face household survey was conducted in five regions of South Korea from June 2008 to August 2008. Among a total of 3,074 individuals aged 65 years and over, 2,002 participants were interviewed. The presence of insomnia was defined as having at least one of four sleep complaints that included difficulty in initiating sleep (DIS), difficulty in maintaining sleep (DMS), early morning awakening (EMA), and non-restorative sleep (NRS) more than three times per week in the last month. The Restless Legs Syndrome (RLS) Questionnaire, a short form of the Geriatric Depression scale (GDS), and a medical review of systems were implemented. Insomnia was found in 29.2% of the participants. DIS, DMS, EMA, and NRS accounted for 19.4%, 21.7%, 19.6%, and 8.0% of the participants respectively. Insomnia accompanied by daytime consequences accounted for 17.1% of the participants. The participants who were females, had no education, lived alone, showed symptoms of RLS or depression, and had a lifetime history of physical illness were significantly more likely to report insomnia. The prevalence of DIS, DMS, EMA, or insomnia increased slightly with age, whereas that of NRS decreased slightly.[4]

Senthilkumar Ramasamy (2018) conducted study to assess the effectiveness of Progressive muscle relaxation technique in reducing anxiety & depression among the hospitalized leprosy affected person in a tertiary care centre. This study is a case series of 50 leprosy affected people aged between 18–60 years who were admitted for leprosy complications in tertiary leprosy referral hospital. The Anxiety-Depression scale was developed and validated by the investigators and administered before intervention of PMRT and after 2 weeks. The finding shows that a statistically significant difference was observed on anxiety domain before and after application of PMRT. The anxiety means score showed steady decline from 6.76 at pre-test to 3.0 ($t=25.068$, $P\leq0.001$) at post-test and 1.12 ($t=22.679$, $P\leq0.001$) at follow-up. In depression domain, a statistically significant difference was seen in before and after application of PMRT. The depression means score showed steady decline from 6.92 at pre-test to 3.28 ($t=16.082$, $P\leq0.001$) at post-test and to 1.16 ($t=18.918$, $P\leq0.001$) at follow-up. This

study proved that the PMRT as a valid treatment option for hospitalized person with leprosy in minimizing the anxiety and depression related symptoms and to benefit the psychosocial wellbeing of leprosy affected patients.5

Ray (2014) conducted a prospective cross sectional study to assess the effectiveness of progressive muscle relaxation in female health care professionals in tertiary care hospital in eastern part of India. The 200 sample were recruited by using purposive sampling method. The presumptive life event stress scale was used in the study. The study finding reveals that significant decrease in resting heart rate, blood pressure and perceived stress scale level was seen after PMR training. The study concluded that increase stress among female health care professionals is a cause offer concern and there is a need to adopt early life style modification by practicing relaxation exercises to ameliorate stress.[6]

Bhumi Reddy Chetan Kumar (2017) conducted study to assess the effectiveness of Progressive Muscle Relaxation Technique on inducing sleep among cancer patients and to associate the effect of Progressive Muscle Relaxation Technique with the selected demographic variables. Quantitative approach and Quasi-Experimental one group Pre-test and Post-test research design was employed. Non-probability convenient sampling technique was employed to select 40 samples. Sleep Assessment Scale & Sleep problem assessment tool was used. All the 40 subjects of the study majority of them were falling in Dissatisfied Sleep 31(77.5%), 9[22.5%] subjects were falling under Disturbed sleep and no were falling under Sound Sleep category. There is a significant decrease in the post-test score (mean 30.7) of subjects after administration of Progressive Muscle Relaxation Technique compared to pre- test score (mean 55.62). Hence the Hypothesis H1 is accepted that is Progressive Muscle Relaxation Technique is effective to induce sound sleep. There is no significant association between the Effect of Progressive Muscle Relaxation Technique and the demographic variables. Hence regular muscle relaxation exercise can help the patient induce sleep and maintain in their healthy sleep pattern.[7]

Francis et al (2012) conducted study to evaluate the effectiveness of progressive muscle relaxation (PMR) on quality of sleep of hospitalized medical patients of a selected hospital in Mangalore. Randomized control trial was used to test the effectiveness of Jacobson's Progressive Muscle Relaxation Technique on quality of sleep (QOS) among 60 medical patients. Both the groups (Experimental and Control) were observed with pre-test and post-test. Demographic perfoma, Modified Pittsburgh sleep quality index and 3 point rating scale on assessing factors affecting Quality of sleep were used to collect data from the sample. The QOS was assessed in 84 patients admitted in medical ward out of which 60 (71.4%) had poor QOS and 24 (28.6%) had good QOS. The mean pre-test score of QOS in the experimental (30) and control group (30) were 16.667 and 16.70 respectively. Psychological factors (74.137%) affected QOS more than the environmental factors (65.989%). Repeated measures ANOVA revealed a significant difference in the QOS from Day 1 to Day 5(. F cal=378.38>F tab (1, 4) = 7.71, $p<0.005$). The Bonferri multiple comparison test revealed a significant improvement in the QOS from day 2 onwards. The calculated t-value of QOS was 17.892, was more than the table value t tab (58) = 2.00, $p<0.05$. Hence, the study revealed a significant improvement in the QOS in the experimental group after PMR. No significant association was found between QOS and selected demographic variables. The present study revealed that 5 days of progressive muscle relaxation therapy was very effective for medical patients with poor quality of sleep.[8]

In experimental group: Majority i.e. 33.33% elders were having 74 to 80years of age, 56.66% elders were female, 43.33% elders sleep were affected by Climate, 36.66% elders have Married and Widow, 40.00% elders staying in old-age home due to Misbehavior of son and daughter-in-law, 46.66% elders have not doing any activity, 36.66% elders sleep for 6-7 hours during night, 80.00% elders sleep for 1-1.5 hours during day time, 76.66% do not awake during night time sleep, 66.66% elders have a no any habit, 30.00% elders are suffering from Hypertension.

Demographic variable, Physical activity was found to have a significant association with sleep quality.

Demographic variables, Age, Gender, Factors affecting sleep, Marital status, Reason to stay in old-age home, Hours of sleep during night, Hours of sleep during day, Frequent night-time awakening, Habits and Medical disorders were did not found any significant association with sleep quality. (p value<0.05).

Average score in post-test effectiveness Jacobson progressive relaxation technique was 2.00 with standard

deviation 0.96.

## Discussion

The finding of the study was discussed with the objectives and hypothesis stated. The present study was undertaken to assess the effectiveness of Jacobson progressive relaxation technique on sleep quality among elderly. The sleep quality was significantly improved with Jacobson progressive relaxation technique among elderly.

## Conclusion

After Jacobson progressive relaxation technique shows that the Jacobson progressive relaxation technique is helpful for improving the sleep quality among the elderly. It concludes that assessment of sleep quality.

**Conflict of Interest:** None

**Source of Funding:** No separate funding was received for this study.

**Ethical Clearance:** The ethical clearance was obtained from our institute.

# Awareness of Various Forms of Treatment Approaches in Stroke amongst Rural Population

**Prajakta S.Kadam[1], Suraj B.Kanase[2]**

*[1]Student, [2]Associate Professor, Krishna College of Physiotherapy, Krishna Institute of Medical Sciences Deemed to be University, Karad, Maharashtra*

## Abstract

**Background:** Stroke is one of the leading cause for mortality and disability. As a medical emergency, timely and appropriate treatment is necessary to save the life and disabilities in patients. Based on the impairments and clinical outcomes of the disease its awareness on knowledge about the condition and treatment approaches should be done especially in rural population.

**Objectives:** 1. To study awareness about stroke 2. To study awareness of various forms of treatment approaches in stroke amongst rural population

**Material and Method:** It is a questionnaire-based survey. 100 subjects participated in the survey. The questionnaire was based on the awareness of treatment approaches. subjects with age 20 and above were included in this study. After the reception of responses, data was analyzed with help of appropriate statistical methods.

**Results:** Out of all respondents, 53% was female population and 47% was male population. Out of which 48 % of female population was aware about stroke and 5% females was unaware. 43% of male populations was aware about stroke and 4%of male population was unaware. The treatment approaches preferred were Medicine and physiotherapy.

**Conclusion:** In rural population, people are well aware about stroke but are less aware about various treatment approaches used.

***Keywords:*** *stroke, awareness, treatment approaches.*

## Introduction

Stroke is the sudden loss of neurological functions caused by an interruption of the blood flow to the brain.1Stroke is one of the leading causes of death and disability in India.3 Globally; stroke is a devastating neurological disorder and a leading cause of death and acquired disability. Women have lower age-adjusted stroke incidences than men. Women with early menopause have twice the risk of ischemic stroke as women with late menopause. Women over 85 years of age have an elevated risk compared to men.1

The majority of the stroke patients experience motor impairments, which affects movements of the face, leg and/or arm on one side of the body and sometimes both leg and arms of the body affects. Unfortunately, most stroke patients recover incompletely after stroke, despite intensive rehabilitation strategies. Although there is a diverse range of interventions aimed at improving motor outcomes after stroke, there is still a pressing need for novel treatment therapies and continued research to reduce disability and improve functional recovery after stroke.[9]

**Corresponding author:**

The best form of treatment for stroke that emerged over last several decades is stroke unit.9Rehabilitation of a stroke patient begins as soon as any impairment is perceived and comprises traditional exercise programs and neuropsychological approaches with the primary aim of restoring mobility and function of patient.4

Different ways of handling stroke patients:

- Medicine
- Physiotherapy17,18
- Acupuncture
- Ayurveda (Panchakarma)
- Chiropractic
- Cupping
- Dry needling
- Brain stem stimulation
- Stem cell therapy
- Miscellaneous quack practice, 2,4-16 etc.

Awareness:

Lack of knowledge could be one of the reasons for variety of handling methods in both doctors and society. Ways of approaches are different for different places due to diversity in geographic distribution, traditional methods of practice, etc.

As stroke is one of the leading causes of mortality and disability its awareness in society needs to be analysed. Although, all such diverse range of treatment approaches are available for stroke, there is still a pressing need of awareness for such novel treatment therapies to reduce disability.13 Hence, we conducting the study of awareness of various forms of treatment approaches in stroke amongst rural population.

## Material and Method

Type of Study: Observational study

Study Design:Survey study

Place of Study:Rural Population in and around Karad(Dist.: Satara, State: Maharashtra, India).

Sample Size: Supposed to be 100. 4

$n = 4pq$

$L2$

Where, $p = 95.9$, $q = 4$

Statistical analysis:A questionnaire-based Observational study was done. Data was anonymously coded and entered into a spreadsheet program before being analyzed using statistical method. Percentage, frequency was calculated to summarize the response.

Sampling Duration: Approximately 6 months

Inclusion Criteria:

- population of age 20 and above.
- Both sexes

Exclusion Criteria:

- Subjects having mental illness, speech abnormalities.

Equipment's and Materials required:

Assessment Charts

Writing Material

Computer for online access

Outcome Measures

- Stroke Questionnaire

## Findings

Out of all respondents, 53% was female population and 47% was male population. Out of which 48 % of female population is aware about stroke and 5% females is unaware.43% of male population is aware about stroke and 4% of male population is unaware.

44% of female population have seen <=5 stroke patients and 9% of population have seen >5 stroke patients. 27% of male population have seen<=5 stroke patients and 20% of male population have seen >5 stroke patients. (Fig 1)

22% of female population is aware about the warning signs/ signs and symptoms about the stroke where 31 % of female population is unaware.21% of male population is aware about the warning signs/ signs and symptoms about the stroke where 26 % of male population is unaware.

33% of females are aware about the treatment approaches and 20% were unaware.34% of males are aware about the treatment approaches and 13% were unaware. 21% of female population and 13% of male population is aware about the medicine approach.25% of female population and 29% of male population is aware about physiotherapy for stroke.17% of female population and 12% of male population is aware about Ayurveda.20% of female population and 19% of male population is aware about the other approach. (Table1)

Various forms of treatment approach available in stroke out of which 12% of female population seen medicine as an approach used the most. 8% of male population agreed with medicine.19% of female population seen physiotherapy as an approach used the most. 24% of male population agreed with physiotherapy approach.11% of female population seen Ayurveda as an approach used the most. 10% of male population agreed with Ayurveda.16% of female population seen other methods as an approach used the most. 13% of male population agreed with medicine approach.(Table 2)

42% female and 29% male out of population will prefer medicine as treatment approach. 23% female and 32% male out of population will prefer physiotherapy as treatment approach.20% female and 14% male out of population will prefer Ayurveda as treatment approach. 0% female and 1% males out of population will prefer Homeopathy as treatment approach.18% female and 12% male out of population will prefer other approaches as treatment approach. (Table 3)In this study, 32% females out of population have seen recovered patients.34% of male population have seen patients recovered from stroke. (Fig 3)

44% of female population knows about physiotherapy and will prefer physiotherapy for stroke and 9% of female population won't prefer.41% of male population knows about physiotherapy and will prefer physiotherapy for stroke and 6% of male population won't prefer. 42% of female population knows about medicine and will prefer medicine for stroke and 11% of female population won't prefer.41% of male population knows about medicine and will prefer medicine for stroke and 6% of male population won't prefer.2% of female population knows about homeopathy and will prefer homeopathy for stroke and 51% of female population won't prefer.2% of male population knows about homeopathy and will prefer homeopathy for stroke and 45% of male population won't prefer.0% of female population knows about Ayurveda and will prefer Ayurveda for stroke and 53% of female population won't prefer.18% of male population knows about Ayurveda and will prefer Ayurveda for stroke and 29% of male population won't prefer.36% of female population knows about massage and will prefer massage for stroke and 17% of female population won't prefer.35% of male population knows about massage and will prefer massage for stroke and 12% of male population won't prefer.

15% of female population knows about quack practice and will prefer quack practice for stroke and 41% of female population won't prefer.8% of male population knows about quack practice and will prefer quack practice for stroke and 39% of male population won't prefer. (Fig2)

As per their awareness, the treatment approaches more preferred are Physiotherapy and Medicine.

**Table 1: What form of treatment can be given in stroke?**

| APPROACHES | GENDER | | | |
|---|---|---|---|---|
| | FEMALE | | MALE (%) | |
| | YES | NO | YES | NO |
| MEDICINE | 21 | 32 | 13 | 34 |
| PHYSIOTHERAPY | 25 | 28 | 29 | 18 |
| AYURVEDA | 17 | 36 | 12 | 35 |
| OTHERS | 20 | 33 | 19 | 28 |

**Table 2: Which treatment have you seen used most?**

| APPROACHES | GENDER | | | |
|---|---|---|---|---|
| | FEMALE | | MALE (%) | |
| | YES | NO | YES | NO |
| MEDICINE | 12 | 41 | 8 | 39 |
| PHYSIOTHERAPY | 19 | 34 | 24 | 23 |
| AYURVEDA | 11 | 42 | 10 | 37 |
| OTHERS | 16 | 37 | 13 | 34 |

**Table 3: Which treatment do you think prefer most?**

| APPROACHES | GENDER | | | |
|---|---|---|---|---|
| | FEMALE | | MALE (%) | |
| | YES | NO | YES | NO |
| MEDICINE | 42 | 11 | 29 | 18 |
| PHYSIOTHERAPY | 23 | 30 | 32 | 15 |
| AYURVEDA | 20 | 33 | 14 | 33 |
| HOMEOPATHY | 0 | 53 | 1 | 46 |
| OTHERS | 18 | 35 | 12 | 35 |

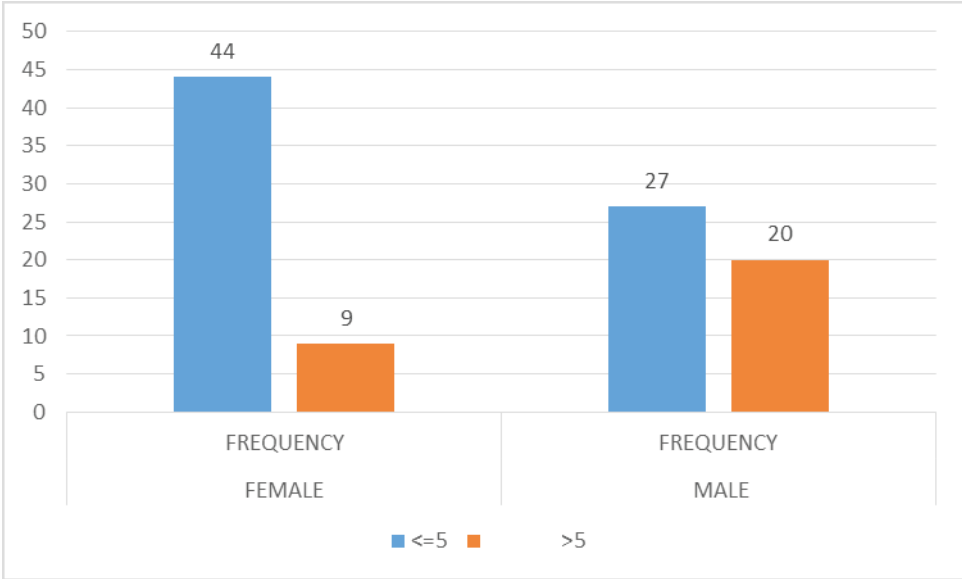

**Fig 1: How many cases of stroke have you seen?**

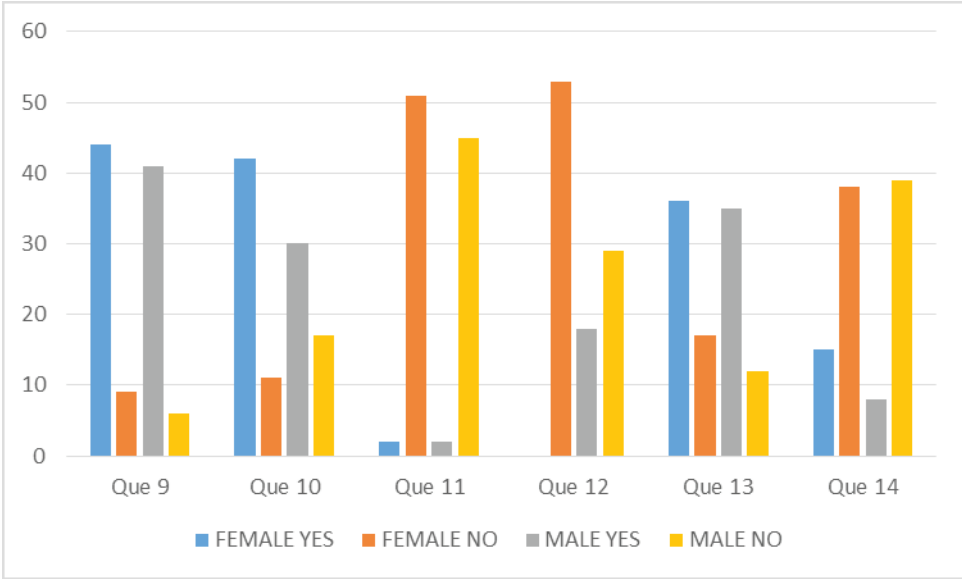

**Fig 2: Do you think this is effective in stroke? Would you prefer this for stroke?**

Que9: Physiotherapy Que10: MedicineQue11: Homeopathy Que 12: Ayurveda

Que13: Massage Que14: Quack therapy

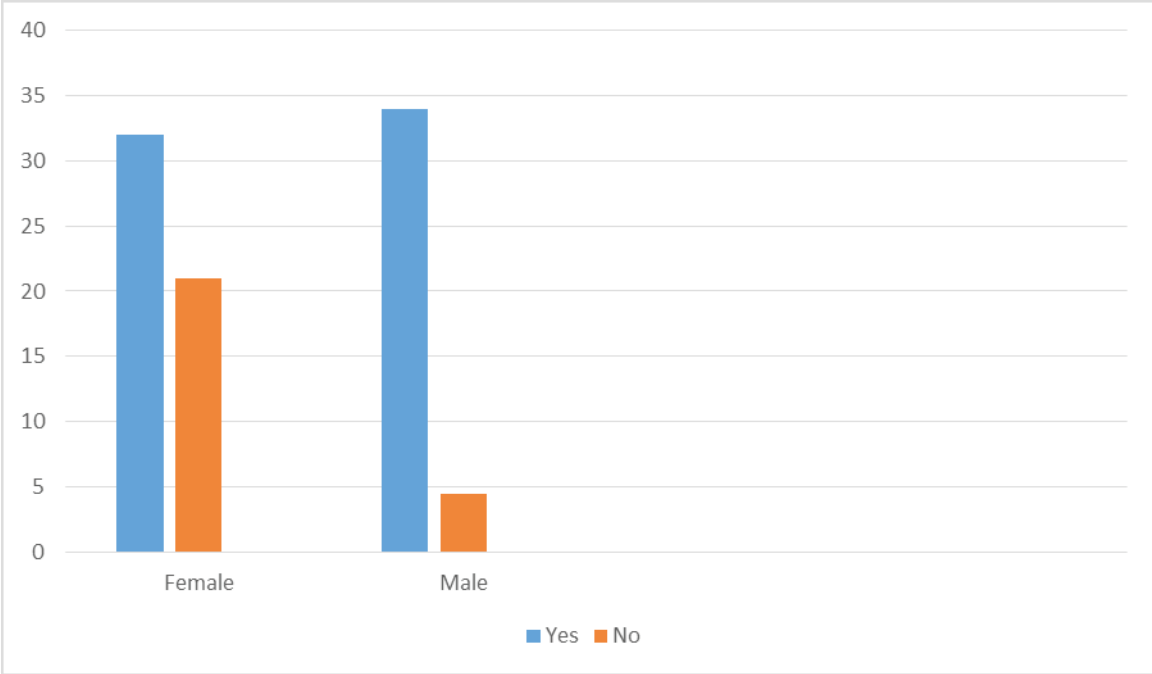

**Fig 3: Have you seen any one recovered from stroke and is able to do activities of daily living**

## Conclusion

On the basis of this study we conclude that there is awareness of stroke in rural population but there is less aware about various treatment approaches used for recovery.

## Discussion

Despite of advsances in the acute management of stroke, a large population of stroke patients are left with significant impairments. Over the coming decades the prevalence of stroke related disability is expected to increase worldwide and this will impact greatly on families, healthcare system and economics. Effective

treatment approaches is a key factor in reducing disability after stroke. In this study, 100 participants were taken in which 53% was female population and 47% was male population. According to our survey 48% of females and 43% of male population was aware.

Cardiovascular diseases affecting the brain and heart have common risk factors in developing atherosclerosis. Major risk factors for stroke are hypertension, Diabetes mellitus, disorders of heart and disorders of heart rhythm. There are some modifiable risk factors- Smoking, physical inactivity, obesity and diet. With some nonmodifiable risk factors- Family history, age, gender and race.22% of female population is aware about the warning signs/ signs and symptoms about the stroke where 31 % of female population is unaware.21% of male population is aware about the warning signs/ signs and symptoms about the stroke where 26 % of male population is unaware.

Rehabilitation of a stroke patient begins as soon as any impairment is perceived and comprises traditional exercise programs and neuropsychological approaches with the primary aim of restoring mobility and function of patient. According to this study, 33% of females are aware about the treatment approaches and 20% were unaware.34% of males are aware about the treatment approaches and 13% were unaware.. Medicine and physiotherapy are the two approaches preferred the most.

Literature and clinical experiences suggest that timely admission to hospital and proper care enhances neuronal plasticity, speeds the recovery and limits the impairments. In this study, 32% females out of population have seen recovered patients.34% of male population have seen patients recovered from stroke. (Fig 3)

Though rehabilitation is proved to be the best treatment patients also prefer other mode of treatment approaches such as Medicine, Acupuncture, Ayurveda, Chiropractic, Cupping, Dry needling, Brain stem stimulation, Stem cell therapy and Miscellaneous quack practice. Most of the population involved in the study was aware about physiotherapy and medicine and would prefer more as a treatment approach.

Quack is one who practice a form of medical system without qualification, training and registration from the appropriate council or authority. Still 15% of female population knows about quack practice and will prefer quack practice for stroke and 41% of female population won't prefer.8% of male population knows about quack practice and will prefer quack practice for stroke and 39% of male population won't prefer. (Fig2)

**Conflict of Interest:** There were no conflicts of interest in my study.

**Source of Funding:** Source Of Funding: Krishna Institute Of Medical Sciences Deemed to be University, Karad

**Ethical Clearance:** The Institutional Ethics committee has hereby given permission to initiate the research project(Protocol number 0458/2018-2019) titled, " AWARENESS OF VARIOUS FORMS OF TREATMENT APPROACHES IN STROKE AMONGST RURAL POPULATION"

# Effect of Multidimensional Exercise Program for Improving Balance in Traumatic Brain Injury Patients

**Pranali Kakade[1], Suraj B Kanase[2]**

*[1]Intern, Physiotherapy, Krishna College of Physiotherapy, Krishna Institute of Medical Sciences, Karad,*
*[2]Associate Professor, Department of Neuroscience of physiotherapy, Krishna College of Physiotherapy, Krishna Institute of Medical Sciences, Karad*

## Abstract

**Background-** Balance disorder is a common problem in post-TBI patients. In many research's done before treatment is given mainly on motor component to improve balance in TBI patients. In this study we are going to give multidimensional protocol - sensory stimulations along with motor components. Balance is a main component of a patient for his mobility, many therapist concentrate on balance in chronic stage of TBI patients, in this study we are going to give treatment in acute stage of TBI patients which will help them to recover fast. There is lack of research's done on acute post TBI patients with multidimensional exercise program for balance disorder. Indeed this made us to study the effect of multidimensional exercise program on balance disorder in TBI patients. **Objectives**- To find out the effectiveness of multidimensional exercise program for improving balance control in mild TBI patients. To find out the effectiveness of multidimensional exercise program for improving balance control in moderate TBI patients. To find out the effectiveness of multidimensional exercise program for improving balance control in severe TBI patient. METHOD- In this study total 20 candidates were taken having impaired balance secondary to TBI from hospitals in karad. Their balance were assessed by berg balance scale and community balance and mobility scale. They were divided into mild, moderate and severe TBI. A multidimensional exercise protocol of 6 week was given for improving balance and their balance was checked at 2nd, 4th, and 6th week by same BBS and CBMS score. Later evaluation and interpretation of data was done. **Result-** The 20.8% improvement is seen in pre and post treatment BBS score and 8.82% improvement is seen in pre and post treatment CBMS score in post TBI patients with balance impairment. **Conclusion**- On the basis of result it can be concluded that multidimensional exercise program is effective for improving balance in TBI patients.

## Introduction

Traumatic brain injury is defined as an alteration in brain function caused by an external force. Brain tissue damage can be of two type: primary injury and secondary injury. Primary injury occurs due to direct trauma to the parenchyma. Secondary injury results from cascade of biochemical, cellular, and molecular events that occur due to an initial injury and injury related hypoxia, elevated intracranial pressure and oedema. (1) There is open head injury and close head injury, open head injury is associated with skull fracture and close head injury occurs in isolation without skull fracture. Blood supply of brain may also get indirectly affected due to the injury of face and neck. Most TBI occurs due to road traffic accident (RTA). The severity of brain injury may be categorised as mild, moderate and severe head injury. (2)

In Mild traumatic brain injury there is minimal damage to the neuroanatomical structures with slight or no permanent impairment. Glasgow coma scale score of more than 13 is defined as mild TBI. In moderate TBI GCS between 8 -13 and the post traumatic amnesia lasting between 1 to 24 hours. Severe TBI is GCS score less than 8. [2]

After TBI – state of consciousness, sensorimotor changes, cognitive, emotional and behavioural changes, attention, balance, dizziness and visual dysfunction, spasticity and post traumatic headache. [2]

Balance disorder is a common consequence of traumatic brain injury. Balance is a condition in which the centre of mass is within the stability limit and base of support (BOS).Balance is depend on 1) sensory / perceptual systems responsible for the detection of body motion and position.2) motor systems responsible for presenting motor synergies.3) CNS process responsible for integration and action plans. (1) Balance is controlled by cerebellum and basal ganglion in brain, damage to this area may cause loss of control of balance.

To maintain a balance, it is important that central nervous system receives and integrates a somatosensory information, which includes both the tactile and proprioceptive system. The receptors which carry tactile sensations are Merkels cells, Pacinian corpuscles, Meissners corpuscles and Ruffini endings. And they are found in feet and might play an important role in maintaining body stability and balance in upright stance. The proprioceptive receptors are muscle spindle and Golgi tendon organs which carry the sense of joint position and joint motion. The proprioceptive receptors in feet are sensitive to ankle rotation and can give information about balance. [3, 4] Stimulation of these receptors may improve balance control in individual with post TBI. The rhythmic auditory stimulation (RAS) also improves the balance and gait of post TBI patients by stimulating brain functions involved in movement, cognition, emotions and sensory perception also RAS helps in execution of movements and normalizing gait parameters. [5, 6, 7] Balance incorporates two vestibular reflexes- the vestibuloocular reflex (VOR) and the vestibulospinal reflex (VSR). To improve balance after TBI the vestibular balance rehabilitation therapy and visual treatments are commonly used. [8]

Postural impairment and coordination are common consequences of TBI which may result in instability while performing day today activities like standing, walking, grasping, difficulty while coordinating eye-head movement and problem while focusing on target. The postural and coordination defect result from damage to cerebellum. [9]

The motor disability following TBI is a common, motor performance can be affected by damage to various loci in the nervous system which can cause reduction in muscle power and tonus disorder which can result in impaired balance. [6, 7] Focal or diffuse spasticity may appear following TBI. Time post injury is an important consideration as spontaneous neurological recovery may continue for 9- 15 months post injury. Motor impairment can also result from prolong immobilization and bed rest during acute period, prolonged immobility can cause effect on multiple body system that impact the motor function the most. Motor rehabilitation is essential in helping the patient re-establishing independence post TBI. [7, 8]

Impaired confidence in balance skill has been reported to cause depression, fear of falling and limited ability to participate in social activity. [9]

Examination of balance in TBI patients is done by using berg balance scale and community balance and mobility scale in ambulatory patients. (10, 11, 12) Initially many therapist concentrate on the motor component of patient to improve his balance in this study we are going to give multidimensional intervention for balance in acute phase of post TBI patients.

## Material and Method

This was a study to find the effect of multidimensional exercise program for improving balance in TBI patients. The study was carried out in hospitals from Karad. An approval for the study was obtained from the protocol committee and ethical committee of KIMSDU. Individual were approach and those fulfilling the inclusive criteria were selected. The purpose was explained and written inform consent was taken prepared in accordance with the Helsinki Declaration from those who are willingly to participate. Total 20 individuals were taken. The inclusion criteria was Acute TBI individuals, candidates with mild, moderate and severe TBI, Both male and females, Age- above 18 years and candidates with injury related balance disorder. The exclusion criteria was individual who are unable to follow simple commands, Intact balance after injury, unconscious patients, unstable vitals and candidates with any

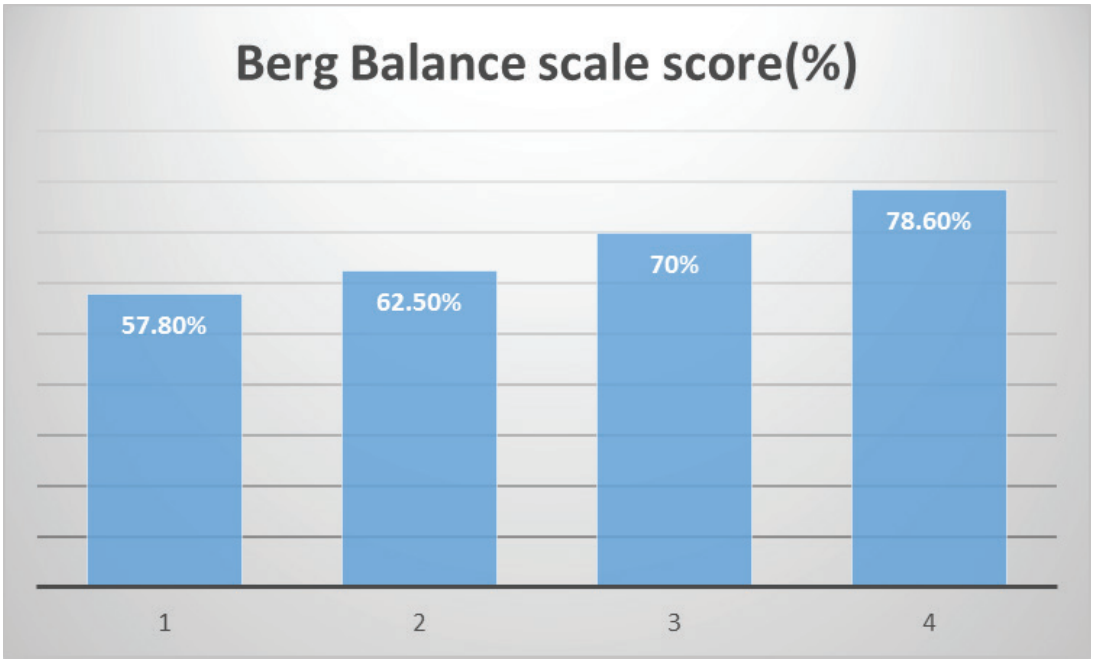
fracture of spine, lower and upper limb. Their balance was assessed by berg balance scale and community balance and mobility scale. Their tone was assessed by modified Ashworth's scale and stage of TBI were seen by initial GCS score. Then the candidates were given multidimensional exercises such as sensory training, bed mobility exercises – segmental rolling, pelvic bridging and heel slides. Active or active assisted ROM exercises to prevent contractures. Tone management by stretching and icing, proprioception training by joint compression, auditory clues by rhythmic auditory stimulation, visual feedback, vestibular rehabilitation exercises, balance and coordination training. This was given for 4 days per week for 6 weeks up to 45-60 minutes per session including rest time. The time of session increased as the week progresses, initially it took 30- 35 minutes per session and later progressed to 45- 60 minutes per session on 6th week.[13] The balance was checked at 2nd, 4th and 6th week by same berg balance scale and community balance and mobility scale to know the progression of candidates. Also the candidates were divided into mild, moderate and severe TBI. Later evaluation and interpretation was done using statistical analysis.

## Statistical Analysis

The paired T test and one-way ANOVA test were used for analysis of data. Statistical analysis of the recorded data was done by using the software SPSS version 20. The p value is less than 0.0001 which is extremely significant for pre and post treatment BBS score and CBMS score.

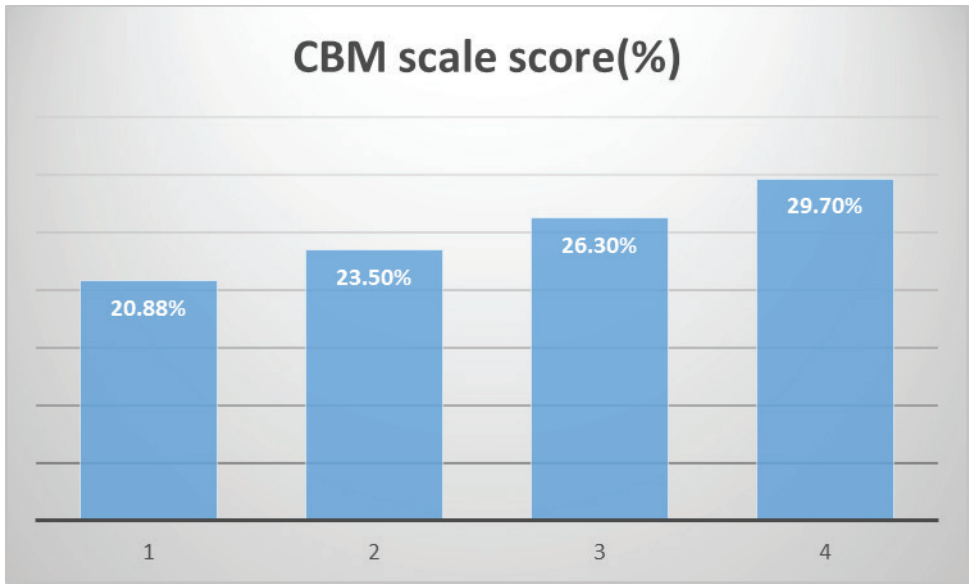
## Findings

The significant difference is seen in pre and post score of berg balance scale and community balance and mobility scale in post TBI patients with impaired balance after multidimensional exercise program of 6 week. The 20.8% improvement is seen in pre and post treatment BBS score and 8.82% improvement is seen in pre and post treatment CBMS score in post TBI patients with balance impairment.(p value= <0.0001). While the mild TBI candidates showed 27.38% more progression in BBS score and 18.38% more progression in CBMS score as compared to severe TBI candidates.(p value= > 0.05)



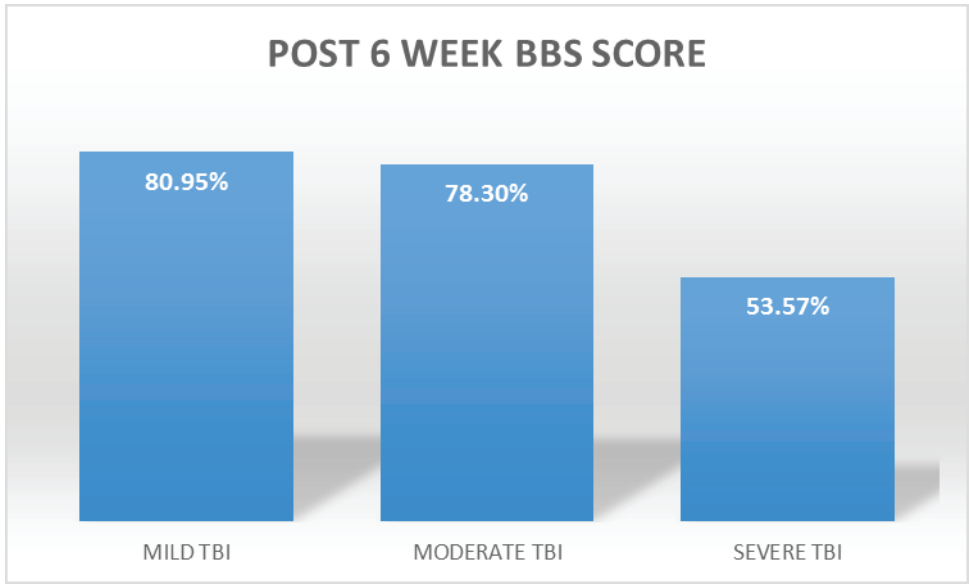
**Graph No.1- Comparison of Pre And Post Treatment Berg Balance Scale Score.**

INTERPRETATION- The above graph shows the comparison of berg balance scale score of pre-treatment, post treatment 2 weeks, post 4 weeks and post 6 weeks score in percentage. It shows significant improvement in score. 1) Pre-treatment score is 57.80%, 2) Post treatment 2 weeks score is 62.50%, 3) Post treatment 4 week score is 70% and 4) Post treatment 6 week score is 78.60%.



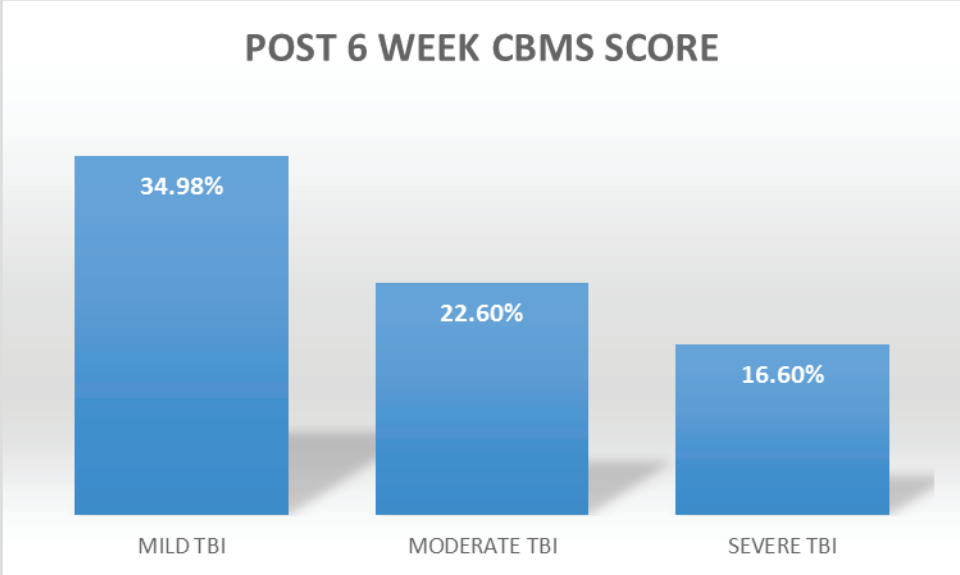
**GRAPH NO.2- COMPARISON OF PRE AND POST TREATMENT COMMUNITY BALANCE AND MOBILITY SCALE SCORE.**

INTERPRETATION- The above graph shows the comparison of community balance and mobility scale score of pre-treatment, post treatment 2 weeks, post 4 weeks and post 6 weeks score in percentage. It shows significant improvement in score. 1) Pre-treatment score is 20.88%, 2) Post treatment 2 weeks score is 23.50%, 3) Post treatment 4 week score is 26.30% and 4) Post treatment 6 week score is 29.70%.



**GRAPH NO.3- COMPARISON OF MILD, MODERATE AND SEVERE TBI PATIENTS POST 6 WEEK BBS SCORE**

INTERPRETATION- The above graph shows the comparison of BBS score post 6 week of treatment in mild, moderate and severe TBI patients in percentage. More improvement is seen in mild TBI patients then moderately and severed injured patients.



**GRAPH NO. 4- COMPARISON OF MILD, MODERATE AND SEVERE TBI PATIENTS POST 6 WEEK CBMS SCORE.**

INTERPRETATION- The above graph shows the comparison of CBMS score post 6 week of treatment in mild, moderate and severe TBI patients in percentage. More improvement is seen in mild TBI patients then moderately and severed injured patients.

## Discussion

The purpose of this study was to find out the effectiveness of multidimensional exercise program for improving balance in TBI patients. About 30% of patients report impaired balance after TBI. [(14)] In many research's done before treatment was given mainly on motor component to improve balance in TBI patients. Many currently practicing physiotherapist mainly concentrate only on motor components of patients. [(7)] Multicomponent exercise program have been found to be effective in managing various impairments following stroke [(15, 16)]. In this study we have given multidimensional protocol like sensory stimulations like tactile, auditory and visual feedback along with motor components like strengthening of trunk muscles, management of muscle tone, balance and coordination training and also prevention of contractures.

Our study included total 20 post TBI candidates with impaired balance. From which 60% candidates were of mild TBI, 35% were of moderate TBI and 5% candidate of severe TBI. In which 40% were females and 60% were males with TBI.

Balance disorder is a common problem in post-TBI patients. This problem may persist for life time after TBI which can affect the Patients daily activities and his mobility. For this early management of patients in its acute stage plays an important role.[(17)] In this study we took a candidates of acute stage from which 30% of them was having impairment in only dynamic balance and 70% were having impairment in both static and dynamic balance. The candidates having impairment in only dynamic balance was also given static balance exercises training to gain a confident in ambulation.

Motor management alone with sensory integration have a more effect in improving balance in post TBI patients. Vestibular apparatus has also been identified as sensory organ that controls sensations of balance and equilibrium in individual. In this study we found that candidates also had impairment in eye-head coordination movements which was improved by vestibular exercises which help in stabilizing gaze and eventually to improve the balance. The vestibular- ocular reflex supports stabilising vision while head is moving. (18) Vestibular rehabilitation is also effective in managing vertigo and dizziness which are commonly found after TBI. [(19)]

Evidence shows that auditory and motor system has high connectivity, hence many research have shown that RAS to be more effective than other sensory cues in rehabilitation. [(8)] Also RAS helps in motor relearning and neuronal plasticity. [(20)]

Stimulation to proprioceptors and somatosensory receptors in ankle and foot are also known to improve

balance. [3, 4]

Motor disturbances following TBI includes reduction of power, tonus disorder (spasticity) and motor control disorganisation. Reduction of spasticity helps in improving ROM and functional activities. The static balance is improved by decreasing muscle tone of neck and upper trunk. Thus improving balance of individuals. [21, 22]

The strength training for core muscles and lower limb also reported to improved patients balance and confidence in daily activities.

In the study made by Vishwajeet Trivedi, et al. showed the satisfactory effect of strength and balance intervention in improving balance, gait pattern and function independency in TBI Patient. Our research also support this study as in our study we have used strength and balance intervention for improving balance in post TBI. [23]

Limitation of this study was that the study is done with small sample size and in limited geographical area.

## Conclusion

On the basis of the results it is concluded that multidimensional exercise program is effective in improving balance in Traumatic brain injury patients. Multidimensional approach improves the balance in various grades of head injury.

**Conflicts of Interest:** There is no conflict of interest in this study.

**Source of Funding:** The study was funded by Krishna institute of medical sciences deemed to be university, karad.

**Ethical Clearance:** This study has undergone ethical clearance through the university level ethical committee. Protocol number 074/2019-2020.

# Traumatic Spinal Injuries: An Autopsy Study at Tertiary Health Care Center of Rajasthan During the Year 2017-18

**R.K.Punia[1], Sanjay Achra[2]**

*[1]Senior Professor & Former Head, Forensic Medicine SMS Medical College, Jaipur (Raj.), [2]Sanjay Achara Medical Officer, BDK Govt. Hospital, Jhunjhunu & Former M.D. Resident Forensic Medicine SMS Hospital, Jaipur, (Raj.)*

## Abstract

**Introduction:** India is a developing country with traumatic fatalities is on the rise. Accurate injury profiles are helpful in prevention strategies as well as clinical and community services for persons suffering trauma especially of spinal region.

**Aim & Objectives**

**Aim:** To study the pattern of traumatic spinal injuries observed in medico-legal autopsies at S.M.S. Hospital, Jaipur during the study period 2017-18

**Objectives**

1. To observe the pattern of traumatic spinal injuries.
2. To observe survival pattern among the patients with soinal injuries
3. To observe the demographic data of traumatic spinal injuries.

**Material & Method:** Descriptive type of observational study of autopsy conducted at Mortuary of Department of Forensic Medicine, SMS Hospital, Jaipur from 1st April, 2017 to 31st March, 2018among Bodies with spinal injuries brought for medicolegal study during study period

**Observations:** a total number of 150 autopsy cases were included in the study.

Out of 150 cases of traumatic spinal injuries, there were 132 males (88%) and 18 females (12%). Maximum numbers of fatalities with spinal injuries were observed in 21-30 years age group (24.66%), there were 75.33% cases from rural regions unemployed (50.67%).

Majority of cases suffered fatality in one to seven days after the traumatic episode (41.33% cases). Road traffic accidents were the major offenders (44.00%) in the present study followed by falls. Level of spinal injury Mid cervical 53 (35.33%). Associated vertebral injuries seen along with spinal injuries as fractures of vertebrae in 49.33% cases and fractures along with dislocations in another 49.33% cases.

**Suggestions:-** Male of earning age group should be target group for education and awareness of spinal injuries prevention education. Mid cervical protection modalities should be deployed

***Key words:-*** *spine, cervical, vertebral injuries*

## Introduction

Spinal injuries one of the major causes of death and disability around the globe1 including India2 and are of a major public health concern. Spinal injury may be caused by traffic and non traffic accidents, falls from

same or higher levels, fall of heavy objects on the head, neck and back of the body, etc. which may vary in manner from accidental or self inflicted or inflicted by others3,4. Trauma to the spine may result in fractures with and without dislocations of the spine, acute injury of inter-vertebral discs, and neurovascular injuries5. Although well protected by bony vertebral encasement and tough muscular and ligament support, yet damage to spinal cord may result, directly by fractures or dislocations of vertebrae or indirectly due to acceleration and deceleration injuries (whiplash injury) resulting in concussion, lacerations, hemorrhage, contusions and prolapsed of spinal cord. Trauma to the spinal cord leads to neurological damage that may affect motor, sensory, visceral, genital and nutritional functions[1].

India is a developing country with traumatic fatalities, like road accidents and falls, on the rise. Accurate mortality statistics from these vices of development are collected in various regions over different periods by researchers [6,7,8]. Such statistics of morbidity and mortality profiles are helpful in recommendations of prevention strategies, improving emergency trauma care, and to frame appropriate services with affordable health packages for their management. No mechanisms of documentation of such statistics including spinal injuries are available at National level in the country. Also, the available literature pertaining to traumatic spinal injuries in medico legal deaths is deficient in this region.

Epidemiological studies are always an asset in planning prevention strategies as well as clinical and community services for persons suffering trauma. They also provide a baseline for monitoring the effectiveness of interventions. Epidemiology of a particular ailment is linked to social, environmental, cultural and biological issues and thus varies over regions and times.

This study was thus initiated in order to observe the pattern of traumatic spinal injuries in medico-legal autopsies of traumatic fatalities at S.M.S. Hospital, Jaipur during the year 2017-18, discuss their causes and their contributions to mortality. An attempt was made to suggest recommendations to clinicians as regards to formulation of more effective diagnostic and management protocols and suggest measures to prevent mortality in cases of vertebral trauma with or without injuries to the spine.

## Aims & Objectives

**Aims**

To study the pattern of traumatic spinal injuries in medico-legal autopsies at S.M.S. Hospital, Jaipur during the study period

**Objectives**

1. To observe traumatic spinal injuries pertaining to region and associated fractures/ dislocations of vertebral column

2. To observe the mode, mechanism, and manner of traumatic spinal injuries.

3. To observe medico-legal and socio-demographic profile of traumatic spinal injuries.

## Material & Method

This study was carried out at the Department of Forensic Medicine, SMS Medical college & Hospital, Jaipur after obtaining due clearance from research and review board of SMS Medical college & Hospital, Jaipur as dissertation of MD Course .

Study type:

Descriptive type of observational study.

Study Area:

Mortuary, Department of Forensic Medicine, SMS Hospital, Jaipur.

Study Period:

One year from 1st April, 2017 to 31st March, 2018

Study Universe:

Medico-legal autopsies conducted at SMS Hospital, Jaipur during the study period.

Cases:

Medico-legal autopsies conducted at SMS Hospital, Jaipur during the study period with traumatic spinal injuries

**Inclusion criteria:**

Autopsy cases of traumatic spinal injuries

**Exclusion criteria:**

1 autopsy cases with incomplete body presented for postmortem examination

2. Cases with traumatic spinal injuries with history of previous pathological conditions of spine.

3. Cases of spinal injuries due to mechanical asphyxia.

4. Subjects with other medical, surgical or metabolic conditions affecting mortality are excluded

**Sample Size**

Sample size was calculated at 95% confidence level assuming prevalence of 75.95% cases with cervical cord injuries as found in reference article at the absolute allowable error of 10% for which sample of 70 cases of medico-legal autopsies of traumatic spinal injuries in medico-legal deaths were required for the present study.

## Method

Detailing of medico-legal information was done on basis of information in the inquest papers and that available from attendants of the deceased. Detailed data were recorded pertaining to the pattern of spinal injuries, region involved, level of spinal injury, duration of survival, isolated and non-isolated spinal injury along with details of associated injuries,

During autopsy, vertebral column was examined from anterior as well as from posterior approach, in different cases. If injuries were observed in the spine, then spinal canal was dissected further to visualize the spinal cord.

**Ethical Clearance :** Taken from research , Review and Ethical committee of SMS Medical College & Hospital, Jaipur.

## Statistical Analysis

The findings were then entered in Microsoft excel datasheet and tabulated for data analysis. Continuous variables were summarized as mean and standard deviation whereas nominal/ categorical variables as proportions. Statistical analysis was then conducted using Medcalc 7.4 version software. Chi square test was used for analysis of nominal categorical variables. P value<0.05 was considered as significant.

## Observations

A total of 3139 medico-legal autopsies were conducted at SMS Hospital, Jaipur during the study period, out of which the total number of autopsies in which spinal injuries were documented were 193 cases but the calculated sample size was 100 cases and after eliminating the cases of fatalities with spinal injuries as per the inclusion and exclusion criteria, a total number of 150 cases were included in the study.

**Table 1: Age group and gender wise distribution of medico-legal fatalities with spinal injuries**

| Age Group | Gender | | Total |
|---|---|---|---|
| | Male | Female | |
| 00-10 | 01 (0.75%) | 02 (11.11%) | 03 (02.0%) |
| 11-20 | 12 (09.09%) | 00 (0.0%) | 12 (08.0%) |
| 21-30 | 34 (25.75%) | 03 (16.66%) | 37 (24.66%) |
| 31-40 | 29 (21.96%) | 06 (33.33%) | 35 (23.33%) |
| 41-50 | 23 (17.42%) | 05 (27.77%) | 28 (18.66%) |
| 51-60 | 23 (17.42%) | 02 (11.11%) | 25 (16.66%) |
| >60 | 10 (07.57%) | 00 (0.0%) | 10 (06.66%) |
| Total | 132 (88.0%) | 18 (12.0%) | 150 (100%) |

Out of 150 cases of traumatic spinal injuries, there were 132 males (88%) and 18 females (12%). The overall male: female ratio was 22:3. Maximum number of fatalities with spinal injuries were observed in 21-30 years age group (24.66%), followed by 31-40 years (23.33%), 41-50 years (18.66%), 51-60 years (16.66%), 11-20 years (8%), and > 60 years (06.66%). Least number of traumatic fatalities with spinal injuries were observed in < 10 years age group with only three cases (02%). There was no female casualty with spinal injuries in 11-20 years and in more than sixty years age group. The youngest female was seven years of age and the oldest one was sixty years of age.

**Table 2: Distribution of cases of medico-legal fatalities with traumatic spinal injuries according to mode of injury (traumatic episode) (n=150)**

| **Mode of injury** | **Number of cases** |
|---|---|
| Road traffic accident | 67 (44.67%) |
| Fall from height | 55 (36.67%) |
| Fall of heavy object | 15 (10.0%) |
| Slip & fall | 09 (06.0%) |
| Assault | 03 (02.0%) |
| Run over by train | 01 (0.66%) |
| Total | 150 (100%) |

Road traffic accidents were the major offenders (44.67%) in the present study followed by falls occurring from same or higher levels (42.67%). 10% cases suffered injuries due to fall of heavy object on the upper body and least fatalities resulted due to injuries inflicted by others deliberately (2%) and railway death (one case- 0.66%).

**Table no. 3 Distribution of cases of medico-legal fatalities with traumatic spinal injuries according to the level of spinal injury and Survival Period**

| **Level of spinal injury** | **Survival period** | | | | **Total** |
|---|---|---|---|---|---|
| | **Brought dead or within 06 hrs** | **06-24 hrs** | **01-07 days** | **>07 days** | |
| Upper cervical | 02 (25%) | 01 (12.5%) | 02 (25%) | 03(37.5%) | 08 (5.33%) |
| Upper & mid cervical | 05(38.46%) | 0 (0.0%) | 05 (38.46%) | 03(23.08%) | 13 (8.67%) |
| Mid cervical | 12(22.64%) | 0 (0.0%) | 23 (43.39%) | 18(33.97%) | 53(35.33%) |
| Mid & lower cervical | 03(09.68%) | 0 (0.0%) | 14 (45.16%) | 14(45.16%) | 31(20.67%) |
| Lower cervical | 04(16.67%) | 01 (04.16%) | 12 (50%) | 7 (29.17%) | 24 (16%) |
| Thoracic | 02(15.38%) | 01 (07.7%) | 04 (30.77%) | 06(46.15%) | 13 (8.67%) |
| Lumbar | 02(33.33%) | 0 (0.0%) | 02 (33.33%) | 02(33.34%) | 06 (4.0%) |
| Lumbo-sacral | 0 (50%) | 0 (0.0%) | 0 (0.0%) | 2 (100%) | 02 (1.33%) |
| Total | 30 (20%) | 03(02.0%) | 62 (41.33%) | 55(36.67%) | 150 (100%) |

Categorizing the spinal injury according to its level, it was observed that there were 129 cases (86%) of cervical injuries, 13 cases of thoracic injuries (08.67%) and remaining 05.33% (08 cases) of Lumbar (06 cases) and lumbo-sacral (02 cases) levels. The cervical injuries were further divided into Upper (C1-C2), Mid (C3-C5) and Lower (C6-C7). Out of 129 cervical injuries, there were eight cases of upper cervical (06.2%), 53 cases of mid cervical region (41.1%), 13 cases involving upper and mid cervical regions (10.2%), 24 cases of lower cervical (18.5%) and remaining 31 cases involving mid and lower cervical regions (24%). Combined, there were 75.2% cases in which the mid cervical region was affected in trauma.

While observing the level of spinal injuries in relation to the survival period, it was found that 50% cases of lower cervical, 45.16% cases with mid to lower cervical injury, 43.39% cases of mid cervical injury, 38.46% cases of upper to mid cervical injuries and 25% cases upper cervical and lumbo-sacral; and 30.77% cases of thoracic injuries died in one to seven day period. 38.46% of upper to mid cervical, 25% cases each of upper and 22.64% cases of mid cervical, 16.67% cases of lower cervical and 09.68% cases of mid to lower cervical were either brought dead or died within six hours. 45.16% cases of mid to lower cervical, 37.5% cases of upper cervical region, 33.97% cases of mid cervical, 29.17% cases of lower cervical and 23.08% cases of upper to mid cervical region succumbed to the injury after a period of one week. 46.15% cases of thoracic injuries died after one week, 30.77% cases died in one day to one week, 15.38% cases died on spot or in six hours and rest 7.7% cases died in six to twenty four hours. In injuries caused to lumbo-sacral region of spine, it was observed that 25% cases each died either on spot or within a week. Rest 50% cases suffered fatality after one week's time. No case of lumbo-sacral injury suffered fatality in six to twenty four hours.

## Conclusion

Spinal injuries were commonly observed in day to day accidents and also displayed reasonable fatality. Fatality resulting from spinal injuries was delayed in most cases thus implying the need for timely and effective intervention for prevention of mortality. There is a need to increase the establishment of specialized spinal injury management centers across the country. Early referral and transfer of patients from peripheries to specialized centers needs to be encouraged for further preventing mortality. Thus, more tertiary trauma care centers should be established with efficient services for spinal injuries.

Steps must also be taken to improve injury surveillance and the quality of data collected. Detailed and relevant studies on larger samples will guide prevention efforts aimed at risk factors in the individual and the environment and provide feedback to trauma care providers. Further monitoring of these trends will influence training, improve the focus of the trauma service and direct the provision of more effective care to these severely injured patients.

## Limitations of the Study

Anything that is perfect is dead. The thesis/ dissertation is alive due to its limitations. No scientific study is ever over without limitations. Postmortem studies arguably have additional limitations. There are multiple confounding factors which need to be considered.

1. All the above data was recorded as per available information and medico-legal examination but was not cross tallied with police investigation records.

2. The data recorded was on the basis of Hospital records and verbal questionnaire and history given by attendants of the victim or deceased.

3. The study is limited to the outcomes of the incidence. Due to lack of interview with the persons available at the site of incidence, the factors that contributed to the cause of trauma is unknown and hence not included in the study.

4. Limited sample size and minimal detailing for few variables.

5. Spinal cord dissection was carried out on autopsy in cases with observable vertebral injures, thus missing out cases of spinal cord trauma without injury to bony encasement.

## Recommendations

I. RECOMMENDATIONS FOR THE TREATING DOCTORS TO PREVENT THE MORTALITY IN SPINAL INJURIES

All the cases of trauma must be properly evaluated for spinal injuries and promptly managed to prevent mortality and morbidity.

Preventive measures like intermittent catheterization, aseptic procedures in setting up intravenous line, chest physiotherapy and pulmonary toileting to reduce mortality from sepsis.

Special care and attention should be given and frequent turning of patients must be done to prevent bed sores help to prevent bed sores and other complications leading to death due to septicemia and multi organ failure.

Regional Tertiary case specialized Spinal injury centers should be established and early referral of cases with Traumatic spinal injuries should be encouraged to such specialized centers to reduce mortality in these cases.

**III. RECOMMENDATIONS TO DECREASE THE INCIDENCES OF TRAUMATIC SPINAL INJURIES**

high speed vehicles should be with well equipped safety measures.

High speed interceptors should be installed at all major roads and highways.

Bikers should be made aware about the safety gears and sensitized beyond just traffic mandatory gears.

Extended neck protection helmets should be promoted for sale by subsidy and promotional money awards.

Substance abuse while driving and pedestrian use should be discouraged.

Workers should be educated about basis safety standards and equipment like ropes and harnesses to be used while cutting trees, working on high rise buildings and under construction projects.

Preventive measure must be compulsion on heights for people at risk.

# An Analysis of Trends of Homicidal Deaths in Western Mumbai Region

**Rajesh B. Sukhdeve[1], Sachin S. Sonawane[2], Shashank Tyagi[3]**

*[1]Associate Professor Department of Forensic Medicine, H. B. T. Medical College, Mumbai, [2]Professor Department of Forensic Medicine, H. B. T. Medical College, Mumbai, [3]Assistant Professor Department of Forensic Medicine, H. B. T. Medical College, Mumbai*

## Abstract

**Background:** The present study conducted for evaluation of trends in homicidal deaths with references to study the specific parameters of homicidal deaths like incidence of homicide, socio-demographic profile of victims and type of weapon used for homicide in western Mumbai region over the period of two years.

**Method:** Study was conducted in department of forensic medicine of H. B. T. Medical College & cooper Hospital, Mumbai for period of 2 years from January 2015 to December 2016. Total 3114 of autopsies were conducted during the period of which 66 (2.11%) were of homicidal deaths.

**Result:** Present study found homicidal deaths accounted for 2.11% of autopsies conducted in study period. Predominance of male victims (54.5%) seen over female victims (45.5%). Maximum number of victims of homicide were in the age group of 21-40 years (60.6%). Most of homicides took place at victim 's residence 45.45%. Arguments (45.45%) were found to be most common motive behind homicide. Hard and blunt weapon (39.4%) is commonest type of weapon used.

**Conclusion:** The trends of homicides are varying from region to region. In most of cases the victims are well acquainted with accused and most common place of crime was victims own house all these findings indicated that homicides were as result of arguments and scuffle between them. The victims in this young age group are more aggressive and less tolerant, proper anger and stress management through the psychiatry counselling of this age group may lower homicide rate.

***Key words:*** *homicide, autopsy, arguments, hard and blunt weapon.*

## Introduction

Homicide is the killing of human being by another human being .There are two types of homicides i) lawful which includes excusable and justifiable homicide ii) unlawful or culpable homicide(sec.229 of IPC) which includes culpable homicide amounting to murder(300 of IPC)and culpable homicide not amounting to murder(304 of IPC).[1] To constitute the offense of murder the two elements are i.e. Mens rea means guilty mind or preplanning with afore thought and actus reus means actual execution of planning are essential. While in offense of culpable homicide not amounting to murder the first component of preplanning i.e. mens rea is absent. The offense of culpable homicide not amounting to murder is often committed by sudden and grave provocation during the scuffle or arguments.[2]

The Mumbai western suburbs have population approximately 6.2 million. There are various offenses affecting the body like rape, attempt to murder, grievous hurt, abetment of suicide, kidnapping etc. of which homicide is most heinous crime against the body known to mankind right from old civilisation to present day. It has grave implication on society. The detection and separation of such offender from society is matter of

**Corresponding author**:
**Dr. Sachin S. Sonawane;**
email – sachinsonawane105@gmail.com;
Mb No.8976224403

vital importance for maintaining safety and security in the entire society. The identification of profile of risk factors of victim of homicide may prevent or reduce the rate of homicide. Therefore, this study was conducted to evaluate the incidence and trends of committing homicides for the cases which are brought to autopsies at department of forensic medicine at H. B. T. College, Mumbai for period of two-year 2015 and 2016.

## Material and Method

The present prospective study is conducted in the department of forensic medicine and toxicology at H.B.T. medical college for the period of two years i.e. 1st January 2015 to 31st December 2016. The data includes cases of homicide referred for post mortem by police station from western Mumbai (western suburbs) region which comes under the jurisdiction of H. B. T. medical college.

**Inclusion criterion:**

1. All case investigated by investing officer under 302 of IPC.

2. The cases with no history of homicide at the time of death but turned to be homicide after autopsy.

**Exclusion criterion:**

1. Cases of infanticides.

2. Custodial (judicial and police) homicides.

The proforma was prepared with different parameter used in study like age, sex, occupation marital status, place of incidence, survival period, motive, accused – victim relation and weapon of offense. The information about the socio-demographic profile of cases was obtained from police inquest, ADR forms, statement of relatives of victims, hospital papers and history obtained from relative, friends accompanying with deceased person. Details of crime scene are obtained from crime scene visit or photographs of crime scene.

## Result /Observation

**Table 1: Total number of autopsy and its relation to homicide autopsies**

| Period | Total autopsies | Homicidal autopsies (%) |
|---|---|---|
| Jan 2015-Dec 2015 | 1524 | 35(2.3) |
| Jan 2016-Dec 2016 | 1590 | 31(1.9) |
| Total | 3114 | 66(2.11) |

Total 3114 autopsies were conducted in period of 2-year Jan 2015- Dec. 2016 out of which total 66 (2.11%) cases were of homicide.

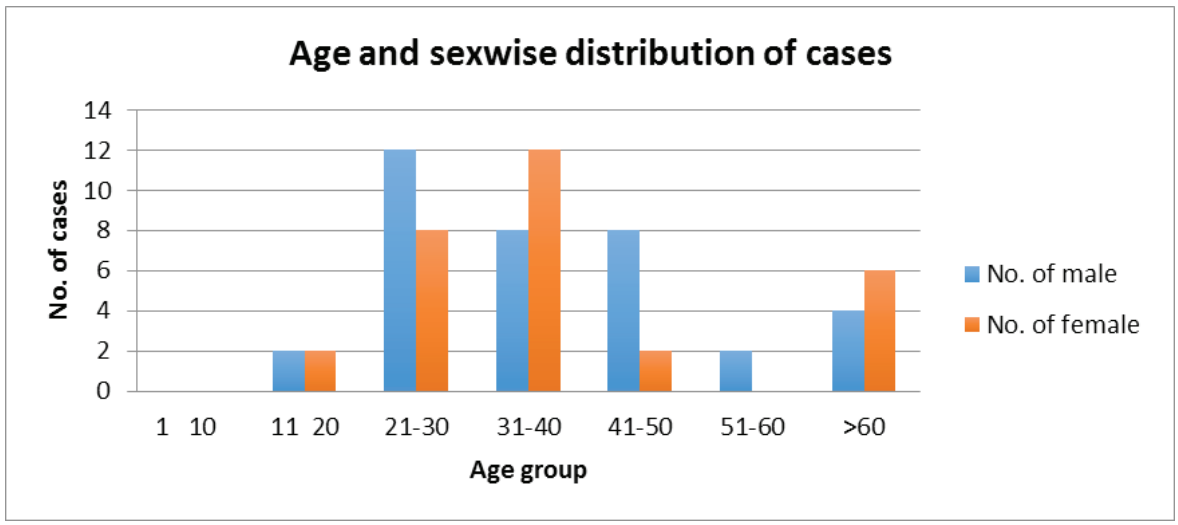

**Chart 1: Distribution of victims according to the age and sex.**

The study reveals the predominance of male victims 36(54.5%) over female victims which account for 30 cases (45.5%). Maximum and same number of victims each 20 cases (30.30%) were found in the age group of 21-30 and 31-40. Victims less than age of 1 year (infanticide) is excluded from study. No case of homicide is reported in age group of 1-10 years. 60.6% homicides were occurred in age group 21-40 years, however least numbers of victims were in the age group of 51-60 years 2 (03.03%).

**Table 2: Socio-Demographic profile of victims**

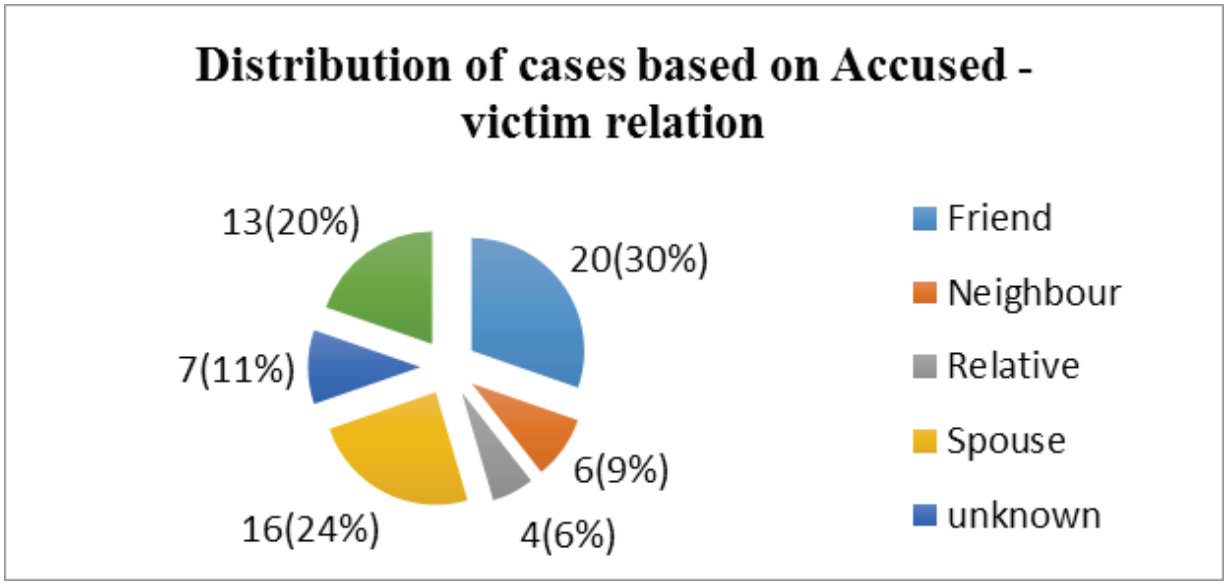
| **Occupation** | **Number of cases** | **Percentage** |
|---|---|---|
| Student | 6 | 09.09 |
| Housewife | 12 | 18.18 |
| Labourer | 8 | 12.12 |
| Salaried/job | 16 | 24.24 |
| Own business | 13 | 19.69 |
| Acting | 4 | 06.06 |
| Retired | 7 | 10.60 |
| Marital status | | |
| Married | 41 | 62.12 |
| Unmarried | 19 | 28.78 |
| Divorcee | 2 | 03.03 |
| Widow/widower | 4 | 06.06 |
| Place of incidence | | |
| Victims house | 30 | 45.45 |
| Assailant house | 10 | 15.15 |
| Remote place | 12 | 18.18 |
| Work place | 8 | 12.12 |
| Street | 6 | 09.09 |

It was observed that most of victims 16 (24.24%) belongs to occupation of salaried /job either in government or private sectors followed by victims with own business 13 (19.69%). Housewives accounts for 18.18% cases.

Majority of victims of homicides were married and accounts for 62.12% (41) cases. Unmarried victims accounts for 28.78% cases. Widows/widower accounts for 6.06% cases and divorcee accounts for 3.03% cases.

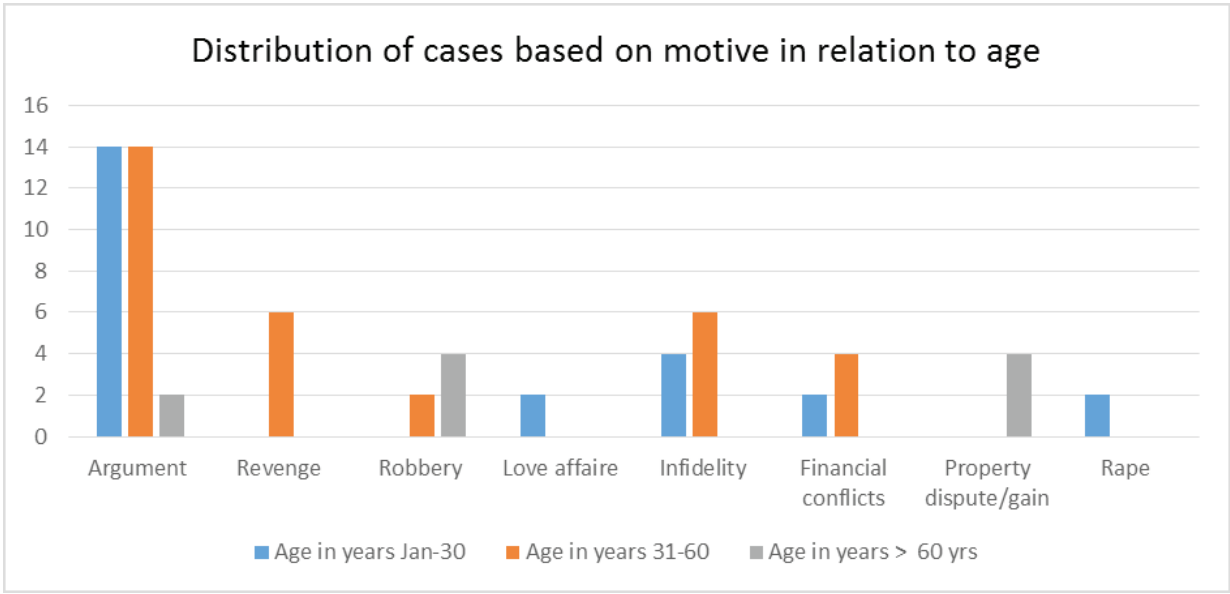
The commonest place for the homicide observed was victims own house 30 (45.45%) followed by remote place 12 (18.18%) and assistant house 10 (15.15%).

Chart 2: Distribution of homicide according to accused victim relation.



It was observed that in majority of cases accused was friend 20(30%) followed by spouse 16(24%) of victim. Relative 4(6%) of victims were found in least cases.

**Chart 3: Motive wise distribution of victims in relation to age:**



Arguments were most common motive behind the homicide, followed by Revenge, robbery, and financial conflicts which constitutes 9.09% each. Argument is most common motive in young age group (1-30 years) which comprises of almost 58.33% of cases. However, the robbery and property gain were comprising of 40% of cases each in old age group (>60 years)

**Table 3: Type of weapons used in cases**

| Sr. No. | Type of weapon | No. of cases | Percentage |
|---|---|---|---|
| 1 | Sharpe edged | 24 | 36.36 |
| 2 | Hard and blunt | 26 | 39.39 |
| 3 | blunt weapon + Sharp | 2 | 3.03 |
| 4 | Ligature material | 10 | 15.15 |
| 6 | Ligature + manual Strangulation | 2 | 3.03 |
| 7 | Thermal burn | 2 | 3.03 |
| 8 | Total | 66 | 100 |

Hard and blunt weapon is most commonly used weapon of offense and observed in 39.39% cases, followed by sharp edged weapon in 36.36% of cases. In 3.035 cases both sharp edged and blunt weapon was used.

## Discussion

During the study period total 3114 autopsies were conducted of which 66 were of homicide accounting 2.11% of total autopsy done over period of two year i.e. Jan 2015 to Dec 2016. Findings of our study were consistent with study of Shailesh Jhaveri , Sandip Raloti et.al study 2.31% in the city of Surat 3 , Dhaval J. Parmar, Love R. Bhagora et.al 2.4%. In Bhvanagar city 4 and some extent to study of Prashanth Mada, P. Hari Krishna where homicide comprises of 3.24% of total autopsies in Hydrabad region5, study of Dr. Basappa S. Hugar, Dr. Girish Chandra Y P et.al 4.32% conducted in Bangalore region.6 However findings are in contrast with Sachidananda Mohanty, Sujan Kumar Mohanty et.al. study where homicides constitute 6.9% of homicides[7], B. C. Shivakumar study 4.76% 8and Ashok K. Rastogi study 4.25%. 9 These differences are due to variation in geographical and development of different region of India. Percentages of homicides are more in southern region in comparison of western region of India.

Our study shows predominance of male victims (54.5%) which is consistent with Sandip Raloti3, Dr. Basappa S. Hugar [6], Dhaval J. Parmar 4, B. C. Shivakumar study8 Prashanth Mada5 Sachidananda Mohanty7 and Ashok K. Rastogi study.[9]

The most important finding of the study is the commonly affected age group of victims, 21-30, 31-40 years and each contributes for 30.30% of cases which together comprises for 60.60% cases. Findings of our study Correlates with other studies such as, Sandip Raloti3, Dhaval J. Parmar4, Prashanth Mada5, Dr. Basappa S. Hugar6, Sachidananda Mohanty7, B. C. Shivakumar study8 and Ashok K. Rastogi study9. In all these studies there is predominance of victims of age group 21-40 which comprises of more than 60% of cases. The high incidence of cases in the age group of 21-40 may be due to person in this age group are more aggressive, short tempered and least tolerant which leads to arguments and scuffle and ultimately end to crime of homicide. The study shows overall predominance of male victims which is consistent with study of Sandip Raloti, Prashanth Mada5 Basappa S. Hugar6, Sachidananda Mohanty[7], Dhiraj Buchade[10].

Present study reveals the most common place of occurrence of homicidal attack was the victims own house 45.45% which indicates that most of homicides accused and victims were closely related with easy access to victim's home. The victims and accused were well acquainted with each other. The findings were similar to study of Prashanth Mada[5] and Dr. Basappa S. Hugar[6]. Argument and scuffles between accused and victims was the most common motive found in this study (45.45%). The most common motive of homicides scuffle and arguments indicates that homicides were not predetermined and planned. The arguments and scuffle with sudden and grave provocation leading

to death of victims. The findings were consistent with study of Prashanth Mada5, Ashok K. Rastogi9, However, inconsistent with study Basappa S. Hugar6, Sachidananda Mohanty7 and B. C. Shivakumar study 8 which reveals the enmity /revenge as common motive behind the homicide.

The present study found commonest type of weapon used in homicides was hard and blunt weapon (39.39%). The findings were consistent with study of Prashanth Mada5, Ashok K. Rastogi 31.7%9 Dhiraj Buchade et.al 37.2% 10. Where common weapon of choice was hard and blunt weapon. Use of only hard and blunt weapons for homicide could possibly be unpremeditated/ unplanned aggressive/ explosive response of person to sudden and grave provocation in arguments primarily. These hard and blunt objects were easily available. The findings were contrast with Dhaval J. Parmar et.al.4, Basappa S. Hugar6, Sachidananda Mohanty7, and B. C. Shivakumar8 where the common weapon of choice was sharp and pointed weapon. However, the studies of Basappa S. Hugar6 Sachidananda Mohanty7 and B. C. Shivakumar8 also shows contrast in motive of homicide which was revenge/enmity. Exclusive use of sharp-edged weapon observed in (36.36%) homicidal cases. The use of only sharp-edged weapon points towards premeditated/planned crimes with motive of robbery, revenge or property dispute.

## Conclusions

The trends of homicides are varying from region to region. The social and demographic factors are affecting the crime of homicide.

Most common age group involved in homicide was 21-40 years 60.60%, the victims are well acquainted with accused and most common place of crime was victims own house all these findings indicated that homicides were as result of arguments and scuffle between them. The victims in this young age group are more aggressive and less tolerant, proper anger and stress management through the psychiatry counselling of this age group may lower homicide rate.

The sharp and pointed weapon was used as weapon of choices in planned homicide with motive of revenge or robbery. However hard and blunt weapon was used as weapon of choice in unplanned/ unpremeditated homicides as easy availability of these weapons.

# Evaluation of Perception of II Year MBBS Students Regarding A Clinical Forensic Medicine Module in a Tertiary Care Centre

**Ravindra Baliram Deokar[1], Harish Manilal Pathak[2]**

*[1]Professor (Additional), [2]Professor & Head, Department of Forensic Medicine and Toxicology, Seth G.S. Medical College & KEM Hospital, Mumbai, Maharashtra, India*

## Abstract

**Background:** Besides providing treatment to patients in medico legal cases, a competent medical practitioner is legally bound to collect all necessary evidence material from the body of patients which may help in the investigation of the crime and to aid in the court of law towards justice. In India, the current practice of theoretical teaching of students in Forensic Medicine towards handling medicolegal cases is not enough to deliver clinical skills effectively in handling medico-legal cases.

**Aims & Objectives:** This study was undertaken with objectives to evaluate students perception on Clinical Forensic Medicine and impart them a hands on training towards handling antemortem medico legal cases.

**Material & Method**: It was an educational interventional study, including 125 second MBBS undergraduate students. At the end of module, the students' responses towards educational project on Clinical Forensic Medicine were collected in the form of a pre-validated questionnaire template.

**Results & Conclusion:** About 52 % students responded as agreed and 29 % strongly agreed with the questionnaires at the end of this module. Students favoured Clinical Forensic Medicine Module as an effective teaching/learning method to learn on the basics of handling medico legal cases.

***Keywords:*** *Case based teaching, Medico legal cases, Clinical Forensic Medicine.*

## Introduction

The current practice of teaching Forensic Medicine to students in India is not able to deliver effectively clinical skills in handling medico-legal cases is a matter of concern1. As per section 39 of Criminal Procedure Code of India, any person who is aware of the commission of an offense by any person in relation to the human body is bound to report such commission of offense to the law enforcement authorities i.e. the police or the magistrate[2].

A medical practitioner is constantly exposed to such information about the commission of a crime as they are in a position to treat patients who are suffering due to crime committed by any person. Apart from conveying this information to the police/magistrates, a medical practitioner is also legally bound to collect all necessary evidence material from the body of patients which may help in the investigation of the crime. It is the discretion and the duty of a doctor to judge a medical case and to assess whether there is a possibility of any crime or not.

Legal court may sometimes refer cases to a medical doctor for the purpose of identification, age estimation, etc.; such cases are generally identified as Clinical Forensic Medicine cases. The training of handling of such medico-legal and clinical forensic medicine cases is given to a medical student during the second year of the MBBS course.

It can be argued that second-year MBBS students may lack awareness about the importance of learning to handle medico-legal cases, probably due to non-exposure to emergency cases at that time. Hence, a dedicated module to teach clinical forensic and medico-legal cases to second-year MBBS students along with hands-on training can impart them with skills required to deal in such cases. It is essential that opinion of one of the main stakeholders that is the students towards this module be taken to assess the usefulness and impact of this module.

## Objectives

This study was undertaken with following objectives:
1. To evaluate students perception on Clinical Forensic Medicine.

2. To impart a hands on training to undergraduate students towards handling antemortem medico legal cases.

## Methodology

Study type: Educational interventional study.

i. Protocol was submitted to Institutional Ethics Committee & IEC Permission will be taken.

ii. Study volunteers: The second undergraduate students of Seth GSMC & KEMH were included in this project. The written informed consent of participants was taken.

iii. Inclusion criteria: The students giving consent voluntarily were included in the study.

iv. Exclusion criteria: First & Third year MBBS students were not included in the study.

v. Study variables: questionnaire with Five point Likert scale used for assessment.

Vi. Faculty were trained specifically for this module to conduct training sessions.

vii. Training sessions:

For the teaching of undergraduate students in Clinical Forensic Medicine, the broad goal is to have the knowledge, skills and behavioral attributes to function effectively as the first contact Medico-legal experts. This course introduced the systematic instruction to undergraduate students in the principles and practice of Clinical Forensic Medicine, including medico legal cases of age & injury by way of lectures, practical demonstrations on subjects or video. In the project, 125 undergraduate students of Seth GSMC & KEMH were taken into consideration with voluntary will to participate. The written informed consent of participants had been taken. Besides lectures, video demonstrations, they were subjected to hands on training in small groups towards handing medicolegal cases such as age & Injury and training given towards preparation of medicolegal reports & expert opinions to investigating agencies.

The project had been completed for the MBBS undergraduate students with 125 students. The batch of 125 students divided in the groups of 25 to 30 students for small group demonstrations. The module was applied to this batch to all participants. The students' responses towards educational project on Clinical Forensic Medicine were collected in the form of a pre-validated questionnaire template.

The perception of students collected in a questionnaire form containing 20 questions viz. I found the teaching method enjoyable; The questions stimulated me to think; The discussion aroused curiosity about the topic & generated lot of new ideas; The method was a useful way to understand the topic; I think the role of teacher as facilitator is important in this method; I was attentive throughout this class; I am rarely bored throughout this course; I am able to memorize what I need; The teaching method facilitated my participation; I found the method to be good for clearing doubts which I had after the initial lecture; Much of what I have to learn seems relevant to a routine clinical medical practice; The teaching method will help me in applying the knowledge in my clinical practice; The programme develops an understanding of application of Clinical Forensic Medicine in clinical practice; It creates interest in subject; The course helps to perform better in University Examination; I would like all practical topics to be covered using the same method; I found the course relevant; I satisfied with the level of my Participation; Case based training in Clinical Forensic Medicine is need of hour; Teaching made us confident towards handing medico legal cases more competently; respectively. The responses were 1-strongly disagree, 2- Disagree, 3- Uncertain, 4- Agree, 5-Strongly agree. The data collected was analyzed.

## Results

About 52 % students responded as agreed and 29 % strongly agreed with the questionnaires of this module [Table 1]. There were 16 % students who were not able to decide whether this module is going to improve their medico-legal knowledge and its use in clinical practices [Table 1].

**Table 1: Overall Students response to Questionnaire**

| Score | OVERALL SCORE | | Percentage (%) |
|---|---|---|---|
| 1- SD | STRONGLY DISAGREE | 13 | 1 |
| 2-D | DISAGREE | 60 | 2 |
| 3-U | UNCERTAIN | 389 | 16 |
| 4-A | AGREE | 1312 | 52 |
| 5-SA | STRONGLY AGREE | 726 | 29 |
| | Total | 2500 | 100 |

For most of the question response for students were either agreed and strongly agreed [Figure 1, 2, 3 and 4] for Clinical Forensic Medicine module as a method of teaching medico-legal aspects and for the method used to deliver this module by video clips and small group case discussion in addition to Lecture. The graphical representation of participant's responses to questionnaire 01 to 20 was shown in figure 01 to 04.

**Figure 1: Proportional Bar Diagram presenting Response Distribution for Q1 to Q5**

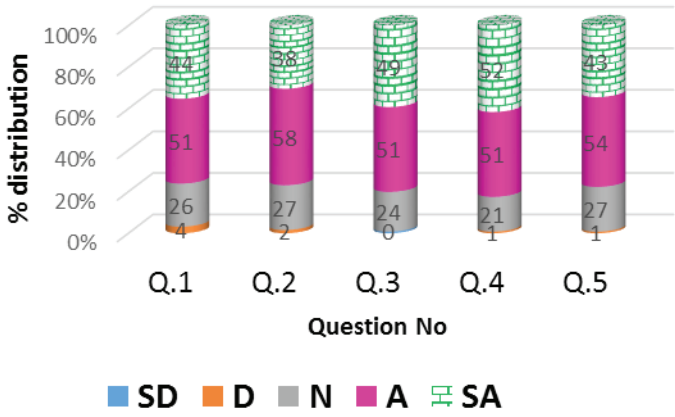

**Figure 2: Proportional Bar Diagram presenting Response Distribution for Q5 to Q10**

## Discussion

Division of Clinical Forensic Medicine is a recent entity which deals with practice of physically examining and assessing a living person who is alleged to be a victim of assault or assessing the alleged culprit of the crime. It includes participation from various other departments such as pharmacology and criminology[1,3].

One of the core competencies of an Indian Medical graduate as per Medical Council of India is that they should know to describe the importance of documentation in medical practice in regard to medico-legal examinations, Medical Certificates and medico-legal reports1. This would include being able to make observations, carry out proper physical examination (Medico-legal) and documentation/reporting of a living person alleged to have been injured as per prescribed and accepted format. He should have knowledge of preservation of relevant biological and also be able to estimate Age for certification. However, until recent past this essential information was delivered in Forensic Medicine through Lectures. However, a shift in teaching system has been initiated world-wide with transition towards an active learning format for delivering such information. Clinical Forensic Modules is a way forward to enlighten students on these aspects which is usually done in small group with discussion on a case scenario or video clipping or clinical rounds. Currently in India, Program on Clinical Forensic Medicine in which evaluation of a living victim is carried out by trained medico legal person has not evolved and also not implemented everywhere[1].

It has also been found that Physicians involved in assessment and treatment of victims of violence or accidents have minimal or no training in forensic aspects of trauma. This would result in overlooking of evidence and sometimes loss of evidence as it would

have been discarded4. Another important skill required is appropriate documentation of evidence which would assist Pathologists, police and legal authorities in the forensic aspects of an investigation5.

It is expected from a medical graduates performing physical examination to be well versed with basic forensic skills to handle medico legal cases. Therefore, this study was undertaken to apply principles of active learning and assess students satisfaction on their learning experience with this Clinical module.

In the present study most of the students (81%) had a good learning experience with this module with reference to enjoyable experience, stimulation to learning, and aroused curiosity about topic. Students who participated in this Clinical module study found the delivery of method useful to understand the topic better. In addition, Students opined that Clinical module and active participation helped them in memorizing and clearing of doubts. Learning seemed to be relevant to them for a routine clinical medical practice and also helped them in applying the knowledge in clinical practice programme. This method developed an understanding in them of application of Clinical Forensic Medicine in clinical practice.

Students felt they can perform better in university examination if they are trained by this module. An acceptance to this module by students encourages implementing this Clinical module as students understanding would improve and will make them competent in Clinical application of Forensic Medicine in medico-legal cases.

More than 80% students (either agreed or strongly agreed) that practical should be covered by this method. Case based training in Clinical Forensic medicine is need of hour, and teaching by this method has given them confidence to handle these medico legal cases. It is essential to take opinion from students too as they are main stakeholders when we design or implement Programs which are not a routine. In this study it was welcoming feature to note students wanted case based learning for other modules as well.

In a relatively similar study done on II MBBS students by Mohite et al revealed comparable results. They concluded in their study that reframing of curriculum with introduction of Clinical posting in Forensic Medicine is need of hour for enabling medical graduate with skills of handling medico legal cases6.

Ingole et al in their study on early Clinical exposure to medico-legal cases documented that implementation of this critically designed module, definitely improved knowledge and skills of students.[7] They discussed that Clinical Posting should start in 4 and 5th semester and have casualty Posting of Interns under forensic Medicine as compulsory which is currently optional in India7.

Overlooking of evidence or errors in documentation due to ignorance by physician may weaken the case for innocent and offers easy escape for the guilty. Hence, medical practitioner must have an adequate knowledge of documentation, policies and dealing of such cases. Solution to this essential lacuna would be routinely training medical students by Clinical Forensic Medicine Module through active learning for topics that requires them to have good knowledge and skills in handling medico-legal cases.

It is hoped that implementation of Clinical Forensic Medicine Program will give an opportunity to the present staff of Forensic Medicine to teach students all clinical medico-legal aspect in an efficient way. This will help definitely to improve the medico-legal examination and medico-legal report writing.

## Conclusion

Students favoured Clinical Forensic Medicine Module as an effective teaching/learning method to learn basics of Medico-legal issues and protocols for them to perform efficiently in Professional examination and also as Medical graduates in future. The approach and tool used in this Module for teaching principles and practice of Clinical Forensic Medicine, including medico legal cases of age & injurywas accepted by students as a good learning method and hence this study demonstrates students acceptance towards active learning method for better understanding of medico-legal issues.

# A Retrospective Study to Determine the Type of Offence Committed by the Juveniles in the Reformatory Schools of a Capital City of India

**Richa Choudhury[1], Neeharika Mishra[2], Pradeep Kumar Yadav[3]**

*[1]Associate Professor & Head, Dept. of Forensic Medicine & Toxicology, Dr RMLIMS, [2]Student, MBBS IInd Year, DrRMLIMS, [3]Senior Resident, Dept. of Forensic Medicine & Toxicology, DrRMLIMS*

## Abstract

**Background:** Juveniles of today will become the adults of tomorrow, the face of the world. Hence, it is of utmost importance to make sure that the youth of nation are given a wholesome protected environment to thrive and grow in. Aim of the Study: Our study was focussed on retrospectively studying the type of offence committed by the juveniles in the reformatory schools. Material & Method Both male and female inmates of the reformatory schools were studied for the unlawful acts which landed them into the Reformatory schools. Observation & Results: The percentage of boys and girls involved in non-heinous and other offences was 36.5% and 33.3% respectively; but this association of type of offence with gender was found to be statistically non-significant ($p>0.05$).There were 103 cases of sexual offences, maximum Cases were of POCSO. Conclusion: Comprehensive violence prevention plans in all spheres of life, i.e. homes, schools, communities to reduce and prevent juvenile delinquency. Special programmes should be designed to prevent sexual reoffending among these juveniles. Development of facilities for counselling and psychological and psychiatric treatment as well as introduction of Juvenile mentoring programs is highly recommended in reformatory schools.

***Keywords:*** *Juvenile delinquency, Comprehensive violence prevention plans, sexual reoffending, Juvenile mentoring programs.*

## Introduction

Juveniles of today will become the adults of tomorrow, the face of the world. Hence, it is of utmost importance to make sure that the youth of nation are given a wholesome protected environment to thrive and grow in. As we are all aware that children come under one of the most vulnerable groups of societies which makes them more prone towards risk of many social evils. Hence it should be considered a priority to provide them with a protective environment with adequate loving care for their appropriate growth and development.[1] According to many studies on adult law offenders, it has been found that they had a history of being a juvenile offender in their teenage[2,3]. It has been recommended that the juvenile delinquents should be given special care and there psychological and risk assessments should be done to prevent recidivism in future.[4,5]

The main purpose of this study is to find out violence assessment of juvenile delinquents. We also wish to address the juvenile related factors associated with violence risk. These results could be utilised by health professionals to initiate appropriate treatment either via psychotherapy or counselling for averting violence episodes and crime prevention in future.

Persons, who have not attained eighteenth year of age at the time of commission of offence, are tried as juveniles under the law. The sentences are comparatively lenient and the major focus is given to rehabilitation to make these child offenders good citizens of the future. The children and adolescents can be reformed by proper nurturing and providing the right guidance. Juvenile Delinquency in India is a major problem. Some research has been done in this sphere, to understand and effectively deal with the situation.

Our study was focussed on retrospectively studying the type of offence committed by the juveniles in the reformatory schools. The purpose behind this study is to assess the causative factors behind the unlawful acts of juveniles and to assess the current psychological state of the juveniles.

## Material & Method

We had conducted this study on the juveniles of government Reformatory schools in the capital city of Lucknow (Rajkiya Bal Sudhar Grah boys and Rajkiya Bal Sudhar Grah, Girls,Barabanki). All the willing inmates who gave their consent for participation were included in our study. Both male and female inmates of the reformatory schools were studied for the unlawful acts which landed them into the Reformatory schools. The data collection was done in a phased manner. Permission was taken from the concerned authority, i.e. the Juvenile Justice Board Magistrate to meet and interview the juvenile inmates.

All the collected data was analysed in the form of tables and charts. The inmates were divided in two groups i.e. below 16 years of age and above 16 years of age. The type of offence committed whether non-heinous crime or a heinous crime was recorded. The number of inmates who were involved in sexual crimes was also noted separately. Presence or absence of drug abuse was also noted. The type of addiction and age of onset was asked.

## Observations and Results

**Table-1:Division into two groups-total 126 boys, girls 42**

| Serial no. | Age of Juvenile | Boys | Girls |
|---|---|---|---|
| 1 | Age <16 | 46 (36.5%) | 7 (16.7%) |
| 2 | Age >16 | 80 (63.5%) | 35 (83.3%) |
| | Total | 126 | 42 |

The percentage of boys aged <16 years and >16 years was 36.5% and 63.8% respectively, and the percentage of girls aged <16 years and >16 years was 83.3% and 16.7% respectively. The percentage of boys aged <16 years (36.5%) in remand home was significantly higher ($p<0.05$) than girls aged <16 years (16.7%).

[chi-square test]

**Table-2:Type of Offence**

| Serial no. | Type of offence | Boys | Girls |
|---|---|---|---|
| 1 | Heinous offence | 77 (61.1%) | 28 (66.7%) |
| 2 | Non heinous offence* | 48 (38.1%) | 14 (33.4%) |
| 3 | Others* | 1 (0.8%) | 0 (0%) |
| | Total | 126 (100%) | 42 (100%) |

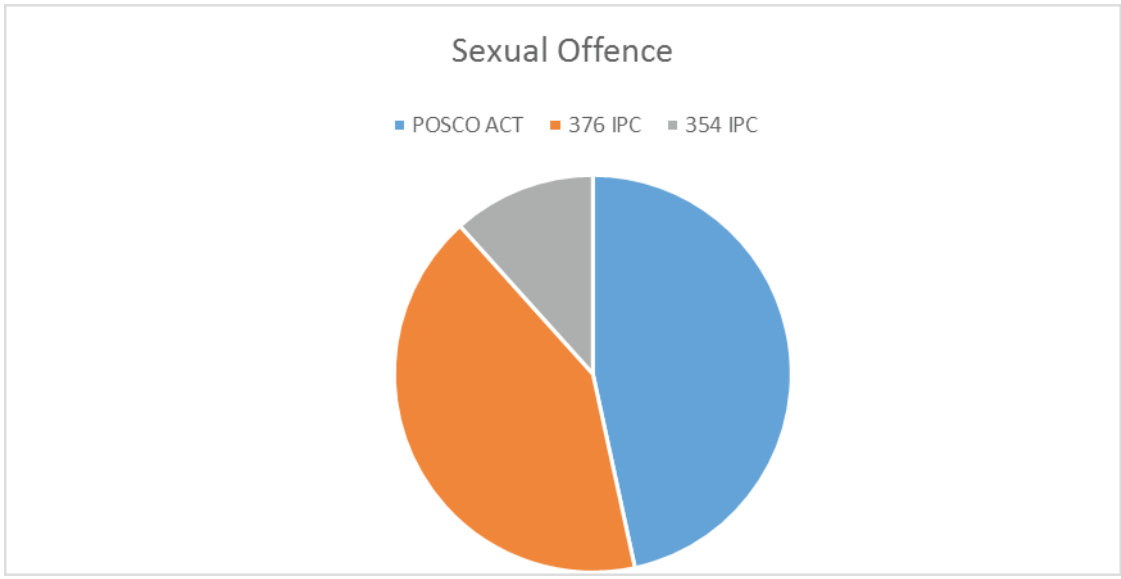
* These groups were merged for statistical purpose.

The percentage of boys and girls involved in non-heinous and other offences was 36.5% and 33.3% respectively; but this association of type of offence with gender was found to be statistically non-significant ($p>0.05$).

[chi-square test]

**Table-3: Sexual offence**

| Serial no. | Sexual offence | Cases |
|---|---|---|
| 1 | POCSO Act | 48 |
| 2 | 376 IPC | 43 |
| 3 | 354 IPC | 12 |
| | Total | 103 |



## Discussion

Our study reveals that the major part of the population of juvenile offenders in remand homes belong to the age group of older than sixteen (63.49%). This finding is significant as it may point towards the increasing tendency of older adolescents to commit crimes. The reasons may vary. Increased testosterone levels in this age group may contribute greatly to the tendency to commit violent and sexual crimes. Greater levels of testosterone have been linked to aggression by various studies.[6,7,8,9] Dominating behaviour may also be a result high testosterone.[10,11] The greater rate of crimes in this age group may also be due to association with adult criminals.

73.57% of the female inmates are older than 16. Some of the girls were even eighteen years old and one of them was twenty-one. These findings indicate the same trend of increasing rates of crimes in older adolescents. It was also observed that the age group of older adolescents committed more violent and heinous crimes than the younger population, including murder and assault. The rising aggression in older females could be due to hormonal changes. The younger population in general committed relatively minor crimes like theft and fraud.

The juveniles belonging to more affluent sections have mostly been arrested under the charges of rape. Many of them were in consensual relationships. This is a very typical scenario in the present age where advantage of existing archaic laws is taken for personal revenge. Despite engaging in sexual activities with full consent, the boy was found guilty of rape as the legal age for consent is 18. Perhaps it is indeed time to review and change the legal age of consent. The ages of attaining puberty in general have been declining indicating earlier onset of puberty.[12,13,14,15] In addition, trends of increasing age of marriage and westernization and liberalization of attitudes towards sexual relationships lead to greater number of teenage relationships. The dynamic, changing attitudes of the society must be contemplated and laws be amended.

A whopping 61.11%of the male juveniles and 66.67% of female adolescents have committed heinous crimes, which are crimes so grave that they have to be tried in courts as adults. These include rape, murder etc. This disturbing observation raises various questions. What causes children and adolescents to commit such grave crimes? Can this be predicted or prevented? 10% of boys were booked under the POCSO Act and 34.13% under IPC 376, rape. The alarmingly high number of sexual offenses including child rape may be because of increasing sexualization of youths in films and media, easy access to pornographic material and repression of sexuality in the Indian culture. Hormonal levels may also be at blame as studies have linked violent sexual crimes and repeated sexual offences to high levels of testosterone [16] . In the rural settings, penetration of internet and quick, effortless access to pornographic films and violent videogames may be at blame. Sex is considered a taboo and society refuses to discuss it, but it

needs to be openly talked about to create awareness and propagate information. Lack of sensitization towards the opposite gender may also be at blame. The current trends regarding violent sexual crimes are discerning. Various studies provide solid evidence suggesting increase in chances of violence and aggression amongst youngsters due to violence in media. This may be due to the tendency of youngsters to emulate observed behaviour. The research by Anderson et al emphasises the link between media and violence.[17]

An extremely disturbing trend observed was the massive number of female juveniles convicted for murder. 45.25% of the girls had committed murder. The reasons for this finding are not properly understood. This must be delved into and studied deeply by further research. Some girls may get involved in romantic relationships and try to elope. When objected by parents and other people they may commit murder due to anger and frustration. Many female inmates have been arrested under Dowry Prevention Act, Section 498 IPC for cruelty to wife by husband or relatives and Section 304 B for dowry death. The girls arrested under Section 498 are mostly sister in laws that get entangled in the family altercations.

Some inmates showed recidivism, they were arrested many times for various offences. These individuals must be given special attention and the underlying causes should be assessed. Upon offering proper guidance, we can come a long way in preventing future crimes. By providing education and vocational courses, social support and rehab facilities, we can effectively reduce the recidivism rates. The stigma attached to convicts need to be eliminated to ensure their assimilation into the mainstream society and rehabilitation.

An important aspect to be looked into is the mental health of the juveniles. It is difficult for these teenagers to stay away from their families and homes. The lack of familial support at this crucial time is very difficult for the juveniles. The contribution of family in the mental health of juveniles cannot be overlooked.18 The Company of other convicted adolescents especially for violent and aggressive crimes, may not be very welcoming. A strong supportive network is extremely essential for maintaining good mental health. The remand homes must strive to provide a nurturing and fear free environment for growth and wholesome development of the juveniles.

## Conclusion

We suggest appropriate measures should be taken to prevent youth victimization and violence, which should include comprehensive violence prevention plans in all spheres of life, i.e. homes, schools, communities. This will definitively reduce as well as prevent juvenile delinquency. Special programmes should be designed to prevent sexual reoffending among these juveniles. They should be provided with appropriate counselling and psychotherapy as and when needed at regular intervals. Such type of intervention could play a major role in preventing recidivism. Extra emphasis should be given to address the needs of the girls in the juvenile reformatory homes. The focus should be on developing new community based and culturally responsive alternatives for reducing too much dependence on confinement of these juveniles in the remand homes.

Development of facilities for counselling and psychological and psychiatric treatment is highly recommended in reformatory schools. Juvenile mentoring programs should be initiated in the reformatory schools where the mentors should guide the juveniles and provide technical assistance and training in their field of interest. There should be facility for web based free learning and training. Thus, we can expect that through proper care and counselling, these juveniles including those showing predisposition towards violence could be moulded to grow in the right direction and become good and responsible citizens of our nation.

**Ethical Clearance** -Taken

Time line-The total duration of the study was six months

**Budget-**Nil

**Conflict of Interest-**None

**Acknowledgement**- We're extremely thankful to the Superintendents of Reformatory schools for their support and cooperation in this research work

# Prevalence of Addiction among Tuberculosis Patients

**Richa Choudhury[1], Shobhit Shakya[2], Pradeep Kumar Yadav[3], Hemant Kumar[4]**

*[1]Associate Professor & Head, Dept. of Forensic Medicine & Toxicology, DrRMLIMS, [2]Assistant Professor, Dept. of Medicine, DrRMLIMS, [3]Senior Resident, Dept. of Forensic Medicine & Toxicology, DrRMLIMS, [4]Assistant Professor, Dept. of Respiratory Medicine, DrRMLIMS*

## Abstract

**Background :** India accounts for about a quarter of the global TB burden. Worldwide India is the country with the highest burden of both TB and MDR TB. Smoking and alcohol use results in sub-optimal response to anti tuberculosis treatment as well as poor prognosis Alcoholism and Nicotine abuse contribute significantly to the development and treatment course of tuberculosis in patients. Aim of the Study: To assess the Prevalence of Nicotine and Alcohol Addiction among Tuberculosis Patients and to monitor the effect of Brief Counselling Sessions for the De-addiction of Alcohol and Nicotine in the management of Tuberculosis Patients. Material & Methods: We had taken the tuberculosis patients coming to the OPD of Medicine and Respiratory Medicine Departments of DrRMLIMS, Lucknow. We used questionnaires for assessing the Nicotine Dependence and Alcohol dependence among the tuberculosis patients (Fagerstrom Tolerance Questionnaire), The Alcohol use disorders Identification Test (AUDIT). Results: Prevalence of Addiction among tuberculosis patient-54 cases out of 447 total cases (April to October). In our study, we found addiction in 45 males and 9 females, Smoking addiction was seen in 13 tuberculosis patients, alcohol addiction was found in 17 tuberculosis patients, and both smoking and alcohol addiction was seen in 24 patients. Conclusion: Nicotine and Alcohol Addiction problem in Tuberculosis patients should be effectively assessed through the nicotine addiction and AUDIT scales and Brief Cognitive Therapy should be introduced along with regular ATT for effective management of such patients.

***Keywords:*** *Fagerstrom Tolerance Questionnaire, The Alcohol use disorders Identification Test(AUDIT), Brief Cognitive Therapy.*

## Introduction

Addictions for Alcohol and Nicotine are the major and significant culprits having a detrimental effect on the health and quality of life of young adults especially in a developing country like India, where the enormous number of young population constitutes as the major internal resource of the otherwise not so rich country. At the same time India accounts for about a quarter of the global TB burden. Worldwide India is the country with the highest burden of both TB and MDR TB. The various risk factors associated with development of tuberculosis include diabetes, smoking, alcohol use and other drugs abuse which result in sub-optimal response to anti tuberculosis treatment as well as poor prognosis with the development of complications leading to simultaneous co morbidities. Many factors contribute significantly to this problem of alcoholism and nicotine abuse among the tuberculosis patients. The inability of today's youth in handling the occupational and environmental stresses along with the social stressors of expectations for excellence in every examination, colleague competition, and emotional stressors caused due to insufficient time to fulfil family liabilities on every occasion creates a disturbed and evading personality. Consequently, alcohol and drugs appear as temporary stress relievers to help in escaping these challenges and simultaneously giving a false sense of well being. Unfortunately, the transition from being a user to an abuser is very gradual and subtle, thus leading to development of various addictions among them. Subsequently these addictions have a devastating effect on the already compromised health status of these patients. Therefore we need to introduce monitoring of extent of alcohol and nicotine addiction and its contributory factors leading to addiction development. This may help in prevention and early management and treatment of tuberculosis patient.

A number of studies have been done on tuberculosis

patients who have concurrent nicotine and alcohol abuse addiction 1. Babor et al., 2007; has emphasized on the alcohol screening, treatment and referral as a crucial part of primary health care in developed countries[2].

Excess alcohol use was common among patients with TB, and was associated with TB transmission, lower rates of sputum culture conversion, and greater mortality [3,4]. The primary objectives of our study were as follows-

1. To assess the Prevalence of Nicotine and Alcohol Addiction among Tuberculosis Patients

2. To monitor the effect of Brief Counselling Sessions for the De-addiction of Alcohol and Nicotine in the management of Tuberculosis Patients

The secondary objectives of our study were to cover the ethical issues in tuberculosis care5.

## Material and Method

We had taken the tuberculosis patients coming to the OPD of Medicine and Respiratory Medicine Departments of Ram Manohar Lohia Institute of Medical Sciences, Lucknow. The recently diagnosed cases of tuberculosis as well as those patients who were undergoing treatment for tuberculosis were assessed in our study. We used questionnaires for assessing the Nicotine Dependence and Alcohol dependence among the tuberculosis patients. For the above purpose we used the following survey instruments for our research-

1. Nicotine Dependence Questionnaire (Modified Fagerstrom Tolerance Questionnaire)6

2. Smokeless Tobacco Dependence Scale

3. The Alcohol use disorders Identification Test(AUDIT)Interview version and

4. The Alcohol Use Disorders Identification Test (self report version).[7]

Only those patients who were willing to participate in the research voluntarily were included in our study. The willing patients were given 30 minutes to complete and return the questionnaire. We also noted the demographic data of the patients of our study including the Age, Sex, educational status, and occupation of tuberculosis patients.

. They were divided into three groups on the basis of their addictions-

- TB with smoking only
- TB with alcohol only
- TB with smoking and alcohol addiction

Tuberculosis patients with addictions for alcohol and nicotine were further divided into two categories on the basis of type of treatment given. Patients were given one of two randomized treatments:

1. Brief counselling intervention(BCI) + TB medication regime(TAU)

2. TB medication regime alone (TAU)

Brief counselling sessions of 10-15minutes for treatment of alcohol and nicotine addictions

We included all the newly diagnosed as well as old cases of pulmonary tuberculosis in the age range of 18-80 years which were having symptoms of PTB, Positive smear, Chest radiograph showing active disease, the patients who give their written consent for participation in the study

We excluded those patients who refused to participate in the study, those patients who are HIV +ve, those patients having cardiovascular disease, diabetes mellitus or any other severe disease, those patients who are taking immune suppressants, those patients who failed to complete the questionnaire or did not return the questionnaire on time, Pregnant females.

## Observations

We came across 447 cases of tuberculosis during the six month period that is April 2019 to October 2019. Out of the detected tuberculosis patients, addiction was found positive among 54 patients.

**Table-1: Prevalence of Addiction among tuberculosis patient-54 cases out of 447 total cases (April to October)**

| S.no | Addiction | Male | Female | N(%) |
|---|---|---|---|---|
| 1 | Addiction present | 43 | 11 | 54 |
| 2 | No Addiction | 277 | 116 | 393 |
| | Total | 320 | 127 | 447 |

In our study, we found addiction in 45 males and 9 females

**Table 2: TUBERCULOSIS WITH ADDICTION**

| S.NO | AGE GROUP | MALE | FEMALE | NUMBER(n)(%) |
|---|---|---|---|---|
| 1 | 18-25 yrs | 15 | 1 | 16 |
| 2 | 26-40 years | 14 | 3 | 17 |
| 3 | 41-50 years | 9 | 2 | 11 |

| 3 | Cook | 10 | 1 | 11 |
| 4 | Self employed | 9 | - | 9 |
| 5 | Homemaker | - | 8 | 8 |
| | Total | 45 | 9 | 54 |

## Discussion

We have studied 447 cases of tuberculosis during the 6 months period, out of which addiction was found in 54 cases (12.08%). About 12% cases reported history of addiction which is considerably less than the findings of Gegia M et al and Khan AH et al in their respective studies on smoking and treatment outcomes.[8,9].

Thomas B. in her study on association of smoking and alcohol use disorder with Tuberculosis treatment outcomes observed that 65% males were associated with smoking and AUD with Tuberculosis. In our study, there were 45 males (83.3%) and 9 females (16.6% ) who had addiction of smoking and alcohol .This number is considerably higher than the findings of similar studies, the reason may be citied as underreporting of actual addiction status by the patients in the previous studies.[10,11,12]

Maximum cases were seen in the most productive age group that is18 to 40 years age group (61.1%),The mean age was found to be 22 years (IQR:18-40).It was followed by 41-50 group with 20.3% cases. Thomas B et al found the mean age to be 38 years 1 . Geriatrics group reported only 5 cases (9.25%).The possible reason could be restricted resources in the form of money and mobility leading to increasing dependency on others with age.

The most common addiction that we encountered in our research was a combination of smoking and alcohol with accounting to 44.44% cases. Smoking also included the smokeless tobacco consuming individuals, mainly in the form of Gutkha and Kheni. Basically the majority of the population that comes to a government hospital comprises of the rural strata where physical labour is the only way to earn a living. The reason behind chewing tobacco or smoking bidis could be somewhat linked to continuous pressure and hard ways of life with most of the hours being spent working in the fields in the hot weather. Alcohol use was fairly common in the tuberculosis with 31.48% cases admitting to alcohol only addiction. Only two females confessed about drinking alcohol that too occasionally. This could easily be understood as in our society there is huge stigma attached to alcohol consumption by the females. Both the females who admitted to alcohol consumption were widows and belonged to the geriatric age group. This could be attributed to the fact that increasing age with fewer family obligations makes a person more carefree, and ignorant to society norms of rights and wrongs.

The male patients who reported Alcohol consumption, admitted to taking around 2 drinks at a time. Soh AZ. et al observed that more than 2 drinks per day with were associated with a risk of development of active tuberculosis.13 Lewis JG et al and Brown KM et al also deduced the similar association of alcohol consumption and smoking habits in development risk of Tuberculosis.14,15 Silva D. et al found that alcohol consumption were associated with an increased risk of tuberculosis when accompanied by smoking which is another risk factor for the development of active tuberculosis.[16]

Nicotine addiction alone in the form of smoking as well as smokeless tobacco chewing was observed

in 24.07% cases with 8 males and 5 females. Among the females, 4 gave a history of chewing tobacco once or twice in a day whereas one confessed of smoking husband's bidi secretly, two three times a day. All the males who gave a positive nicotine addiction history admitted to taking cigarettes, bidis as well as tobacco chewing.

Hermosilla S. et al in their study on Risk factors of Tuberculosis found that Alcohol abuse influences the incidence, clinical evolution and outcome of Tuberculosis [17]. According to Fiske CT et al and Jakubowiak WM et al in their respective studies observed that such patients were not only more infectious but were often associated with higher rates of treatment default and relapse of disease [18,19].

We also tried to analyse the indirect factors such as education status and occupation link with Tuberculosis and addiction cases. However, no conclusive evidence in the form increased susceptibility could be derived from such findings.

Addictions were commonly seen in the eight pass and tenth pass group showing 31.4% of the patients. It declined with education, such that the Intermediate pass and the graduates showed 16.66% cases. Surprisingly, the illiterates and the read and write group also projected a lower incidence of addiction along with Tuberculosis.

Talking on the occupational front of our research sample, we found that majority of male patients were farmers. This again could be linked to the fact that mainly rural population visit the government hospitals in our country. The females were mainly homemakers. One alarming fact that needs to be specifically mentioned here is that there were 20.3 % patients whose primary occupation was being a cook. On a brighter side, these individuals responded positively to brief counselling sessions and were very much motivated for completing their Tuberculosis treatment regime. Only five patients were in government jobs, pointing towards the scarcity of government jobs in our society.

## Conclusion

In our research we intended to find out the prevalence of Nicotine and Alcohol addiction among Tuberculosis patients. Though we were able to assess a sizable number of patients having addiction, we failed to assess the definitive role of Brief Cognitive Behavioural Therapy in the treatment course of Tuberculosis patients. Although we focused on the brief counselling sessions for de-addiction to nicotine and alcohol at our initial contact with the patient, we could not ascertain their effect due to poor compliance in follow ups by the patients.

However, we strongly believe and recommend intervention in the Tuberculosis management to introduce brief CBT along with ATT regime.

This would help to tackle the nicotine and alcohol use and thus help in treatment as well as prevent relapse and recurrence of the disease. The health care providers should be trained to assess and apply the nicotine addiction scale and AUDIT scale.

**Ethical issues** in the study and plans-None

Time line-The total duration of the study will be six months

## Abstract

**Introduction:** Homicide is heinous crime and it is one of the oldest crimes in human civilization. Homicidal pattern vary from country to country and from one region to another, and are influenced by many factors like commonly available weapons, methods of killing, etc. In the present day world violence is clearly recognized as a global public health problem. The total number of murders recorded all over India in 2010 was 33,335 and in 2011 were 34,305. Materials and Methods: 2 year autopsy based study conducted in Vijayapura. All homicidal cases brought to the department for medico legal autopsy and also the cases which were later registered as homicide were studied. Detailed information regarding the circumstances of crime was sought from the police, victim's relatives and friends, visits to the scene of occurrence or deduced by the photographs of the scene of occurrence. The alleged weapons that were produced in the respective cases were examined and opined. Results: Among 67 cases, 43 (46.18%) were male and 24 (53.82%) were female. Most commonly affected victims were from 21 – 30 years age group. Large number of cases occurred in streets. The blunt injuries were most common 31(46.27%) to cause death.

***Keywords:*** *Homicide, blunt weapons, murder, autopsy.*

## Introduction

Homicide is heinous crime and it is one of the oldest crimes in human civilization1. Death is inevitable to everyone, once life starts, but premature ending of one's life by others has seen an alarming rise in the recent years. Homicide (homos: human being, caedere: to kill) literally means to kill a human being. Homicide is defined as killing of one human being by another human being and is one of the leading causes of unnatural deaths2. It is also defined legally as destruction of human life by an act, agencies, procurement or culpable omission of some other person or persons, is the most heinous crime.' The WHO defines homicide as any death resulting from injury purposefully inflicted by another person, is dealt under codes E960 – E9693.To commit murder, two elements ("Mens–rea" which means preplanning or afore thought and "Actus rea" which means the actual Execution) should work together to constitute the crime4. Death of a human being can occur by different methods. Many of the times they may occur in a rage, sometimes with lot of planning. There may be one man involved in a killing or many assailants may be there. Homicidal pattern vary from country to country and from one region to another, and are influenced by many factors like commonly available weapons, methods of killing, motive behind killing, family relationship problems like marital disputes, cultural, psychological, social influences, religious attitudes, criminal activities, drug culture, political factors, unemployment and socio economics status. The various patterns of homicidal deaths include assault by sharp weapon, blunt weapon, firearms, strangulation, homicidal hanging, smothering, drowning, burns, poisoning etc. In the present-day world violence is clearly recognized as a global public health problem. Violence and injuries account for 9% of global mortality and 12% of all disability adjusted life years (DALY). As per Global Burden of Armed Violence Report, 2011, the average annual global violent death rate between 2004 and 2009, was 79 per million. Globally around 5,20,000 people die each year as a result of interpersonal violence which equates to 1400 deaths every single day5. As per National Crime Record Bureau, violent crimes reported in India were 10.9% of the total Indian Penal Code crimes. The total number of murders recorded all over India in 2010 was 33,335 and

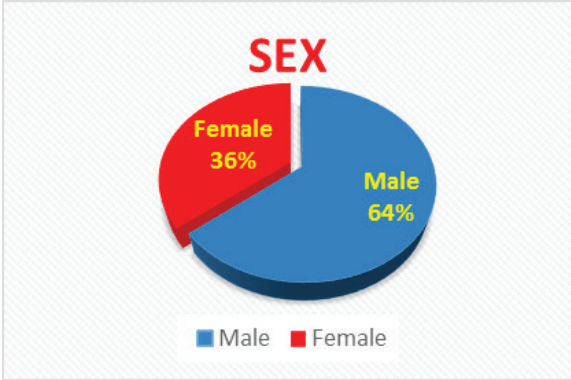
in 2011 were 34,305. Very often, the newspapers scream headlines about the rising incidence of these most horrific crimes taking place in different parts of the Vijayapura city. How safe exactly is the city, is a question that has been debated in print with increasing intensity. Where exactly does the problem lie? In the current situation, where murders have become common place, the police system has become an easy target.

## Materials and Method

The present study was conducted in the department of Forensic Medicine and Toxicology, Al- Ameen Medical College and Civil Hospital mortuaries, Vijayapura during the period from June 2013 to May 2015, a period of 2 years. All homicidal cases brought to the department for medico legal autopsy and also the cases which were later registered as homicide were studied. Ethical clearance was obtained from the institutional ethics committee prior to the conduct of the study. Detailed information regarding the circumstances of crime was sought from the police, victim's relatives and friends, visits to the scene of occurrence or deduced by the photographs of the scene of occurrence. Socio Economic status of the victim was based on Modified Kuppuswami's classification (2007 revision)6. Post Mortem examination of the victims was conducted. Viscera were sent for Chemical Analysis in suspected cases of alcohol consumption. The alleged weapons that were produced in the respective cases were examined and opined.

## Results

67 cases of homicidal deaths were sorted out for this study amongst 896 total autopsies conducted from June 2011 to May 2013. Among 67 cases, 43 (46.18%) were male and 24 (53.82%) were female. It is observed that most commonly affected victims were from 21 – 30 years age group 25(37.31%) followed by 31 – 40 age group 13(19.40%). Most of the victims are in upper lower socio- economic class i.e. 23 cases (34.33%), followed by 16 cases (23.88%) are in lower class. Large number of cases was occurred in streets 39 cases (58.21%) and 6 cases (8.96%) were found in victim's house, 41 corpses (61.19%) are present in same spot of scene of occurrence and 17 victims (25.37%) are disposed from the scene of occurrence. Most homicides took place in the evening (6pm-12midnight) and late night (12midnight-6am) i.e., about 28 cases (41.79%) and 24 cases (35.82%) respectively. The blunt injuries were most common 31(46.27%) to cause death followed by sharp injuries 25(37.31%).



**Graph 1: Sex distribution**

**Table 1: Victims distributed according to socio-economic status:**

| Si. No | Socio-Economic Class | Number | Percen-Tage |
|---|---|---|---|
| 1 | Upper (I) | 0 | 0% |
| 2 | Upper middle (II) | 14 | 20.89% |
| 3 | Lower middle (III) | 13 | 19.40% |
| 4 | Upper lower (IV) | 23 | 34.33% |
| 5 | Lower (V) | 16 | 23.88% |
| 6 | Not known | 1 | 1.49% |
| | total | 67 | 100% |

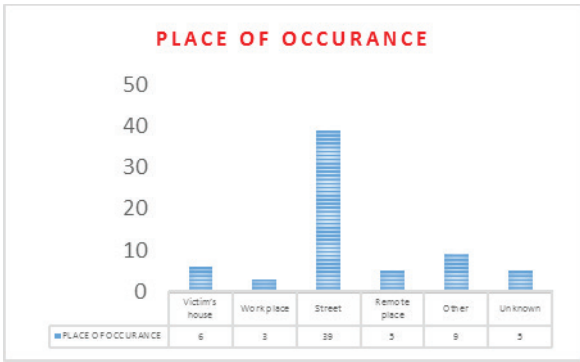

**Graph 3: Homicides distributed according to place of disposal of dead body:**

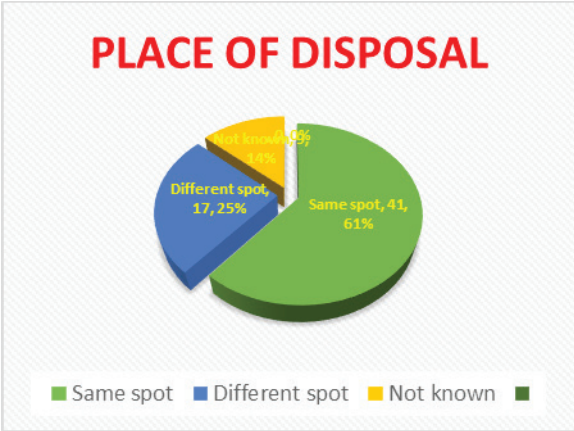

**Table 2: Homicides distributed according to time of occurrence of crime:**

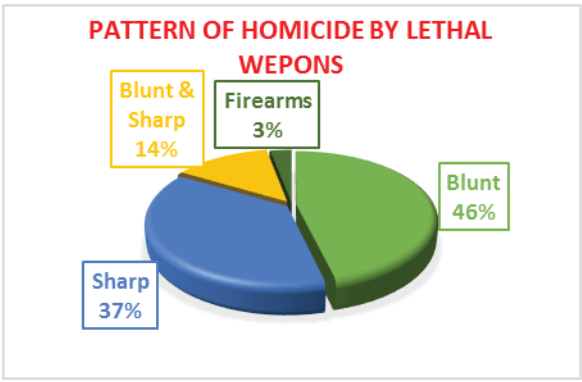
| Sl.no | Time of Occurrence | Number | Percentage |
|---|---|---|---|
| 1 | Morning (6Am-12Noon) | 06 | 8.96% |
| 2 | Afternoon(12Noon-6Pm) | 06 | 8.96% |
| 3 | Evening (6Pm-12Midnight) | 28 | 41.79% |
| 4 | Late Night(12Midnight-6Am) | 24 | 35.82% |
| 5 | Not known | 03 | 4.48% |
| | Total | 67 | 100.00% |



**Graph 4: Homicides distributed according to pattern of homicide by lethal weapons:**

## Discussion

During the study period, from June 2013 to May 2015, 896 medico-legal autopsies were conducted, of which homicidal deaths constituted 67 cases (7.48%). The factors contributing for highest incidents in the 21-30 years age groups were allegedly due to marital disputes, unsuccessful romantic disputes, and infidelity, and related to dowry in females and gang rivalry, unemployment, arguments, drug addiction, property disputes, extramarital affairs were the reasons in males. The next vulnerable age group being 31-40 years of age constituted 19.40%. In studies by Gupta A et al.1, and Mohanty M.K et al.3 most of the victims belonged to the age group 21-30 years which is consistent with our study. The present study is in contrast to the findings observed by Wahlsten P et al.7

Male victims contributed to more than 2/3rd (64.18%) of the cases which can be attributed to the aggressive nature of males than females. Similar observation made by Gupta A et al.1, Mohanty M.K et al.3. The present study observation is in contrast to Kominato Y et al.8 where male to female ratio of the victims was 1:1

In our study the maximum numbers of victim (34.23%) were from the upper lower socioeconomic status followed by lower socio economic status (23.88%), this could be because ours is a developing country and much of the people fall in this group, also the changing social trends of nuclear families, unemployment, illiteracy, financial problems etc. Similar observations are made by Karn A et al.9 lower economic class people committed more crime. The present study contrasts with those by Hugar B S et al.10 where majority was from middle class people.

Our study observed that maximum number of victims (58.21%) were done to death at streets and lonely places, which implies that these homicides were mostly pre meditated as the assailants were aware of the victim's whereabouts and motive being financial dispute or murder for gain, followed by 9 cases (13.43%) which were in other places which were due to gang rivalry, revenge murders and arguments arising while under the influence of alcohol followed by victims house in which mostly the victims were staying alone and homicide committed by known assailants.

Other places in the study consisted of Railway Station, playground and auditoriums etc. This study is similar to the study conducted by Syed Amjad Agha et al.11, Vijayakumari N et al.12, where majority of homicides took place in the streets and is in contrast with the study of Hugar B S et al.10, where majority took place in victim's residence & according to Dhaval J et

al.13, it took place in dense forest areas.

In present study, in 17 cases (25.37%) the dead body was moved from the scene of the crime and attempts were made by the assailants to obliterate the identity and as well as the evidence of crime in the form of covering with the slab, or disposing the corpse in lonely places or on roads for masquerading as an accident with ultimate purpose of concealing homicide. The presence or absence of viz. blood stains, signs of struggle/disturbance at the spot of recovery of body were taken into account for the above inference, by visiting the scene, observing the spot photographs and information furnished by the police. This observation is supported by Hugar B S et al.10 where in 15.75% of the cases moved from the spot, Wahlsten P et al.7, where in 8% of the cases the body was moved from the scene of the crime, Mohanty M.K et al.3, the body was disposed in different spot in 14.7% of cases.

Maximum number of the homicides took place in the evening 28 cases (6pm-12midnight) and late night 24 cases (12midnight-6am) which can be attributed to the factors like night fall or in darkness the chances of assailant being recognized is reduced, after a day's hard work the chances of victims and assailant engaging in arguments, be it domestic or financial are high when they meet up after work and as revealed in the study, most of the victims belonged to low socio-economic status. Further alcohol has been a major contributory factor. Similar observations were made in studies conducted by Hugar B S et al.10, and Mohanty M.K et al.3, in all these studies maximum homicides occurred in the evening and night. Our study in contrast to studies conducted by Vougiouklakis T et al.14, where in maximum (26.9%) of cases occurred during noon. The incidence of homicide was more during day time 74.55% in a study conducted by Vijayakumari N et al.[12].

Death due to blunt weapon injuries were 31 cases (46.27%) which outnumbered those due to sharp weapon injuries of 25 cases (37.31%). This is attributed to the easy availability of various blunt weapons in this area. In one case the assailant used sharp weapon to cause fatal injury and also strangulated his wife with a ligature. In another case the assailant used multiple methods (blunt, sharp and firearm) to cause fatal injury. Majority of the blunt and sharp weapon injuries were pre-meditated and mainly involved gang rivalry whereas few blunt weapon injuries were unpremeditated and assailants used the blunt weapon available at the scene of occurrence. Only 2 cases of fire arm injury was observed as the law in India is strict regarding gun licensing. Similar study was made by Vijayakumari N et al.12, where blunt weapon injury was the most common cause of death and Mohanty M K et al.3, blunt weapon injuries accounted for 36.5%. Our study is in contrast to the studies by Hugar B S et al.10, Gupta A et al.1, sharp weapons were the most commonly used. Humayum H et al.15 noticed firearms were the most common means used for homicide. This could be attributed to the lethality of weapon and determination on the part of assailant to kill the victim, since most of these cases were premeditated.

## Conclusion

- The study group included 67 homicidal cases.
- Maximum number of homicides occurred in the age group 21-30 years in both sexes constituting 37.31%.
- Males are the commonest victims, twice more likely than that of females. Most of the victims (56.25%) were married.
- Most of the victims were in the lower socio-economical class.
- Maximum homicide took place on the streets.
- The corpse was moved from the scene of crime in 25.37% of the cases.
- Most of the homicides took place in the evening and late night.
- Blunt weapon injuries were the commonest pattern followed by sharp weapon.

# A Descriptive Study on Alleged Sexual Offenders in South Bangalore

**Sujatha P. L[1], Ananda. K[2], Mandar Ramchandra Sane[3]**

*[1]Assistant Professor, [2]Professor & HOD, Department of Forensic Medicine Sambhram Institute of Medical Sciences and Research, D.K. Plantation, BEML Nagar, Kolar Gold Fields, Karnataka, [3]Assistant Professor, Department of Forensic Medicine and Toxicology, AIIMS, Nagpur, Maharastra*

## Abstract

Rape is a serious offence and understanding the offender may help us to understand the antecedents leading (directly or indirectly) to the act. The examination of the survivors of alleged sexual offences is one of the most difficult tasks in Medical practice. Methodology: This study was carried out between January 2012 to June 2013 in the Department of Forensic Medicine at Tertiary care centre, South Bangalore, Karnataka. The cases registered under sections 375, 376 IPC and Protection of Children from Sexual Offences Act were included in the study. Results: Total 38 accused were examined during study period. 55.3% of cases were in the age group of 21 years to 30 years. 57.9% of cases were graduated, and 34.2% were employed. 44.7% cases belong to lower middle class (III). In 47.5 % of cases the incident occurred between evening & mid night time. Offender was close friends of the victim in 47.5% cases. Non genital external injuries were present in 5.3% of cases. Discussion: Young adult males were involved in majority of cases due to their immature mind set. Majority of the offenders were close friends of the victim, and were booked due to stringent provisions of POCSO Act. Consensual sexual activity between teenagers can be decriminalized.

***Key words:*** *Sexual offence, perpetrator, 375 IPC, POCSO Act, rape.*

## Introduction

Sexual violence is ubiquitous; it occurs in every culture, in all levels of society and in every country of the world. Data from country and local studies indicate that, in some parts of the world at least, one woman in every four has suffered an attempted or completed rape by an intimate partner during her lifetime.(1) Sexual violence takes place within a variety of settings, including the home, the workplace, schools and the community. There are various ways and forms in which sexual exploitation is practiced. The most perverted and degrading form is rape. Incidence of rape, particularly among young and adolescent girls is reported almost daily.

**Corresponding author:**
**Dr. Sujatha P. L.**
Assistant Professor, Department of Forensic Medicine and Toxicology, Sapthagiri Institute of Medical Sciences & Research centre, No.15, Chikkasandra, Hesaraghatta Main Road, Bangalore 560090
Email: dr.sujata.pl@gmail.com, Mob: +919844116333

According to the data collected by NCRB, rape cases have increased from 24206 cases in 2011 to 38947 cases in 2016(2), however as against this conviction rate of sexual offenders remains low i.e. around 28 % in 2014(3) to 36 % in 2016(4). This is inspite of the amendments made in Indian Penal Code (IPC), Criminal Procedure Code (CrPC), Indian Evidence Act (IEA) and enactment of POCSO Act, 2012 which provides legal protection to children below 18 years.

There are many studies on profile of victims of sexual offence whereas studies on profile of accused are less. Considering the danger of allowing true offenders to go unpunished as well as injustice of wrong convictions, the task of the examining physician becomes even more important. So, present study was aimed to find out the profile of sexual offences in South Bangalore and to describe the characteristics of accused of sexual assaults.

## Materials and Method

This was a prospective descriptive study, carried out for a period from January 2012 to June 2013 in

the Department of Forensic Medicine at Tertiary care centre, South Bangalore, Karnataka State, India. Study was started after approval from Institutional Ethical Committee. The cases registered under sections 375, 376 IPC (inclusive of amendments) and Protection of Children from Sexual Offences Act (POCSO Act) were included in the study. Similarly, alleged sexual offence cases which later turned out to be false allegations were not included in study. Sexual offenders involved in offences against males were also not included. Informed written consent has been taken from the accused. A standardized proforma was filled in each case after detailed interviews with the investigating officials and alleged accused. The information regarding the age, socio-economic background, level of education, occupation, marital status, history of sexual offence as stated by the accused. During examination, general details of the accused' health, mental state, physical examination, injuries, examination of the genitalia, and laboratory findings, were recorded in proforma. The comparison was made between these findings and conclusions were drawn after comparing and discussing with similar type of the work carried out by other authors.

## Results

Total 38 accused were examined during study period. Maximum numbers of accused i.e. 21 cases (55.3%) were in the age group of 21 years to 30 years. (Table 1) Maximum number of accused i.e. 22 (57.9%) cases were graduated. Maximum number of accused i.e. 13 cases (34.2%) were employed. 17 (44.7%) cases belong to Lower middle class (III).(Table 2) In majority of cases i.e. 18 (47.5 %) cases the incident occurred between evening & mid night time, i.e. from 6.00PM to 12.00AM.(Table 3) Among 38 cases, 18 (47.5% ) cases, the offence was committed by close friends of the victim followed by 10 (26.3 %) case, the accused were neighbours of victims.(Table 4) 15 (39.5 %) cases occurred in the accused house, followed by 9 (23.7%) cases occurred in the other indoor places like lodge, friend's house.(Table 5) In the present study non genital external injuries were present in 2 cases (5.3%).(Table6)

**Table 1: Age wise Distribution of accused of sexual offence cases**

| Age (years) | Accused (number) | Percentage |
|---|---|---|
| 0-10 | 00 | 00.00 |
| 11-20 | 08 | 21.05 |
| 21-30 | 21 | 55.26 |
| 31-40 | 08 | 21.05 |
| 40+ | 01 | 2.63 |
| TOTAL | 38 | 100 |

| Urethral discharge/ signs of sexually transmitted diseases | NIL | - |

## Discussion

Thirty eight cases of sexual assault were examined. Age of accused ranged from 17 to 57 years. Majority of the accused (55.26%) were in the age group of 21-30 years. This finding is consistent with the findings of studies done by Bhowmik[5] and Veeresh[6]. Offenders were of younger age group due to their immature mind set which make them prone to indulge in unlawful sexual activity.

Considering the education of accused, 22 cases (57.9%) were graduates, 12 (32%) cases were studied up to school and 4 cases (10.5%) were illiterates. The findings in the present study differ from the study done by Veeresh[6] in which 77.28% of accused were illiterates. In our study maximum number of accused i.e. 13(34.2 %) were employed, followed by 12(31.6%) were labourer by occupation. The findings in this study differ from the study done by Veeresh[6] in which 54.55% of accused were labourers. Considering the socio economic status of the accused, the present study shows that majority of accused i.e.17 (44.7%) cases belong to Class III, followed by 12(31.6%) cases belong to Class IV. Least number of accused i.e.2 (5.3%) cases belongs to Class I. The findings of this study slightly differs from the other study done by Veeresh et al[6] in which majority of the accused were from poor socio economic status.

Our study showed that majority of cases i.e. 18 (47.5 %) occurred between evening & night time, i.e. from 6.00PM to 6.00 AM. These figures are similar to those encountered in studies in India [7] and non-Indian community [8]. The reason attributed towards the highest incidents occurring at night are that during this period either the event takes place unnoticed or the victim cannot get help from others[7] or due to social habits of the majority of victims and the fact that cover of darkness can give opportunities for assaults to take place[8].

In the present study, majority of the sexual assault i.e. 15 (39.5 %) cases occurred in the accused house. It is followed by 9 (23.7%) cases occurred in the other indoor places like lodge, friend's house. The findings of our study are consistent with the study done by Sean D McDermott et al[8] in which 43% of cases occurred in the indoors but he has not categorized as victims'/ accused house. It differs from study by Roychowdhury et al[9] who observed in 77.5% of cases the incidence occurred outside, and, it also differs from the study done in Bangladesh[10] in which 36.95% of incidents occurred in victims' house. The occurrence of events mostly inside the house is attributed to the accused being able to trap the victim easily inside a closed room[7].

Relationship of accused with the victim has been studied by various authors. Present study shows that accused was close friend of the victim in 47 % of the cases; while he was completely stranger in 5 % of the cases. While findings of Indian studies were similar with close friend of the victim being offender in 37 %(3) of cases to 55 %[5] of cases. The reason proposed was that a closer acquaintance knows about the weakness of a victim and takes advantage of her loneliness by development of trust.[7] However, rape cases in Indian context were found to be consensual in 62 % of cases(11) Majority of such cases are of consensual elopement and sexual activity of victim and accused; however they were covered under stringent provisions of POCSO Act.[11][12]

Consensual sexual activity is also one of the reasons for lack of genital injuries in all cases and non-genital injuries in only 5.3 % cases in present study. In 5 cases (13.2%), penis was circumcised. Presence of smegma was noted in only 1 case (2.6%). Genital examination of the accused did not reveal any evidence of sexual assault. The findings of our study are consistent with the study done by Veeresh.[6]

National Crime Record Bureau plans to compile 'Sex Offenders Database at National Level' with primary goal to provide tracking and monitoring of the offenders.[2] More studies with background of present study will provide a holistic view of sexual offenders. However, this study had several limitations which included absence of data regarding offenders of sexual assault where victims were male. Psychiatric evaluation of the offenders was not evaluated as plea was not raised regarding it. Less sample size may have less statistical impact of the results, but might reflect the burden of the evil in the society and provide comparative data and impetus for further studies involving larger population strata.

## Conclusions

It is a known fact that recorded rape cases are only the tip of the iceberg as not only many cases of rape are not reported, but also many of those cases in our country are not registered. The forensic examination of the victim as well as accused may play a vital role in helping the law to give justice to the victims. The present study shows that young adult males were involved in majority of cases.

This denotes the immature mind set of young adults who are more prone to commit an offence. We encounter two types of offence one being the genuine rape cases and another type is in which the girls had gone voluntarily with their boyfriends. In such cases, the minor age of girls makes the accused as culprit and punishable for their offence. To prevent such kind of cases there should be a proper education for both teenage girls and boys. Further, consensual sexual activity between teenagers can be decriminalized to avoid criminal stigma.

# Pattern and Nature of Fatal Blunt Force Homicidal Injuries and Its Correlation with the Weapon

**Sujith Sreenivas C**

*Associate Professor & Deputy Police Surgeon, Department of Forensic Medicine, Govt.Medical College, Kozhikode*

## Abstract

Blunt force trauma or blunt injury is a Physical / Mechanical injury which is non- penetrating or penetrating in nature characteristic of a weapon / instrument / object which is not sharp. The word denotes the nature of object producing the injury rather than the type of injury. Injuries produced by blunt trauma include abrasions, contusions, , lacerations or bone fractures. The pattern and nature of the injury is influenced by the force transmitted, weight of object / weapon and nature of the surface of blunt object. The study evaluates the fatal blunt injuries over a period of six years (2006-2011) and correlates the pattern, nature and configuration of injury with the alleged weapon / object used to inflicting it.

***Key words –****Blunt force injuries -Homicide*

## Introduction

The hemodynamics of force transmitted during forceful blunt contact is the transfer of kinetic energy or potential energy of moving object or body resulting in mechanical injury[1]. The kinetic energy ($1/2\ mv^2$) is directly proportional to the mass of the object and velocity of contact. The nature of the tissue, its composition or plasticity has also an influence on the nature of injury. The nature of the surface of the object also has an influence on the external injury.The nature of blunt injury inflicted by a plastic instrument or an instrument which breaks on impact may also be different from that produced by a rigid instrument. When a moving object comes to rest by contact with human body, the entire kinetic energy of the moving object is transmitted on to the body resulting in injury, however in a glancing blow or impact only the kinetic energy corresponding to the decrease in velocity is discharged to the tissues[2]. Factors which prolong the time of transmission of the energy will also reduce the destructive effect of the impact / blow. The skin being elastic and fat content of subcutaneous tissue being pliable, blunt injuries inflicted over these areas has a compressive effect resulting in rupture of smaller blood vessels. The crushing effect resulting in a contusion or undue stretching may result in a stretch rupture of deeper soft tissues like muscle. Even though a definite quantification of blunt force applied cannot be measured evaluation of type and nature of injuries sustained to deeper soft tissues and bones help in an approximate evaluation of blunt force transmitted[3] .

## Aims and Objectives

1. Evaluation of pattern and nature of blunt force injuries and correlation of injuries with weapon used for infliction.

2. Evaluation of probable nature of weapon by examination of blunt injury during medicolegal autopsy.

## Materials and Method

Retrospective evaluation of death by blunt force injuries by perusal of notes prepared during medicolegal autopsy in the Department of Forensic medicine Govt. medical college Kozhikode.

The pattern and nature of fatal blunt force injuries is evaluated and correlated with the nature of weapon shown by the investigating officer during the course of investigation .The study is conducted over a period 2006-2011 . Approval of research project obtained from Institutional Ethics committee of Govt. Medical college Kozhikode.

**Inclusion criteria**

All medicolegal autopsy cases of murder by blunt force in which the weapon of offence has been identified beyond reasonable doubt during the crime investigation and submitted before the doctor who had conducted the postmortem examination .

**Exclusion criteria**

Decomposed dead bodies has been exempted from the study

## Observation

Evaluated 11 deaths conducted in the year 2011. Abrasions were seen in 4 cases and all of them were associated with underlying contusion. Out of the 11 cases, 9 deaths were due to blunt head injury. Contusions were seen in 6 of the deaths due to head injury with abraded contusions in 4 cases. 5 cases of head injury was having laceration of scalp and all of them were having underlying contusion. One case of injury inflicted by a laterite stone had abrasion, contusion and laceration of scalp. 8 cases of fatal head injury had fracture of skull out of which one was suture diastasis. Cerebral contusions were seen underneath the fracture in 8 cases with overlying subarachnoid haemorrhage subdural bleed in 5 of them . Death due to blunt trauma to chest in both cases was by stamping. Defence wound was seen in cases of homicide using wooden stick or iron rod / pipe except in one of the case.

Evaluation of 9 fatal injuries were conducted in the year 2010. 8 cases had died of blunt injuries sustained to the head. Abraded contusions were seen in four of the head injuries. In four cases, there were scalp contusion with overlying split laceration in three of them. Five cases having laceration of scalp was associated with underlying fracture. All the cases of fatal head injuries were associated with underlying fracture. Subdural and subarachnoid bleed was associated with brain contusion in six of the cases. Depressed fracture was seen in two cases where iron rod was used as weapon and in two cases and where stone was used as weapon. Defence wounds were seen only when the weapon was a linear blunt object (sticks/rods). One death was due to blunt injury to chest and abdomen resulting in fracture of rib and liver injury.

In the year 2009 ten deaths were evaluated out of which 8 were due to head injury. Abrasions were seen in four of the cases and was associated with contusion of scalp. Four cases were associated with contusion of scalp. Contusion was associated with laceration in one case with laceration of scalp in five of them. Comminuted fracture with depression was seen when stone was used as the weapon. Other cases had fissured fracture and sutural diastasis. Subarachnoid haemorrhage was seen in all cases with contusion of brain. Subdural haemorrhage was seen in four cases with contusion and subarachnoid haemorrhage. Extradural haemorrhage was associated with fracture of skull. Eventhough SAH and SDH was associated with contusion of the brain EDH was not associated with brain contusion. Comminuted fracture of skull was seen when the object used for inflicting blunt force was stone. Blunt force injury due to stamping had resulted in injuries to chest and abrasion. Defence wounds were only seen when the weapon was linear blunt weapon(sticks / rods ).

In the year 2008, 11 cases of homicide by blunt force were evaluated. 10 deaths were due to head inury. 8 cases had contusion of scalp and 6 out of it had overlying abrasions. 9 cases of head injury was associated with laceration of scalp.Fractures were seen in all head injuries . Comminuted fracture and multiple fissured fractures of skull were seen when the blunt weapon was broad, heavy and hard like stone, linear fissured fracture was seen when weapon was linear blunt weapon which had also resulted in depressed fracture in one cases. 7 cases were associated with cerebral contusions and subarachnoid haemorrhage and subdural haemorrhage. Cerebral laceration was seen underneath the depressed fracture .Death had resulted from bowel rupture and peritonitis following blunt injury sustained to the abdomen. Defence wounds were seen in 7 cases of blunt injury using linear blunt weapon (stick/rod).

In the year 2007, 10 cases of homicide due to blunt force was evaluated. 5 deaths were due to head injury. Four cases were having abraded contusion of scalp. 3 cases were associated with laceration of scalp. All the death due to traumatic brain injury was associated with fracture of skull, the fracture being comminuted when stone was the weapon used. 4 cases of death due to traumatic brain injury was having brain contusion and subarachnoid haemorrhage. Laceration was seen

underneath the comminuted skull fracture in one death. Defence wounds were seen in all deaths where the weapon was linear and blunt (stick/rod ). Two deaths were due to the combined effects of multiple injuries sustained, inflicted by a group of people using sticks and rods. Blunt injury to neck using linear blunt weapon resulted in delayed death due to quadriparesis.One death was due to chest injury involving lung due to stomping .

In the year 2006, 11 deaths due to blunt force injuries were evaluated out of which 7 deaths were due to head injury. Four of the deaths were associated with contusion of scalp with abrasion in 3 of them. Laceration of scalp was seen in 5 of fatal traumatic brain injury. All the seven deaths were associated with fracture of skull out of which two had depressed fractures. Both the depressed fractures were associated with cerebral lacerations. Cerebral contusions with subarachnoid haemorrhage was seen in 3 cases with fissured fracture. Scalp lacerations were seen in both the cases where the blunt injury was inflicted with stone. All the head injury using linear blunt weapon was associated with fissured skull fracture. Defence wounds were seen in all cases of assault with stick / rod. Two deaths due to stomping had resulted in blunt injury to abdominal viscera and kicking had resulted in blunt trauma to viscera of chest and pneumothorax.

## Discussion

Most of the deaths in homicides due to blunt violence was due to traumatic brain injury (47 cases of TBI out of 62 homicides)[4], the head being the most vulnerable part in blunt force trauma. Traumatic blunt injuries was inflicted using wooden stick in majority of deaths (20/62 cases), followed by iron rods / pipes (18/62 cases) and stone (13/62 cases) and blunt impact on wall in 3/62 cases. In two cases, the assailants were multiple using wooden sticks and iron pipes / rods. Majority of the deaths due to traumatic brain injury by blunt force had scalp lacerations with underlying contusions (32/62) contusions associated with abrasions were seen in 25 out of 62 cases and contusions without abrasions or lacerations were seen in 27 out of 62 cases. Blunt traumatic injuries to head with underlying fractures was seen in 46 cases out of the 47 deaths due to traumatic brain injury. Even though the blunt force delivered during assault cannot be precisely quantified, the force exerted in all cases of homicide was sufficient to fracture the skull[5]. Coup contusions were seen in majority of cases (33/47) underneath the skull fracture and the contusion was associated with Extra dural / subdural bleed / Subarachnoid haemaoohage in 35 cases. Out of the 62 homicides by blunt force one deaths was due to injuries to the neck. Stamping of neck resulted in rupture of trachea and soft tissue contusion of neck . Blunt injury inflicted to the neck with linear blunt weapon resulted in cervical spinal cord injury. A small proportion of homicides by blunt force were injuries involving chest and abdomen (5/62 each) involving the lungs, liver and bowel and all of them were blunt force inflicted by stamping and not by weapons. They appear to have been inflicted in the lying down position of the victim. Three deaths were due to combined effects of multiple injuries inflicted including soft tissue injuries and bony fractures. They were inflicted by many assailants with blunt weapons like sticks and rods. There was no evidence of a single fatal injury but death had occurred due to the effects of multiple injuries. Following blunt trauma to the head, majority of (27/47) subjects developed coup contusion underneath the site of blunt impact associated with surrounding haemorrhage (haemorrhagic contusion extending into subarachnoid space or subdural space), possibly a compression contusion and haemorrhage from damaged blood vessels of brain parenchyma. Contra coup contusions was seen in two persons possibly a acceleration contusion due to movement of head at the time or immediately after sustaining the blunt force[6]. Contusion without haemorrhage was seen underneath the fracture in 7/47 cases, possibly due to inbending of the skull at the site of blunt injury due to the elastic nature[7]. Depressed fracture was associated with underlying dural tear and cerebral laceration. Intra cranial haemorrhage without contusion of brain parenchyma was seen in

7/47 cases which appears to be due to the sudden jerky movement of the unsupported head within the cranial cavity resulting in vascular stretch, shearing or rupture of the bridging veins.

## Conclusion

Most of death due to blunt trauma / blunt force injuries in homicide is due to head injury. The excess force applied that is always more than required to cause death has almost always resulted in skull fracture and brain contusions[8]. The patients had not survived in the hospital following sustaining the injury which on evaluation retrospectively conveys the intention to kill, however the knowledge that he will die would not have been amenable for evaluation by the assailant forcing him to use excess force. Most deaths due to blunt injuries were unlikely to happen as a result of grave provocation as the weapon commonly used, a linear blunt weapon like wooden stick or iron rod suggest premeditation.A prospective study is also being attempted to observe the changes in the pattern and nature of injuries and the manner of homicide by blunt force which is a curse to the society in the name of politics, religion,and vengeance .

# Prevalence of Odontogenic Cysts and Tumors – A Clinicopathological Study

**Sushruth Nayak[1], Asha Karadwal[2], Prachi Nayak[3], Kush Pathak[3]**

*[1]Professor & Head, [2]Sr. Lecturer, [3]Reader, Department of Oral Pathology & Microbiology, M.M. College of Dental Sciences And Research, M.M (Deemed to be University), Mullana (Ambala), Haryana*

## Abstract

**Background:** The incidence and frequency of odontogenic cysts and tumors depends on the different geographic location. Odontogenic cysts and tumors are lesions that arise from the tooth apparatus or its remnants. The purpose of this study was to determine the prevalence of odontogenic cysts and tumors over a period of 5 years 9 months and to compare our results with other published studies.

**Aim and Objective:** The purpose of this study was to evaluate the prevalence of odontogenic cysts and tumors diagnosed at the Department of Oral Pathology, M.M. College of Dental Sciences & Research, Mullana (Ambala) and to compare the results with findings in the literature.

**Materials and Method:** Data of odontogenic cysts and tumors diagnosed during 2014 to 2019 (till September) w4ere collected from the files of the Oral Pathology Department, M.M. College of Dental Sciences & Research, Mullana (Ambala).

**Results:** Out of the total 71 cases of odontogenic cysts, most prevalent odontogenic cysts were found to be radicular cysts (n=42, %= 59.1%), followed by dentigerous cysts (n=17, %=23.9%) and odontogenic keratocyst (n=12, %=16.9%). Among the odontogenic tumors out of 49 cases reported, the most prevalent was ameloblastoma (n=28, %=57.1%) followed by, ameloblastic fibroma (n=06, %=12.2%), odontoma (n=05,%=10.2%), adenomatoid odontogenic tumor (n=03, %=6.1%), peripheral odontogenic fibroma (n=02, %=4.08%), ameloblastic carcinoma (n=02, %=4.08%), odontogenic fibroma (n=02, %=4.08%) and odontogenic myxofibroma (n=01, %=2.04%). The anterior and posterior portion of the body of mandible was the most common site for both odontogenic cysts and tumors. The age group for odontogenic cysts ranged from 07 to 72 years of age, whereas for the odontogenic cysts the range was 10 to 75 years of age. The male to female ratio for the odontogenic cysts was 1:1.2, whereas for the odontogenic tumors it was found to be having more female predilection with the ratio of 1:1.3.

**Conclusion:** The prevalence of odontogenic cysts was similar to that reported in the literature, with incidence of radicular cysts seen most frequently. In case of odontogenic tumors the findings vary to the reported literature with ameloblastoma being more commonly reported.

***Key words:*** *Ameloblastoma, dentigerous cysts, odontogenic cyst, odontogenic tumors, odontoma, radicular cysts*

## Introduction

Odontogenic cysts and tumors are derived from epithelial, ectomesenchymal or both the elements of the tooth-forming apparatus.[1,2] The jaws are host to a wide variety of cysts and tumors because large part of the tissue is involved in tooth formation.[3]These generally show slow, expansive growth and in some cases associated with marked bone destruction and recurrence.[4] Studies using histopathological data are important to characterize and establish the prevalence of oral and maxillofacial lesions in different age groups. In this respect, research based biopsy records are necessary to analyse the main types of lesions that occur in a given population and to provide data that can guide pathologists particularly in the

diagnosis and management of these lesions. Therefore, the purpose of this study was to evaluate the prevalence of different types of odontogenic cysts and tumors diagnosed histopathologically over a period of 5 years and 09 months in Mullana (Ambala) at the institutional level according to age, gender and site affected and to compare the results with findings in the literature.

## Materials and Method

Data of odontogenic cysts and tumors diagnosed during 2014 to 2019 (till September) were collected from the files of the Oral Pathology Department, M.M. College of Dental Sciences & Research, Mullana (Ambala). The data were collected according to the variables; age, gender and site.

## Results

Out of the total 71 cases of odontogenic cysts, most prevalent odontogenic cysts were found to be radicular cysts (n=42, %= 59.1%), followed by dentigerous cysts (n=17, %=23.9%) and odontogenic keratocyst (n=12, %=16.9%). Among the odontogenic tumors out of 49 cases reported, the most prevalent was ameloblastoma (n=28, %=57.1%) followed by, ameloblastic fibroma (n=06, %=12.2%), odontoma (n=05,%=10.2%), adenomatoid odontogenic tumor (n=03, %=6.1%), peripheral odontogenic fibroma (n=02, %=4.08%), ameloblastic carcinoma (n=02, %=4.08%), odontogenic fibroma (n=02, %=4.08%) and odontogenic myxofibroma (n=01, %=2.04%). The anterior and posterior portion of the body of mandible was the most common site for both odontogenic cysts and tumors. The age group for odontogenic cysts ranged from 07 to 72 years of age, whereas for the odontogenic cysts the range was 10 to 75 years of age. The male to female ratio (M:F) for the odontogenic cysts was 1:1.2, whereas for the odontogenic tumors it was found to be 1:1.3.

## Discussion

Odontogenic cyst and tumors account for less than 2-3 % of all oral and maxillofacial lesions.[1] More than 95% of all odontogenic tumors are reported in large series are benign and around 75% are represented by odontomas, ameloblastomas and myxomas.[5] In the present study, Out of the total 71 cases of odontogenic cysts, most prevalent odontogenic cysts were found to be radicular cysts (n=42, %= 59.1%), followed by dentigerous cysts (n=17, %=23.9%) and odontogenic keratocyst (n=12, %=16.9%) which is in accordance to other studies in various countries.[4,6-9] This high incidence of radicular cysts may be due to the precarious oral conditions of the population studied and the lack of public awareness to prevent oral infectious diseases.[4] Among the odontogenic tumors out of 49 cases reported, the most prevalent was ameloblastoma (n=28, %=57.1%) followed by ameloblastic fibroma (n=06, %=12.2%), odontoma (n=05,%=10.2%), adenomatoid odontogenic tumor (n=03, %=6.1%), peripheral odontogenic fibroma (n=02, %=4.08%), ameloblastic carcinoma (n=02, %=4.08%), odontogenic fibroma (n=02, %=4.08%) and odontogenic myxofibroma (n=01, %=2.04%). Similarly, studies from Nigeria, China, Tanzania, and SriLanka show a higher prevalence of ameloblastoma.[10-14] Ameloblastoma accounts for 60.3% of all odontogenic tumors in Indian population, with a mean age of presentation of 30.2 years.[15] As studies on the incidence of ameloblastomas are rare but at the molecular level, it was observed that the transforming growth factor-β (TGF-β)/SMAD signaling pathway is commonly activated in ameloblastomas, adenomatoid odontogenic tumor, and calcifying cystic odontogenic tumors. Meanwhile, the TGF-β/SMAD immuno reaction is significantly reduced in ameloblastomas in comparison to AOT's and calcifying cystic odontogenic tumors. These changes may lead to the more aggressive biological behavior of ameloblastomas through increased cell proliferation and reduced apoptosis and differentiation.[16] In the present study, the anterior and posterior portion of the body of mandible was the most common site for both odontogenic cysts and tumors similar to the studies reported by Nunez-Urrutia et al,[7] Avelar et al[6] and Meningaud et al[17] whereas many previous studies have reported maxilla[18-20] was the anatomic site most often affected by odontogenic cysts but there is no definitive explanation in the literature related to site variations.[21]

The age group for odontogenic cysts ranged from 07 to 72 years of age, whereas for the odontogenic tumors the range was 10 to 75 years of age. The male to female ratio for the odontogenic cysts was 1:1.2 with a female predilection. Similar results have been reported in Brazilian population.[22] On the contr4ary, male predominance was found in other studies[22-26]whereas for the odontogenic tumors it was found to be having

more female predilection with the ratio of 1:1.3.

## Conclusion

The prevalence of odontogenic cysts was similar to that reported in the literature, with incidence of radicular cysts seen most frequently. In case of odontogenic tumors the findings vary to the reported literature with ameloblastoma being more commonly reported.

**Ethical Clearance:** Since it was a retrospective study, there was no need for the ethical clearance from the committee.

# A Study of Over-The-Counter (OTC) Drug Usage Pattern among the Patients attending a Medical College Hospital

**Tejasvi.P.K[1], Magendran.J[2]**

*[1]Second year MBBS, [2]Professor, Department of Forensic Medicine, Saveetha Medical College, Thandalam, Chennai, India*

## Abstract

**Background:**Over the counter drug abuse is a growing problem and it needs more recognition. This current study is aimed to assess the pattern of over the counter drug usage among the patients attending Saveetha medical college hospital, Chennai, Tamil Nadu.

**Method:** This cross-sectional questionnaire based study was conducted at Saveetha medical college and hospital, Chennai, Tamil Nadu. The patients who signed the informed consent form were the study participants, a total of 100 patients were involved. The study period lasted from 23rd January 2019 to 30th March 2019. After the data was obtained they wereanalyzed using Microsoft excel. Percentages and frequency were calculated.

**Result:** A total of 100 filled questionnaires were collected from the study participants. Majority of the participants (63%) bought OTC drugs on occasion and the rest (37%) bought them always. Most of them (43%) consumed OTC drugs when the symptoms were minor/manageable, 33% of them whenever they felt sick and 24% when they couldn't go to a doctor. Many (41%) believed they could relieve fever by using OTC drugs, 20% to relieve nausea and 39% to relieve headache. Antipyretics (47%) were the most commonly consumed OTC drug. Most (38%) common reason for choosing OTC drug was to save time.

**Conclusion:** This study helped gauge the general public's views on OTC drug usage and gives an idea about the amount of work that is yet to be done or has to be done to bring OTC drug abuse under control. It is almost obligatory to make the patients understand the detrimental effects of OTC misuse and abuse- and the most effective way to achieve this is by making the people aware of them in the first place. Even though OTC drug abuse is a largely recognized problem, we still have a long way to go in terms of actually solving it.

***Keywords:****Over the counter drug, OTC drug misuse and abuse, self-medication.*

## Introduction

A drug is a substance intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease.

OTC drugs are:

- Drugs that do not require a doctor's prescription
- Bought off-the-shelf in stores
- Regulated by FDA through OTC drug monographs[1].

OTC drug monographs are a kind of "recipe book" covering acceptable ingredients, doses, formulations and labeling. Monographs will continually be updated adding additional ingredients and labeling as needed. Products conforming to a monograph may be marketed

without further FDA clearance, while those that do not, must undergo separate review and approval through the "New Drug Approval System"[1].2

Simply put, Over the Counter (OTC) drugs are medicines available without a prescription at pharmacies and are a part of self-medication process.

OTC medications have become a mainstay of Indian healthcare as more and more people are self-medicating.

A survey conducted in 2015, participated by 20,000 people from 10 Indian cities through an online doctor consulting platform, found that 52% of the participants practiced self-medication - citing lack of time to visit a doctor, wanting to save on consultation fee, reliance on internet for solutions as themajor reasons[2].

Patients rely more on their friendly neighbourhood chemists to give them their appropriate medication for ailments such as cough, cold, allergies, headache, fever and even skin-related conditions[2].

OTC drugs can provide immediate relief and are safe to an extent but people should realize that even an aspirin has adverse effects or can cause harm. People should realize that OTC medications are intended to treat short term illnesses and symptoms. Many OTC drugs are formulations of several medications which could interact with each other and cause harm. According to the FDA the most vulnerable people i.e. people most at risk are young children, adults over 55 and patients using drugs that affect kidneys.

Globally there is a demarcation – a separate category for drugs that can be sold without a prescription, but India doesn't have one[4,5]. If regulated properly – armed by more patient education, OTC medications can be an useful tool to deal with the problems of rising out-of-pocket healthcare costs, inadequate doctor-patient ratio and, weak and overburdened public healthcare system.

OTC medication abuse is a recognized problem and more research is needed to quantify the problem. This questionnaire based study is aimed to access the pattern of OTC drug usage and make people aware of the risks of self-medication. People shouldconsciously take steps to- go to the doctor, avoid unnecessary self-medications, adhere to the recommended dosage and read the labeling. Reporting any and all of the adverse effects experienced due to the consumption of an OTC drug ensures that proper pharmacovigilant actions can be taken. Following which the harmful effects of OTC drug usage can be minimized. Bottom line is that we should educate the patient before they self-medicate, so that they can make the right choices.

## Materials and Method

This cross-sectional, questionnaire based study was conducted to assess the pattern of OTC drug usage among the patients attending Saveetha Medical College hospital Chennai. The duration of the study was from 23rd January 2019 to 30th March 2019.

The study was conducted after obtaining permission and approval from the IRB.The participants in the study were the patients who attendedSaveetha Medical college, Thandalam.Objectives and procedure of the study were explained to the participants and those who signed the informed consent form were enrolled in the study. Those who hesitated to participate were excluded from the study.

The questionnaire containing various questions regarding OTC drug usage, like place of purchase of OTC drug, frequency of buying OTC drugs, common reason for consuming OTC drug etc was administered to each participant. The filled questionnaires were then retrieved from 100 participants.

Statistical tool: All the data obtained were analyzed through Microsoft excel. Percentages were calculated and chi-square test was done.

## Result

**Gender:**

Both women and men who took part in the survey were equally likely to use OTC medications.

**Place of purchase of OTC drugs:**

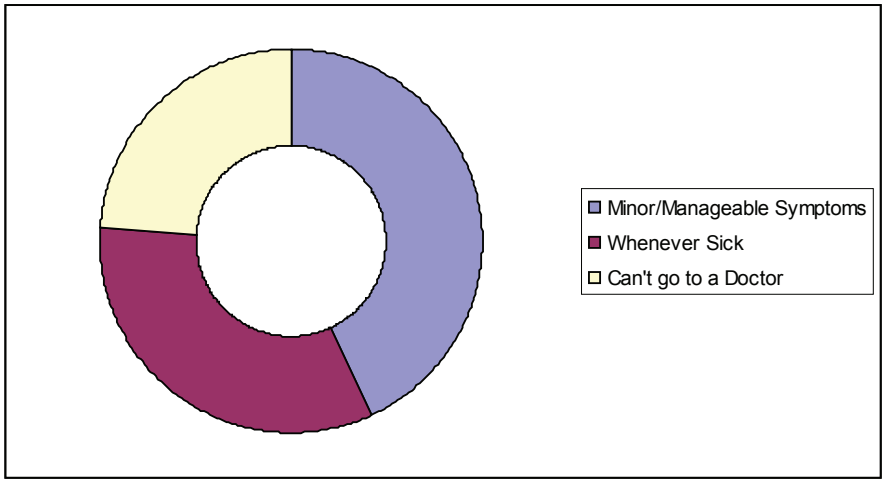
It was observed that 49% of the participants purchased OTC drugs from outside pharmacies, while 33% got them from hospital pharmacies and 18% got them from friends or relatives.

**Frequency of buying OTC medications:**

63% of the participants bought OTC drugs on

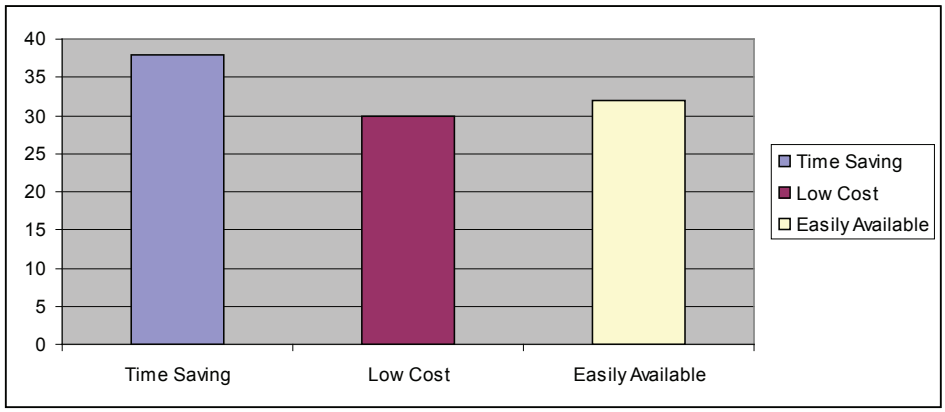
occasion while 37% of the participants opted to buy OTC drugs always.

**Figure 1: Time of consumption of OTC drugs**



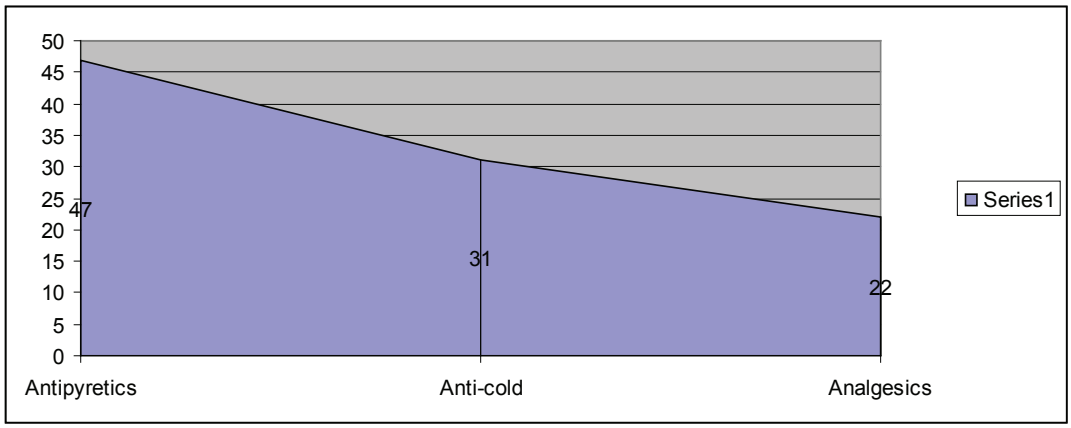
43% of the participants consumed OTC drugs when the symptoms were minor or manageable, 33% whenever they felt sick and 24% when they couldn't go to a doctor (Figure 1)

**Figure 2: Most common reason for purchase of OTC drugs**



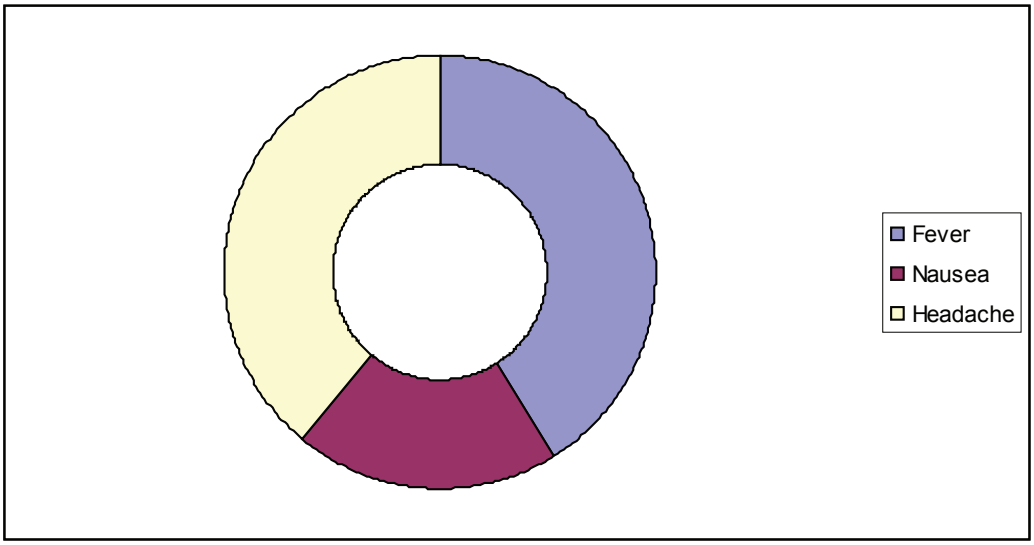
38% of the participants cited time saving as the reason for using OTC drugs, 30% of the participants used OTC drugs as they were a cheaper option and 32% used OTC drugs as they were easily available (Figure 2)

**Figure 3: Most common OTC drug consumed**



**47% of the participants bought antipyretics the most, 31% bought anti-cold and 22% bought analgesics (Figure 3)**

**Figure 4: Most common ailment they consume OTC drug for**



41% of the participants took OTC drugs because of fever, 20% to relieve nausea and 39% to relieve headache (Figure 4)

**TABLE 1: Taking the recommended dose**

| Options | Percentage |
|---|---|
| Took more than the recommended dose | 23% |
| Took only the recommended dose | 77% |

On asking whether they took more than the recommended dosage of the OTC drug, 23% of the participants agreed to over medicating and 77% of the participants said they only took the recommended dosage even if they weren't relieved of their symptoms or problem.

**TABLE 2: Adverse effect because of the OTC drug**

| Options | Percentage |
|---|---|
| Has experienced adverse effect | 28% |
| Has not experienced any adverse effect | 72% |

28% of the participants had experienced an adverse effect from taking the OTC drug while 72% of the participants had not experienced any adverse effect.

## Discussion

The frequency of usage of OTC medications in developing countries is believed to show an increase[6,7].There are various studies that suggest that sociodemographic factor plays an important role in OTC drug consumption. Socioeconomic factor also affects theconsumption of OTC drug in a particular demographic area[8]. In our country there are no specific regulations or rules laid down yet that can help bring down OTC medication misuse and abuse[2].Abusing OTC drugs can lead to a variety of health problem ranging from gastric ulcers to kidney failure and death[3]. It could worsen the condition of the patient by causing other debilitating diseases or making the disease itself to progress. There

have been many studies before with similar intentions and tones as this one; to raise awareness about the ill-effects of OTC drug abuse.

Inthe study done by Parikh.D, Sattigeri.B.M, Kumar.A, Brahmbhatt.S, 87% of the participants shared OTC drugs among their friends and relatives[10]. In this study however only 18% percentage of the participantsreceived OTC drugs from friends or relatives.

Easy availability of OTC drugs, chance to avoid the doctor's consultation fee, and save time were among the most common reasons for choosing to buy OTC drugs instead of directly consulting a doctor. As observed by this study, the most common reason for purchase of OTC drugs was to save time (38%) but in the study done byMourya, A., Mary, C., James, C., Jose, J., & Srinivasan the most common reason was easy accessibility.

In this study, it was found that majority of the participants took OTC drugs as a remedy for fever (41%). While in the study done by Parikh.D, Sattigeri.B.M, Kumar.A, Brahmbhatt.S the frequently reported illnesses that prompted self-medication were headache, cough and cold[10].

In another study[13], the most common drug used for self-medicating was paracetamol, this is in line with the current study, according to which antipyretics (47%) were most commonly consumed by the participants.

Another study, from the Journal of Public done by Niamh AFingleton, Margaret C Watson, Eilidh M Duncan, came to the conclusion that analgesics were the drugs commonly misused or abused (dependence was reported) and the most common illnesses were cough and cold[14]. This is in contrast with the current study, which gathered that the most common OTC used were antipyretics and the most common illness was fever.

It was found that 28% of the participants in the current study had experienced adverse reactions from taking OTC drugs, while in a different study 18.62% of the participants had experienced side effects from consuming OTC drugs[16].

The variation in the results obtained by all the past studies and this one is probably due to the difference in sociodemographic details of the study.

## Conclusion

OTC medication misuse and abuse is a growing problem, especially in developing countries like ours and it has been overlooked. Raising awareness about the adverse effects of self-medication is the best way to counter this problem. It should be an obligatory part of the duties of a health care professional.

Educating the public or the patients on how to self-medicate is an important step that can be taken to reduce the chances of them misusing or abusing OTC medications. A patient or person solely dependent on themselves or blindly trusting their local pharmacists for the right remedy might end up with a bigger disease or problem than with what they started. They focus on just treating the symptom and might even let the underlying disease progress into a severe or fatal form.

Interventions at different levels (accessibility, affordability) that will change the public's perception of OTC medication usage and vigilance during drug dispensation may help reduce the OTC medication abuse.

# Tobacco Toxicity in Tobacco Chewers

**V. Chandrasekhar**

*Professor & PG HOD of FMT+ Dean, MAEER's MIMSR Medical College, Latur, Maharashtra State*

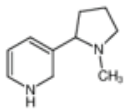
## Abstract

Nicotine is highly addictive plant derived alkaloid and the most important species in human use today is Nicotiana tabacum. There are direct health effects of chronic nicotine exposure. Even in low doses, nicotine causes vasoconstriction and other cardiovascular effects related to catecholamine release and promote angiogenesis, neuroteratogenicity, and possibly some cancers[1]. Periodontal disease and dental cavities and have up to 48 times the risk of oropharyngeal cancers compared with people who do not use tobacco products[2]. Low doses exposure produces fine tremor, cutaneous vasoconstriction, increased GI motility, and increase in heart rate, respiratory rate and blood pressure[3]. Low dose nicotine also increases mental alertness and produces euphoria and desired psychoactive effects[3]. Metabolism is via the hepatic cytochrome oxidase system. The half life of nicotine in the body is 1 to 4 hours and decreases with repeated nicotine exposure[4].

***Key words:*** *Vasoconstriction, periodontal disease, leucoplakia, psychoactive effects, myocardial ischemia, macular degeneration, impotence, atrial fibrillation, cancers.*

## Introduction

**Nicotine, $C_{10}H_{14}N_2$ [5] MW = 162 daltons**



**It is a colorless, volatile, bitter, hygroscopic liquid alkaloid that turns brown and resinous on exposure to air.**

Action of Nicotine: It acts on the autonomic ganglia which are stimulated initially, but are depressed and blocked at later stage. It also acts on the somatic neuromuscular junction, and afferent fibers from sensory receptors[6].

## Materials and Method

On Examination of **126** Persons in MAEER'S MIMSR Medical College & YCR Hospital who **is chewing tobacco since 5 years.**

1) These persons are mostly attenders, sweepers, technicians, and clerks, extra.

2) All are males.

3) They used to mix lime and tobacco or only tobacco and rub on the palm of one hand and place it between lower lip inner aspect of mouth and right or left lower jaw gums. They place it for 10 to 30 minutes, and allow it absorb through the mucous membrane.

4) Immediately they will get euphoria, pleasuring mind, and false sense of wellbeing.

5) They take it when they are at leisure.

6) After and during chewing tobacco they prefer rest.

7) Above 85% are well nourished and in active sex, rest are not in active sex and not take much food.

8) All are living in Endemic area of Tobacco chewing. All are hailed from village areas of Marathwada region of Latur District-rural where natives chewing tobacco products habitually.

**On examination Findings:**

**Pulse:** Normal for all; for those who chew tobacco for 10 15 years vessel wall is thick, sclerotic changes like fibrosis of vessel wall is found.

**B.P.:** Mild increase immediately after chewing. Lower for those chew tobacco for over 15 years.

**Liver** and spleen are normal.

**Respiratory** rate is 18 to 22/minute.

Mentally alert, listen to commands.

Always restrains extra activities, extra work.

Increase in rest taking behavior.

## Findings

1) Compulsion to chew tobacco for further time.
2) Addiction forming for mental well being.
3) Abstinence due to knowing of its harmful effects. But he again takes it for mental pleasure.
4) He takes it thinking that he is doing adult type of thing for self prestige as he moves in lower job works and others to speak of his health.
5) For hunger it is used as alternative to the food.
6) It works as appetite suppressant.
7) In persons of 5 to 10 years of chewing history show

a) Reduced visual acuity. b) Reduced field of vision.

[Macular fovea reflex is absent, indicating macular involvement of macular region of retina – observed in village rural people coming to Ophthalmology OPD]

8) Pupillay reaction is not brisk.
9) Tobacco amblyopia – in persons of history above 10 years. Reduction of- vision of retinal or macular/ CNS origin.
10) Pulse is – Normal or Reduced in rate.
11) Memory loss: To the extent of learning remembering of educational type.
12) Develops selfishness behaviors, of his very near personal benefit/ pleasure type.
13) Develops narrow mindedness. Have selfish mind. Immediate benefits type though he knows that this may be damaging.
14) He sticks to the local of his known rules/norms/ customary things. (taking tea, tiffin during examination times).
15) Monetary/Economic Affairs: i) economically selfish, to the temporary immediate comports. ii) No long term savings or investments on lands or plots, etc for longer periods of decades. iii) Selfish to his own sexual affairs and acts. iv) 90% of all these taken alcohol once in a week to have sexual pleasure.
16) For sexual purpose he is gradually increasing the dose of Alcohol. Previous 30ml to have sex. Now to take 90ml to have sex. It shows there gradual decrease of Libido-male Impotence
17) Mouth: 1. Oral mucous membrane is light violet colour like cyanosed mucous membrane. Normally it is pinkish to red in colour.

**2. Alternate cyanosed, pale whitish areas are found.**

**3. Micro ulcers (about 0.1mm) in the oral cavity are found in 96 persons – 76%;**

**4. Macro-ulcers -20.63%. (26)**

**5. Pre-leukoplakia pale areas (mid way between normal and leukoplakia found in -8.7% (11)**

**6. Leukoplakia appeared and reversed on stoppage of tobacco chewing and taking adequate food -2.38% (3)**

**7. Brownish staining of teeth is seen in -97.61% (123); Brownish staining of Oral mucous membrane in 95.23% (120)**

**8. Brownish staining of gums is seen in -97.61% (123)**

**SUGGESTIONS:** Tobacco Control Legislation[7] to be implemented.

## Conclusions

1) These people are at the risk of forthcoming development of a) Endarteritis obliterans. b) Alzheimer's like disease with memory loss. c) Visual field defects. c) Leucoplakia (precancerous condition). d) Cardiac disorders like angina pectoris, myocardial ischemia, and cardiac irregularities, atrial fibrillation. E) Early appearance of Peptic ulcer and are more likely to fail antacid and $H_2$-blocker therapy for peptic ulcer disease[8]. F) Increased risk of osteoporosis, senile cataracts, and macular degeneration; and results in wrinkling of the skin, gallstones and male impotence[9]. G) High blood pressure.

2) Abstinence is the primary method of therapy.

3) These people are of lower socio-economic group.

4) The natives of their villages are in the habit of tobacco chewing. So they are ignoring the risks of tobacco chewing.

5) They unable to afford the Tobacco replacing/ abstinence therapy.

6) They are not approaching the Doctor because it

hampers their duty, loss of money.

7) Unable to afford the Tobacco replacement therapy.

8) They are at the risk of developing **CANCERS**: Cancers of lips, oral cavity, pharynx, esophagus, pancreas, larynx, lung, kidney, urinary bladder, other urinary organs[10].

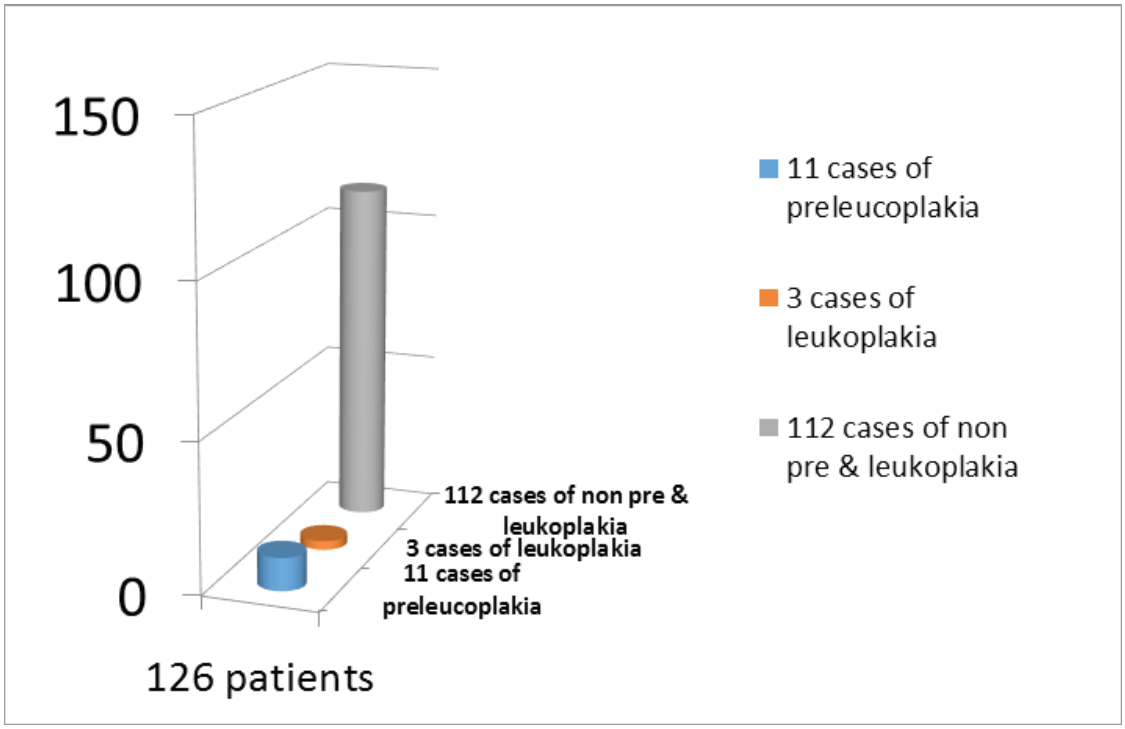


**Fig.1. Incidence of Leukoplakia and pre-leukoplakia.**

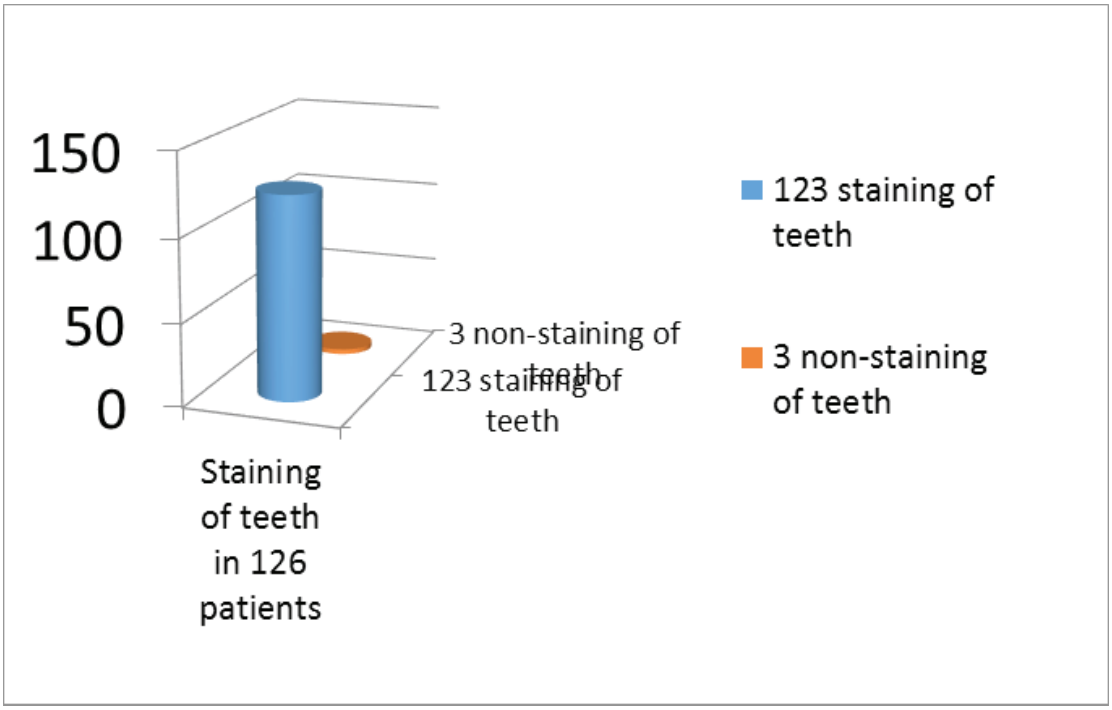

**Fig. 2. Incidence of Teeth staining.**

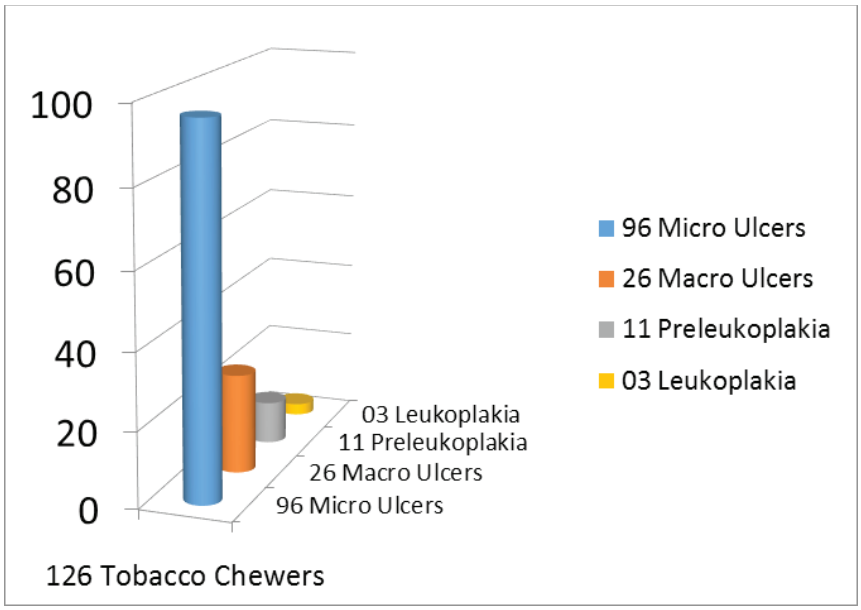

**Fig. 3. Incidence of ulcers, pre-leukoplakia and leukoplakia.**

**Acknowledgement:** I thank to all persons who cooperated and volunteered.

**Declaration:** I, Dr. Prof. V. Chandrasekhar, declare that the work done is solely belongs to me alone. This is not published in any National /International Journal.

# Study of Temporary Trends in The Pattern of Poisonings in a Tertiary Care Hospital

**V.K.Sowmithra[1], Magendran.J[2]**

*[1]II MBBS, Saveetha Medical College, Thandalam, Chennai, India, [2]Associate Professor, Department of Forensic Medicine, Saveetha Medical College, Thandalam, Chennai, India*

## Abstract

**Introduction***:*Acute Poisoning forms one of the commonest causes of emergency hospital admissions. Poisoning both accidental and intentional are a significant contributor to mortality and morbidity throughout the world.A complete review of the risk factors decreases incidence and significant morbidity and mortality rates.The present study aims to characterize contemporary trends in the pattern of poisonings in a tertiary care hospital in Chennai,Tamil Nadu.

**Materials and Method:** The study was conducted in tertiary care hospital [Saveetha Medical College and Hospital] for a period of one year[from January 2018 to December 2018].The data was obtained retrospectively from medical case sheets and various parameters such as sex ratio,occupation,poison type,etc., were analyzed and compared with other studies .

**Results:** The study population consists of 294 cases, among which 232 were suicidal and 62 were accidental. Female predominancy was reported in the present study, with the prevalence of poisonings more common among the age group 21-30y years.Household poisons like insecticides and rodenticides were the most commonly administered.Most of the patients admitted were skilled workers and homemakers .

**Conclusion:** Poisoning was more common in young adults,particularly females.Insecticides and rodenticides were major causes of poisoning,with the higher incidence among skilled workers.Highly equipped treatment facilities and establishment of poisoning centers have become the need of the hour.

***Keywords:*** *Insecticides,poisoning, household poisons,poison information center.*

## Introduction

Poison is a substance (solid,liquid or gas), which if introduced in a living body or brought into contact with any part thereof would produce disease or even death by its constitutional or local effects or both [(1)]. Death due to poisoning has been known since time immemorial [(2)]. In the present world, there has been reports of increased morbidity and mortality due to poisoning. It has posed a major health distress to all parts of the world in various degrees. Toxicology is the science dealing with properties, actions, toxicity, fatal dose , deduction and estimation of, interpretation of the results of toxicological analysis and treatment of poisons [(1)]. Among the unnatural deaths, death due to poisoning comes next to road traffic accidents[(3)].

Pattern of poisoning in a region depends on various factors which include availability and access to the poison, socioeconomic status of an individual, cultural and regional influences etc. Poisons include chemicals, biological agents and radioactive substances which may be in the solid , liquid or gaseous state. Rapid industrialization, introduction of newer range of drugs for treatment and massive use of pesticide in agriculture

**Corresponding author:**

E-mail:drmagi83@yahoo.com.

has increased the incidence of poisoning [3]. Agricultural poisoning, death due to snake bite, household poisoning and poisoning due to pharmaceutical products have shown a rise in the recent times[2].

Both cases of intentional and unintentional poisonings are seen. Intentional poisonings include homicidal and suicidal poisonings. According to the legal system of our country, all poisoning death cases are recorded as unnatural death and a medico-legal autopsy is routine [2]. Knowledge of general pattern of poisoning in a particular region will help in early diagnosis and treatment of cases,thus decreasing the rate of morbidity and mortality.Hence this study was carried out with the objective to find out the contemporary trends in the pattern of poisonings in a tertiary care hospital.

## Materials and Method

A retrospective study on pattern of poisonings was conducted in Saveetha Medical College and Hospital, Thandalam, Chennai. The study included various poisoning cases reported in the Emergency Department of the hospital during the year 2018 (January 2018 -- December 2018). Data collection was done as per the hospital rules and regulations. Permission from both Forensic Medicine Department and Medical Records Department was obtained prior to data collection.

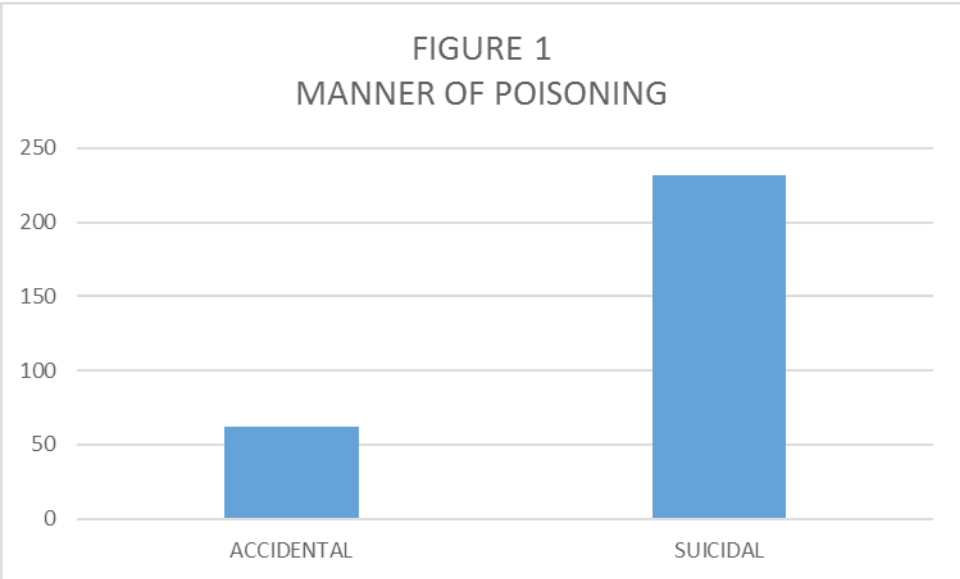
The study included all poisoning cases like household poisoning, agricultural poisoning, poisoning due to pharmaceuticals, food poisoning, and poisoning due to snake bite. The study population consisted of 294 cases that included people of all age groups, right from 5 months to 83 years. Details regarding age, sex, occupation, time taken of hospitalization after ingestion of poison, condition at the time of hospitalization, manner of poisoning, mode of administration, type of poison and marital status of the patient were collected from the hospital records, documented in a pre-structured proforma and analyzed. Socioeconomic status of the patient could not be analyzed as information regarding educational status and percapita income was not available.

***INCLUSION CRITERIA:****ALL CASES OF ACUTE CHEMICAL,PHARMACEUTICAL,FOODPOISONING AND SNAKEBITE CASES IRRESPECTIVE OF AGE AND SEX.*

***EXCLUSION CRITERIA:****CASES OF ANIMAL EVENOMATION(WITH THE EXCLUSION OF SNAKE BITE CASES) AND ALLERGIC DRUG REACTION.*

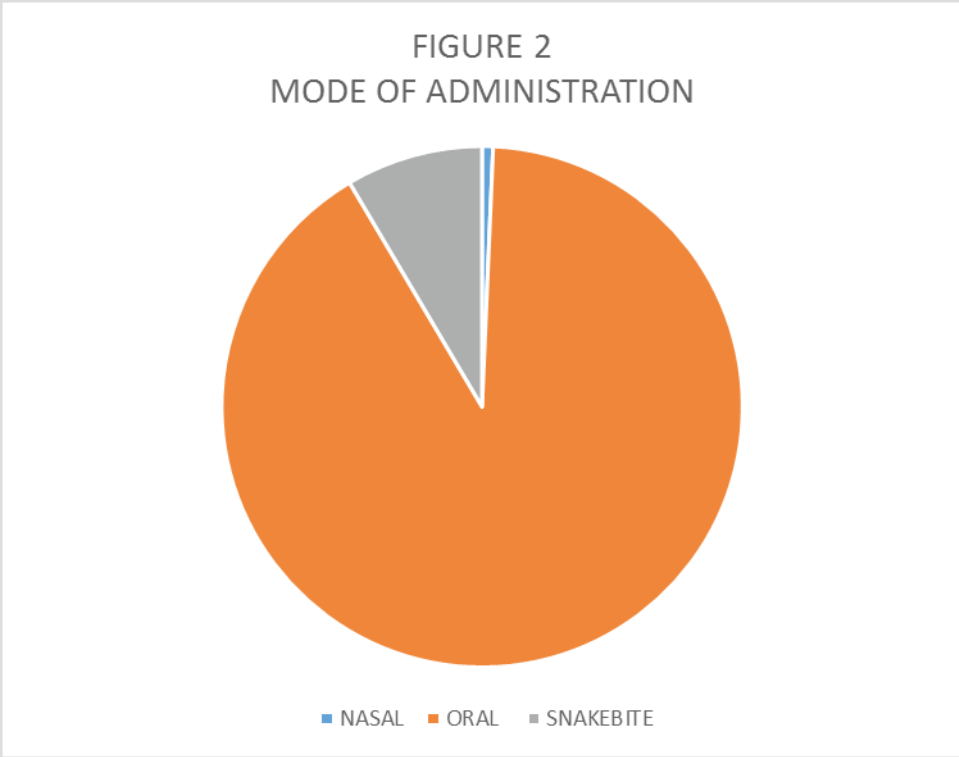
***RESULTS***

A total of 294 poisoning cases were reviewed, out of which, 232 (78.911%) were suicidal and 62 of them (21.088%) were accidental, indicating a majority to be of intentional type of poisoning [Refer FIGURE 1].



The study revealed that poisoning among female population (52.21%) was higher when compared to that of male population (42.278%) and it was found that poisoning was common among the unmarried (54.421%) than among the married (43.877%).

Among the cases reported, around 90.816% were found to be due to ingestion of chemicals like insecticides and other cleaning agents. Also poisoning due to snake bite and inhalation of toxic substances were reported [Refer FIGURE 2].



The incidence of poisoning was found to be the highest among individuals aged between 21-30 years followed by those aged between 11-20 years. Poisoning cases of individuals belonging to the age group 31-40 years, 41-50 years , those above 50 years and of those 10 years and below were reported[Refer TABLE 1].

**Table 1**

| **Age** | **No. of Poisoning Cases** | **Percentage** |
|---|---|---|
| LESS AND EQUAL TO 10 | 17 | 5.782 |
| 11-20 | 79 | 26.87 |
| 21-30 | 114 | 38.775 |
| 31-40 | 47 | 15.986 |
| 41-50 | 20 | 6.802 |
| 51-60 | 6 | 2.04 |
| ABOVE 60 | 7 | 2.38 |
| UNKNOWN | 4 | 1.36 |

Poisoning rates were high among skilled workers (69 out of 294 cases) and homemakers (52 out of 294 cases). Least number of cases were reported among the unemployed class.

**TABLE 2: Poisoning rate among people of different occupational status is as follows.**

| Occpation | No. of Poisoning Cases | Percentage Of Poisoning Cases |
|---|---|---|
| HOMEMAKERS | 52 | 17.687 |
| STUDENT | 51 | 17.346 |
| CLERICAL | 6 | 2.04 |
| CHILDREN[OF AGE GROUP 1-6 YEARS] | 13 | 4.421 |
| SEMI-PROFESSION | 16 | 5.442 |
| PROFESSION | 4 | 1.36 |
| SKILLED | 69 | 23.469 |
| UNSKILLED | 32 | 10.884 |
| UNEMPLOYED | 1 | 0.34 |
| UNDETERMINED | 50 | 17.006 |

**Refer TABLE 3. Analysis of the poisoning cases revealed poisoning rates to be high during the month of July, January, August and November**

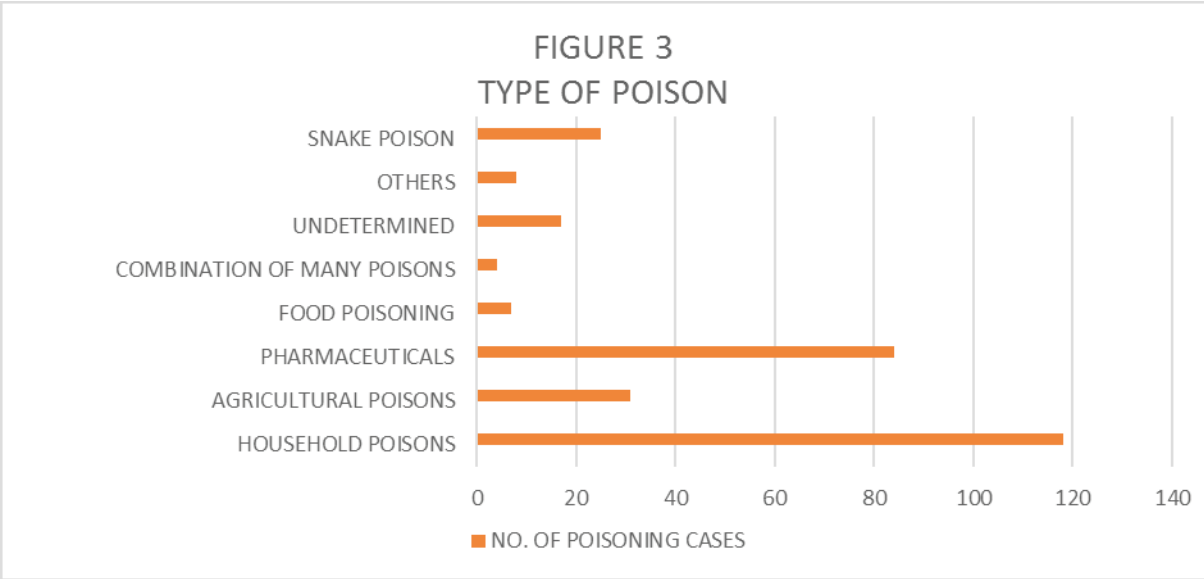
| MONTH | NO. OF POISONING CASES | PERCENTAGE OF POISONING CASES |
|---|---|---|
| JANUARY | 27 | 9.183 |
| FEBRUARY | 22 | 7.482 |
| MARCH | 23 | 7.823 |
| APRIL | 25 | 8.503 |
| MAY | 24 | 8.163 |
| JUNE | 9 | 3.061 |
| JULY | 40 | 13.065 |
| AUGUST | 27 | 9.183 |
| SEPTEMBER | 26 | 8.843 |
| OCTOBER | 26 | 8.843 |
| NOVEMBER | 28 | 9.523 |
| DECEMBER | 17 | 5.782 |

Most of the patients( about 96.598) were conscious at the time of hospitalization. Only 0.34% was found to be delirious, 0.68% to be semi-conscious and 2.38% to be unconscious.

The study revealed that the most common type of poison consumed were household poisons which included insecticides, rodenticides, detergents, disinfectants, kerosene, petrol, corrosive acids, disinfectants, medicated oil, rust preventive oil and matchsticks and pharmaceuticals which included antacids, anti epileptics, anti anxiety drugs, antibiotics, NSAIDS, antidiarrhoeal drugs, antidepressants,hypoglycemics, multivitamins, anti hypertensives, antihistaminics, antifungals, anti hypertensives, antimalarial, antiseptics, antitussives, antivirals, antiparkinsonian drugs, calcium channel blockers, antiadrenergics, hypolipidaemics, cholinesterase inhibitors, sedatives-hypnotics, iron and other nutritional supplements.There were also cases of poly pharmacy poisoning.

Agricultural poisons like fertilizers, herbicides, oleander leaves, pesticides, flowers and seeds were the second most common cause of poisoning. Accidental food poisonings have also been reported which included poisoning due to consumption of lizard fallen food and some seafood. Rate of poisoning due snake bite was found almost equal to that of agricultural poisoning.

Interestingly,poisoning due to combination of various substances such as calcium channel blockers and NSAIDS along with disinfectants, pesticides along with herbicides and rodenticides, rodenticides along with kerosene, rodenticides along with insecticides, thyroxine tablets along with disinfectants have been reported . Acetonide poisoning, poisoning due to ammonia, hydrocarbon, paint varnishes, paint thinners and tensene were also reported. Some of the poisons were undetermined .



**[ Refer FIGURE 3]: Type of poisoning is categorized as follows**

Out of the total poisoning cases reported, about 31.63% were hospitalized within the time frame of 1-3 hours after ingestion of poison. 29.591% were hospitalized within less than an hour, 11.34% hospitalized within 3-5 hours and the remaining after 5 hours of ingestion.

## Discussion

The occurrence of 294 cases in a single hospital within a period of 12 months signifies the seriousness of poisoning in this region. Poisoning rates were found to be high among the female population. Although it contradicts with studies like Bhagora et al.,Gopal et al.and Panda et al.,foreign studies like Tufekci et al and Kavalci et al support the present study with female dominancy in poisoning cases ([4-8]). Poisoning was more commonly seen in young adults ,especially in the age group of 21-30 years. Stress is believed to be the

major cause. Mental strain and pressure during studies, unemployment, financial problems,marital conflicts,etc., may aid the reason.

Most of the poisoning cases reported were found to be suicidal and showed similarity with results of studies like Sharma BR et al.,Karamjitsingh et al.,and Sanjeev Chaudhry et al [9-11]. Although accidental poisoning can occur at any age,it was found to be more common in children less than 10 years of age. Snakebite was the main cause for accidental poisoning. Almost all cases of suicidal poisonings were by the consumption of chemicals and other pharmaceutical agents.

In this study, poisoning rates among unmarried population outnumbered married ones that contradicts with other studies [12-15] , in which more no. of poisonings were seen among married people. The incidence of poisoning was higher during the months of July followed by November.This contradicts with studies conducted in India that showed more incidences during summer [16]. Some studies also show increase in poisoning during rainy season [17] and supports the present study. There are studies which show that there is a relationship between summer suicide rates and biochemical, metabolic and immune variables [18].

The study revealed increase in the number of poisoning cases due to household poisons. There is dissimilarity seen when compared to studies conducted in western countries [17,19,20] and in India, where agrochemicals were the most common poisoning agents [14, 16, 21, 22]. Household poisons consumed included insecticides and rodenticides. Availability of different kinds of household products due to advancement in science has a influence on the increase in intentional household poisoning. Easy accessibility of drugs has made them the second most common poisoning agent. Occupation and area of residence has an influence on the availability of poisons. In the previous decade farmers were more in number and used agrochemical agents as poisons. But today, with development of industries and increased manual empowerment, there is a change seen in the type of poison consumed. People have better access to pharmaceutical agents and household poisons. The area where this hospital is located has many industries in the neighborhood and hence shows a rise in poisoning due to household poisons and pharmaceuticals.

## Conclusion

In the present study,females were affected more than males with the higher of incidence among people of 21-30 years of age.Unmarried cases outnumbered married ones.Most common type of poisons administered were household poisons.Among them majority were insecticides and rodenticides.Incidence of poisonings were found to be the highest among skilled workers,particularly company workers which may be due to the prevalence of multiple companies in the area .

Highly equipped treatment facilities, establishment of poison information centers and surveillance centers have become the need of the hour.Extending psychiatric services to the community may help in identifying high risk population who are likely to commit deliberate self-harm.

# Amputation of Penis Due To Electrocution- A Case Report

**Vedant Kulshrestha[1], Mohammad Amjad[2]**

*[1]Senior Resident, [2]Junior Resident, Department of Forensic Medicine & Toxicology, Vardhman Mahavir Medical College & Safdarjung Hospital, New Delhi*

## Abstract

Electricity is an integral part of modern society. Without electricity the existence of human life seems difficult, but it has the capacity to stand life and destroyed the life up to the death. The most fatalities caused due to electricity are accidental and result from passage of an electric current [both low & high voltage] through the body. Penile trauma presents a difficult physical and psychological problem and is rare. The causes of penile trauma are varied; it can be iatrogenic or caused by traffic accidents, thermal and electric burns, ritual circumcision, animal bites, gunshots or self-mutilation. The type and extent of penile trauma varies from mild to severe injuries, sometimes even with total amputation.

In the present case, a 24 year old young male from Palwal (Haryana) sustained electric burn injuries while he was standing in the balcony and came in contact with high voltage electric wires passing in front of the balcony. He was admitted in Safdarjung hospital, Delhi and expired on the same day. During autopsy electric contact burn marks were present on unusual sites of the body like head, neck, abdomen, pubic region and root of penis with amputation of penis. Electric flash burns were also present on different parts of the body along with fracture of cervical vertebra.

***Key Words:*** *Electricity, Electric current, Electric burn injuries, Electrocution, Penile trauma, Amputation of penis.*

## Introduction

Electricity is an integral part of modern society. Without electricity the existence of human life seems difficult, but it has the capacity to stand life and destroyed the life up to the death. The most fatalities caused due to electricity are accidental and result from passage of an electric current [both low & high voltage] through the body. Suicides and homicides from electrocution are very rare.[1] In comparison to western countries India shows relatively higher incidence of electrocution.[2] Penile trauma presents a difficult physical and psychological problem and is rare, because the penis is a mobile organ enveloped into loose skin, well protected by its position; however, the penis is more prone to trauma during sexual intercourse while rigidly erect.[3] The causes of penile trauma are varied; it can be iatrogenic or caused by traffic accidents, thermal and electric burns, ritual circumcision, animal bites, gunshots or self-mutilation.[4,5,6,7] Reports of trauma to the external genitalia are sporadic. The type and extent of penile trauma varies from mild to severe injuries, sometimes even with total amputation. [8]

**Corresponding Author:**
**Dr. Vedant Kulshrestha**
Senior Resident, Department of Forensic Medicine & Toxicology, Vardhman Mahavir Medical College & Safdarjung Hospital, New Delhi.
E-mail: vedant_kulshrestha@yahoo.co.in
Mob. No.- 8105979445

**Case history:**

A 24 year old young male from Palwal (Haryana) sustained electric burn injuries on 11/11/2018 at around 5:30 AM while he was standing in the balcony and came in contact with high voltage electric wires passing in front of the balcony. He was initially taken to a private hospital at Palwal. Then referred and admitted at Safdarjung Hospital, Delhi on 11/11/2018 at 09:10 AM where he died while undergoing treatment on 12/11/2018 at 12:00 AM.

**Autopsy findings:**

Dead body was of a male wrapped in white coloured hospital sheet. Moderately built, Cornea was hazy. Rigor mortis was present all over the body. Post mortem staining was present over back except pressure and burnt areas, and was fixed.

**Antemortem external injuries:**

(1) Electric contact burn marks, 2 in number, of sizes 5 cm x 3.5 cm x scalp tissue deep and 3 cm x 2 cm x scalp tissue deep respectively were present over back of head on left side. Margins were irregular, everted and base was indurated. Surrounding area was pale. Blackening was present around the wound. Scalp hair were singed at places. (Fig. 1)

(2) Electric contact burn mark of size 12 cm x 5 cm x muscle deep was present over nape of neck. Margins were irregular, everted and base was indurated. Surrounding area was pale. Blackening was present around the wound. (Fig. 1)

(3) Electric contact burn mark of size 7 cm x 3 cm x subcutaneous tissue deep was present horizontally over right side front of abdomen, situated 10 cm below the umbilicus. Margins were irregular, everted and base was indurated. Surrounding area was pale. Blackening was present over and around the wound. (Fig. 2)

(4) Electric contact burn mark of size 12 cm x 3.5 cm x muscle deep was present horizontally over pubic region on right side. Margins were irregular, everted and base was indurated. Surrounding area was pale. Blackening and charring was present over and around the wound. (Fig. 2)

(5) Electric contact burn wound of size 5 cm x 4.5 cm x muscle deep was present over root of penis and penis was amputated and missing. Margins were irregular and everted, and base of wound was indurated. Blackening and charring was present over and around the wound. (Fig. 2)

(6) Epidermal to dermo-epidermal electric flash burn injuries were present in patches over face and neck, in patches over back of chest, in patches over front of abdomen, external genitalia and in patches over left forearm. Right upper limb including both palms, front of chest, back of abdomen and both lower limbs including soles were spared. Total electric flash burn injury involved about 20 % of total body surface area. Burnt area showed redness, peeling and blackening of skin at places. (Fig. 1, 2, 3)

**Internal examination:** Cervical vertebra was fractured at C3-C4 vertebral level with blood extravasation at fractured site. Underneath spinal cord was contused. Lungs were congested and edematous. Stomach was empty with no unusual smell and normal mucosa. All other organs were congested.

Opinion regarding cause of death was given as shock as a result of electrocution.

**Fig. 1- Figure showing electric contact burn marks over back of head and nape of neck, and electric flash burn injuries**

**Fig. 2- Figure showing electric contact burn marks over front of abdomen, pubic region and penis with amputation of penis due to electrocution, and electric flash burn injuries**

**Fig. 3- Figure showing electric flash burn injuries over face, neck, shoulder and upper part of back of chest**

## Discussion

In a study done by the auther in Bangalore, majority 48.8% of electrocution cases were young adults in the age group of 21-30 years followed by 31-40 years which include 17.1% cases. Majority of victims of fatal electrocution were male (85.4%) and only 14.6% were female.[9] The studies conducted by Guntheti BK et al[1], Rajesh B et al[10] and Shaha KK et al[11] also reported that most of the victims were from 21-30 years age group. Similar findings of male dominance were also reported by them.

In the present case also the victim of electrocution was a 24 year old young male.

The reason for such a marked male predominance of young age in a variety of studies from different communities is probably the fact that mostly males of young age are involved in the electrical works.

Accidental electrocution among these would have occurred because of carelessness, ignorance, haste, malfunction of appliances or equipment such as ineffective insulation, lack of protective earthing, faulty grounding and short circuits.[12]

In a study conducted by Ragui S et al[13] in Manipur, most of the victims were electrocuted on the road side (68%) and the remaining victims were electrocuted in their houses. While in a study conducted by Pathak AK et al[14] at Jaipur 70% victims were electrocuted at home.

In the present case the victim got electrocuted at home while he was standing in balcony.

In the study done by the auther in Bangalore, in most of the cases (46.3%), there were only entry wounds. While in 29.3% cases both entry and exit wounds were seen. Electrical flash burns were seen in 36.6% cases. Majority of cases (75.6%) showed electric contact marks present on upper limbs including palms and fingers.[9] This usual site of electric entry mark is also mentioned in many textbooks.[15,16] In a study conducted by Rajesh B et al[10], 44.5% cases showed only entry wounds while in 27.8% both entry and exit wounds were present. In the study conducted by Guntheti BK et al[1], 40.3% cases showed only entry wounds, 35.48% cases showed both entry and exit wounds. While 25.8% cases showed flash burns.

In the present case both electric contact burn marks and electric flash burns were seen. Electric contact burn marks were present on unusual sites of the body like head, neck, abdomen, pubic region and root of penis with amputation of penis. Fracture of cervical vertebra also present.

## Conclusion

The etiology of penile trauma varies but ranges from self-infliction in psychiatric patients, to industrial accidents or assaults, and rarely from circumcision mishaps. The traumatic amputation of the penis in adults following electrocution is rare. Whenever it happens, it can be devastating to the patient, his spouse and his relatives.

The risk of getting electrocuted from the haphazardly installed electric wires without proper maintenance and careless use of electrical appliances is the matter of concern. Nevertheless, spread of awareness and adoption

of safety measures are important factors required for prevention of fatal electrocution and penile trauma.

# Towards Digital Diagnosis of Oral Cancer: A Study on Optimum Preferences of Histopathological Techniques and Features

**Tabassum Yesmin Rahman[1], Lipi B. Mahanta[2], Anup K Das[3], Jagannath D Sharma[4]**

*[1]Research Scholar, Cotton University, Guwahati, Assam, India, [2]Associate Professor, Institute of Advanced Study in Science & Technology (IASST), Guwahati, Assam, India, [3]Chief Pathologist, Arya Wellness Centre, Guwahati, Assam, India, [4]Professor and HOD, Department of Pathology, Dr B. Borooah Cancer Institute, Guwahati, Assam, India*

## Abstract

Accurate diagnosis is dependent on various factors in the pathological domain, like types of slides used and features scrutinized. Sometimes a diagnosis is evident due to clear symptoms. But under adverse constraints, like improper acquisition etc., it is very difficult to give a quick and clear diagnosis. The study aims to conduct a survey from the well-known histopathologists of the country to gather an understanding of the techniques preferably used by them for diagnosis of the disease and summarize it, for arriving at optimum options which may be adopted for automation. This was a cross-sectional study conducted from March 2018 to May 2018 using a pre-tested structured questionnaire of multiple answer choices. The study subjects comprised of resident histopathologists of the hospitals covering states/locations all over the country, by selective sampling. The hospitals were selected based on the availability of on-site pathology centres and wide coverage. The analysis of the data was done using Ms-Excel and SPSS. The Non-Parametric Friedman Test was conducted to test for significance of the responses. Oral Squamous Cell Carcinoma (OSCC) of buccal mucosa with both moderately and well-differentiated grades were reported. For diagnosis, H&E stain for the slides of 4μ thickness is mostly used. Further, invasion of basement membrane was the most important architectural feature and increased nucleo-cytoplasmic ratio the most important cytological feature. This type of survey will help in carrying out a directed diagnosis or further research for automated diagnosis using the results.

## Introduction

Healthcare costs will need to reduce if we are to treat more people. The area of diagnosis offers possible significant cost reduction while improving accuracy by using technology. Recent times have witnessed an increase in the incidence of cancer.[1] According to the World Health Organization, 6,57,000 new cases of cancers of the oral cavity and pharynx are estimated each year and more than 3,30,000 demises.[2] This is mainly because of urbanization and industrialization which leads to a major change in lifestyle and exposure to environmental pollution. It is well known that cancer incidence in urban population is nearly double that of the rural population. Further other important factors like demographics, increased life expectancy and access to healthcare contribute to the cause. Morbidity due to cancer is almost double in the rural population than the urban population.[3] Clear causes are poverty, illiteracy, ignorance, myths of the disease and access to cancer facilities. Oral and oropharyngeal carcinomas still continue to hold the sixth most common cancers in the world.[4] Surveillance, Epidemiology, and End Results (SEER) 9 registries of the National Cancer Institute of the United States Public Health Service, 2018 report shows the following statistics.[5]

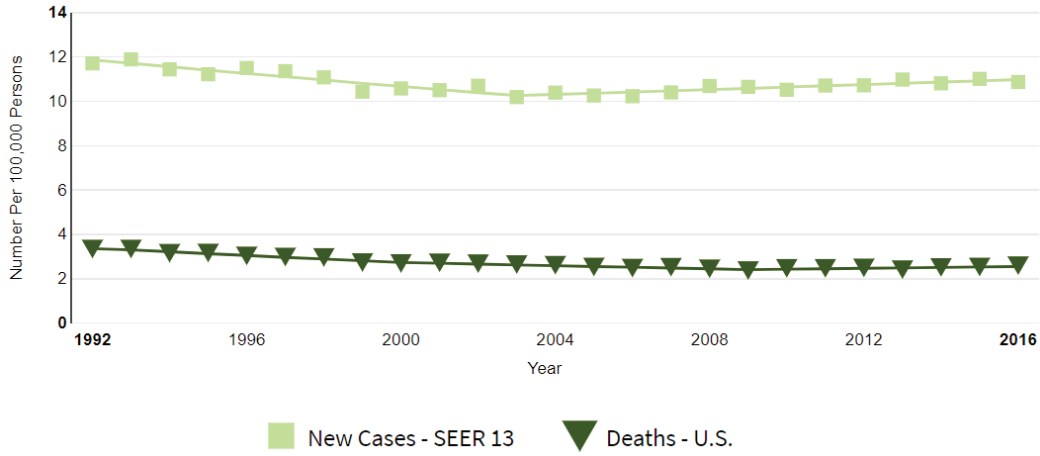

**Figure 1: Trends in incidence rates of cancer of the oral cavity and pharynx from 1975-2015**

Head and neck cancers are a major concern worldwide and especially in North-East India. National Cancer Registry Programme declares that, in India, oral cancer is the most common cancer amongst men (16.1 % of all cancers) and the second most common cancer amongst women (10.4 % of all cancers). According to Globocan 2018 (it is an online database providing estimates of incidence and mortality in 185 countries for 36 types of cancer, and for all cancer sites combined) data, new cases registered for oral cancer is 1,19,992. The total number of demises in men and women together is 72,616.[6]

**Figure 2** shows the proportion of mouth, tongue and other oral cancers incident in patients of North-East India, as per latest report of Dr. B. Borooah Cancer Institute (BBCI), a grants-in-aid institute of Department of Atomic Energy, Government of India, and a unit of Tata Memorial Centre, Mumbai, and the premier institute of cancer treatment in the region.

Two points are noteworthy regarding oral cancer control and treatment management. First, as per WHO recommended priorities and strategies for prevention and control of Oral (Mouth and Pharynx) cancer, Primary prevention is very effective and early detection is partly effective.[7]

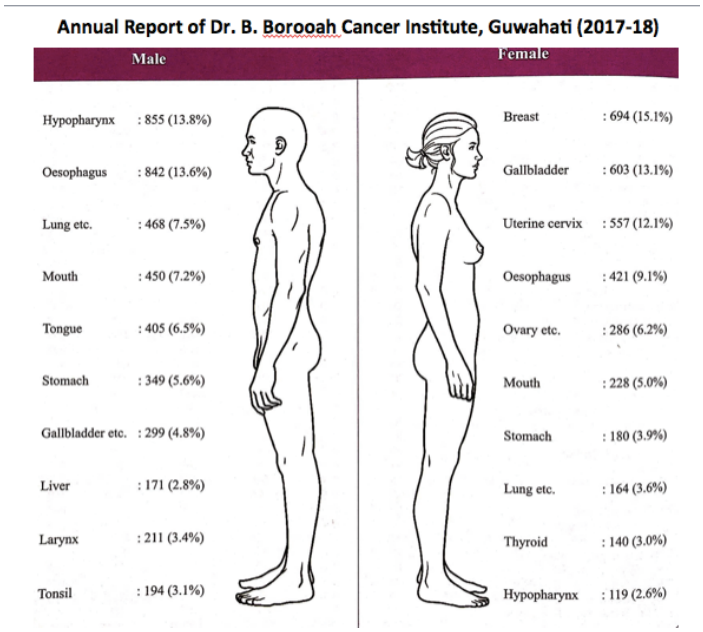

**Figure 2: Distribution of various types of cancers by site in male and female**

Hence, coupling the two together gives a direction for activating control programmes. Secondly, more than 80% of the diagnosis of oral cancers is done on the basis of microscopy. Accurate and timely diagnosis is the major strategy, as well as a challenge for lowering the incidence of the disease and follow-up clinical treatment. It itself is a by-product of various inputs, starting from the type of slide to type of stains used and types of features inspected and analysed. This stimulates us to conduct a survey in this direction to gather some information from the well-known histopathologist of the region, so as to make a bucket list of the most important parameters required for generating a fast yet accurate diagnosis. For the survey, we have designed a questionnaire consulting with highly experienced pathologists. The queries placed through the questionnaire carries significance as it gives us ample insight into understanding the techniques used by the pathologist for the diagnosis of the disease. Our aim is to utilize the information hence collected, for development of algorithms for automated oral cancer diagnosis, so that the software may be as realistic as possible and may relate well with the process followed in the region.

## Materials and Method

### *Study Population and study design*

This survey was conducted from March 2018 to May 2018. The study subjects comprised of resident histopathologists of the hospitals who were sent the questionnaires by post and contacted either by phone or email for intimation. The study does not involve any ethical clearance as no experiments were done on the participants. This is a cross-sectional study covering states/locations (Assam, Meghalaya, Manipur, Kolkata and Kerala) all over the country, by selective sampling. In total, 110 questionnaires were sent to the histopathologists of different hospitals and well-known diagnostic centres of India. The hospitals were selected based on the availability of on-site pathology centres and wide coverage.

### *The Questionnaire*

All information was obtained by using a pre-tested structured questionnaire with multiple answer choices (**Annexure 1**). Then data were compiled in an excel sheet and calculations and data analysis was done with the help of SPSS-14 version. The questionnaire consisted of two parts. The first part contained the questions regarding preferred broad techniques related to the detection of oral cancer from biopsy sections. In the second part, some additional questions were put forward to understand in detail the common features observed by the pathologists for detection of malignancy.

It was also queried "What is the maximum time taken to investigate one slide?" Finally, pathologists were asked whether any automated imaging system was used for diagnosis. Response category for this question was "Yes" and "No". For each query, the respondents were offered to give all their options, with priority if so entailed.

### *Analysis*

The analysis of the data was done using Ms-Excel (Ver 2016) and SPSS (14). The data were coded and entered in SPSS where the Non-Parametric Friedman Test was conducted to test for significance of the responses.[8] The Friedman test is most suitable for the study as the responses are all 'ordinal', that is being scaled according to preferences stated by the respondents. It is further appropriate because the data may not be normally distributed. To calculate the percentage of preference for the questions with priority choice, weights were assigned. Highest weight was given to the first choice, and so on in reverse order. The study tested for the perception of pathologists about the response to different questions. Thus null hypotheses formed for each response were "there is a difference in perception or preference between the pathologists regarding the responses".

## Findings

75 responses were received (68.18 %) out of 110 questionnaires mailed. All the pathologists (100%) viewed squamous cell carcinoma as the most common histological type of oral cancer diagnosed in their laboratories. The number of choices per question is shown in the following table [**Table 1**].

From the study, it was observed that 43.5% opted for buccal mucosa as the most common site of occurrence followed by 17.4% for gingivobuccal sulcus, 13% for tongue, 7.2% for alveolus, 5.8% each for lip and base

of the tongue, 4.2% for gingiva and 2.9% for retromolar trigone. The percentage of choices were calculated and are depicted in **Figure 3**.

Further, as per the survey, both well-differentiated grades and moderately differentiated grades have been found to be in the leading position with 48 cases. Poorly differentiated grade was in the second position with 11 cases. Regarding preference of thickness of biopsy section/sample used for preparing a slide, most of the laboratories 43.9% preferred 4µ thickness, followed by 17.1%, 12.2% and 7.3% preferred for 3µ, 5µ and 6µ respectively.

All 75 laboratories (100%) uses Hematoxyline and Eosin stain for a routine examination. 31 pathologist (22.7%) considers the invasion of basement membrane as the most important architectural feature to diagnose malignancy. 22 pathologists agreed on the invasion of sub-epithelial tissue/other tissue as the second most important architectural feature to diagnose malignancy and 20 put loss of polarity of basal cells in third place. A maximum number of pathologists (22.7%) considers increased nucleo-cytoplasmic ratio as the most important cytological feature to diagnose cancer followed by hyperchromasia (19.2%) and atypical mitotic figures (17.4%).

Response to the question "Maximum time taken to investigate one slide" varies from 1 minute to 1 hour. Further, no histopathologist reported uses of any automated imaging system for diagnosis in their laboratories.

The test-statistic of Freidman test, viz. Chi-Square is like a variance over the mean ranks: it's 0 when the mean ranks are exactly equal and becomes larger as they lie further apart. Also, *p* is the probability of finding our sample differences, i.e. if the population distributions are equal. The mean ranks of the responses, chi and respective *p*-values of the test are shown in the last two columns of **Table 1**.

**Table 1: Response of respondents on general observations**

| Question | Response choices | No. of responses | Mean ranks | Chi (p) |
|---|---|---|---|---|
| most common histological type of oral cancer diagnosed | Squamous cell carcinoma | 75 | 5.00 | 132.000 (.000) |
| | Verrucous carcinoma | Nil | 2.50 | |
| | Minor salivary gland carcinomas | Nil | 2.50 | |
| | Lymphomas | Nil | 2.50 | |
| | Other | Nil | 2.50 | |
| Most common site of occurrence | Lip | 7 | 4.64 | 66.860 (.000) |
| | Gingiva | 7 | 4.50 | |
| | Gingivobuccal sulcus | 32 | 5.73 | |
| | Alveolus | 11 | 4.77 | |
| | Buccal mucosa | 52 | 6.83 | |
| | Tongue | 30 | 5.29 | |
| | Base of tongue | 11 | 4.62 | |
| | Retromolar trigone | 5 | 4.36 | |
| | Other | Nil | 4.26 | |
| maximum reported grades of OSCC | Well-differentiated | 48 | 2.20 | 12.071 (.002) |
| | Moderately differentiated | 48 | 2.20 | |
| | Poorly differentiated | 11 | 1.61 | |

***Cont...*** **Table 1: Response of respondents on general observations**

| | | | | |
|---|---|---|---|---|
| Thickness of biopsy section/sample used for preparing slide (in µ) | 3 | 16 | 3.03 | 29.108 (.000) |
| | 4 | 36 | 3.86 | |
| | 5 | 16 | 2.88 | |
| | 6 | 7 | 2.73 | |
| | Other | Nil | 2.50 | |
| Stain used for routine examination | Hematoxyline and Eosin | 75 | 2.00 | 33.000 (.000) |
| | Other | Nil | 1.00 | |

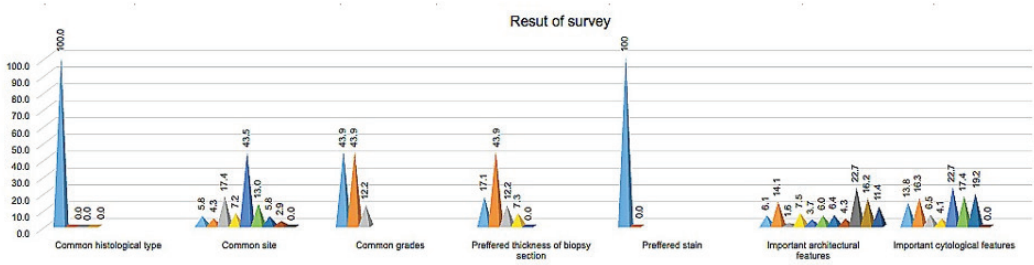

**Figure 3: The percentage of choices of different responses**

## Discussion

According to the SEER (Surveillance, Epidemiology, and End Results program of the National Cancer Institute of the United States Public Health Service) registries in the USA between 1973 and 1987, of all the oropharyngeal malignancies reported, more than 95% were squamous cell carcinomas.[9] Other studies have corroborated that OSCC is the most common oral malignancy, representing up to 80–90% of all malignant neoplasms of the oral cavity.[10,11] The incidence of OSCC remains high.[12,13] 90% of all oral malignancies involve with OSCC.[13-16] As per the latest report of Dr B. Borooah Cancer Institute, 95% of head and neck cancers are squamous cell carcinoma. Likewise, in our study, we got 100% responses for OSCC. Other epidemiological studies found that tongue, lip, and floor of the mouth were the most frequent sites of lesions of OSCC.[17-19] Studies reported buccal mucosa and mandibular alveolus as most common sites too[20,21] and that the lip and tongue were the most and second most common site of OSCC.[21,22] The report of the findings is presented in **Table 2**.

**Table 2: Response of respondents on features for the diagnosis**

| Question | Response choices | No. of responses | Mean ranks | Chi (p) |
|---|---|---|---|---|
| Most important architectural feature to diagnose malignancy | Irregular epithelial stratification | 11 | 5.55 | 54.336 (.000) |
| | Loss of polarity of basal cells | 20 | 7.42 | |
| | Drop-shaped rate ridges | 2 | 4.18 | |
| | Increased number of mitoses | 13 | 6.05 | |
| | Abnormally superficial mitoses | 7 | 5.00 | |
| | Premature keratinization in single cell | 9 | 5.14 | |
| | Intraepithelial keratin pearls | 10 | 5.56 | |
| | Loss of intercellular attachment | 8 | 5.36 | |
| | Invasion of basement membrane | 31 | 7.67 | |
| | Invasion of sub-epithelial tissue/other tissue | 22 | 6.82 | |
| | Lymphatic and vascular invasion | 18 | 7.26 | |

***Cont...*** **Table 2: Response of respondents on features for the diagnosis**

| | | | | |
|---|---|---|---|---|
| Cytological features observed | Abnormal variation in nuclear size | 18 | 3.97 | 78.049 (.000) |
| | Abnormal variation in nuclear shape | 23 | 4.85 | |
| | Abnormal variation of cell siz | 12 | 3.92 | |
| | Abnormal variation of cell shape | 8 | 3.56 | |
| | Increased nucleo-cytoplasmic ratio | 32 | 6.67 | |
| | Atypical mitotic figures | 28 | 4.56 | |
| | Hyperchromasia | 30 | 5.92 | |
| | Other | Nil | 2.55 | |

As evident from the Friedman analysis, all the *p* values are highly significant and hence all the null hypotheses are rejected. It is henceforth summarized that there is a marked difference in perception of the pathologists about the histological methods and features used for evaluation of slides. Further, if choice is to be made for best 5 features for digitization, then that would be, in descending order of priority.

i) Invasion of basement membrane, Invasion of sub-epithelial tissue/other tissue, Loss of polarity of basal cells, Lymphatic and vascular invasion, and Increased number of mitoses for architectural analysis, and

ii) Increased nucleo-cytoplasmic ratio, Hyperchromasia, Atypical mitotic figures, Abnormal variation in nuclear shape, Abnormal variation in nuclear size for cytological analysis respectively

## Conclusion

North-East India is considered to have the highest occurrence of oral cancer across the country. We have conducted this nation-wide survey to gather some useful information about the diagnosing techniques used by the pathologists and to summarize them, so as to identify the optimum ones. This information may be adequately used to incorporate into algorithms for automated detection and diagnosis of oral dysplasia, for researchers who want to carry out research in the area of digital pathology.

**Acknowledgement** The authors thank all the pathologists who had contributed in deriving a significant inference out of this survey with their valuable inputs. The first author would like to acknowledge the Department of Science and Technology (DST), Government of India for proving fund under Women Scientist-A scheme (SR/WOS-A/MS-11/2013 date 20.08.2014) for this study.

# Trauma to the Thoracic Cage – An Autopsy Study

**Thankamma P. George[1], K. Sreekumari[2], Sreedevi C. S.[3]**

*[1]Associate Professor and Deputy Police Surgeon, Department of Forensic Medicine, Government Medical College Thiruvananthapuram, [2]Joint Director of Medical Education, Directorate of Medical Education, Government of Kerala, Thiruvananthapuram, [3]Professor and Police Surgeon, Department of Forensic Medicine, Government Medical College, Trissur*

## Abstract

**Background:** Injuries of the chest causing disruption of the thoracic cage are increasing daily. Thoracic cage may be injured due to blunt trauma like blows, compression of chest or grinding force of automobile run over or due to penetrating injuries.

**Method:** This study analysed the pattern of injury thoracic cage in victims in trauma. 250 cases brought to a tertiary care institution for autopsy were studied from 1st January 2005 to 30th November 2005(1st July 2005-30th November prospectively, and 1st January-30th June 2005, retrospectively). A cross sectional study design including all cases of trauma to the thorax and heart with consecutive sampling was done. Data was collected in pro forma and analysed.

**Results**: 206 victims were males. 130 (52%) were victims of road traffic accidents Pedestrians constituted the majority (26.4%). External injuries were not found in 67 cases (26.8%). Involvement of rib alone constituted 93 cases (37.2 %) followed by combination of rib and lung 54 cases (21.6 %), rib and sternum 13 cases (5.2%), sternum and lung 12 cases (4.8 %) and combination of various other organs occurred in 67 cases (26.8%). Simple fractures were the common rib injury in both sides. 34 cases (13.6%) with vertebral injuries were observed and 19 were associated with spinal cord injury.

**Conclusions**: There is little that the autopsy surgeon can contribute to elucidate the factors leading to accidental deaths. Multiple regression is useful to correlate between predictor and outcome variables. Hopefully, future research will improve the methodology to predict the outcome of trauma to thoracic cage accurately.

## Introduction

### Anatomy of Thorax

The thorax (chest) is the region of the body between the neck and abdomen. The frame work of the walls of the thorax, the thoracic cage, is formed by the vertebral column behind, the ribs and intercostal spaces on either side, and sternum and costal cartilages in front. Superiorly the thorax communicates with the neck and inferiorly it is separated from the abdomen by the diaphragm. The thoracic cage protects the lungs and heart and affords attachments for the muscles of the

thorax, upper extremity, abdomen and back[1].

The thoracic wall is covered on the outside by skin and muscles and lined inside with parietal pleura[1]. It is formed posteriorly by the thoracic part of the vertebral column, anteriorly by the sternum and costal cartilages, laterally by the ribs and intercostal spaces, superiorly by the suprapleural membrane and inferiorly by the diaphragm[1,2,3]. The sternum, a flat bone which lies in the middle of the anterior thoracic wall, consists of manubrium sterni, body and xiphoid process[1,2,3,4]. The xiphisternal joint lies opposite the body of the ninth thoracic vertebra[5]. There are twelve pairs of ribs, each with a head, neck, tubercle and body (shaft). Each one articulates posteriorly with the vertebral column. Thoracic vertebrae are twelve in number and can be recognized by the presence of at least one articular facet on the body for articulation with their ribs[6].

Fracture of sternum is rare. The fragments either remain in position or the upper portion passes backwards behind the lower, and are liable to damage the viscera behind it. The driver may be thrown forward and strike the chest on the steering wheel or upper abdomen on the wheel rim or the horn boss may strike the sternum and produce a transverse fracture[4]. Fracture of sternum is seen as a result of deceleration on to seat belts[7].

The most common blunt thoracic injury in both adults and children are rib fractures[8,9,10]. Rarely a rib may be partly or completely cut by a stab or it may form a part of projectile in fire arm injury[11]. Markedly elastic ribs of a child may escape fracture[12,13,14]. In children and in young adults, the chest wall is very mobile as the calcification is incomplete, fatal injuries may be inflicted upon the heart, lung and great vessels, without any fracture to the rib cage or breast bone[15]. In infants especially victims of child abuse, rib fracture (knobbing fracture) are common[8,16]. Many of the fractures in indirect violence are oblique[11,17]. Fractures of the ribs occur in the regions of maximum stretch, hence anteroposterior compression of chest causes fractures at the necks and costochondral junctions[18].

Shoulder restraints are responsible for fracture of ribs, cervical spine, lumbar spine and sternum; skin and subcutaneous tissue injury and deep organ lesions of larynx, liver, spleen, kidney, major vessels and diaphragm[1,2,9,14,19].

A flail chest occurs when a segment of the chest wall does not have any bony continuity with the rest of the thoracic cage[20]. This condition usually results from automobile accidents. Flail chest results in independent and paradoxical movement of chest wall. Associated pain with restricted chest wall movement and underlying lung injury contribute to the patient's hypoxia[21]. External cardiac massage causes fracture at the costochondral junction, especially at the third to fourth ribs on the left side with minimum bruising[22,23].

## Objectives

### Primary Objective

To describe the pattern or profile of injury to thoracic cage.

### Secondary objectives

1. To evaluate the nature and intensity of the injuries of sternum, ribs, vertebrae and spinal cord.

2. To analyse the medicolegal aspects of thoracic cage injuries.

## Materials and Method

This study is part of a larger study including 250 cases of trauma to chest, which aimed at analyzing the pattern of injuries sustained to thorax following various types of trauma, with special reference to thoracic cage. 250 known dead bodies of both sexes with thoracic injuries brought for medicolegal autopsies to the mortuary of the Department of Forensic Medicine in a tertiary care institution were included in the present study. All cases from 1st July 2005 till 30th November were selected prospectively and from 1st January till 30th June 2005, retrospectively. Among the 250 cases, 236 were found to have thoracic cage injuries and have been included in this study. Descriptive study design was followed.

A meticulous external examination was made and details were entered in a proforma. Autopsy was conducted by modified Rokitansky's method of *in situ* dissection in part and *en masse* removal. All thoracic organs and bones were examined for injury and when present, details of injuries were recorded and photographed.

## Observations

Of the 250 cases investigated, 67 (26.8%) did not have external injuries. Abrasion contributed 85 cases (34%), contusion 33 (13.2 %), lacerated wounds were rare (1; 0.4 %). Remaining 64 cases (25.6%) were a combination of various other injuries (Table 2). 45 cases showed sternal fracture (18%), of which 13(28.9%) were due to traffic accidents and 12(26.7%) were fall from height (Table 1). One (2.2%) incidence was due to cardiopulmonary resuscitation. The most vulnerable site of sternal fracture was found to be between manubrium and body of sternum (Table 3).

Fracture of rib was noted in 236 cases (94.4%). Majority were due to traffic accidents, in which 51 (21.6%) showed right side alone, 25 (10.6%) left side alone and 49 (20.7%) showed a bilateral involvement. Rib fracture was observed in fall from height in 46 (19.5%) cases, with right side in 15 (6.3%), left side 14 (5.9%) and bilateral in 17 (7.2%) cases. Cardiopulmonary resuscitation caused rib fracture in 3 (1.2%) cases and that was to the left side. Bilateral involvement of ribs was reported in 104 cases (41.6%). Involvement of right side alone was reported in 76 cases (30.4%) and that of left side was seen in 56 cases (22.4%). 14 cases (5.6%) did not have any fracture to the ribs.

129 cases (51.2%) had simple injuries to the right side and was the commonest type. Multiple injuries were reported in 34 cases (13.6%) followed by a combination of injuries in 16 (16.4%). Injury due to nick was reported in one case (Tables 3,4).

On the left side simple fracture is the commonest type of injury with 105 cases (42%). Multiple fractures occurred in 36 cases (14.4%). Both simple and multiple in 10 cases (4%). In 7 cases (2.8%) a cut or nick were noted. On the left side multiple site were affected in 32 cases (12.8%). Front aspect alone was affected in 30 (12%) and angle alone was affected in 17 cases (6.8%). In 52 (20.8%), single or other combinations of sites were noted. In 89 cases (35.6%) there was no fracture on the left side (Tables 3,4).

Regarding the total number of ribs affected in various types of injuries, the highest incidence is with 8 ribs, in 26 cases (10.4%) on right side and 20 cases (8%) on left side. Regarding the site, front aspect was found to be most vulnerable, in 38 cases (15.2%). Back aspect was affected in 34 (13.6%) and multiple sites were affected in 53 cases (21.2% %). 1$^{st}$ rib was injured in 64 cases on right side and 51 on left side. 16 cases and 10 cases on right and left sides showed whole ribs fractured. 3$^{rd}$ to 10$^{th}$ ribs showed maximum involvement (Table 13). 11$^{th}$ and 12$^{th}$ ribs seen fractured in 28 cases.

Thoracic vertebral injuries occurred in 34 cases (13.6%). Fractures of body $T_5$ and $T_{10}$ occurred with equal frequency of 3 cases (1.2%). Fracture separation between $T_2$ and $T_3$ occurred in 5 cases and that between $T_8$ and $T_9$ in 4 cases. In 15 cases fractures occurred in other levels (Table 5). Spinal cord injuries were reported in 19 cases of which in 9 (3.6 %) were contusion, 2 laceration and transection in 8 cases (3.2 %) (Figure 1).

**Table 1 Causes of Trauma to chest**

| Cause of Injury | No. of cases | Percentage |
|---|---|---|
| Traffic | 130 | 52.0 |

## Discussion

Motor vehicle accidents and fall from height account for 28.9% each of all sternal fractures in our studies. Ribs were the most commonly traumatized bone and injury to it was seen in 236 cases (94.4%) and our findings are in near agreement with the previous observation by Sudeshini (90.5%)[21]. It was found that direct violence caused rib fractures in majority of cases (203;81.2%) and blunt indirect violence caused injuries to ribs in 25 (10%) and penetrating injuries in 8 (3.2%).

Out of 130 cases of traffic accidents, 125 were reported with rib injury. In short, 96.14% of traffic incidences caused rib fractures as observed by Geetha (2001) who reported 96.1% rib fractures. 47 cases of fall from height were reported and 46 (97.87%) showed rib fractures (Sudeshini; 98 .05%)[14].

Of the 10 cases of stab injury, 7 (70%) were reported with rib fractures. Among 27 cases of railway occurrence, 26(96.3%) showed with rib fractures. All 3 cases with the history of fall from boat showed rib injury (100%).

All 3 cases with the history of CPR showed rib injury. Of 250 cases, 129 (51.6%) showed simple fractures at the right side and 105 (42%), on the left side. Multiple rib fractures were observed in 33 cases (13.2%) on the right side and 36 (14.4%) on the left. Combination of simple and multiple fractures were reported in 16 cases (6.4%) on the right side and 10 (4%) on the left. Among the penetrating injuries a cut on the rib on right side occurred in a single case and a similar injury on the left side occurred in 7 cases.

The common sites of fractures situated anteriorly, on the right side 33 cases (13.2%), left side 21 cases (8.4%) posteriorly on the right side with 32 cases (12.8%) and 26 cases (10.4%) on the left side, These prevalence of occurrence of rib fractures could be due to the higher incidence of traffic accidents with pedestrian involvement (50.7%). Rib fractures occurred on the outer aspects in 18 cases (7.2%) on the right side and 16 (6.4%) on the left, in agreement with Guharaj[5].

First rib was injured in 64 cases on right side and in 51 on left side. 11$^{th}$ and 12$^{th}$ ribs involved in 27 cases on right side and 19 cases on left side, the lower occurrence due to high mobility and yielding nature of the floating ribs[12,24]. Majority of rib fractures occurred through 3$^{rd}$ to 10$^{th}$ ribs, in 166 (66.4%) on right and 159 on left side (63.6%), which is in agreement with Tedeschi[12].

34 cases (13.6%) with vertebral injuries were observed and 19 were associated with spinal cord injury, contusion observed in 9 cases (3.6%) and transection in 8 cases (3.2%). The most common level of fracture of thoracic spinal column was between 2$^{nd}$ and 3$^{rd}$ vertebrae (2 %). Multiple fracture sites were obtained in 2 cases (0.8 %). In a previous investigation P. Rema (1988) reported commonest sites of injury as 3$^{rd}$ and 12$^{th}$ vertebrae with equal frequency[23].

## Conclusions

1. External injuries were not found in 67 cases (26.8%). Subcutaneous emphysema was noted in 14 cases (5.6%),13 due to blunt injury and 1 due to penetrating injury.
2. One case (0.4 %) was reported with external injuries without any internal thoracic injury. Involvement of rib alone constituted 93 cases (37.2 %) followed by combination of rib and lung 54 (21.6 %), rib and sternum 13 (5.2%), sternum and lung 12 (4.8 %) & combination of various other organs occurred in 67 (26.8%).
3. Motor vehicle accidents and fall from heights account for 28.9% each of all sternal fractures.
4. Rib fractures were due to direct violence in majority of cases (203 cases; 81.2%) and blunt indirect violence in 25 cases (10%) and penetrating injury in 8 cases (3.2%).
5. Simple fractures were the common rib injury in both sides (51.6% in right and 42% in left side respectively).
6. 34 cases (13.6%) with vertebral injuries were recorded and most common level of fracture of thoracic spine was between 2$^{nd}$ and 3$^{rd}$ vertebrae (2.0 %).

# Evaluation of the Cookies Formulated with *Costus igneus* Plant Material for Antidiabetic Activity

**A. Rajani Chowdary[1], Raaththika R[2], Payala Vijayalakshmi[3]**

*[1]Assistant Professor, Department of Microbiology and Food Science & Technology, GITAM Institute of Science, [2]Msc student, Department of Microbiology and Food Science & Technology, GITAM Institute of Science, GITAM (Deemed to be University), [3]Assistant Professor, Department of Microbiology, GITAM Institute of Medical Sciences and Research (GIMSR), GITAM (Deemed to be University), Visakhapatnam, Andhra Pradesh, India*

## Abstract

Diabetes Mellitus is a fast-growing disorder in the current scenario commonly affecting all age groups especially elder groups. The high blood glucose can be kept in control with nutraceutical foods. The present study is aimed to formulate a nutritionally rich cookie with *Costus igneus* leaf extract and to determine the effect of cookie consumption on decreasing blood glucose levels in type 2 diabetic patients. Cookies made with *Costus igneus* leaf powder etc. were analyzed for proximate analysis and phytochemical analysis with standard procedures. A total of 30 Type-II diabetic patients were selected for the study whose demographic variables and blood glucose levels were measured on the first day and after 15 days, 30 days of cookies consumption. The proximate and physic-chemical analysis showed cookies contain high amount of secondary metabolites including antioxidant compounds. Among the 30 study subjects, the mean levels of FBS and PBS were decreased significantly in all the four groups from day 0 to day 30 which indicates that *C.igneus* cookies consumption had good effect in reducing the blood glucose levels. However the HbA1C has been decreased by one unit in all the four study groups. The cookies made with *Costus igneus* plant material have good antimicrobial, antioxidant and antidiabetic activities and can be used as a therapeutic and functional food source for the treatment of overweight, obesity and diabetes.

***Key words:*** *Costus igneus, cookie, proximate analysis, phytochemicals, antioxidant, post prandial, glycated hemoglobin.*

## Introduction

The incidences of deficiency diseases are on decline phase due to the incorporation of fortified foods into our diet. However, the prevalence of obesity, diabetes mellitus (DM) and cancer are escalating due to food and lifestyle changes. Diabetes mellitus is a group of metabolic diseases characterized by hyperglycemia (high level of sugar in the blood for a prolonged period), resulting from defects in insulin secretion, or insulin action or both. Nutritional management plays a key role in managing diabetes. Foods with a lower glycemic index (GI) scores are ideal for helping to keep blood sugar levels stable. Several studies have reported that the consumption of fiber-rich and low-GI foods like oats, ragi, soya, bajra, almonds, flax seeds, etc. will help to keep blood sugar level stable and also significantly decrease in total cholesterol, LDL-cholesterol, and triglyceride levels. Antioxidants like polyphenols and ascorbic acid are vital substances which possess the ability to protect the body from damage caused by free radical-induced oxidative stress. [1-5] The use of antioxidants from food sources is an active area of study in diabetes research.

*Costus igneus* is an herbaceous plant, its alternative names include insulin plant, spiral flag or fiery *Costus*. It belongs to the *Costaceae* family. It is widely grown and

used in South India, to treat diabetes due to its antidiabetic property. The various ethanolic and methanolic extracts of *C. igneus* have been reported for many pharmacological activities such as antidiabetic in controlling the blood glucose levels, antibacterial, antifungal, antioxidant, hypolipidemic, hepatoprotective, anti-inflammatory, antiproliferative and many more and these properties are due to presence of secondary metabolites such as alkaloids, quercetin, diosgenin, steroids, beta-carotene, flavonoids, terpenoids and phenolic compounds in the leaf extracts. [6-8] Most of the individuals living in both urban and rural areas of Visakhapatnam who were suffering with type 2 diabetes practicing of consuming 1-2 leaves of *C.igneus* per day daily in their diet. Hence the present study is intended to develop a nutritional rich cookie formulated with *C. igneus* leaf powder and to determine the effect of consuming *Costus igneus* cookies on decreasing blood glucose levels in type 2 diabetic patients.

## Materials and Method

**Collection of plant extract:** *Costus igneus* plant leaves were collected from Ambasamudram, Tirunelveli, Tamil Nadu, India. Fresh leaves of *Costus igneus* were collected, cleaned and shade dried. The dried leaf was made into powder using a mechanical grinder. The powdered samples were extracted with methanol using a Soxhlet apparatus.

**Preparation of cookie:** In the present study the following raw materials were used to prepare cookies which include *C. igneus* leaf powder, multigrain flour (oatmeal, ragi, bajra, soya, wheat flour), almonds, flax seeds, maida, butter, vegetable oil, milk, sweetener. Insulin plant leaves were shade dried, grinded and sieved into a fine powder. Oatmeal, ragi, bajra, soya were roasted and grinded into fine flour. A known amount of dry mix was prepared by mixing multigrain flour and insulin plant leaf powder in a vessel. Wet mix was prepared in a separate vessel by mixing a known amount of vegetable oil and melted butter. Salt, sweetener, baking powder, and a drop of vanilla essence for the flavor were added to the wet mix. Prepared dry mix was added slowly to the wet mix and mixed well to make the dough. The dough was kneaded well and made into shapes. The shaped dough was baked at 180°C. Cookies were packed into airtight cover and stored in the cool and dry place.

**Figure 1: Cookie prepared with *Costus igneus* leaf powder**

**Proximate analysis:** In proximate analysis total moisture, total solids, total ash, water-soluble ash, acid-insoluble ash, sulphated ash and fat content of *Costus igneus* cookie were analysed with standard procedures [9-11]. Moisture content and solid content of the sample were analyzed in moisture analyzer MB45. Estimation of protein was carried out by standard Lowry's method (1951).[12] Total Carbohydrate content was estimated by modified anthrone method (Hedge and Hofreiter, 1962). The total reducing sugar content of *Costus igneus* cookie was evaluated with 3,5-dinitrosalicylic acid (DNS) method. [13] α-Amylase inhibitory activity of the extract and fractions was carried out according to the standard method with few modifications.[14]

**Phytochemical analysis:** In the present study, several phytochemical constituents were evaluated qualitatively using standard protocols [15-17].

**Antioxidant activity:**

**Estimation of Ascorbic Acid:** Ascorbic acid estimation was carried by the volumetric method described by Pisoschi et al. (2008) [18]. Amount of ascorbic acid present is calculated by below formula

$$\text{Ascorbic acid} = \frac{0.5}{V1} \times \frac{V2}{5} \times \frac{100}{wt.of\ the\ sample} \times 100$$

**Determination of β-carotene:** Estimation of beta-carotene in cookie sample was performed according to Mustapha and Babura (2009). The following formula was used to calculate

$$\beta\text{-carotene } (\mu g/100gm) = \frac{OD\ at\ 452nm \times 13.9 \times 104 \times 100}{Wt.of\ sample \times 560 \times 1000}$$

**Total Phenolic Content (TPC):** The total phenolic content (TPC) of *Costus igneus* cookie sample

was determined by Folin-ciocalteu method.[19] TPC quantification and results were expressed as mg/g (Gallic Acid Equivalent (GAE)/ dry weight).

**DPPH radical scavenging assay:** The radical scavenging activity of cookie sample was determined by 1, 1-diphenyl-2-picrylhydrazyl (DPPH) using the method described by Shimada et al. (1992). The percentage inhibition was calculated by the following equation.

$$\% \text{ radical scavenging activity} = \frac{(absorbance\ of\ blank - absorbance\ of\ sample)}{(absorbance\ of\ blank) \times 100}$$

**Evaluation of cookies for controlling the blood glucose levels in Type-II diabetic patients:** The study was a randomized clinical trial done to evaluate the effect of consuming *C.igneus* cookies on decreasing the blood glucose levels in 30 Type-II diabetic patients. From the 30 subjects, blood samples were collected and sent for analysis of FBS, PBS and HbA1C using C111 Cobas analyzer. The inclusion criteria of the study were Age > 35 years, non-pregnancy, non-allergic to herbal products, not taking any herbal products during the study, no acute infection, HbA1C > 7, FBS > 140 mg/dl, PBS > 200 mg/dl and non-insulin dependent. *C.igneus* cookies were prepared in a way that each cookie weighs 20 g and each contains 500mg of *C.igneus* plant extract. After explaining the main objective of the study, study protocol and importance of consuming *C.igneus* cookies in controlling the diabetes, a written consent form was taken from each individual. Each subject was instructed to consume a single cookie after half-an-hour of breakfast, lunch and dinner along with their routine regular diabetic drugs for 15 days initially. After 15 days, FBS, PBS and HbA1C tests were performed. Again they were instructed to take the same quantity of cookies at three different time intervals in a day for another 15 days and their blood glucose levels were again monitored. Data was analyzed using SPSS Version 24.0. Results were expressed as Mean ±SD of three replicates determinations.

## Results and Discussion

Proximate analysis is an important index to classify the nutritional value of a food material. The proximate compositions determined in the cookie samples were summarized in Table 1. It shows that the cookie sample has a moisture content (7.94 ± 0.2), total ash (70.7 ± 0.1), high protein content (4.24 ± 0.4), high fiber (8.03 ± 0.007) content; and a relatively lower fat content (3.75 ± 0.3). This indicates that *C. igneus* cookies are good source of mineral elements as they contained a high percentage of ash. The presence of high protein content in cookie promotes body development, growth control, maintenance of fluid balance, strong immune function etc. As the fibre content of the cookie was high which may helpful for the better digestion process. It was found that, the total carbohydrate content of the cookie sample was high (80.2 ± 1.1) which are major contributors of energy. From the present study, it has been shown that cookies made with *Costus igneus* plant leaf have less reducing sugar (0.07 µg/ml) when compared with standard (1.05µg/ml). The results of the present study on in-vitro anti-diabetic activity of *Costus igneus* cookie are shown in Figure 2. Cookies made with *Costus igneus* have good α-amylase inhibitory activity at 500 µg/ml. The present study had proved that cookies made with *Costus igneus* leaf had shown good anti-diabetic property which can better control the blood glucose levels in diabetic patients because α- amylase inhibitors also called as starch blockers tend to prevent or slow down the absorption of starch into the body mainly by blocking the hydrolysis of 1,4-glycosidic linkages of starch and other oligosaccharides into maltose and other simple sugars.

*Costus igneus* cookie was subjected to preliminary phytochemical analysis and the results showed the presence of phytochemicals which include flavonoids, alkaloids, terpenoids, tannins, steroids, quinones, polyphenols, phenols, saponins, glycosides and coumarins and this in turn indicates it have good antibacterial, anti-inflammatory, anticancer, and antidiabetic activities and cardiac failures. The results obtained with *Costus igneus* cookie revealed the ascorbic acid content as 4.2µg/g hence act as a powerful antioxidant which fights against free-radical induced diseases. β-carotene was estimated, and the results showed that *Costus igneus* cookies have high β-carotene content 1.49µg/g and vitamin content 2.48µg/g. The results showed that the total phenolic content of cookie was 5.44 mg of GAE/g of dry sample. As the cookie showed higher phenolic content, it is likely to be a potential antioxidant. DPPH radical scavenging activity of cookie was showed in Table 2. Cookie at 10 µg/ml showed the lowest inhibition with 9.92%. The $IC_{50}$ value for DPPH, the *Costus igneus* cookie shows

maximum antioxidant activity with 62.3% (Table 3).

All the 30 subjects fasting serum blood glucose levels, post-prandial serum blood glucose levels, HbA1C levels before and after intervention were showed in the Table 4. The mean levels of FBS and PBS were decreased significantly in all the four groups from day 0 to day 30 which indicates *C.igneus* cookies consumption had good effect in reducing the blood glucose levels. However the HbA1C has been decreased by one unit in all the four study groups. Akhila et al. (2010) found that leaves of *Costus igneus* reduced the fasting and postprandial blood sugar levels, bringing them towards normal, in dexamethasone-induced hyperglycemia in rats [20]. The study was mainly designed and investigated based on the consumption of *C.igneus* leaves by the local inhabitants of Visakhapatnam to control their blood glucose levels by both type I and type II diabetic patients. The *Costus igneus* plant was cultivated in their own houses and daily they were consuming 1-2 leaves per day. However further research has to be carried out to know the effect of *C.igneus* cookies in Type-I diabetic patients.

**Table 1: Proximate analysis of *C. igneus* cookies**

| **Parameter** | **Percentage dry weight basis** | **Mean** | **SD** | **SEM** |

## Conclusion

Due to high antioxidant potential and phenolic content of the *Costus igneus* cookie, it can be used as a therapeutic or functional food source for the treatment of overweight, obesity and diabetes. The study also concluded that, regular consumption of *Costus igneus* cookies reduced serum glucose levels and glycated hemoglobin levels in people with type 2 diabetes.

**Conflict of Interest:** Conflict of interest declared none.

**Source of Funding:** The work was not supported by any grants and funds

**Ethical Clearance:** This study was reviewed and approved by The Ethics Committee of GITAM Institute of Medical sciences and Research, Tertiary care hospital, GITAM (Deemed to be University)

**Conflict of Interest:** The study declared "No conflict of interest"

Research Article

# A Study to Assess the Effectiveness of Training Program on Knowledge and Practices Regarding Advanced Cardiovascular Life Support (ACLS) among Staff Nurses in MMIMS & R Hospital

**Alka Walia[1], Simaranjit Kaur[2], Vinay Kumari[3]**

*[1]MSc Nursing M.M College of Nursing, [2]Assistant Professor, College of nursing, Adesh University (Bathinda), [3]Professor, Chitkara School of Health Sciences, Chitkara University (Chandigarh), Punjab, India*

## Abstract

Advance cardiovascular life support is a level of medical care which is used for clients with life threatening illness. Death can occur at any time due to causes like stroke, poisoning, accidents, suicide, injury, medication error, shock and cardiac arrest. Among these, cardiac arrest deaths remain major cause of mortality. Therefore, one of the measures to improve survival is by introducing the concept of "chain of survival". The elements of the chain of survival include recognition of early warning signs, activation of the emergency medical system, basic cardiopulmonary resuscitation, defibrillation, intubation and intravenous delivery of medications. Advance cardiac life support (ACLS) refers to a set of clinical interventions for the urgent treatment of cardiac arrest and other life threatening medical emergencies. Extensive medical knowledge and rigorous hands-on training and practice are required to master ACLS. Only qualified health care providers, physicians, paramedics, nurses, respiratory therapists, pharmacists, and other specially trained health care providers can provide ACLS, as it requires the ability to manage the patient's airway, initiate IV access, read and interpret electrocardiograms, and understand emergency pharmacology. Therefore, training program on ACLS is required for staff nurses, to gain knowledge and improve skill. Quantitative approach was selected with pre-test - post-test only design. 36 samples were chosen (working in ICU/ ICCU/ emergency/ medical wards / surgical wards) using random sampling technique. Training program was given to the study subjects and a structured questionnaire and structured checklist was used to collect data regarding Advanced cardiovascular life support of subjects before and after the administration of training program. Findings revealed that the mean post-test sore was greater than the mean pre-test score. Thus it is concluded that the training program on Advanced cardiovascular life support was effective for teaching and improving staff nurse's knowledge and practices.

***Key words:*** *Training, ACLS, staff nurses*

## Introduction

Death can occur at any time due to causes like stroke, poisoning, accidents, suicide, injury, medication error, shock and cardiac arrest. Among these, cardiac arrest deaths remain major cause of mortality[1]. As per World Health Organization (WHO) census, statistics mortality due to cardiac causes has overtaken mortality due to all cancers put together. Approximately, 4280 out of every one lakh people die every year from cardiac arrest in India alone[2]. The survival rate of intra-hospital post-cardiac arrest patients, related to the identification of cardiac arrest and care performance by nurses trained in Advance Cardiac Life Support (ACLS), and by untrained nurses. Therefore, one of the measures to improve survival is by introducing the concept of "chain of survival" and Only qualified health care. physicians, paramedics, nurses, respiratory therapists, pharmacists, and other specially trained health care providers can provide ACLS, as it requires the ability to manage the Defibrillation is by far the most effective treatment among the components recommended in the American Heart Association(AHA) Advance Cardiovascular Life Support (ACLS) guidelines[3].

**Objectives**

**1**. To assess and compare knowledge practice regarding ACLS before and after administration of training program.

**2.** To assess and compare practices of staff nurses regarding ACLS before and after administration of training program.

**3.** To determine the relationship between knowledge and practice of staff nurses regarding ACLS.

**4.** To determine the association of knowledge and practice of staff nurses regarding ACLS with selected variables.

## Material and Method

Quasi-experimental One group pre-test post-test design. The design can be represented as[4]:

OK1P1 X OK2P2X1OK3 P 3X1 OP4OK 4P5.

$\mathbf{O_{K1P1}}$= denotes the assessment of knowledge and practice regarding ACLS before implementation of ACLS training program

**X** = ACLS training program

$\mathbf{O_{K2P2}}$ = denotes the first posttest Knowledge and practice of staff nurses regarding ACLS after implementation of ACLS training program

$\mathbf{X_1}$= Individualized feedback on ACLS for identified knowledge and practice deficit areas

$\mathbf{O_{K3P3}}$= denotes the second posttest of knowledge and practice of staff nurses regarding ACLS

$\mathbf{O_{P4}}$= denotes the third posttest of practice of staff nurses regarding ACLS

$\mathbf{O_{K4P5}}$= denotes the assessment of posttest knowledge and practice of staff nurses regarding ACLS

**VARIABLES UNDER STUDY : Independent variable**: Advance Cardiovascular Life Support training program.**Dependent variable**: Knowledge and practice of staff nurses regarding ACLS.

**SETTING** : The present study was conducted at **Maharishi Markandeshwer Institute of Medical Science and Research Hospital**, Mullana, which is 950 bedded multi-specialty hospital situated in the campus of Maharishi Markandeshwer University, Mullana, Ambala. The data was collected from staff nurses working in ICU, CCU, emergency, Medical ward and surgical wards.

**SAMPLING:** The sampling technique used was random sampling technique.

**SAMPLE SIZE**: The sample size for the present study was 36.

**DESCRIPTION OF TOOLS:**

A structured knowledge questionnaire, and observational checklist were used for the data collection in the study. The structured knowledge questionnaire was divided into two parts as under:

**SECTION I**– consists of 6 questions related to the background data of eligible students.

**SECTION II**- consists of 40 knowledge items

Covering the following areas:

Concept of ACLS, Components of ACLS & its techniques, Rhythm of ACLS, Medication.

The structured practice checklist consists of 60 practice items based on the content on Advance cardiovascular life support.

## Major Findings

1. The mean 4$^{th}$post-test knowledge score (36.36) was significantly (F=322.8, P≤ 0.01) higher than the mean pre-test knowledge score (18.08).

2. The mean 5$^{th}$post-test practice score (52.33) was significantly (F=1073.9, P≤ 0.01) higher than the mean pre-test practice score (12.97).

3. There was no correlation between post knowledge with post practice of staff nurses regarding ACLS (r=0.053, p>0.05).

4. The knowledge and practice of staff nurses regarding ACLS was not significantly (p≤0.05) associated with selected variables.

**CONCLUSION DRAWN FROM THE STUDY:**

The mean posttest knowledge score in all areas of knowledge questionnaire was significantly higher than pretest knowledge score.

The mean posttest practice score in all the areas of practice was significantly higher than the mean pretest practice score.

## Discussion

In the present study the 3rdpost intervention of knowledge score 36.3±3.09 and 4th post intervention of practice score 52.3±2.51with mean difference of 18 in knowledge score and 39.26 in practice score. The computed t value was found to be significant (t=31.0, p=0.00) and (t=26.6, p=0.00) at 0.05 level of significance. Similarly, in a study is conducted by **Amal Saied Taha Refaey** reported that on the second post-test the knowledge score 36.6±3.97 and practice score 2.25±18.7. The difference between mean knowledge and practice score was found to be statistically significant

**Implications**

**1. Nursing Education**

— Student nurses should be educated about Advance Cardiovascular Life Support.

— In service education should be planned for the nurses to upgrade their knowledge and practice regarding ACLS

— Induction program should be organized by continuous nursing education cell of an institution for the staff nurses regarding evidenced based procedure.

— Educational aids should be developed regarding ACLS

**2. Nursing Administration**

· Nurse administrator should organize various in-service education/ program /workshop to update the knowledge and practice of nursing employees on Advance Cardiovascular life supported.

· Nurse administrator should employ and encourage the use of new and creative teaching strategies utilizing the latest technologies directed towards the goal of enhancing the knowledge and practice of staff nurses regarding ACLS.

· Nursing administrator should appoint a nurse responsible for training regarding ACLS.

3. Nursing Practice

— Nurses play a vital role in providing care to the patient, so it is imperative for nurses to provide ACLS.

— Nurse educator should use a standardized, valid and reliable structured knowledge questionnaire and observation checklist to assess the knowledge and practice among staff nurses.

— Nurse educator should assess baseline knowledge and practice of staff nurses regarding ACLS.

— Nurses should follow the proper guidelines and technique for Advance Cardiovascular life support.

— Nurses should re-evaluate the level of knowledge and practice after implementation of training program to determine the practice.

**Recommendations**

· The study can be replicated on a larger sample of staff nurses in different setting for making broad generalization.

· A true experimental study can be conducted with training program regarding ACLS

· A study can be conducted to assess the knowledge and attitude among staff nurses regarding ACLS.

· A descriptive study to assess the knowledge and practice of staff nurses regarding ACLS.

· Various teaching strategies like demonstration, video teaching regarding ACLS can be developed.

**Conflict of Interest:** No

**Source of Funding:** Self

**Ethical Clearnce:** Ethical approval to conduct the study was obtained from the institutional Ethical Committee of M.M University, Mullana, Ambala, Haryana.

# Punjabi Adaptation of WHO's Global Physical Activity Questionnaire (GPAQ) in Gurumukhi Script: A Validity and Reliability Study

**Harmandeep Singh[1], Sukhdev Singh[2], Amandeep Singh[3]**

*[1]Assistant Professor, Department of Physical Education, Apeejay College of Fine Arts, Jalandhar, Punjab, India,*
*[2]Professor & Head, Department of Physical Education (T) Guru Nanak Dev University, Amritsar, Punjab, India,*
*[3]Assistant Professor, Department of Physical Education (T), Guru Nanak Dev University, Amritsar, Punjab, India*

## Abstract

**Background:** WHO's Global Physical Activity Questionnaire (GPAQ) has not yet been adapted in the Punjabi language. This study was aimed to adapt the GPAQ into the Punjabi language in Gurumukhi script and to make it useful for physical activity surveillance on Punjabi population.

**Methods**: We translated the GPAQ-English into Punjabi language (Gurumukhi script) using the forward-backward translation technique. A total of 81 adult participants including staff and students having good command over Punjabi and English languages were conveniently recruited from Guru Nanak Dev University, Amritsar, Punjab, India. The validity of the adapted version was tested against the original English version of GPAQ by applying Spearman's rho. Test-retest reliability was tested by employing ICC coefficients.

**Results:** GPAQ-P demonstrated good validity for total PA ($r_s$ = 0.877), work domain ($r_s$ = 0.815), transport domain ($r_s$ = 0.876), and moderate intensity PA ($r_s$= 0.860); moderate validity for recreation domain ($r_s$ = 0.643) and sitting time ($r_s$ = 0.629); and low for vigorous intensity PA ($r_s$ = 0.466). Moderate to excellent reliability was detected between two administration of GPAQ-P, excellent intraclass coefficients for total PA (ICC = 0.918), work domain (ICC = 0.943), transport domain (ICC = 0.968), recreation domain (ICC = 0.952), and moderate intensity (ICC = 0.956); good ICC for vigorous intensity (ICC = 0.845) and moderate ICC for sitting time (ICC = 0.704).

**Conclusions:** Punjabi adaptation of GPAQ in Gurumukhi script has good validity and reliability and it can be used for physical activity surveillance in Punjabi knowing population.

***Keywords:*** *Punjabi, GPAQ, validity, reliability, Physical activity, questionnaire, WHO*

## Introduction

The research area of Physical activity epidemiology in the Indian context is still barren. A very few studies have been accomplished concerning prevalence, patters and associated factors of physical activity in the Indian settings.[1, 2] Physical activity can be assessed among the populations using two approaches such as objective methods through the use of Accelerometers, Pedometers, Doubly labeled water and heart rate monitors.[3] The disadvantages associated with these methods are that these are relatively expensive and have less administration feasibility on larger populations.[4] Alternatively, self-reporting approach is the most feasible methods to assess the physical activity levels in larger populations.[5, 6] But low validity and reliability of the questionnaire is the major limitation of this approach. Global Physical Activity Questionnaire is one of the widely used instrument for assessing the physical activity levels in epidemiological studies.[7, 8] It has been recommended by the WHO for its STEPwise Approach to Non-communicable Disease Risk Factor Surveillance

**Corresponding author:**
**Amandeep Singh,** PhD
Email: prof_aman@yahoo.com

(STEPS).[7] Studies using GPAQ on Punjabi population are scarce.[2] To the author's best knowledge, no Punjabi (Gurumukhi Script) adaptation of the GPAQ is available yet. Gurumukhi and Shahmukhi (Perso-Arabic) are two different scripts in which Punjabi is written. Gurumukhi script is used in Indian Punjab while Shahmukhi (Perso-Arabic) script is used in Pakistani Punjab.[9] We have translated and adapted GPAQ into Gurumukhi script of Punjabi. The objective of this study was to establish the reliability and validity of the Punjabi version (Gurumukhi script) of WHO's Global Physical Activity Questionnaire.

## Material and Method

### Sample

As referred in previous studies, the ratio of 5 subjects per item was considered to finalize the sample. As GPAQ has a total of 16 items, it was assumed that a minimum 80 participants would be required for the study.[10, 11] Hence, by using the convenience sampling technique, a sample of 81 participants of age 18 to 64 years were recruited from Guru Nanak Dev University, Amritsar, Punjab, India. The sample consisted of 43 male and 39 females. Only those participants were included who can speak, read and write both Punjabi and English languages proficiently.

### Protocol

Based on the methods adopted by previous similar studies,[12, 13] the original English version of Global Physical Activity Questionnaire (GPAQ-English) was translated into the Punjabi language into 'Gurumukhi' script by the research team and then evaluated and back translated by three bilingual experts. Their disagreements were further discussed and a final consensus was made. Some more examples were inserted relevant to the local conditions to make the statements more intelligible to the respondents. Some terms of which no Punjabi version was available, were written in their original form in the Gurumukhi script. However, due consideration was given to maintain the actual concept of the statements. A pilot testing was done on a small sample of 20 subjects to elude any confusion or ambiguity in any of 16 items of the newly translated questionnaire.

### Data collection

The original version and translated version of the GPAQ were distributed to the participants to fill in on day one and were instructed to continue their normal routine for a week ahead. On day eight, participants were again approached and asked to fill the same Punjabi version of GPAQ.

### Scoring

Ainsworth's compendium of physical activity was used to assign the MET values to particular physical activities.[14] For the estimation of energy cost, a value of 4 METs to moderate intensity activities and 8 METs was assigned to vigorous intensity activities. The METs min/week were computed using the following equation:

*Minutes of activity/day X 7 days X MET level*

### Data Analyses

Descriptive statistics of MET scores derived from questionnaires were presented as mean, standard deviation and median. The concurrent validity of the GPAQ Punjabi version (filled on day 1) against the GPAQ English version was examined using Spearman's coefficient of correlation. Following the guidelines by Koo et al.[15] on the selection of test-retest reliability analysis method, Intra-class correlation (ICC) with 95% confidence intervals was computed between the scores of first and second administrations of GPAQ-P. The results were considered significant at the 0.05 alpha level.

## Findings

**Table 1: Descriptive figures of MET scores and sitting hours measured by GPAQ original and GPAQ-P on first and second administration**

| Variable | GPAQ (Original Version) | | | GPAQ-P (First administration) | | | GPAQ-P (Second administration) | | |
|---|---|---|---|---|---|---|---|---|---|
| | **Mean** | **SD** | **Median** | **Mean** | **SD** | **Median** | **Mean** | **SD** | **Median** |

**Table 2: Spearman's rho between original version of GPAQ and Punjabi (Gurumukhi script) version of GPAQ**

| GPAQ-P (MET-min/week) | Males (N=43) | | Females (N=39) | | Both genders (N=81) | |
|---|---|---|---|---|---|---|
| | $r_S$ | Sig. | $r_S$ | Sig. | $r_S$ | Sig. |
| Work domain PA | 0.751 | 0.001* | 0.861 | 0.001* | 0.815 | 0.001* |
| Transport domain PA | 0.893 | 0.001* | 0.853 | 0.001* | 0.876 | 0.001* |
| Recreation domain PA | 0.538 | 0.001* | 0.746 | 0.001* | 0.643 | 0.001* |
| Moderate intensity PA | 0.811 | 0.001* | 0.887 | 0.001* | 0.860 | 0.001* |
| Vigorous intensity PA | 0.500 | 0.001* | 0.444 | 0.001* | 0.466 | 0.001* |
| Total PA | 0.843 | 0.001* | 0.910 | 0.001* | 0.877 | 0.001* |
| Sitting time | 0.491 | 0.001* | 0.744 | 0.001* | 0.629 | 0.001* |

*$r_s$ = Spearman's correlation of coefficient*

*MET = Metabolic equivalent of task*

Table 2 demonstrates the results of concurrent validity of GPAQ-P against the original GPAQ. Spearman's correlation of coefficient was run to examine the correlation between MET scores of different domains, intensities and total PA alongwith sitting time hours/day. Analyses revealed good correlation in all categories and both genders ranging from .466 to .877 ($p<.05$). In a combined sample of both genders, maximum and minimum correlations were found in total PA ($r_s = .877$) and vigorous PA ($r_s = .466$) respectively. Meanwhile, high correlations were noticed in Moderate intensity PA ($r_s = .86$), Work domain PA ($r_s = .815$) and transport domain PA ($r_s = .876$) with original GPAQ scores. Low to moderate correlations were observed in vigorous intensity PA ($r_s = .466$) and recreation domain PA ($r_s = .629$). The correlation for sitting time was also acceptable ($r_s = .629$). In this case, scores of females depicted better correlation ($r_s = .744$) than males ($r_s = .491$) in sitting time.

**Table 3: Reliability of GPAQ-P based on ICC coefficients**

| GPAQ-P (MET-min/week) | ICC (95% Confidence intervals) | | |
|---|---|---|---|
| | Males | Females | Overall |
| Work domain PA | 0.917 (0.852-0.954) | 0.967 (0.939-0.983) | 0.943 (0.912-0.963) |
| Transport domain PA | 0.964 (0.934-980) | 0.979 (0.960-0.989) | 0.968 (0.968-0.951) |
| Recreation domain PA | 0.905 (0.832-.947) | 0.974 (0.952-0.987) | 0.952 (0.927-0.969) |
| Moderate intensity PA | 0.952 (0.913-0.974) | 0.962 (0.929-0.980) | 0.956 (0.932-0.971) |
| Vigorous intensity PA | 0.791 (0.648-0.881) | 0.902 (0.821-0.948) | 0.845 (0.77-0.898) |
| Total PA | 0.897 (0.819-0.943) | 0.944 (0.896-0.971) | 0.918 (0.875-0.946) |
| Sitting time | 0.59 (0.357-0.754) | 0.782 (0.621-0.936) | 0.704 (0.575-0.799) |

*ICC = Intra class correlation*

Table 3 shows the results of reliability analyses of scores of GPAQ-P. Significant intra class correlations were detected among all categories of GPAQ-P. Excellent correlations were observed for work domain PA (ICC = 0 .943, CI = 0.912 – 0.963), transport domain PA (ICC = 0.968, CI = 0.951 – 0.979), recreation domain PA (ICC = 0.952, CI = 0.927 – 0.969), moderate intensity PA (ICC = 0.956, CI = 0.932 – 0.971) and total PA scores (ICC = .918, CI = 0.875 – 0.946). A slightly less correlation was found for vigorous intensity PA (ICC = 0.845, CI = 0.77 – 0.898) but the correlation was still high though not excellent. Meanwhile, a moderate correlation was found for sitting hours (ICC = 0.704, CI = 0.575 – 0.799). Similar to validity analyses, females showed better reliability than males in each category.

## Discussion

The study was intended to develop a Punjabi version (Gurumukhi Script) of Global Physical Activity Questionnaire (GPAQ) which is an official instrument of WHO for physical activity surveillance in large population settings. The original version of GPAQ is in English language and Roman script.[7] GPAQ is also part of WHO's STEPwise approach to non-communicable disease risk factor surveillance.[7, 8] The current study has focused on the Punjabi language of northern India, in which GPAQ has not been translated yet. In this regard, taking into consideration the high need for Punjabi adaptation of GPAQ, a Punjabi translation of GPAQ was done by utilizing the protocol mentioned in the material and methods section. The results revealed significant validity and reliability of the Punjabi version of GPAQ. Excellent validity was observed in total PA scores, work domain, transport PA and moderate intensity scores except for vigorous intensity and recreation PA that showed low and moderate validity respectively. Furthermore, females showed higher correlations than males in terms of validity. Similar results were observed by Mumu et al.[8] while validating GPAQ in Bangladeshi population. Contrarily, another study on the French version of GPAQ demonstrated limited though acceptable validity and reliability.[12] In a comprehensive study in nine countries, GPAQ had shown poor validity and reliability.[16] In the same study, sitting time was poorly and insignificantly related to pedometer data. However, in our study, sitting time was also found to have acceptable validity and reliability in the overall sample. The reason for those poor results may be that they used the original English version of GPAQ in those populations whose native language is not English. The same study has recommended local adaptations of the instrument to make it more intelligible to the non-English speakers. Another study on the Brazilian population observed acceptable reliability but limited validity.[17] Our results showed high reliability in all PA domains and intensities whereas as reported by Bull et al.[16] work domain has shown higher reliability than recreation and transport domains in the reliability studies of Bangladeshi, Chinese, Ethiopian, Indonesian, South African, Japanese, and Taiwanese versions of GPAQ. A review of literature led by Matthews[18] reported that the GPAQ has similar validity and reliability to other physical activity questionnaires such as the IPAQ, Madras Diabetes Research Foundation-Physical Activity Questionnaire (MPAQ), Total Energy Expenditure Questionnaire (TEEQ), etc. In Punjabi context, International Physical Activity Questionnaire short form (IPAQ-SF) has been adapted in the Punjabi language by Shenoy et al.[13] They found Spearman's coefficient of 0.994, signifying excellent concurrent validity of IPAQ-SF Punjabi version. They found excellent validity for moderate and vigorous intensities. However, the major limitation of IPAQ-SF is that it does not measure domain-specific physical activity whereas GPAQ has the advantage of being short and producing domain-specific PA data. Although the adapted Punjabi version of GPAQ has shown good validity and reliability, refinement is still required to standardize it by using more rigorous methods.

### Limitations

At first, the sample size was small and subjects were not included from all age groups, socioeconomic statuses, and both urban and rural populations. Increased sample size may have produced more truthful results. Second, the validity was not tested against any objective measure such as accelerometers, pedometers or heart rate monitors which provide more accurate data on physical activity than self-report questionnaires. Third, recall bias may have its effects on the mindset of subjects.

### Suggestions for future research

This is the first attempt to adapt the WHO's GPAQ instrument in Punjabi for surveying physical activity in

larger populations. More studies of this kind with greater sample size are required to be carried out at local level to validate the adapted version.

More robust methods for establishing validity such as accelerometery, pedometery or heart rate monitoring may be used.

International Physical Activity Questionnaire long form (IPAQ-LF) is another widely used questionnaire for population surveys of PA. Concurrent validity of GPAQ-P against IPAQ-long form may be assessed in a further study.

Apart from Gurumukhi script, Punjabi is also being written in 'Shahmukhi' (Perso-Arabic) script in Pakistani Punjab, so a Punjabi translation in 'Shahmukhi' (Perso-Arabic) script is also required to be done.

## Conclusion

The Punjabi version of WHO's GPAQ in Gurumukhi script has acceptable validity and reliability and can be used for physical activity surveillance of Punjabi speaking population. It would be easy to understand for Punjabi speakers as it is enriched with local and simplified examples of work, transport and recreation domains, and PA intensities.

# Management of Oroantral Communication Using Double Layered Closure with Buccal Fat Pad and Buccal Advancement Flap: Prospective Randomized Clinical Study

**Kumar Nilesh**

*Prof and Head of Department, Dept. of Oral and Maxillofacial Surgery; School of Dental Sciences; Krishna Institute of Medical Sciences University; Karad*

## Abstract

**Introduction:** Although many techniques are available for management of oroantral communication, they utilize single layer tissue for closure of defect which is composite in nature. There is limited evidence in literature regarding efficacy of double layered closure using combination of flaps. This study was designed to assess utility of double layer closure of oroantral communication using buccal fat pad and buccal mucosa advancement flap.

**Material and Method:** Patients with oroantral communication were randomly allocated to two groups; group A were treated with two layered closure (buccal fat pad and buccal mucosa) and group B were treated with single layer closure (buccal fat pad). Same protocol of perioperative management was used for both groups. The postoperative parameters evaluated included success of surgery (complete closure without any nasal regurgitation), duration of surgery, pain, swelling and mouth opening.

**Results:** Total of 27 patients were divided into group A (n=13) and group B (n=14). The mean size of the defect was 28.23 mm in study group and 24.57 mm in the control group. The surgical procedure took more time (42.23 minutes) in group A, as compared to group B (26.21 minutes). Post-operative evaluation of pain and mouth opening showed no statistically significant between the two groups at 7th and 30th postoperative days respectively. However, swelling was relatively more when combination of buccal fat pad and buccal advancement flap was used.

**Conclusion:** Double layered closure is efficient in management of OAC. No dehiscence of flap was seen in study group. Comparatively 3 dehiscence was observed in control group, especially with large size defect. The postoperative sequel in both groups was similar.

***Keywords:*** *oroantral fistula, combination flap, maxillary sinus, nasal regurgitation*

## Introduction

Oroantral Communication (OAC) is an unnatural communication between the oral cavity and maxillary sinus resulting from composite tissue loss involving the oral mucosa, alveolar bone and the sinus lining. It may occur subsequent to extraction of maxillary posterior teeth in close proximity to the sinus floor, during removal of cyst/ tumour in posterior maxilla or due to trauma or infection. Options available for management of OAC are variable and primarily depend on size of the defect. OAC which are 5 mm or smaller in diameter are most likely to close spontaneously without the need of any surgical intervention.[1] Larger communications may often persist, and require surgical closure of the defect. Various techniques have been suggested in literature for closure of OAC, which range from simple primary closure, to use of buccal advancement flap, palatal rotation flap, split thickness skin graft, allogenic graft, regional flap, distant flaps, bone grafts, or buccal fat pad. [2] The surgical option used depends on type and size of the defect and surgeon's choice.

The conventional methods for management of OAC attain closure using a single layer of tissue, which can be mucosa (palatal rotation flap, buccal advancement flap), muscle (tongue flap, temporalis flap), bone graft (autogenous or alloplast) or adipose tissue (buccal fat pad). The present study intended to evaluate the efficacy of double layer closure using combination of buccal fat pad & buccal advancement flap in management of OAC and compare it with the conventional single layer closure using buccal fat pad.

## Materials and Method

The study was initiated after due approval of ethical committee and patients were enrolled after acquiring written informed consent. The study design used was prospective double blind randomized clinical trial. Patients with clinically evident OAC, secondary to varying aetiology were included in the study. The exclusion criteria included history of recurrent sinusitis, pervious history of sinus surgery, immunocompromised patients, uncontrolled diabetes mellitus, history of radiation therapy, OAC subsequent to resection of malignancy and patients on long term steroid therapy. Patients were blindly allocated to group A (two layered closure with combination of buccal fat pad and buccal mucosa) or group B (single layer closure using buccal fat pad) using random allocation software (WINPEPI software version 11.65).

**Surgical Procedure:**

Patients in both groups were prescribed nasal decongestant (xylometazoline nasal spray), chlorhexidine oral rinse and antibiotic (amoxicillin 500 mg + clavulanic acid 125 mg BD), two days prior to the procedure, which was continued till 5th postoperative day. Choice of anaesthesia varied from local to general depending on case. The operator and the 1st assistant were kept same for all the cases. The size of the opening was measured in millimetres using graduated periodontal probe. Intra-operatively the lining of the OAC was freshened and the fistula tract was excised in case of long-standing communication. In group A, full thickness buccal mucoperiosteal flap was reflected, keeping the flap at least 0.5 cm anterior to the anterior margin of the defect. Periosteal scoring was done to mobilize the buccal flap for advancement over to the palatal side. Harvesting the buccal fat pad was done using blunt dissection, till adequate bulk of fat was mobilized at the surgical site (figure 1d). The harvested fat was sutured to the palatal mucosa using 3-0 polyglactin (vicryl, Ethicon, violet braided) suture. Additionally, when required holes were drilled at bone over buttress area to stabilize the buccal fat pad anteriorly (figure 1e). The buccal mucosal flap was then advanced and sutured over the palatal mucosa using 3-0 polyglactin suture to attain a double layered primary closure (figure 1f). Patients in group B received a single layer closure using buccal fat pad. Duration of the procedure was measured from the time of incision to placement of the last suture using digital stop watch.

Immediate postoperative care was kept same for both groups. Patients were advised to eat soft diet, avoid vigorous oral rinses and blowing of nose. Analgesic (diclofenac sodium 75 mg BD) was prescribed for 7 days to patients of both groups. The parameters evaluated included the primary outcome (successful closure of OAC) and secondary outcomes (postoperative pain, swelling and mouth opening). The parameters were measured by different investigator and the operators were blinded from the same. The success of the surgery was judged based on complete closure of the oroantral communication with lack of any nasal regurgitation at one week and 1 month after the surgery. Pain was evaluated on 1st and 7th postoperative days using visual analogue scale (VAS). Patients were verbally asked to rate intensity of pain on scale of 0 to 10, with 0 being no pain and 10 being unbearable pain. Swelling was assessed preoperatively and on 1st and 7th postoperative days using flexible measuring tape. The horizontal dimension of swelling was measured from lower attachment of ear lobe to commissure of the mouth, while the vertical dimension of swelling was measured from angle of mandible to the outer cantus of the eye. The facial swelling was calculated by multiplying the horizontal and vertical dimensions of swelling. Percentage of change in facial swelling was calculated using formula; [(postoperative value – preoperative value) ÷ preoperative value] × 100. Mouth opening was measured in millimetres as interincisal distance between central incisor teeth or between crest of alveolar ridge in edentulous patient on 7th postoperative day and at one month. The data collected was tabulated and analysed statistically.

## Results

Total of 27 patients, both males (n=16) and females (n=11) with clinical diagnosis of OAC and willing to participate in the study and follow-up were enrolled for the study. Patients were randomly allocated to group A (n=13) and group B (n=14). All the patients completed follow-up of 1 month and there was no dropout. The size of the defect varied from 11 to 40 mm with mean diameter of 28.23 mm in study group (A) as compared to 24.57 mm in the control group (B). The surgical procedure took more time in group A, with mean time of 42.23 minutes, as compared to 26.21 minutes in group B.

Postoperative pain was measured using VAS. The pain scores on 1st and 7th postoperative day were lower in group B (mean pain on 1st day was 1.71; with range of 1-3, while mean pain on 7th day was 0.21; with range of 0-1) as compared with group A (mean pain on 1st day was 1.768; with range of 0-4, while mean pain on 7th day was 0.538; with range of 0-2). Statistical analysis showed no significant difference between postoperative pain among the two groups.

Mann-Whitney U statistical test was used to assess the Percent change in facial swelling with significance level at 0.05. The mean percentage of change in facial swelling on 1st postoperative day in group A was 25.97%, as compared to 13.39% in group B. With the U value of 16 and z-score -3.6152, the difference was statistically significant (p-value 0.0003). There was considerable reduction in percentage of facial swelling in both the groups on 7th postoperative day with mean of 05.44% and 02.64% in group A and B respectively. However, the difference of facial swelling between the two groups was statistically significant (p-value 0.03078).

The mouth opening was measured as interincisal distance preoperatively and on 7th postoperative day and 1month. The interincisal distance on 7th postoperative day was 27.84 mm and 38.42 mm in group A and B respectively. T-Test was used for assessment of the two-independent means, with significance level of 0.05. The t-value at 7th day was -7.16975. The p-value was < .00001, which was statistically significant. The difference was close to preoperative baseline in both groups at one-month follow-up. The mean interincisal opening at 1 month was 39.61 mm and 40.85 mm respectively. The t-value was -0.776 and the p-value was 0.222, which was not significant statistically.

Evaluation of the primary outcome (success of surgery) included complete closure of the oroantral communication with lack of any nasal regurgitation. At 1-month follow-up no opening was seen in study group (group A). However, three patients (21.42%) in group B had dehiscence with oroantral communication. The patient who showed dehiscence had mean defect size of OAC of 35.33 mm, which was higher than the mean value of 24.57 mm for the entire group. Ecchymosis over buccal vestibule was seen in 3 patients of group A and 5 patients of group B. No other complications were seen in either group.

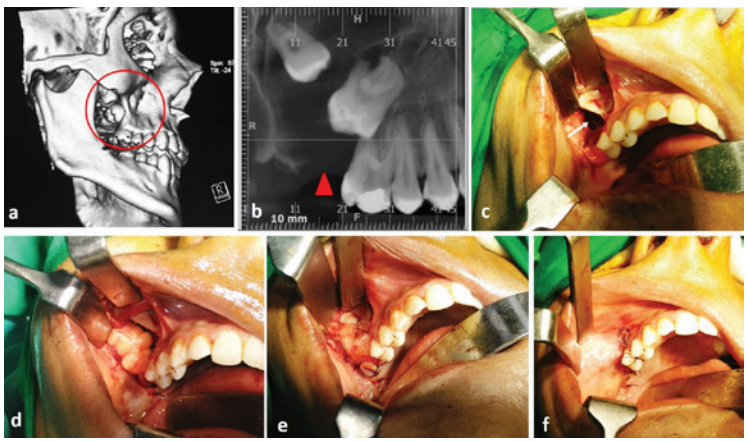

**Figure 1: Intraoperative steps in closure of OAC using combination of buccal fat pad and buccal mucosal flap; preoperative imaging showing cystic lesion in posterior maxilla with involvement of maxillary sinus (a, b), surgical defect resulting in OAC after cyst enucleation (c), mobilization of buccal fat pad encapsulated within its lining at the surgical site (d), closure of the defect with fat pad, note anchorage of the fat with sutures through the hole drilled over maxillary buttress (e), buccal mucosa advanced and sutured to attain double layer closure.**

## Discussion

The present study intended to evaluate the efficacy of double layered closure (mucosa and fat) of composite defect of OAC. Traditionally both buccal fat pad and buccal advancement flap have been used independently for closure of OAC with varying success rate. Anatomically buccal fat pad is consolidated fat mass enclosed in thin capsule. It is present in the masticatory spaces of oro-maxillofacial region and contributes to the facial contour. This anatomic entity was first mentioned by Heister in 1732 and later described in detail by Bichat in 1802.[3] Egyedi first reported the use of buccal fat for repair of oral defects in 1977.[4] The fat mass receives its blood supply from vestibular branches of maxillary artery, transverse facial branches of superficial temporal artery and branches of facial artery. The rich blood supply and availability of the fat close to the defect of OAC explains its utility in management of OAC.

As advocated by Egyedi, conventionally buccal fat pad was lined with a skin graft, to aid in complete epithelization of the flap.[5] However, it is well documented that fat graft when used alone, adequately epithelizes on its own by 3$^{rd}$ to 4$^{th}$ week of inset.[6] There is limited evidence in literature regarding use of double layered closure using combination of flap for closure of OAC.[7] Advantage of combining buccal fat pad with buccal mucosa appear to have an advantage in case of closure of large size defect, where the buccal fat pad tends to gets unduly stretched or perforated. In all the cases of OAC treated with combination flap showed complete coverage with no dehiscence. Whereas use of single flap in control group, showed dehiscence in 21.42% cases. Dehiscence was seen in 3 cases with mean defect size of 35.33 mm, which was higher than the mean value of 24.57 mm for the entire group.

Candamourty R et.al. suggested that defects larger than 50 mm should be managed with combination of buccal fat pad with buccal advancement flap rather than fat pad alone.[8] Another indication for use of combination flap is lack of adequate volume of the fat graft available for harvest. The BFP has volume of 10 mL and weighs approximately 9.3 grams. When adequately dissected and mobilized it can provide 70× 40× 30 mm of pedicled graft.[9,10] However, the graft volume is greater in infants and children and reduces with age. Its size also varies among individuals. Volume of buccal fat pad may be inadequate in some cases, especially for large size defect

closure indicating the need of a combination flap.

Harvesting and inset of buccal fat pad is relatively simple. However, care should be taken to gently harvest the flap with blunt dissection without breakage of its thin capsule. The flap should be suture without tension. Anchoring of the fat tissue to the malar buttress after drilling holes through it was used to further stabilize the flap in the presented cases when indicated (figure 1e). This possibly adapts the flap better over the defect and when combined with mucosal layer provides composite closure of the OAC. Although relatively safe, minor complications have been associated with harvesting buccal fat pad which includes; haematoma, flap necrosis, scarring, infection and facial nerve damage.[11] Evaluation of post-operative sequel showed no statistically significant difference in pain and mouth opening between the two groups at 7$^{th}$ and 30$^{th}$ postoperative days respectively. However, swelling was relatively more when combination of buccal fat pad and buccal advancement flap was used, understandably because of greater tissue dissection and handling. Flap dehiscence was seen in 3 patients with single layer closure, whereas self-limiting ecchymosis in buccal vestibule was observed in total of 8 patients. No case of facial damage or infection was seen. Harvesting the flap in patients with previous radiotherapy, midface and malar hypoplasia and thin cheeks are relatively contraindicated. In the present cases contraindications of the procedure were; uncontrolled diabetes mellitus, history of radiation therapy, ablative defect after resection of malignancy and patients on long term steroid therapy. Double/combination flap took more time for completion of the procedure (group A-mean time of 42.23 minutes, group B-mean time 26.21 minutes). The greater time taken was due to need of harvesting of two flaps in group A as compared to one in group B.

## Conclusion

Combination of buccal fat pad and buccal advancement flap provides double layered closure of the composite defect of OAC. The technique is efficient in management of OAC and can be especially used in case of larger defect size. The postoperative sequel of using the combination flap is similar compared to single layer closure with buccal fat pad.

# Information Booklet on Self-Care Management of Chemotherapy among gynecological Cancer Survivors at Selected Hospital, Mangalore, Karnataka

**Shynee Paul[1], Jacintha Veigas[2]**

*[1]PhD Scholar, [2]Professor & Clinical Coordinator, Nitte Usha Institute of Nursing Sciences, NITTE Deemed to be University, Derlakatte Mangaluru, India*

## Abstract

**Background of the study:** Cancers of the female reproductive tract and breast has a high incidence amongst Indian women. Cancer registries have also highlighted that more than 70% of cancers in females occur in the age group of 35-64, and that these cancers exercise an adverse influence on the productive role of women in our society. Chemotherapy is a type of cancer treatment that uses one or more anti-cancer drugs that can have severe adverse effects on the patient both during the therapy and for some time after.

**Title of the study**: Information Booklet on Self-Care Management of Chemotherapy among gynecological Cancer Survivors at Selected Hospital.

**Objectives**

1) To assess the knowledge on self-care management of chemotherapy among Gynecological cancer survivors

2) To determine the effectiveness of information booklet on self-care management of chemotherapy among Gynecological cancer survivors

**Hypothesis:** H1: The mean posttest knowledge level will be significantly higher than mean pretest knowledge level on self-care management of chemotherapy among Gynecological cancer survivors.

**Methodology**: Quantitative research approach and the design adopted was pre experimental in this study. The investigator selected total of 60gynaecologic cancer survivors receiving chemotherapy through purposive sampling technique. The researcher collected the data from the participants with the help of validated knowledge questionnaire and demographic Performa information before administering self care management information booklet. The information booklet was comprised of side effects and management of chemotherapy with pictorial depiction. The posttest was conducted at the immediate subsequent cycle of chemotherapy. The obtained data were analyzed by using descriptive & inferential statistics.

**Results**: The result of the present study showed that the mean post-test knowledge score (11.63) of gynecologic cancer survivors were significantly higher than their mean pre-test knowledge score (7.90). The calculated‘t’ value was (15.562) and’ p’ value is less than 0.05.Hence the research hypothesis was accepted at 5% level significance.

***Key Words:*** *Chemotherapy, information booklet, gynecological cancer survivors.*

## Introduction

Cancer is a group of diseases involving abnormal cell growth with the potential to invade or spread to other parts of the body. Gynecological cancer induces a major break in every-day life and a threat to existence for both the patients and their families. Many gynecological cancer patients experience physical,

psychological, social, practical and economic challenges during treatment. Gynecological cancer requires multi-disciplinary management. Chemotherapy may be used as adjuvant therapy or for management of locally advanced or recurrent tumors[1].

Chemotherapy affects healthy body cells as well as cancer cells and its side effects mainly depend on the dose of chemotherapy drug what is administered to the patients. However, most women will suffer some short-term side effects with chemotherapy and different people's bodies can also react differently to the same type and dose of drugs. While receiving treatment, the patient would suffer from uncomfortable feelings which include fatigue, hair fall, anorexia, nausea, vomiting, constipation, diarrhea, mouth sores and low white blood cell, anemia and thrombocytopenia[3]. Low platelets can cause abnormal bleeding. Health personals are responsible for encouraging and promoting proper self-care of the patients being treated with chemotherapy.

Although some side effects of chemotherapy drugs such as nausea can occur within minutes to days after the drugs are given, a potentially life-threatening side effect such as myelosuppression can occur from one to four weeks. Patients and families need to become more familiar with their disease, treatment regimens, and side effects[3].

The nurse's responsibility is to assess these patients and determine their educational needs regarding drugs, potential side effects, and appropriate self-care measures. Once patients gain adequate knowledge about their drugs and self-care measures, they should be able to distinguish when they can manage their side effects at home or when they should seek medical attention[2].

The present study focuses on self-care management of cancer patients treated with chemotherapy, in order to promote appropriate self-care behaviors. Empowering patients toward effective self-care can be done by providing knowledge and understanding.

## Materials & Method

The investigator selected total of 60 gynecological cancer survivors receiving chemotherapy through purposive sampling technique. The research instrument was validated by the experts. The researcher obtained the internal consistency of the instrument through split half method and the Karl Pearson correlation coefficient 'r' value was (0.76) and the instrument was found reliable.

**Ethical consideration:** The investigator obtained ethical clearance from the ethics committee of the institution. The investigator met the subjects and explained the purpose, procedure, benefits, duration of the research, and their role in the study. Investigator obtained informed consent and assured confidentiality of the information.

**Data collection procedure:** The researcher took permission from the concerned authority before starting data collection. The investigator administered the demographic Performa and structured knowledge questionnaire to the subjects before administering the information booklet on self care management of chemotherapy. The demographic Performa comprised of 15 items which include age in years, religion, educational status, occupation, marital status, type of family, monthly income, family history of cancer, previous history of cancer, age of menarche, age of menopause, whether menopause was chemotherapy induced, have you used contraceptives in past, parity, history of breastfeeding. The knowledge questionnaire comprised of 20 items. The researcher distributed the information booklet to all participants and post test was conducted at the immediate subsequent cycle of chemotherapy. The components of information booklet included the side effects of chemotherapy and its management. The investigator translated the tools to Kannada and then back to English. The participants took nearly 15 minutes to complete the self reported questionnaire

## Results

**Demographic findings:** Distribution of subjects according to the age showed that majority (40%) belongs to more than 60 years. Majority (91.7%) of clients belongs to Hindu religion. 16.7% of the subjects had family history of cancer (breast and stomach) while only 1.67% subjects had previous history of cancer. Only 6% of the client used intrauterine contraceptive such as Cu-T and 15% of subjects were nulliparous.. 85% of subjects' breast fed their children. 75% of the subjects attained their menopause at the age of 50-54 years out of which only 2 subjects had chemotherapy induced menopause.

81.7% of the subjects were married and 83.3% belonged to a modern nuclear family.

**Table 1:-Level of knowledge on self-care management. n=60**

| LEVEL OF KNOWLEDGE | PRE TEST | | POST TEST | |
|---|---|---|---|---|
| | Frequency(f) | Percentage (%) | Frequency (f) | Percentage (%) |
| Poor (0-6) | 14 | 23.3 | 0 | 0 |
| Average (7-13) | 46 | 76.7 | 43 | 71.7 |
| Good (14-20) | 0 | 0 | 17 | 28.3 |

**TABLE 2: Effectiveness of information booklet on self-care management during chemotherapy**

**n=60**

| Group | Mean | SD | Calculated t-value | df | LOS |
|---|---|---|---|---|---|
| Pre - test | 7.90 | 2.072 | 15.562 | 59 | p<0.001 HS |
| Post - test | 11.63 | 2.577 | | | |

Hs-Highly Significant

The data depicted in the table shows, the 'p' value is less than 0.001and there was a difference in the mean preinterventional knowledge score and mean post interventional knowledge score. Hence the research hypothesis was accepted.

## Discussion

The findings of the present study are compared with other studies to translate the available data into information. Majority (40%) of the subjects were above 60 years. Majority (91.7%) of clients belongs to Hindu religion. 16.7% of the subjects had family history of cancer (breast and stomach) while only 1.67% subjects had previous history of cancer. Only 6% of the client used intrauterine contraceptive such as Cu-T and 15% of subjects were nulliparous.. 85% of subjects' breast fed their children. 75% of the subjects attained their menopause at the age of 50-54 years out of which only 2 subjects had chemotherapy induced menopause. 81.7% of the subjects were married and 83.3% belonged to a modern nuclear family.

The above findings are contradicted by descriptive study conducted at multispecialty, teaching hospital in Uttarakhand, on Knowledge Regarding ill Effects of Chemotherapy and Its Home Management among Patients Receiving Chemotherapy showed that majority 22 (37%) of cancer patients falls between the ages of 49 to 64 years; 19 (32%) fell between the ages group 33 to 48 years; 10 (17%) fell between the ages group 65 to 82 years and 9 (15%) were found between 17 to 32 years

In the present study the investigator observed that (28.3%) subjects scored good knowledge and (71.7 %) scored average knowledge related to self

care management of chemotherapy caused side effects and there was a difference between the mean preinterventional knowledge score and mean post interventional knowledge score. Hence the research hypothesis was accepted and the information booklet was effective to improve their knowledge.

A descriptive study on Knowledge Regarding ill Effects of Chemotherapy and Its Home Management among Patients Receiving Chemotherapy was conducted at multispecialty, teaching hospital in Uttarakhand and the result showed majority of the cancer patients (63%) had only satisfactory knowledge,30% patients showed good level of knowledge and only 7% patients had poor level of knowledge[4].

Another descriptive cross-sectional hospital based study on Knowledge on Management of Chemotherapy Related Side-effects among 70 Cancer Patients conducted at Bhaktapur Cancer Hospital to support the present study. 54.9% of cancer patients knew that drinking too much liquid during the day removes the harmful agents from the body. 28.4% of the respondents ate high fiber foods with adequate fluid to manage constipation, 45.9% respondents perfumed oral care and gargle 3-4 times daily for management of stomatitis and mucositis, 67.6% of respondents took anti-emetic medication before meals for management of nausea and vomiting, 40.5% of responded drank more fluid than usually with ORS for management of diarrhea, 43.2% respondent put on scarf and cap/wig for management of hair loss. Over all findings showed that (58.1%) of respondents had average knowledge, (39.2%) had poor knowledge, and (2.7%) had good knowledge on management of chemotherapy related side effects.

## Conclusion

The diagnosis of cancer and its treatments are one of the most fearful life events which affect the general wellbeing of patients. Patients require knowledge and understanding about the health condition to overcome the physical and psychosocial distress caused by the cancer diagnosis and chemotherapy to improve their quality of life and, the health care professionals can play a major role to make them aware and equip with them sufficient knowledge on self-care strategies[5]. The investigator found lack of knowledge among cancer survivors regarding self management of chemotherapy from above study findings; hence there is a need for conducting such studies.

# Effect of Yoga Therapy on State and Trait Anxiety in Perimenopausal Women: A Non-Randomized Controlled Study

**Abhishek Chaturvedi[1], Asha Kamath[2], Gayathry Nayak,[3], Anjali Rao[4]**

*[1]Senior Grade Lecturer, Department of Biochemistry, Melaka Manipal Medical College Manipal campus, [2]Professor, Department of Data Science, Prasanna School of Public Health, [3]Former Associate Professor, Department of Yoga, Kasturba Medical College, Former Professor, Department of Biochemistry, Kasturba Medical College, Manipal, Manipal, Manipal Academy of Higher Education, Manipal, Karnataka, India*

## Abstract

High rates of anxiety symptoms have been reported in early or late perimenopausal women. The objective of this study was to determine the efficacy of 12-week Hatha yoga on state and trait anxiety score in perimenopausal women and to compare it with physical exercise (control) group. 247 women aged between 40 and 60 years experiencing perimenopausal symptoms were recruited, after 12.5 % loss to follow up, 216 women participated either in a yoga group (n=111) or a physical exercise group (n=105). The intervention in the yoga or control group consisted of a lecture, demonstration and practice session of 45 minutes each day for 12 weeks. State and trait anxiety was assessed using STAI inventory. State and trait anxiety was reduced significantly in the yoga group but not in the control group. Yoga intervention is effective in reducing state and trait anxiety than the physical exercise in women experiencing perimenopausal symptoms.

***Key words:*** *State and trait anxiety, Yoga, Physical exercise, Perimenopause, Cortisol*

## Introduction

Women in menopausal transition are four times as likely to develop depressive symptoms compared to premenopausal women. [1] Anxiety is the most experienced symptom of a depressive episode. In menopause, it is associated with vasomotor symptoms, nausea, distress, difficulty in initiating sleep (DIS) and impaired quality of life. [2] Previous studies have reported significantly high rates of anxiety symptoms in early or late perimenopausal women than premenopausal women. [3, 4] This anxiety is further classified by Spielberger into state or trait anxiety. [5] State anxiety is an unpleasant feeling or state of mind when the person faces a particular condition, demand, situation, event or an object. On the contrary, trait anxiety is a subjective phenomenon. It is based on the personality characteristic than on the transitory feeling. There is heightened oxidative stress in middle-aged women, more so during the menopausal transition. [6] Different measures have been used to relieve this stress, anxiety and calm the mind. Short term lifestyle intervention has been most promising in decreasing the anxiety, depression, stress and improving the overall well-being of an individual. Among these, yoga is reported to be the most effective modality to bring down stress, anxiety and to increase the antioxidant levels in the body. [7, 8] Yoga not only decreases anxiety but also enhances attention, cognitive functions, mood, wellbeing, mental focus and tolerance to stress. [9] Prior clinical study reported that yoga-based lifestyle intervention can decrease state and trait anxiety in diseased subjects. [10] Elavsky et al reproduce this study in middle-aged women and indicated that walking and yoga can improve fitness, which in turn reduces the reported symptoms in menopause. [11] The physical exercise is one modality which is compared with yoga. Previous reports have indicated that exercise improves

sleep quality and decrease depression in midlife women but does not improve the vasomotor symptoms. [12] Systematic review by Cramer et al indicated that yoga is effective in reducing menopausal symptoms and far superior in reducing vasomotor symptoms compared to exercise and for other symptoms (psychological, somatic, and urogenital) it is as effective as other exercises. [13] Thus both the modality are comparable and equally effective in menopause.

Considering above reports this study was planned to assess the efficacy of 12-week hatha yoga on state and trait anxiety score in perimenopausal women compared to the physical exercise (control) group. Serum cortisol and protein thiol were also calculated in both the groups to ascertain the efficacy of yoga in improving antioxidant power in anxiety disorders.

## Materials and Method

Participants

A total of 247 women aged between 40 and 60 years experiencing perimenopausal symptoms were included in the study with 216 women following up to the end of the study. Participants were recruited from self-help groups, women's organizations and rotary clubs through personal contact. Institutional ethical committee (IEC) permission was taken and participation was kept voluntary. Participant's information sheet was distributed to all participants which explain about the procedure and intervention detail and informed consent were obtained from all the volunteers who participated in the study.

**Study design**

This was a non-randomised control trial. 247 women participated at the beginning of the study (Figure 1). They were voluntarily divided into either a yoga therapy group (test group, n=127) or physical exercise group (control group, n=120). These groups were further subdivided, yoga therapy group (n=127) was divided into 10 subgroups and physical exercise group (n=120) was divided into 6 subgroups. After 12.59% loss to follow up in yoga group and 12.5% loss to follow up in control group, the remaining 216 women participated either in a yoga group (n=111) or a control group (physical exercise) (n=105). The intervention for both (test & control) the groups was, practicing a given protocol for 45 mins daily for 12 weeks. All the participants of the respective group (yoga or control) attended all the sessions scheduled for the group.

Yoga intervention

The intervention in the yoga therapy module consisted of a lecture, demonstration and practice session of 45 minutes each day for 12 weeks. The yogic asanas and pranayamas that were followed in this study have been tested and published previously. [14]

Control group

In the control group, the practice session consisted of loosening exercises for 10-15 minutes and strengthening exercises (while standing) for 30-35 minutes. The set of physical exercise that were followed in this study were standard exercises for mild to moderate activity and has been designed by experts in physical education, tested and published in previously. [15]

Study assessments

1. The irregularity of the periods and the reported length of time since the last menstrual period was used as a basis to determine menopausal status.

2. A self-administered questionnaire on State and Trait Anxiety Inventory for Adult [STAI] [5] was used to differentiate between the 'state anxiety' and the 'trait anxiety'

3. Blood samples (2 mL) were drawn one day prior to the schedule start day of the intervention and the day following the last day of the intervention between 7.30 am and 9.00 am. The serum was separated and used for measurement of protein thiols, which was done spectrophotometrically using DTNB (5',5'-dithio-bis-2-nitrobenzoic acid). [16] Serum cortisol was measured by chemiluminescent immunoassay. [17]

## Statistical Analysis

Statistical analysis was performed using Statistical Package for Social Sciences, version 15.0 (SPSS South Asia, Bangalore) for a level of statistical significance of 5%. Characteristics of the participants are presented as the percentage for categorical variables and mean ± standard deviation for continuous variables. Two way repeated measures ANOVA was used to compare the results within the group and between the groups. Spearman's rank correlation was used to get the correlation between the two variables.

## Results

The study included 216 women with perimenopausal symptoms with a mean age of 48.3 ± 4.6 years in the yoga group and 48.3± 5.1 years in the control group. The data on state and trait anxiety showed a significant improvement (p=0.001) from baseline to 12 weeks, as assessed by STAI. This significant improvement was observed in yoga group compared to control group. Post-intervention, serum cortisol level was unchanged in the yoga group and increased (p=0.04) in the control group. Serum total thiols increased in both the groups but the increase was not significant in the yoga group, whereas in control group and between the group the difference was statistically significant (p=0.001) (Table 1).

**Table 1: Mean Score of state and trait anxiety, cortisol and protein thiols before and after the intervention in both the groups.**

| Test | Results | Yoga (n = 111) | Control (n = 105) | p value |
|---|---|---|---|---|
| State anxiety | • Pre<br>• Post<br>• p value | 35.09±10.47<br>28.51±9.34<br>0.001* | 38.47±10.85<br>37.92±11.53<br>0.50 | 0.001‡ |
| Trait anxiety | • Pre<br>• Post<br>• p value | 39.32±10.01<br>32.03±9.79<br>0.001* | 41.90±9.91<br>40.71±10.16<br>0.14 † | 0.001‡ |

| Trait anxiety and state anxiety | 0.895 | < 0.001* | 0.880 | < 0.001* | 0.831 | <0.001* | 0.828 | <0.001* |
| Cortisol and thiols | 0.103 | 0.282 | 0.349 | < 0.001* | 0.037 | 0.710 | 0.155 | 0.115 |

*Correlation is significant at p< 0.001, Spearman's correlation was used to get the association between the variables.

## Discussion

In the current study, 12 weeks of yoga intervention is associated with a significant reduction in the state and trait anxiety score compared to controls who practiced physical exercise. Previous report indicated that yoga keeps a check on sympathetic over activity and helps in calming the body and mind and reduces the anxiety. [18] Prior clinical studies have reported the similar trend in state and trait anxiety score on normal and diseased subjects. [10] But all these studies are based on individuals without a formal diagnosis of anxiety by Diagnostic and Statistical Manual (DSM) criteria. A recent meta-analysis by Cramer et al indicated that yoga has no effect on anxiety which was diagnosed by DSM criteria. Yoga showed an effect on anxiety only in those studies which do not have a formal diagnosis or the diagnostic was done using other methods. [19] Thus reduction in state and trait anxiety score in yoga group should not be considered as reduction in anxiety levels unless diagnosed by DSM criteria. The serum levels of cortisol remain unaltered and protein thiols showed a slight increase in the yoga group but significant increase in the control group. Serum cortisol levels tend to increase in situations of acute psychological stress and anxiety disorders. [20] This cortisol level might be deranged due to loss of homeostatic control of Hypothalamic-Pituitary-Adrenal (HPA) axis with advancing age in perimenopausal women. [21] It is hypothesized that yoga down regulates the sympathetic nervous system (SNS) and HPA axis and thus helps in maintaining the cortisol levels. [22] Our results on serum cortisol is in line with previous report by Schell et al. They reported an improvement in psychological parameters post yoga intervention but cortisol remain unchanged. [23] On the contrary, physical exercise tends to increase the cortisol levels by stimulating the HPA axis and SNS. [24] The intensity of the exercise provoke an increase in the cortisol levels but the final level depends upon the total duration of exercise session. Previous studies have indicated that acute exercise increases the oxidant levels in the untrained individuals or beginner but continuous exercise can increase the antioxidant levels either by upregulating the endogenous antioxidants or by increasing the mobilization of antioxidants from the tissue stores to provide protection against ROS induced lipid peroxidation.[25] In the present study, we have observed a significant increase in the levels of protein thiols post-intervention in the control group (physical exercise) which indicates that it as an adaptive response to protect the cells against oxidants and to maintain cellular oxidant-antioxidant homeostasis during exercise. [26, 27] Previous studies have indicated that regular practice of yoga between 12 weeks to 6 months attenuates oxidative stress and increases total glutathione (GSH) content. [28] Glutathione being abundant in thiols,

we observed a slight increase in protein thiol levels post yoga intervention. But this increase was not statistically significant when compared to pre-intervention levels. Probably a longer duration of yoga therapy can bring about the significant change in the protein thiol levels. Therefore for future research, longer duration of yoga intervention at least for 6 months could be tried along with the measurement of norepinephrine and epinephrine to establish the association between catecholamine levels and reduction in anxiety post yoga intervention. The oxidation products such as 4-hydroxynonenal, protein carbonyls, and additional antioxidant enzymes can be measured to support the efficacy of yoga in improving the antioxidant status (protein thiols) and decreasing the anxiety in women with perimenopausal symptoms.

## Conclusion

This study suggests that 12 weeks of yoga practice can reduce state and trait anxiety score in women with perimenopausal symptoms but could not bring about an effective change in the serum levels of cortisol and protein thiols in women experiencing perimenopausal symptoms. Based on the above findings, yoga can be considered at least as effective as physical exercise. Therefore, the regular practice of yoga during menopausal transition can help these women in reducing the anxiety and stress related to perimenopausal symptoms and improve the quality of life.

Original Paper

# A Clinical Study of Complicated Inguinal Hernia with Special Reference to Its Management

**Pulin Ch Kumar[1], Paul Pratik[2]**

*[1]Associate Professor, [2]PGT, Department of General Surgery, Gauhati Medical College and Hospital, Guwahati, Assam*

## Abstract

**Introduction:** The complications of hernias are incarceration, strangulation, and bowel obstruction. The reasons for the simple hernia to go into complications are of manyfold including lack of public awareness of the dangers of hernia complications, etc. Therefore, evaluating the high-risk causes of the complicated inguinal hernia and its effective management is very important in clinical practice. Materials and methods: It was a hospital-based prospective observational study. Results: The complicated inguinal hernia was observed with a male and female ratio of 24:1 and highest (30%) frequency in the age group of 50-60 years. The right-sided involvement was seen in 33(66%) cases with more features of strangulation. The primary and recurrent hernia was observed in 48(96 %) and 2(4 %) cases respectively. Complications are more in 35(70 %) cases with a short duration (<1 yr). The pain and irreducible groin swelling were seen in all 50(100%) of cases. Viability of content as per intraoperative finding where gangrenous/strangulated bowel was found in 18(36%) cases. Reduction and Hernioplasty was done in 28(56) of cases. Conclusion: A systematic evaluation of clinical features with early intervention help in the management of the cases effre3ctively to reduce mortality and morbidity.

***Keywords:*** *Pain; time lapsed; gangrenous resection anastomosis; herniorrhaphy.*

## Introduction

A hernia is a protrusion of a viscus or part of a viscus through an abnormal opening in the walls of its containing cavity.[1]

Seventy-five per cent of all abdominal wall hernias are found in the groin, making it the most common location for an abdominal wall hernia. Of all groin hernias, 95% are the hernias of the inguinal canal with the remaining being femoral hernia defects. Inguinal hernias are nine times more common in men than in women. The overall lifetime risk of developing a groin hernia is approximately 15% in males and less than 5% in females. Inguinal hernias are further divided by anatomical location into direct and indirect types. This differentiation is based on the location of the actual hernia defect concerning the inferior epigastric vessels.[2] Indirect inguinal hernias strangulate more commonly, the direct variety not so often because of the wide neck of the sac.[1]

There is an association between age and hernia diagnosis. After an initial peak in the infant, groin hernias become more prevalent with advancing age. In the same way, the complications of hernias (incarceration, strangulation, and bowel obstruction) are found more commonly at the extremes of age.[2]

The reasons for the simple hernia to go into complications include lack of public awareness of the dangers of hernia complications and reluctance on behalf of the non-surgical medical personnel to refer patients with known risk factors.[3]

An inguinal hernia either direct and indirect is one of the most common problems that we face in our routine surgical practice and uncomplicated hernia possess no difficulty so far as many advances are present for the repair of the defect. Management of these complicated hernias is different from uncomplicated hernias. Most important is the morbidity and mortality associated with this hernias.[4]

This paper aims to find out the high-risk factors for the development of the complicated inguinal hernia and also to find out effective management of the operated patients.

## Materials and Method

It was a prospective observational study. The study consists of 50 cases undergone surgery for complicated inguinal hernia in various surgical units in Gauhati Medical College and Hospital, Guwahati, Assam during the period July 1st 2017 to June 30th 2018. The study was conducted among patients admitted from casualty with the complaint of a groin swelling and associated features of its complication, who were of age above 12 years and with the unilateral hernia. Before collection of the data ethical approval was obtained from the ethics committee (Human).

## Results

In our present study, we found that out of the 50 patients of complicated inguinal hernia involved dominantly the male population (96%) as compared to females (4%) giving a male and female ratio of 24:1 as shown in **Fig**. **1**.

**Fig. 1 Sex-wise inguinal hernia patients**

Out of 50 patients maximum cases, (30%) presented complicated Hernia that falls under the age group (50-60) years and very less number of cases below 20 years (**Fig. 2**).

**Fig. 2 Distribution of inguinal hernia patients according to age**

The present study reveals that inguinal hernias more common on right side 33(66%) than that in left side 17(34%). Right-sided hernias tend more to present with features of strangulation than left side; $p < .0448$ which is statistically significant. We have also found that 48(96%) of patients had a primary hernia and only 2(4%) had a recurrent hernia. The hernias with a short duration (<1 yr) were those who mostly developed the highest rate of complications with 35 cases (70%).

**Table 1 Symptoms of complications**

| Symptoms | No. of patients | Percentage |
|---|---|---|
| Pain | 50 | 100 |
| Irreducible Groin Swelling | 50 | 100 |
| Vomiting | 32 | 64 |
| Absolute Constipation | 30 | 60 |
| Fever | 10 | 20 |

In our study, pain and irreducible groin swelling were seen in all 50(100%) of cases. Details are shown in

**Table 1**.: The three categories, i.e., irreducible, obstructed and strangulated inguinal hernia based on relevant clinical symptoms and signs are shown in **Table 2** with their frequencies.

**Table 2 Clinical presentation**

| Presentation | No. of patients | Percentage |
|---|---|---|
| Irreducibility/ Incarceration | 20 | 40 |
| Obstructed | 18 | 36 |
| Strangulation | 12 | 24 |

Viability of content as per intraoperative finding where gangrenous/strangulated bowel was found in 18(36%) of the total cases as shown in **Table 3**.

**Table 3 Viability of content as per intraoperative finding**

| Status of Content | Contents | | |
|---|---|---|---|
| | Bowel | Omentum | Total |
| Viable | 19(38%) | 10(2%) | 29 |
| Gangrenous | 18(36%) | 3(6%) | 21 |
| Total | 37(74%) | 13(26%) | 50 |

It has been found that among the 28 patients who presented > 24 hrs after onset of symptoms 17(60.71%) had gangrenous changes of bowel requiring resection, compared to 9 patients who presented < 24 hrs where the resection rate is 11.11% (p - < 0.0188) as shown in **Table 4**.

**Table 4 Time elapsed from the onset of symptoms & presentation and the status of bowel intraoperatively**

| Time elapsed | Viable bowel (not requiring resection) | Gangrenous bowel (requiring resection) | Total |
|---|---|---|---|
| <24 Hrs | 8 | 1(11.11%) | 9 |
| >24 Hrs | 11 | 17(60.71%) | 28 |
| TOTAL | 19 | 18 | 37 |

The evaluation of the result shows that the majority(90%) of complicated inguinal hernia is indirect and the rest (10%) are the direct hernia.

The details operative procedures undertaken were shown in **Table 5**.

**Table 5 Operative Procedure performed**

| Procedure Performed | Number (%) |
|---|---|
| Reduction and Hernioplasty | 28(56) |
| Omentectomy and Herniorrhaphy | 3(6) |
| Resection of Bowel with Herniorrhaphy | 16(32) |
| Resection of bowel with Stoma formation with Herniorrhaphy | 2(4) |
| Appendicectomy with Herniorrhaphy | 1(2) |
| Total | 50(100) |

## Discussion

The male and female ratio (24:1) in the current study among the complicated of inguinal hernia in the present study is in the consistency of Hariprasad et al.[5]

This finding of ours was following that of the study done by Hariprasad et al.[5], where the author observed that the majority (22.5%) of patients with complicated inguinal hernia presented in $5^{th}$ -$6^{th}$ decade of life.

The right-sided hernias tend more to present with features of strangulation than left-sided hernias (p < .0448). These findings are in concordance with S Rai et al.,[3] NJ Andrews et al.,[6] Hariprasad et al.,[5] and Prakash JS.[7]

The hernias (70%) presented with complication did so within 1 year of duration. This finding was following the result of the study done by S Rai et al.[3] where the author described that short duration of a hernia was found to be a very significant risk factor which predicted complication. The author noted that the majority of adults with complicated hernias (65.8 %) had the hernia for a duration less than or equal to 1 year (p- < 0.05).

The primary hernias were observed in 96% of patients and the rest 4% were the recurrent hernia.

The type of hernia also affects the viability of content, especially recurrent hernias. In our study, there were 2 recurrent hernias and both of the cases had gangrenous contents and needed resection. S Rai et al.,[3] also noted a similar finding in his study where all 4 cases of recurrent hernia underwent resection and the author have regarded recurrent hernias to be susceptible to strangulation. NJ Andrews et al.,[6] also observed that risk of strangulation in recurrent hernia is more as compared to primary hernias, the increased risk has been attributed to their having narrow irregular defects with unyielding walls; the author also concluded that strangulated recurrent hernias were associated with high morbidity and mortality.

In the current study, pain and irreducible groin swelling were seen in all 50(100%) of cases; vomiting was seen in 32(64%) cases while absolute constipation was seen in 30(60%) cases and fever was present in 10 (20%) cases. Similarly, Manish Baria et al.,[4] in their study has observed that pain and irreducible hernia swelling was present in all the cases (100%), 30% of patients had nausea, vomiting, constipation and abdominal distension was present in 20% of cases each.

Incidence rates of symptoms obtained by Prakash JS et al.,[7] in their study also shows a similar pattern, pain and irreducibility in 100% of cases, vomiting in 82.8%, abdominal distension in 80%, constipation in 74.35 and fever in 25.7% cases. Hariprasad et al., [5] in their study have observed similar findings. Irreducibility of the hernia swelling, absent cough impulse and local tenderness were seen in all 50(100%) cases; abdominal tenderness was seen in 30(60%) of cases while abdominal muscle guarding and absent bowel sound was observed in 18(36%) of cases. Similar results are obtained by Hariprasad et al.,[5] and Muhammad Hasan Abbas et al.[8]

Signs of peritonitis which predict strangulation significantly among other clinical features were observed which agree Muhammad Hasan Abbas et al.[8] The author stated that in the absence of obvious peritonitis, clinical signs cannot reveal the condition of incarcerated bowel. There may be speculation based on the duration of symptoms and hernia type but the only safe management is early operation after necessary resuscitation as stated by NJ Andrews et al.,[6]

The results report that 40% of cases presented with painful irreducibility; 36% of patients presented with features of obstruction, and 24% cases with features of strangulation which agrees Manish Baria et al.[4]

A total of 28 patients who presented 24 hours after the onset of symptoms, 17(60.71%) cases developed gangrenous changes of bowel requiring resection which is in support of Hariprasad et al.,[5] and Kulah B et al.[9]

Viability of the contents in complicated hernias correlated significantly with the delay in presentation; The greater the delay, greater the risk for strangulation.[3] Martinez-Serrano et al.,[10] revealed higher rates of mortality in patients with acute complication as their first hernia related symptom and whose treatment was delayed for more than 24 hours.

Thus in 36% cases, general anaesthesia was given and 64% cases spinal was given. All cases where strangulation was suspected and peritonitis were there general anaesthesia was preferred where there was a strong suspicion of strangulation. These findings are following Brindelli et al.,[11] and Rene E Stoppa,[12]

The higher frequency of indirect inguinal hernias of the current study agrees Hariprasad et al.[5] The viability of contents of the current study are in support of Hariprasad et al.[5]

In the current study, 18 cases had gangrenous bowel as content requiring resection, 16 underwent resection with herniorrhaphy and 2, resection with a stoma with herniorrhaphy. 28 cases where the content was viable underwent reduction and hernioplasty as the surgical field was clean and hernioplasty prevents recurrence; 3 cases where the omentum was necrotic, omentectomy with herniorrhaphy was done; in one case there was inflamed appendix as content so appendicectomy with herniorrhaphy was done. The surgical procedures undertaken agree with Manish Baria et al.,[4] and Rives et al.[13]

## Conclusion

Elderly age group is most susceptible for development of hernia complications with a higher frequency in male. Right-sided hernias develop more complications. Direct hernias are much less affected than indirect hernias.

Hernia of short duration is also found to be more prone to develop complications. Recurrent cases had gangrenous content and needed resection. Pain and irreducibility of groin swelling were the most common presenting symptoms, other being vomiting, absolute constipation and fever. The signs of peritonitis including muscle rigidity and absent bowel sound predictive of strangulation.

The raised total leukocyte count was found to be significantly predictive of strangulation. Spinal anaesthesia was preferred. All cases where bowel was gangrenous resection anastomosis was done followed by herniorrhaphy (Bassini); similarly, in cases with gangrenous omentum omentectomy with herniorrhaphy was done. Cases, where the content was the viable reduction of the content and Lichtenstein tension free hernioplasty, was done. The outcome of 70% of cases in this study went uneventful, 10% of cases developed wound infection.

# A Comparative Study of Medical Termination of Pregnancy Act, 1971 with Recent Medical Termination of Pregnancy (Amendment) Bill, 2020 Through Judicial Pronouncement

**Pyali Chatterjee**

*Assistant Professor, MATS Law School, MATS University, Raipur, CG*

## Abstract

Recently Cabinet has passed the proposed Medical Termination of Pregnancy (Amendment) Bill, 2020. In current bill certain changes has been made regarding the upper limit of gestational age for termination of pregnancy under MTP Act, 1971. Through this paper researcher will discuss about the drawback of the MTP (Amendment) Bill, 2020 in terms of gestational age with the help of the various judicial pro-announcement.

***Keywords***- *Abortion, Miscarriage, Right to life, Gestation, Reproductive right*

## Introduction

The current MTP Bill of 2020 has proposed certain amendments under Section 3 of the MTP Act, 1971. The Bill[1] generally speaks about two important points relating to amendments-

I. Abortion right- This bill speaks about the abortion right for single or unmarried lady which is not allowed in MTP Act of 1971.Prior to this Bill, even in MTP (Amendment) Bill, 2014 it was suggested to include single and unmarried lady for abortion right.

II. Gestational age- Upper age limit for termination of pregnancy for rape victim is suggested to be increased up to 24 weeks and for fetal abnormalities there will be no limit.

The current Bill of 2020 has considered the single and unmarried women right for abortion because in last few years various courts in India including Supreme Court, considered Live-in relationship as legal. In **Khushboo versus Kanniammal, 2010 5 SCC 600** the Honorable Supreme Court held that "that a living relationship comes within the ambit of right to life under Article 21 of the Constitution of India. The Court further held that live-in relationships are permissible and the act of two major living together cannot be considered illegal or unlawful[2]".

To know about the drawback of current and previous Bill of MTP, first we have to know about Section 3 of The MTP Act, 1971. Section 3 of The MTP Act, 1971 deals with When Pregnancies may be terminated by registered medical practitioners. If we go through the Section 3 then we will find that basically it allows abortion only in three grounds-

i. *When the continuation of the pregnancy will risk mother life or grave injury to physical or mental health*[3].

Explanations 1 and 2 of Section 3 are the only two situations where it is considered that continuation of the pregnancy will risk mother life or it will cause grave injury to her physical or mental health i.e.

a. For the Victim of rape and

b. For married women when she get pregnant on the ground of failure of any contraceptive device used by her or by her husband.

ii. *When there is a substantial risk that if the child born, it will suffer from such physical or mental*

**Corresponding author**:
**Pyali Chatterjee,**

Contact No. 7489371981

*abnormalities which may lead to being seriously handicapped*[3].

iii. *Any actual or reasonable foreseeable environment*[3].

Now here what is "actual or reasonable foreseeable environment" under Section 3(3) needs an elaboration? This is the gap of law which needs to be filled thorough medical research, because only the medical expert can give the best explanation here.

Regarding the gestational age for termination of pregnancy for all cases the maximum limit is 20 weeks where the opinion of two registered medical practitioners is needed and opinion of one registered medical practitioner is needed to terminate the pregnancy below 12 weeks.

Section 5 and 8 of MTP Act, protect doctor for any act which is done in good faith for the protection of mother life. But then also in numerous cases doctors refused to terminate the pregnancy and referred patients to apply before court. It might be because of the lack of knowledge of the Act and judgment passed by the Supreme Court relating to this Act.

## Material and Method

This research is purely doctrinal in nature. Researcher has used both Primary and secondary sources available for this research like Gazettes of India, Acts, Books, Journals, and Newspaper etc.

**Critical Study of the Upper Age Limit For Mtp Through Judgements**

Issues relating to gestational age will get cleared from the following judicial cases-

 ***Chandrakant Jayantilal Suthar v. State of Gujarat, 2016(4)RCR(Criminal)876***

This is a landmark judgment where Supreme Court has allowed termination of pregnancy of a minor rape victim even after 20 weeks of pregnancy.

 ***Kavita v. State of Haryana, 2015(2) RCR(Criminal)606***

**Question of Law:** Whether a 12-year-old rape victim will be allowed for medical termination of pregnancy in 34 weeks of pregnancy?

**Judgment-** The Court constituted two panels of specialists to look into the matter that whether terminating of pregnancy at 34 weeks constituted a crisis life-sparing measure under Section 5 of the MTP Act? The medical panels noticed that continuing pregnancy will not amount to any danger to a girl's life but it will be risky to do abortion at 34 weeks because the result will be the delivery of live baby. The Court did not take into account the termination of pregnancy but rather did express its sympathy for the rape survivor. In the light of this constrained pregnancy, the Court requested the clinic to furnish her with a private room, free medicinal services, and psychological well-being care administrations, and Rs. 2 lakhs to help her kid.

***Critical study-*** *This case raises the question in our mind that giving 2 lakhs compensation will be sufficient to compensate the victim for taking care of her baby. A girl who is just 12 years old and a victim of rape for her family whether it will not amount to mental torture to take care of the child of the rapist. Whether the family will take care of the girl child who is a victim of rape or the baby born to her? What will be the relation of the child with the family? How society will treat the child in such cases? How the family will overcome such ordeal? Who will be responsible for the ordeal of the family and for the upbringing of the unwanted child born forcibly from the rape? These entire questions need to be answered*.**.**

 ***R and Another v. State of Haryana 2016(3) RCR(Criminal)***

A girl was kidnapped from her friend's place and was then raped. The doctors, in this case, didn't perform MTP even after knowing that this is a case of rape and also there was a long procedural delay in the investigation. The victim was then left with no choice but to seek termination of pregnancy after 20 weeks. By the time she was 22 weeks pregnant. The High court directed to set a committee of doctors if the pregnancy could be terminated. The doctors reported that pregnancy would cause no harm to the victim and the MTP act does not allow terminating pregnancy beyond 20 weeks.

*The Court, in this case, ordered the government to provide Rs. 5000 to her each month and also urged the*

*doctors to provide her proper medical care and asked the state to deposit five lakh rupees in her account*.

Critical Study- *Whether the court has done justice with the girl by denying her the abortion right even after knowing that she is a victim of rape? Giving monthly expenses and compensation of 5 lakhs is sufficient? If this so then there is no need for the provision of Section 3 of MTP Act, 1971 which says that rape victims will be allowed to MTP under this act. These cases are examples to show that even after having the law; women were denied from their basic rights. This is the failure of the law to provide justice to the victim of a most heinous crime by denying them the abortion right.*

 ***Sonali Kiran Gaikwad vs. Union Of India, MANU/SCOR/43704/2017***

In this case medical termination of pregnancy was allowed in 28 weeks of pregnancy because the fetus was suffering from serious anomalies.

Thus, the recent judgment clearly indicates that pregnancy can be terminated even after the 20 weeks whether it's a case of rape or any other case ( e.g. Ms. X v. Union of India & Others AIR 2016 SC 3525). From the cases discussed above, it has been proved that termination of pregnancy can be safe even after 20 weeks. Also regarding the abnormality of the fetus, it is necessary to mention here that any abnormality of the fetus is known during 20 weeks of pregnancy as there are many tests which is conducted during 20 weeks of pregnancy like *TRIPLE MARKER TEST*[4]. So, in such a situation there is a need of amendment of the MTP Act where termination of pregnancy should be allowed even after 20 weeks.

COMPARATIVE STUDY OF THE MTP (AMENDMENT) BILL, 2020 WITH PAST MTP BILLS

The MTP Bill, 2020 as already discussed above, has suggested to increase the upper limit of MTP for rape victim upto 24 weeks and for fetal abnormities cases there will be no upper limit. Even the previous MTP (Amendment) Bill, 2014 has given the same suggestion relating to upper limit for abortion in fetal abnormalities cases means no upper limit for fetal abnormities cases[5].

*Now if we compare or study the MTP Bill of 2014 and MTP Bill of 2018 with MTP Bill of 2020 then we will find-*

- *That 2014, 2018 and 2020 Bills gives a wide power to doctors to terminate the pregnancy even after the upper limit for cases of fetal abnormalities.*
- *The MTP Bill, 2018 suggested to increases the upper limit for rape victim upto 27 weeks. But current Bill of 2020 has reduced the upper age limit for rape victim upto 24 weeks like that of MTP Bill of 2014.*
- *The MTP Bill, 2014 and the MTP Bill, 2020 are the only two bills which give the proposal to include the single unmarried women for MTP in parent Act.*

Another important point to mention here that in MTP Act, 1971 there is no such discrimination made between rape victims with fetal abnormalities cases related to upper age limit for MTP. ***But one can find the discrimination in terms of upper limit for termination of pregnancy for rape victims and for the cases of abnormalities of fetus in current MTP Bill, 2020. Now the question which arises here is that what is the need of such discrimination?***

ISSUES WHICH NEED TO BE HIGHLIGHTED

***1. Whether monetary compensation is enough for a rape victim whose right to abortion has been denied?***As already seen in the case of *Kavita v. State of Haryana, and R and Another v. State of Haryana* which raises the question in our mind that whether giving compensation will be sufficient to compensate the rape victim after denying her the abortion right for taking care of the baby born from the rapist. Taking care of the child is not a duty of one day or one year. It's a responsibility for a lifetime. The government failed to consider here about the financial and social situation of the family. Even about the future of the girl whose life has been vandalized due to rape at such a tender age or even if she is major the intensity of the pain will be same for the both. The situation here will be like that whom the family will care first, the girl child who is a victim of lady or the baby born to her? It will be like a mental torture for them to take care of the child of the rapist. Even it is also true that the child born from rape has no fault in it but it is also the bitter truth of the society that a child born from rape will never get the respect from the

society when the truth of the birth of the child will be known to all. Another issue here is about the relationship of the child with the family-like relationship with the victim's family and with the accused family? There is no clarity in it. Again who will be responsible for the ordeal of the victim family and for the upbringing of the unwanted child born forcibly from the rape? These entire questions need to be answered. Denying women for abortion right even after knowing that she is a victim of rape is injustice and violation of her Reproductive rights. Giving monthly expenses and compensation of a certain amount is not sufficient to solve the issues where abortion right is denied. If this so then there is no need of the provision of Section 3 of MTP Act, 1971 which says that rape victim will be allowed to MTP under this act. These cases are examples to show that even after having the law; women were denied to exercise her basic right. This is the failure of the law to provide justice to the victim of most heinous crime by denying them the abortion right.

Even it's the lacunae on the part of the legislative and judiciary system for not providing justice to the rape victim and even to the child born from this heinous crime. Their Right to privacy which is part of the Right to life with dignity under Article 21 of the Indian Constitution is grossly violated in such situations. Mother and child rights should be protected separately in such a way that their life and future get secured.

*There must be some rehabilitation or adoption center where the child born from the rape victim should be taken care but only for those cases where the court denied the rape victim for abortion and the child is unwanted.*

***2. Whether Fetus Right to Life is a Fundamental Right?***

After the above discussion now it is also important to know about the Right to Life of an unborn fetus, because one of the common reasons for denial of abortion right is to protect the life of the unborn child. Right to life is a fundamental right of all people in every part of the world. But conflict arises when question comes regarding Abortion right of a woman. Almost in all International Human Rights Law, Right to Life is protected after the birth and this is only because to protect the women's rights, it may amount to serious threat to women's rights to abortion, if the right to life before birth gets protected. Though States has a duty and right to protect the life of the unborn child too but not at the cost of mother life.

Actually no one can say exactly when human life begins. The medical and scientific community did not arrive at any conclusion that when human life begins. To understand this better first we have to know about the meaning of fetus and embryo. According to Springer pocket Dictionary, Gynecology embryo[6]means concept us developing inside the uterus up to the 85th day of pregnancy and fetus[6]means intrauterine child from the third month of pregnancy; prior to this embryo. From the definition it is clear that one can call an embryo to fetus from the third month of pregnancy i.e. after 12 weeks.

**DEFENCE BY INTERNATIONAL LAW FOR THE PROTECTION OF MOTHER LIFE**

Even according to "Article 1 of the Universal Declaration of Human Rights" states that "All human beings are born free and equal in dignity and rights[7]." Here the word born does not include fetus. So, Right to Life here will be for those who are born. Even the International Covenant on Civil and Political Rights (ICCPR) 1966, and The United Nations Convention on the Rights of the Child (UNCRC) 1990, speaks about the rights of children born and no reference is made regarding the rights of a fetus.

The Human Rights Committee in L.M.R. versus Argentina, UN Doc. CCPR/C/101/D/1608/2007, held that "the denial of a legal abortion for a rape victim inflicted physical and mental suffering, violating the woman's right to be free from torture or cruel, inhuman, or degrading treatment, and her right to privacy[8]".

In ***Vo versus France, (2005)40 EHRR 12***[8], where the European Court of Human Rights, interprets and monitors compliance with the European Convention affirmed that "the unborn child is not regarded as a 'person' directly protected by Article 2 of the Convention and that if the unborn do have a 'right' to 'life,' it is implicitly limited by the mother's rights and interests," including her rights to life, health, and privacy.

Even it was for the first time in India, during ***N. K. Sharma and Ors. versus Union Of India (UOI) and Anr***, question was arises that Whether MTP Act

infringes the Right to Life of a unborn child protected under Article 21 of the Indian Constitution? The Court in this case examined the Act and found that it aims is to save women's lives and to protect their mental and physical health. The Court recognized that there may be a debate about when a fetus "comes to life so as to attract Article 21," but concludes that a woman's life and health trump any concern for the fetus[9]".

Regarding the right to life of the fetus several courts has different opinion. Even neither Section 10 nor Section 11 of the IPC speaks about an unborn child. But Section 312-318 of IPC protects the life of unborn children in cases when miscarriage is done without the intention of protection of mother life.

From the above cases it's clear that Right to life started from birth and not before that so there is no point to deny the abortion right to women as this will amount to be violation of their reproductive right which is already discussed above.

Putting restriction on women for having legal abortion is indirectly forcing her to choose unsafe abortion which again may cause damage to her mental as well as physical health. In such situation whom we should blame, the women who choose the illegal methods for having an abortion or the law makers who failed to considered the pain of the lady?

**Conclusion and Suggestions**

The following are the suggestions-

1. Abortion right on demand to all women irrespective of marital status.

2. Increase of time limit for abortion as discussed above.

3. For those cases where abortion is not possible due to any reason then in such a situation, the Government should provide alternatives where the parents or rape victims can give the child for adoption immediately after birth.

4. More research is to be done in the field of gynecology and in law to find out the situation when a pregnancy can cause anguish to a women.

Apart from these suggestions, the issues which are highlighted here need to be answered separately by the judiciary and the legislature. All those points are social and legal issues. Giving compensation to rape victim for taking care of the rapist child is like a mockery of the law and it will be like social rape for her where she will be raped every day by the members of the society for giving birth to a rapist child. Emotionally it will be no less than a criminal rape, the only difference will be here is that here the rape will be done verbally by the judiciary and by the so-called members of the society reminding her about the ordeal that she is a victim of rape and she has given birth to a rapist child.

The purpose and object of the MTP Act will be fulfilled only when this law will be applicable to all women and abortion will be allowed on demand. *Legislative and Judicial interference is necessary but that should be limited when it comes to abortion right for a woman.*

**Conflict of Interest:** I have no conflict of interest**.**

**Source of Funding:** No funding for this research.

**Ethical Approval**: The study does not require the approval of Institutional Ethics Committee. As the study is the combination of socio-medico-legal issue. No field study is done for this research.

# Effect of Kangaroo Mother Care on Physiological Parameters of Low Birth Weight Babies Admitted in NICU

**Pratibha Thakur[1], Jyoti Sarin[2], Yogesh Kumar[3]**

*[1]Nursing Tutor, Department of Child Health Nursing Maharishi Markandeshwar College of Nursing, Mullana, Haryana, India, [2] Dean, Principal of Maharishi Markandeshwar College of Nursing, Mullana, Haryana, India, [3]Professor, HOD of Department of Child Health nursing, Maharishi Markandeshwar College of Nursing, Mullana, Haryana, India*

## Abstract

**Background:** Neonatal mortality is often associated with low birth weight (LBW) which is a common problem in India. Kangaroo Mother Care (KMC) is a special method of providing care to low birth weight babies where skin to skin contact is provided by placing a low birth weight (LBW) baby vertically between mother's breasts. The aim of the study is to assess and compare the effectiveness of Kangaroo Mother Care on Physiological Parameters of the LBW babies who were admitted in NICU of MMIMS&R hospital of Haryana.

**Materials and Method:** Quasi experimental one group pre test post test design was conducted. Total 30 LBW babies (<2000gm) were selected through purposive sampling. KMC was provided for one hour, three sessions per day for three consecutive days. The physiological parameters were assessed and compared on radiant warmer and immediately before, during and after KMC for 3 consecutive days.

**Results:** Findings of the study showed the statistical differences before and after the implementation of KMC. The comparison of physiological parameters (temperature, respiratory rate. heart rate and $SpO_2$) means under radiant warmer and during KMC showed significant difference ($p \leq 0.05$) on day 1, day 2 and day 3.

**Conclusions:** This study showed statistically significant difference in physiological parameters on all three days. Thus, KMC was found to be effective method in maintaining the stability of physiological parameters of low birth weight babies.

***Key Words**: Kangaroo Mother Care, Physiological Parameters. Low Birth Weight Babies*

## Introduction

The first 28 days of life – the neonatal period –are the most vulnerable time for a child's survival. The level of low birth weight in developing countries (16.5%) is more than double the level in developed regions (7 %). LBW is considered as the single most important predictor of infant mortality, especially of deaths within the first months of life. A baby's low weight at birth is either the result of preterm birth (before 37 weeks of gestation) or restricted fetal (intrauterine) growth.[1]

Preterm birth (born before 37 weeks of pregnancy) face many challenges to maintain their physiological parameters in extra uterine life which may lead to many complications.[3]

Thus, preterm infants need supplementary energy for the maintenance of stable physiological parameters, warmth, feeding, and to be infection free in their postnatal life. The insufficiency of thermal security is still a large scale threat for newborn survival in developing

countries. Kangaroo Mother Care (KMC) is one of cost effective intervention which is very easy but more powerful method to reduce many complications mainly in low birth weight babies. Indian data on outcome of KMC are limited, though it has been found to be an effective and feasible method of care of LBW babies in hospital setting. [5] T hus researcher decided to conduct a study aimed at determining the impact of KMC on physiological parameters of LBW babies.

## Methodology

This quasi-experimental study, one group pre test post test design was conducted on 30 low birth weight babies admitted in NICU of Maharishi Markandeshwar Hospital Mullana Ambala. The sampling technique used was purposing sampling. The inclusion criteria were Low birth weight babies who were being nursed under radiant warmer and were hemodynamically stable Low birth weight babies(<2000g). Study excluded LBW babies having any severe life threatening respiratory, nervous, and circulatory and congenital anomalies and babies whose mothers do not consent for study.

In order to get the data, clinical profile of the LBW babies including gestational age, chronological age, birth weight, gender, mode of feeding and type of feed was used mothers were instructed about the procedure and taken informed assent. KMC was provided in three sessions each of one hour for three consecutive days. Physiological parameters (Axillary temperature, respiration rate (RR/ min), heart rate (HR/ min), and oxygen saturation(SpO2))were recorded in three observations on radiant warmer before each session of KMC and also three observations of physiological parameters were monitored and recorded during each session of KMC for three consecutive days.

### Procedure

For implementing KMC, mothers were asked to use any front open light dress. Babies were dressed with cap, socks, and nappy and no other garments. After placing into a custom-made KMC bag, the baby was placed upright inside mother's clothing against bare skin of the chest and abdomen. Head was turned to one side and placed in a slightly extended position and eye to eye contact between mother and baby was encouraged. The hips were kept flexed and abducted in a ′frog′ position; the arms were also flexed. Counseling and demonstration were repeated for initially hesitant mothers till they were able to offer KMC confidently and correctly.

To measure the temperature, digital thermometer was used. the temperature was recorded in ◦C. Heart rate and SpO2 were recorded by using Pulse oximeter. Respiration was assessed by recording chest expansion and relaxation.

**Ethical considerations :** The ***ethical clearance*** was obtained from university research ethics committee of Maharishi Markandeshwar Deemed to be University Mullana, Ambala (MMDU/IEC/967). Informed consent was obtained from the mothers of Low birth weight babies.

## Results

The analysis was done by applying parametric tests after checking normalcy of the data by Shapiro Wilk Test. Descriptive and inferential statistics were utilized for data analysis. p value $\leq 0.05$ was considered as significant for the present study. the paired 't' test was used to compare the means of vital signs on radiant warmer and during KMC. One way ANOVA was used to test the associations with selected variables of LBW babies. Complete data was available of 30 low birth weight babies were recruited at the level of 0.05 level of significance.

The results of the study showed that more than half of the Low birth weight babies (63.3%) were preterm, with chronological age between 5-10 days . Less than half (43.3%) weighed in between 1800-2000grams birth. Most of them were females (60%) and more than half (56.7%) were on

nasogastric/orogastric feeding and less than three fourth (73.3%) were getting expressed breast milk. [Table 1].

The comparison of the Physiological parameters between means on radiant warmer and during KMC on three consecutive days in three sessions per day showed statistically significant difference using the paired 't' test which showed that the Physiological parameters (Temperature, Heart Rate, Respiratory Rate & SpO2 ) of LBW babies was more stable during KMC than on Radiant warmer (RW).($p \leq 0.05$)[Table2,3,4,5] on 1st ,2nd and 3rd day respectively which indicates that the stabilization of physiological parameters during KMC in low birth weight babies was true difference and not by chance, suggesting that KMC was effective in stabilizing the temperature of low birth weight babies.

**Table 1: Frequency and Percentage Distribution of characteristics of LBW babies.**

| Sr.no | Sample characteristics | Frequency% |
|---|---|---|
| **1** | **Gestational age** | |
| 1.1 | Term/Small for date | 11(36.7%) |

◦C. DEGREE CELCIUS

## ❖ ABBREVATIONS USED

1. KMC: KANGAROO MOTHER CARE
2. LBW: LOW BIRTH WEIGHT
3. RW: RADIANT WARMER
4. NICU: NEONATAL INTENSIVE CARE UNIT
5. RR: RESPIRATORY RATE
6. HR: HEART RATE

## Discussion

The study results showed a significant increase in the average temperature in the LBW babies in the 1st to 3rd days after KMC, the findings are consistent with the results of many studies in

this regard. Only a study, before and after, showed that the newborns temperature reduced during KMC compared to the incubator care, although the temperature rates were in the normal range. Sontheimes et al . showed that even in newborns transferring with KMC compared to incubator care, the HR, respiratory rate, arterial oxygen saturation rate, and the temperature remain constant.[6] Hence, we can say that the KMC leads

to the temperature stability or its increase in the normal range. Indeed, putting the newborn in skin contact with the mother will prevent the heat loss. Increasing temperatures, particularly for low birth weight and premature newborns with tendency to hypothermia is very useful and improves the treatment outcomes, while the metabolic rate and oxygen consumption increase with the heat loss and lead to physiological and metabolic instability, homeostatic problems, apnea intensifying, and impaired weight gain.[7]

The research results showed a significant increase in oxygen saturation rate during the 1st to 3rd days after KMC compared to radiant warmer which is consistent with the results of many studies. Increase in arterial oxygen saturation rate can be due to calm and comfortable contact of the newborn with the mother and possibly the reduced oxygen consumption.[8]

In a number of clinical trial studies on similar preterm subjects, no changes have been reported in the rate of arterial oxygen saturation during KMC. Furthermore, in a study, no change was observed in the rate of arterial oxygen saturation in preterm neonates on heel prick and during puncturing the heel stick during the KMC than to the incubator cure.

Some researchers mentioned that during neonatal transportation toward the KMC, SpO2 may decrease, statistically, but not clinically, significant and will become normal within three minutes of KMC. Nonetheless, head in upright position is important to maintain the oxygen saturation[9].

The findings of the present study were also found to be consistent with the study conducted by Dr. Deepa.S.Phirke, Dr Sudhakar Bantewad to evaluate the effect of KMC on low birth weight babies, where the change in temperature ranged from -2 to +2oF and 78 babies had increased in temperature. The change in heart rate (HR) ranged from 3 to 12 beats/min.73 babies had decreased heart rate. The range of change in respiratory rate (RR) was 3 to 8 per minute. Total 75 babies had a decreased RR. The change in SPO2 was 3 to 8 and total 78 babies showed an increase in the SPO2. The mean of HR was 146.95 and 139.55, For RR 45.96 and 40.175, for temperature 97.69 and 98.50 and was 93.55 -97.48 for SPO2 before and after receiving KMC respectively .P value was <0.0001 in all parameters.[10]

## Conclusion

The results of the study concluded that that the KMC contributes in stabilizing the physiological parameters (the temperature, cardiovascular and respiratory stability) of LBW babies.

**Recommendations:**

· A study to evaluate the effectiveness of KMC on high risk newborn in terms of neurobehavioral outcomes.

· A follow up study can be conducted to assess the long term effects of Kangaroo mother care.

· A qualitative study can be conducted to assess the barriers faced by nurses and mothers in implementation of KMC.

· A exploratory study can be conducted to find out the prevalence and duration of KMC practice in the selected hospitals of Haryana.

· A comparative study can be conducted to assess the effectiveness of KMC versus coconut oil massage on multiple variables for viz. Stability of physiological parameters, weight gain, sepsis, feeding behavior, apnea, duration of stay in hospital etc.

A mixed approach study can be conducted on impact of frequency and duration of KMC on maternal and neonatal outcomes of LBW babies.

**Limitations:**

The study is confined to a small number of sample. This limit the generalization of the findings to study samples only.

Monitoring of physiological parameters during KMC .Researcher must had let the mothers and baby undisturbed during KMC sessions.

# Perception of Medication error among Interns and Staff Nurses in a Selected Hospital at Mangaluru- A Mixed Method Approach

**Pavithra K[1], Latha S[2], Gincy Joseph[3], Sujatha.R[4] , Jyothi Rao[5]**

*[1]Lecturer, Department of Medical-Surgical Nursing, Yenepoya Nursing College, Yenepoya (Deemed to be University) Deralakatte, Mangaluru- 575018, Karnataka, India, [2]Associate Professor,[3] Lecturer, [4] Professor, NITTE (Deemed to be University) ,Nitte Usha Institute of Nursing Sciences, Mangalore, India Deralakatte, Mangaluru, Karnataka, India, [5]Lecturer, Department of Medical-Surgical Nursing, Yenepoya Nursing College, Yenepoya (Deemed to be University) Deralakatte, Mangaluru- 575018, Karnataka, India*

## Abstract

**Objectives:** The present study assessed the perception of medication error among the Interns and Staff Nurses and also elicited the experiences of those who have witnessed or committed medication error.

**Method:** A mixed method approach was adopted, and by Purposive sampling technique, 50 Interns and 50 Staff Nurses were selected as participants. The initial Quantitative Phase Data was obtained by using Demographic proforma, and Modified Gladstone scale of medication error. Qualitative Phase data was collected by Semi-Structured open-ended Questionnaire.

**Result:** The findings of Descriptive and Inferential statistical analysis revealed that Majority of the Staff nurses had High Perception (52%) and Interns had Moderate perception (68%) about the medication error. Staff nurses (51.14) perception of medication error was higher than that of Interns (46.70). In the second phase Qualitative data was collected by Semi-Structured open-ended Questionnaire, and the verbatim was analyzed by Colaizzi's data analysis. With the verbatim, six themes emerged, which are Patient safety threat, Physical and physiological effect, Handling the error, reporting attitude, negative emotions, and problem focus strategy of medication error. The triangulation of Qualitative and Quantitative findings revealed the congruency between the four domains like causes, types, reporting behavior, and Views or feelings on medication error.

**Conclusion:** The study identified the gap between the nurse's perception of medication error with their actual knowledge. It was clear that the nurses need specific information about what constitutes medication error.

***Key Words:*** *Medication Errors, Perception, Health Personnel, Patient safety*

## Introduction

In the healthcare system, advancements and Errors are an all-time high happening. The system of treatment is becoming more hi-tech and more sophisticated, which is vulnerable to errors at the same time.[1] If wrong medicine is administered, it can cause severe adverse reactions instead of cure. A medication error is a significant threat to the patient's safety. It is the most frequent error occurring in the health care set up due to the negligence or malpractice of the health care professionals, who involve in the direct patient care such as Nurses, Doctors, and the Pharmacists which lead to the harmful effects on the patients .[1]

India records around 5.2 million injuries due to the medical errors of which medication error is one of them.[2] According to the Food and Drug Administration, in the United States, about 1.3 million people have been injured annually due to the medication error.[3]

An Indian study conducted on the medication error in a general hospital of Bangalore; Karnataka, revealed that the incidence of medication error was 38.12%.[4] Another study conducted in a tertiary care teaching hospital of Gulbarga, Karnataka, revealed that the incidence of medication error was 33.4%.[5] Hence it was found that medication error is the most common and severe problem that occurs in the hospital due to the various causes.

Nurses play an influential role in preventing, identifying, and reporting medication error. Despite the medication error, some nurses fail to report the error because of their perceived barrier. Nurse's perception should be changed to prevent medication error by enhancing their knowledge regarding the safe practices of medication administration. Nurses are the line of defense for patient's safety in administering medication, detecting and managing errors during the patient care. There is a lack of statistics about the medication error as the committed persons do not report it. The present study aimed to assess the perception of medication error among the Interns and Staff Nurses and also to elicit the experience of health personnel who had witnessed or committed medication error so that the corrective actions can be taken to prevent future errors thus increasing the patient's safety.

## Materials and Method

A Mixed method approach with sequential exploratory design (Phase I- Quantitative followed by Phase – II Qualitative) was adopted. In this study, health personnel refers to staff nurses and nursing interns. The required permissions were obtained from the hospital authorities.GNM and B.Sc (N) Interns who are undergoing internship and Staff nurses who are involved in direct patient care were included for the study.50 Staff nurses and 50 Nursing interns working in all the wards were selected by purposive sampling technique in Phase I. Informed written consent was taken from the participants. Ward in-charges, supervisors, M.Sc qualified nurses and Nurses working in the Hospital for less than 1 Year and those under supervision were excluded. In phase II focussed group discussion was held to obtain qualitative findings from the few Nurses who had witnessed or committed medication error.

**Data collection tools:**

The quantitative data was collected by demographic proforma and modified Gladstone scale of medication error in Phase I and Semi-Structured open-ended questionnaire in phase II.

**Demographic Proforma:**

It consisted of 14 items, which includes age, gender, Education, working area, years of experience, work experience in other hospital, number of patients handled, Practice of basic rights, Medical Professional in the family, Previous Knowledge, facilities to gain knowledge, training during initial days of internship, medication administration without supervision, witnessed medication error and committed Medication error.

**Modified Gladstone Scale of Medication error:**

This scale initially was developed by Jill Gladstome (1995) [6] and the researcher obtained permission to use and modify it for the present study. Items were categorized into four domains, such as Causes, Types, Reporting Behaviour, and Views/ Feelings with a maximum score of 75. The overall score of all four domains was calculated and interpreted as Low Perception 1-25, Moderate Perception 26-50, and High Perception 51-75.

The Semi-Structured open-ended Questionnaire had six questions entailed of experience of a medication error, consequences, managing, reporting, emotional changes, and coping strategies adopted after a Medication error.

Nine subject experts of nursing tested the content validity and relevance of the questionnaire. By using "Cronbach's alpha," the reliability of the tool was measured and was found adequate for the study (0.75).

**Quantitative data analysis:** Descriptive statistics (Frequency, Percentage, Mean, Mean Difference, and Standard Deviation) and inferential statistics were used for the analysis of quantitative data. Independent t-test was used to compare the perception of medication error among the Interns and Staff Nurses and Chi-square test

to find out the association between the level of perception with selected demographic variables). Significance level was considered at $p < 0.05$.

**Qualitative data analysis:** The written verbatim of the Staff nurses who have either witnessed or committed medication error was analyzed using "Colaizzi's data analysis framework, and themes and sub-themes were emerged. The themes were validated by two experts in the field of qualitative research.

**Triangulation of data:** Triangulation of data is the merging of quantitative and Qualitative data. The congruent findings from the Phase I Quantitative (Collected with Modified Gladstone scale) and the Phase II-Qualitative (written verbatim) were analyzed and merged to derive a common conclusion.

## Findings

Majority of the Nurses and interns were in the age group of 20-25 years and completed (54%) diploma in Nursing education.Most (64%) of the staff nurses had 1-3 years of experience,and 52% of the staff nurses handle 7- 11 patients during a shift. Table 1 presents descriptive characteristics of Staff Nurses and Interns.

**TABLE NO: 1 DISTRIBUTION OF SUBJECTS ACCORDING TO THE DEMOGRAPHIC CHARACTERISTICS** n = 100

| Characteristics | Interns | Staff Nurses | Percentage |
|---|---|---|---|
| Age | | | |
| 20-25 | 50 | 19 | 69 |
| 26-30 | 0 | 25 | 25 |
| 31-35 | 0 | 6 | 6 |
| Education | | | |
| GNM | 25 | 29 | 54 |
| B.Sc (N) | 25 | 15 | 40 |
| P B B.Sc (N) | 0 | 6 | 6 |
| Currently working | | | |
| Medical | 11 | 12 | 23 |
| Surgical | 10 | 16 | 26 |
| ICU | 10 | 6 | 16 |
| Paediatric | 5 | 5 | 10 |
| OBG | 10 | 7 | 17 |
| Casualty | 4 | 4 | 8 |
| The practice of 10 basic rights of drug administration | | | |
| Yes | 33 | 46 | 79 |
| No | 17 | 4 | 21 |
| Witnessed medication error | | | |
| Yes | 10 | 19 | 29 |
| No | 40 | 31 | 71 |
| Committed medication error | | | |
| Yes | 0 | 1 | 1 |
| No | 50 | 49 | 99 |

Figure 1 represents the Interns Perception of medication error where majority 46% had moderate level of perception about the causes of medication error, 58% had moderate level of perception about the types of medication error, 64% had a low level of perception about the reporting behavior of medication error, 60% had a Moderate level of perception about the Views/ feelings of medication error.

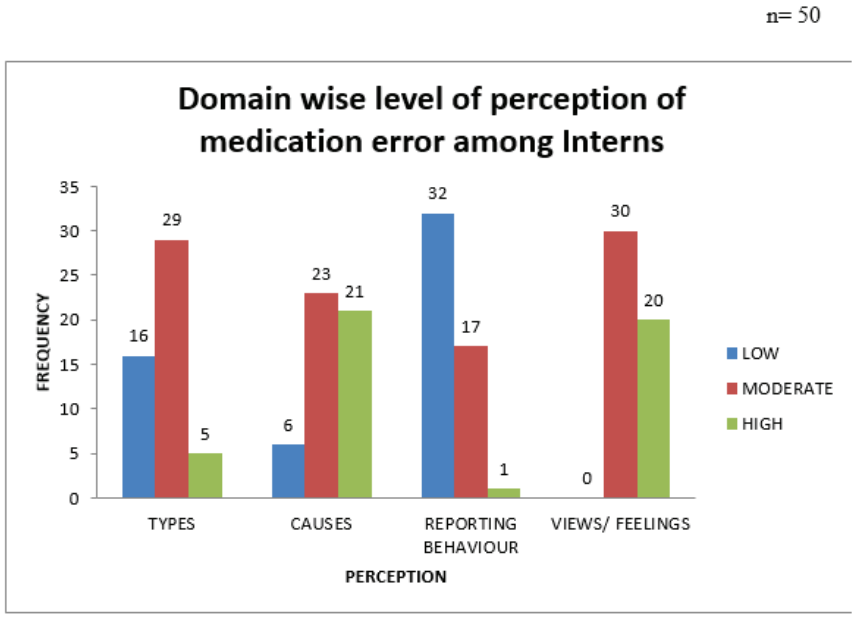

**Fig No 1: Bar diagram representing domain wise level of perception of medication error among Interns**

Figure 2 represents the Staff nurses Perception of medication error which depicts that majority 50% had moderate level of perception about the causes of medication error, 54% had moderate level of perception about the types of medication error, 52% had low perception about the reporting behavior of medication error and 84% had high level of perception of the Views/ feelings of medication error.

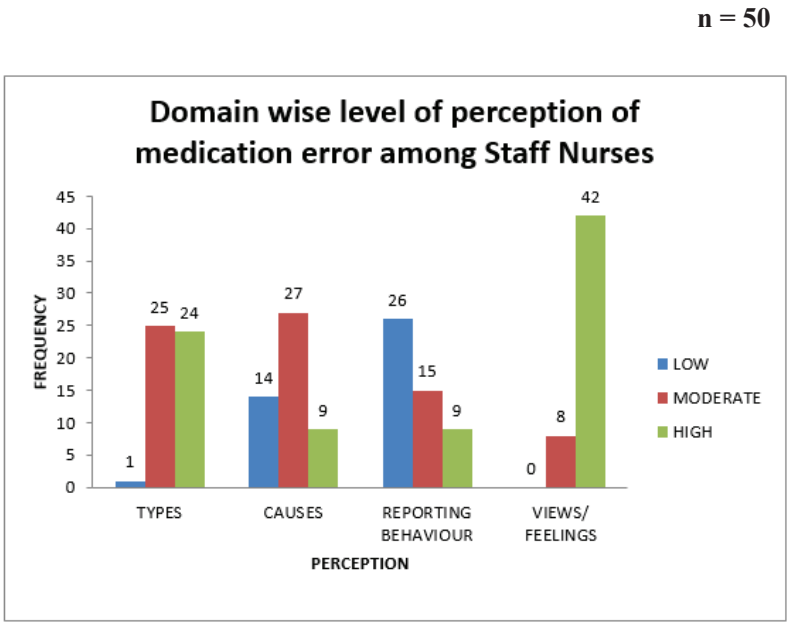

**Fig No 2: Bar diagram representing domain wise level of perception of medication error among Staff nurses**

From the error bar diagram ( Figure 3) it is clear that among the Staff nurses and Interns, the level of mean perception about medication error was 51.14±6.65 and 46.7±9.6.

**n= 100**

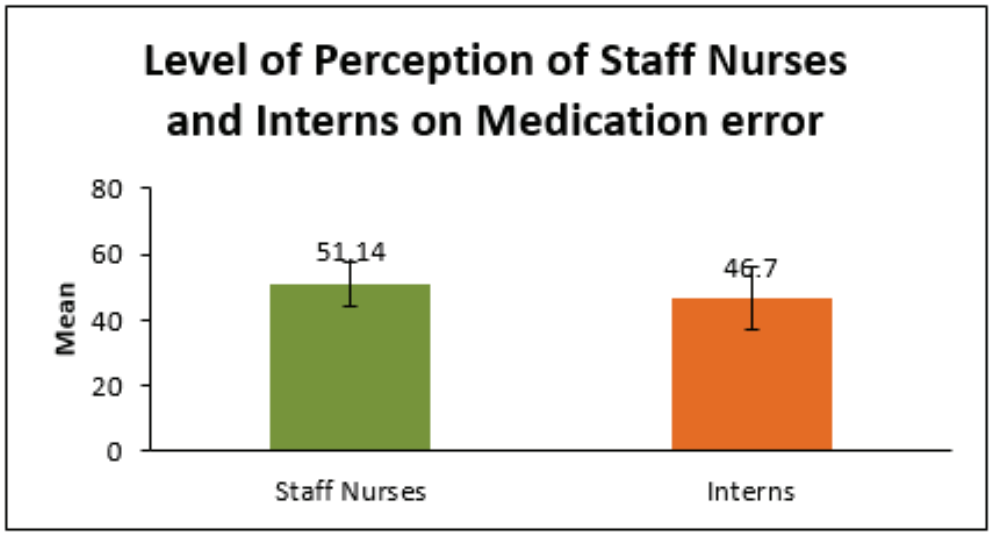

**Fig no 3: Error bar diagram representing the mean and standard deviation of staff nurses and Interns level of perception of medication error**

The independent sample 't' test calculated value is 2.68, with the p-value of 0.009, which is less than 0.05. Hence the research Hypothesis is accepted, and it is concluded that there is a difference in the overall perception of medication error between the staff nurses and interns at a 5% level of significance. (Table no. 2). There is no significant association found between the Interns and staff nurses level of perception with the selected demographic variables at a 5% level of significance.

**TABLE NO 2: COMPARISON OF THE LEVEL OF PERCEPTION AMONG INTERNS AND STAFF NURSES**

**n = 100**

| Level | Group | Mean difference | 't' | P value |
|---|---|---|---|---|
| Over all Perception | Interns | 4.440 | 2.68 | 0.009* |
| | Staff nurse | | | |
| Causes | Interns | 0.70 | 0.67 | 0.504 |

| Types | Interns | 0.460 | 1.64 | 0.104 |
| | Staff nurse | | | |
| Reporting | Interns | 0.50 | 1.821 | 0.072 |
| | Staff nurse | | | |
| Views/ Feeling | Interns | 2.780 | 3.981 | <0.001* |
| | Staff nurse | | | |

* indicates significant

The findings of the study revealed that there was no significant association between the staff nurses and Interns

level of perception with the selected demographic information.

An attention-grabbing finding found is that 10 Interns and 20 Staff Nurses had witnessed or committed medication error. Those were asked to write in-depth about the medication error experiences based on the Semi-Structured open-ended questionnaire. The verbatim of the Interns and Staff nurses was analyzed and found that 10 Interns Verbatim was inadequate. Therefore 20 Staff Nurses Verbatims were selected for the In-depth Qualitative analysis.

Based on the staff nurses verbatim, six main themes were derived. They are patient safety threat, impact and severity, strategies adopted, reporting attitude, psychological effect and problem focus strategy.

- **Patient safety threat** theme was derived from the three subthemes such as communication error; failure to adhere to the rights of medication administration and nurse's dereliction to the duty.

- **Impact and severity** was derived from the physical and physiological effects of medication error such as no harm, minor adverse effects, major adverse effects and life threatening.

- **Strategies adopted** was derived from the ways of handling error such as reporting the error, monitoring the patient, symptomatic error, antidote administration and transferring the patient to ICU.

- **Reporting attitude** was derived from the subtheme of positive and negative attitudes.

Positive attitude were following the correct Hierarchy of reporting (Doctor, NS, Quality assurance department), reporting through the incident form and reporting the error to the patient and patient relatives. Negative attitude such as not reporting the error to anyone, nurses think that the error was not serious to report, hiding the error with support, reporting the error only to the Doctor, not disclosing the error to the patient or patient relatives and disclosing the error to the patient due to the death of the patient.

- **Psychological effect** was derived from primary and secondary negative emotions of the staff nurses after the medication error. Primary negative emotions were scared, anxious, stress, upset, worried, crying, embarrassment, guilty. Secondary negative emotions were fear of getting scolding, fear of retaliation, fear of paying penalty and fear of losing job.

- **Problem focus strategy** was derived from the various defence mechanism adopted by the nurses. They are adaptive coping strategies such as understanding the responsibility, seeking help from Doctor, discussing with peers and carry out remedial measures quickly and mal adaptive coping strategies were blaming others, Self isolation and avoiding peers, trying to manipulate and ignoring the mistake done.

For the Triangulation of the Data, findings of the Quantitative phase (50 Staff nurses) and the Staff Nurses Verbatim (19 Witnessed and one committed medication error) of the qualitative phase have been merged, and a matrix developed.

In the modified Gladstone scale, 12 items of causes of medication error were compared with the qualitative findings of the Staff nurses. Out of which, five causes were similar with 7 participants verbatim of the qualitative findings namely patients with similar names, failure to check the IP number, incorrect setting of the infusion device, illegible handwriting of the doctor in the prescription chart, and received verbal or telephonic orders.

Regarding types of medication error, which contains six items, two were coinciding with that of the four staff nurses verbatim. They were Wrong dose error and the deteriorated error.

Among the Six items of the reporting behavior, three items of the scale were corresponding with eight nurses verbatim of the qualitative findings. Those are staff nurses report medication error immediately, failure to follow the correct hierarchy of reporting (Doctors, Nursing superintendent, and quality assurance department) and failure to report error through the incident form.

Another interesting finding to note is that 4 Perceived barriers of medication error were coinciding with 14 participants verbatim of the qualitative findings like failure to report due to the reaction from the authority and others; nurses think that the error was not serious to report, fear of disciplinary action, loss of job and they

think that it is safe not to report to patient relatives in some situations.

## Conclusion

The study result findings state that the work experience plays an important role in committing any kind of error in a hospital setup. As the age increases the clinical experiences also improves and makes the nurses more mature thereby, they may be more cautious to avoid all chances of committing the mistakes and errors.

The results attribute to a salient point that, medication error is the most common error in the hospital which varies with the severity, and the most strong point is that the causes of medication errors are preventable. During the induction training, all the nurses and interns should be provided with an equal opportunity to familiarize with hospital policies in medication administration and standing orders related to medication administration.

The medication error is not only a local or regional issue; it has a global impact where the errors seem to be silly but have a huge implication in the patient's life. If it is not identified early and counteractions were not initiated at the earliest, it may cost the life of the patient. However, these errors can be completely avoidable if the care provider or nurse shows alertness and mindfulness. Shortage of workforce and workload of individual nurses patient care settings may be the hindering factor leading to lethargic environment, which need to be addressed at the administrative level.

The researcher felt that there was a gap between the perception of medication error and the actual knowledge of the staff nurses and Interns. Fear of the nurse manager and loss of job was the strongest barrier found in reporting the medication error. These findings emphasize the importance of developing a rational blameless climate for honest reporting of the intended or unintended medication errors and using those reports for improving patient safety.

**Conflict of Intrest:** None

**Source of Funding:** Self

**Ethical Clearance:** The research proposal was placed in the Institutional ethics committee and obtained permission.(NUINS/CON/NU/IEC/ 2015-16 dated 16/01/2016).

# Knowledge of Antenatal Mothers Regarding Human Milk Banking

**Philomena Fernandes[1], Sabitha Nayak[2]**

*[1]Department of OBG (N), Nitte Usha Institute of Nursing Sciences, Paneer, Mangalore, [2]Professor, Department of OBG (N), Nitte Usha Institute of Nursing Sciences, Paneer, Mangalore*

## Abstract

**Introduction: Background**: Breast milk is the perfect food and uniquely superior to, artificial baby milk. Giving a child breast milk from another woman is not a newer concept; wet nursing was a fairly common practice a few decades ago. Human milk banks are services which collect, screen, process and distribute donated breast milk. Current research evidences suggest that pasteurized donor human milk can provide many of the components and eliminate the risk of transmission of infectious agents.

**Method:** Quantitative research approach was adopted to assess the knowledge on Human Milk Banking; a structured knowledge questionnaire was given to100 antenatal mothers. The study was conducted at Justice K.S Hegde charitable Hospital. Descriptive survey design was adopted to accomplish the objectives.

**Results:** Findings revealed that 52% of mothers had good knowledge and remaining mothers had an average knowledge. The 'p' value of age with regards to knowledge on human milk banking is 0.099, whereas the 'p' value of parity is 0.718. Meanwhile the 'p' value of family is 0.213 and that of religion is 0.428. For education, occupation, income and any previous exposure with human milk banking the 'p' values were 0.284, 0.082, 0.104 and 0.750 respectively. The above results shows that for all the demographic characteristics, the 'p' value is >0.05. Hence it was found that there was no significant association between knowledge of antenatal mothers with selected demographic variables.

**Conclusion:** Providing knowledge to antenatal mothers on human milk banking serve as an investment for the future needs. The nurse practitioner has a primary responsibility of enhancing the knowledge and developing positive attitude, towards utilization of human milk banking.

## Introduction

Breast milk is the perfect food for human infants. It is markedly different from, and uniquely superior to, artificial baby milk[1]. Wet nursing was fairly common practice few decades ago. Human milk banks play an essential role by providing human milk to infants who would otherwise not be able to receive human milk. Human milk protects premature infants from necrotizing enter colitis and from sepsis, two devastating medical conditions. Milk banks collect, screen, store, process, and distribute human milk. Donating women usually nurse their own infants and have a milk supply that exceeds their own infants' needs[2]. Breast milk is the main source of food for the baby, which is necessary for its growth and development[3]. Every mother looks forwards for a healthy baby. Breastfeeding also allows mother and baby to bond emotionally.

WHO Recommended exclusive breastfeeding for first 6months and continue till two years of age along with weaning4. In some instances the mother may pass away soon after delivering, mother maybe having infectious diseases or the mother is not able to produce sufficient milk. Unfortunately the baby may not get the mother's breast milk and thus the basic needs couldn't

**Corresponding author:**
**Dr. Sabitha Nayak,**
Professor, Department of OBG (N), Nitte Usha Institute of Nursing Sciences, Paneer, Mangalore.
E-mail: sabitha@nitte.edu.in

be meet. In such cases the human milk bank plays a vital role. The human milk bank is a service which collects, screens, crosses and dispenses human milk[5].

**Background of the study**

The world's first human milk bank was founded in 1909 in Vienna, Austria6. After Vienna, the first human milk bank opened in the United States in the Boston Floating Hospital. In the 1960s, efforts in human milk bank faded due to advances in neonatal medical care and infant nutrition. Human milk banks are services which collect, screen, process and distribute donated breast milk. Recipients are generally ill and premature infants whose mothers are unable to breastfeed them. As survival rates for preterm infants improve, more attention is being focused on improving the quality of survival through optimal nutritional management. WHO and UNICEF, made a joint statement in 1980: "where it is not possible for the biological mother to breast feed, the first alternative, if available, should be the use of human milk from other sources[7].

Breast milk that has been expressed, pasteurized and stored in sterilized conditions is safe and healthy for babies. The milk in the human milk bank is collected from donor mothers on the third day after giving birth, if they fulfill certain safety criteria that have been set by the hospital. The milk bank has one refrigerator, one sterilizer and two pasteurizers[8]. The steel containers are washed and sterilized in the sterilizer. The containers are then sent for collection of milk. The technician washes her hands, and labels the containers. The milk is pasteurized in the pasteurizer for half an hour at the prescribed temperature. A sample is taken and sent to microbiology department for testing for infections. After the report comes the milk is stored in the freezer at -20 degrees C. Milk thus collected can be stored for 3 to 6 months in prescribed conditions[9].

Working mothers are more prevalent in today's world comparing with the ancient era. This brings a greater revolution in the life style of the people. So the women cannot concentrate on adequate nutrition to the child at the fullest. On the other hand women who are not able to breast fed their child because of the circumstances like diseases, infections or due to death of the mother soon after the delivery. At this point human milk banking is the better option[10].

A study was conducted in South Australia by Lording R J in 2006.The study explored mothers knowledge towards human milk banks. Semi structured interview was conducted with 12 mothers who were breast feeding or have preterm babies or sick babies. Mothers of pre term infants would use a human milk bank only if they are ensured that milk was safe and appropriate for their babies[11].

A study conducted by Ahmet Karadag, Ramzan Ozdemir,Nuharrem Ak,Ali Ozer,Deryo Gumus Dogan and Ozlem Elkiran,Turkey, the study aims to determine the knowledge . They used descriptive cross sectional study on 1042 mothers who delivered at 2 different hospitals in Turkey. The result was almost half of the participating mothers (49.9%) agreed to the establishment of alternative HMB. Only 7.75% of mothers expressed views in favour of HMB .Only 9.2% mothers were willing to donate their breast milk for HMB.33.9% of mothers approved receiving milk from this type of HMB[12].

A study was conducted by Derya Kaya Senol, Ergul Aslan in Turkey. The study was to determine opinion of woman about human milk donation and HMB. They used cross sectional descriptive design on 231 married women who gave birth at least once. Data was collected using questionnaire and face to face interview, result was half of the women found human milk donation acceptable and 58% of the women stated they wanted to donate their milk ,45% women refused since it was against religious rule and 23.6% since it was having risk for infectious disease[13].

A study conducted in India (2006) has been providing mother's milk to new born babies. The human milk banking at Sion Hospital caters new born and premature babies whose mother's do not lactate. There are at least 8000 babies born every year, in that 20-35% of these cases, direct breast feeding becomes impossible where human milk bank becomes a support system[14].

A study conducted in Perth; the expression of breast wil allow of the mother to be away intermittently from her infant while continuing to breast feed. Total 587 mothers were taken, out of which 93% of mothers though returning from work were exclusively giving breast milk with the help of expressed breast milk whereas 7% discontinued with the reason of less breast milk[15].

A study conducted at Tumkur City to assess the effectiveness of information booklet on knowledge and practices of expressed breast milk among 30 postnatal mothers. The result was that 71% of mothers were found to get effective information regarding expressed breast milk[16].

**Need for the study**

Working mothers are more prevalent in today's world comparing with the ancient era. This brings a greater revolution in the life style. Women who are not able to breast fed their child because of the circumstances like diseases, infections or due to death of the mother soon after the delivery. At this point human milk banking is the better option.

When maternal breast milk is not available in sufficient quantity, donor breast milk is recommended as an alternate source of nutrition, particularly in preterm and other high-risk infants.

It is universally accepted that breast milk is the optimum exclusive source of nutrition for the first six months of life. Despite advances in infant formulas, human breast milk provides a bioactive matrix of benefits that cannot be replicated by any other source of nutrition. When the mother's own milk is unavailable for the sick, hospitalized newborn, pasteurized human donor breast milk should be made available as an alternative feeding choice.

Promoting health is the role of an advanced nurse practitioner in improving and maintaining the health and well-being of newborn babies. Educating and empowering the antenatal mothers to integrate healthy practices is an important task in the hand of health care providers. Therefore, the investigator was interested in preparing an information booklet on human milk banking.

**Objectives**

1. To assess the knowledge of antenatal mothers regarding human milk banking.

2. To find an association between knowledge of antenatal mothers on milk banking with selected demographic variables.

3. To prepare an information booklet on human milk banking

**Protection of human subject**

1. Ethical clearance was obtained from Institutional ethics committee after presenting the research proposal.

2. To conduct research study, the investigator obtained written permission from Justice K. S Hegde Hospital. Informed consent obtained and confidentiality was assured.

**Research methodology**

Quantitative research approach was adopted in the study. Convenient sampling technique was used to select 100 antenatal mothers from Justice K. S. Hegde charitable hospital. Descriptive survey design was adopted in order to accomplish the objectives.

The data collection instruments were demographic proforma and a structured knowledge questionnaire on human milk banking consists of 28 questions. The value of reliability of tool was obtained through Cronbach's Alpha using SPSS statistics and it is found to be reliable with the score 0.76. The data were collected from 11/1/2019 to 19/2/19. And the data were entered systematically in the SPSS for data analysis.

**Development of information booklet**

On interpretation of results it was found that only few antenatal mothers had some knowledge on human milk banking. To spread the awareness about human milk banking an information booklet was developed that provided basic information on human milk banking and its need.

## Result

Data were analyzed using descriptive and inferential statistics with the help of frequency and percentage. Chi square test have been applied to find the association. Data analysis under the following sections

**Section I:** Description of demographic proforma

**Section II:** Knowledge on human milk banking

**Section III:** Association between knowledge of antenatal mothers with selected demographic variables.

SECTION I: DESCRIPTION OF DEMOGRAPHIC CHARACTERISTIC

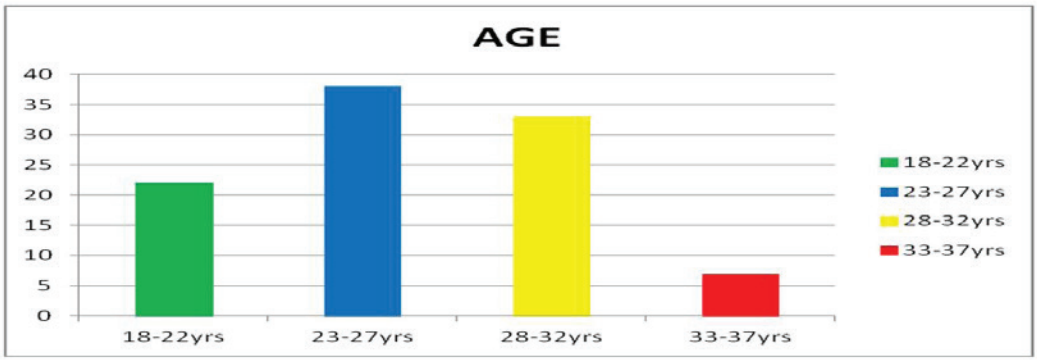

**Figure 2: Distribution of age**

**Fig 1: Distribution of Age**

The graphical representation depicts that out of 100 participants 38 of them were in the age group of 23-27 years and 33 of them were in the age group of 28-32 years, 22 were in the age group of 18-22 years and only 7 of them were in the age group of 33-37 years.

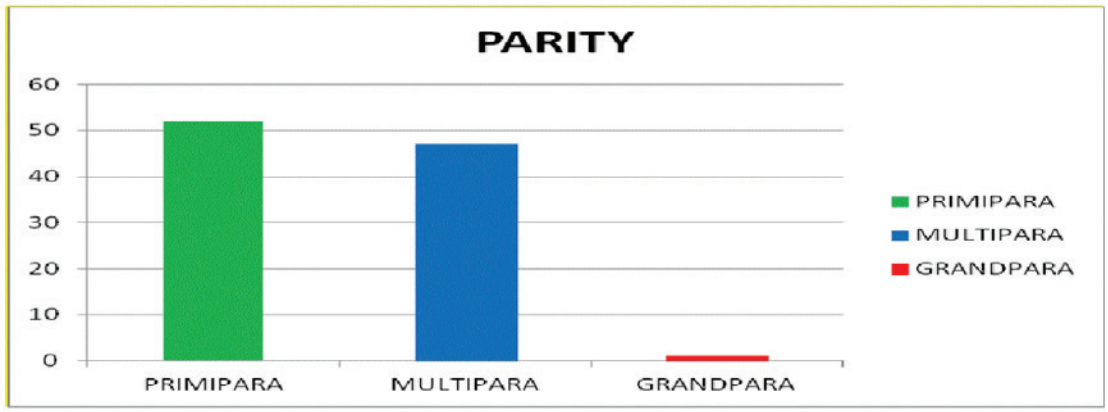

**Figure 3: Distribution of Parity**

**Fig 2: Distribution of Parity**

The bar diagram shows that 52 of them were primipara, 47 of them were multipara and only 1 belongs to grand multipara

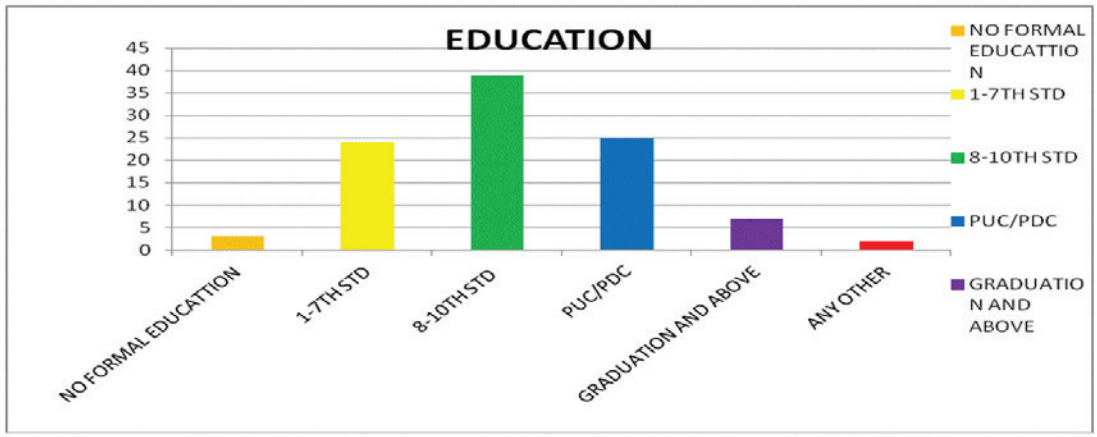

**Figure 4: Educational Status of antenatal mothers**

**Fig 3: Educational status of antenatal mothers**

The bar diagram shows, out of total participants 3 of them were having no formal education, 24 of them had education between 1-7th standard, 39 of them educated in between 8-10th standard, 25 of them studied till PUC and 7 of them were graduates and only 2 of them were not belonging to any of these categories.

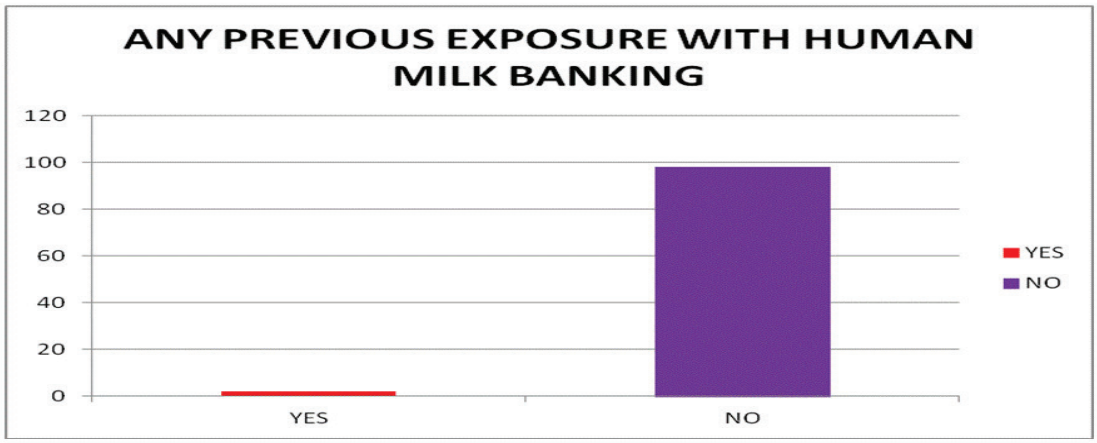

**Figure 5: previous exposure to human Milk banking**

**Fig 4: Previous exposure to human Milk banking**

Bar diagram shows that, out of 100 participants 98% of them were not having any previous exposure with human milk banking and only 2% of them were having a vague knowledge regarding human milk banking.

**Section II:** Knowledge on human milk banking

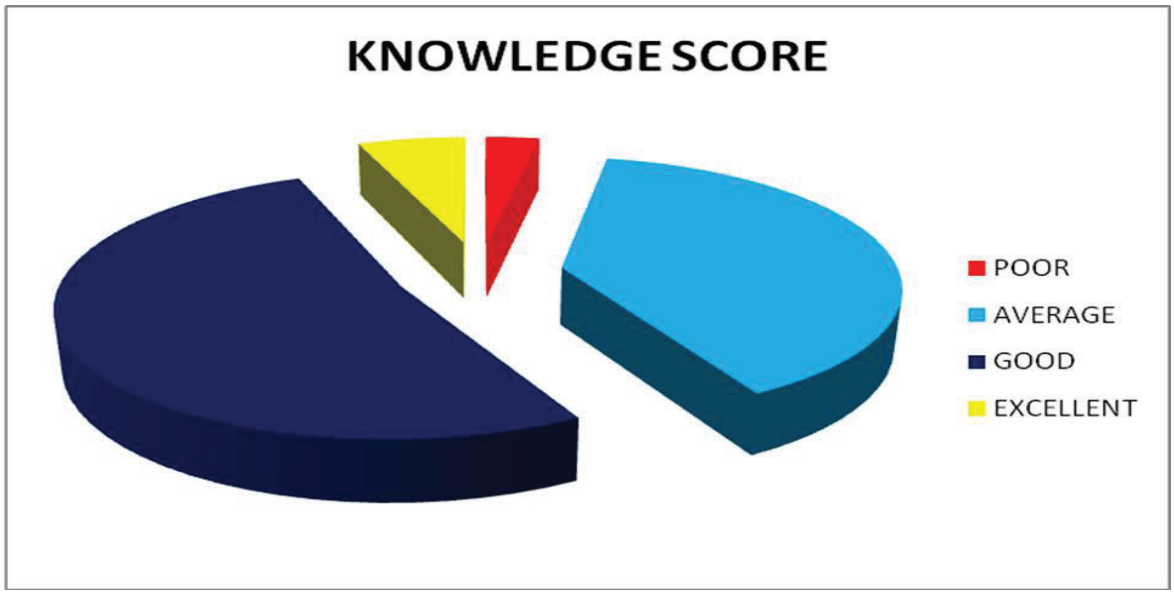

**Figure 6: Level of knowledge on Human Milk Banking**

**Fig 5: Level of Knowledge on Human Milk Banking**

Pie diagram depicts majority of the participants (52%) were having good knowledge regarding human milk banking following 39% of the antenatal mothers were having average knowledge, a few (6%) were having excellent knowledge and only 3% were having poor knowledge on human

**Section III:** Association between knowledge of antenatal mothers with selected demographic variables.

The results of the study shows that the 'P' value of chi square test for association between knowledge on human milk banking with demographic variables such as age is 0.099, whereas the 'p' value of parity is 0.718. Meanwhile the 'p' value of family is 0.213 and that of religion is 0.428. For education, occupation, income and any previous exposure with human milk banking the 'p' values were 0.284, 0.082, 0.104 and 0.750 respectively. The table mentioned above shows that for all the demographic characteristics, the p value is >0.05. Hence it was found that there was no significant association between knowledge of antenatal mothers with selected demographic variables.

## Discussion

Description on demographic variables

Majority of the subjects (38%) belong to 23-27 years of age group.

Most of the mothers (52%) were belonging to primipara.

It is evident that majority of mothers (65%) belong to nuclear family.

More number of the antenatal mothers (64%) belongs to Hindu religion.

The greater (39%) were having education between 8-10th standard.

More than half of them (56%) having income of <10000.

Two of them had received the information about human milk banking from internet. In a study on 60 working mothers those who are working in selected urban areas most of the mothers were in the age group of 18-35years.Majority of the study population were Hindus (85%), housewives (77%), living in nuclear family set-up (66%).

Description on knowledge score of antenatal mothers.

The findings of the study revealed that 52% of antenatal mothers had good knowledge and 39% of them had average knowledge on milk banking. Whereas only 6% of the mothers had excellent knowledge and 3 of them had poor knowledge.

The above findings were supported by the study conducted by Sangeetha et.al in selected hospitals to assess the knowledge and attitude regarding donating milk to the human milk bank. This study consisted of 60 postnatal mothers of selected hospital. Results shows that majority of the samples were having adequate knowledge.78 .33% of the samples had excellent level of knowledge score and 21.67% had good knowledge score.

## Conclusion

Change is the end result of all through Learning 17.

Artificial formula feeds cannot supply broad benefits of human milk. The most suitable way to acquire is only the Human Milk Banking. A large number of literatures strongly suggest that the antenatal mothers have poor knowledge on Human Milk Banking. Health education is one of the cost effective means that can be adopted to educate the antenatal mothers regarding human milk banking will help them in times of need, which can save lives.

Recommendations for future research:

A comparative study can be done in both antenatal and postnatal mothers to assess the knowledge regarding human milk banking.

**Acknowledgment**

The authors deeply acknowledge the antenatal mothers for their participation in the study.

**Conflict of Interest:** Nil

# A Study on Occupational Health Psychology of Employees in IT Sector in Ahmedabad City

**Pranav Saraswat**

*Senior Assistant Professor, Institute of Law, Nirma University Ahmedabad*

## Abstract

In this fast paced global world, human being is surrounded by numerous tensions and various competitors. To survive in this complex world one has to put his whole and sole effort to earn his livelihood. For this he has to do millions of work which causes stress. So employees need to manage stress and remove their occupational illness.

The objective of this research is to determine how occupational health psychology is being handled in IT industry. Along with that I will analyze the importance of stress management from the organizations point of view, identify reasons, effects and stress release strategies. I have used primary data of the IT industry to study how health and safety measures can be taken to remove the mental and physical illness of employees in IT sector. Secondary data is also used for analysis purpose.

***Keywords:*** *Stress, Occupational Health Psychology, Information technology,Stress Management*

## Introduction

The Information technology industry in India has gained a brand identity as a knowledge economy due to its IT and ITES (IT-Enabled Services) sector. TheIT–ITES industry has two major components: IT Services and business process outsourcing (BPO).[10]The growth in the service sector in India has been led by the IT–ITES sector, contributing substantially to increase in GDP, employment, and exports.The New Telecommunications Policy, 1999 (NTP 1999) helped further liberalize India's telecommunications sector. The Information Technology Act 2000 created legal procedures for electronic transactions and e-commerce.[16] The success of Information Technology in India not only had economic repercussions but also had far-reaching political consequences. India's reputation both as a source and a destination for skilled workforce helped it improve its relations with a number of world economies. The relationship between economy and technologyvalued in the western world facilitated the growth of an entrepreneurial class of immigrant Indians, which further helped aid in promoting technology-driven growth.India's growing stature in the Information Age enabled it to form close ties with both the United States of Americaand the European Union. However, the recent global financial crises has deeply impacted the Indian IT companies as well as global companies. As a result hiring has dropped sharply, and employees are looking at different sectors like the financial service, telecommunications, and manufacturing industries, which have been growing phenomenally over the last few years.[7]

India's IT Services industry was born in Mumbai in 1967 with the establishment of Tata Group in partnership with Burroughs. The first software export zone SEEPZ was set up here way back in 1973, the old avatar of the modern day IT park. More than 80 percent of the country's software exports happened out of SEEPZ, Mumbai in 80s.[9]

In this fast paced global world, human being is surrounded by numerous tensions and various competitors. To survive in this complex world one has to put his whole and sole effort to earn his livelihood.[1] For this he has to do millions of work which causes stress. So employees need to manage stress and remove their occupational illness.

The objective of my research is to determine how occupational health psychology is being handled in IT industry. Along with that I will analyze the importance of stress management from the organizations point of view, identify reasons, effects and stress release strategies.[8] I

can also recommend some strategies for future course of action. I have used questionnaire as a research tool to study how health and safety measures can be taken to remove the mental and physical illness of employees in IT sector. Secondary data is collected through internet and magazines. I have done analysis with the help of different charts and used chi-square as a statistical tool.

## Literature Review

A literature review revealed the following: key work factors associated with psychological ill health and sickness absence in staff were long hours worked, work overload and pressure, and the effects of these on personal lives; lack of control over work; lack of participation in decision making; poor social support; and unclear management and work role.[3] There was some evidence that sickness absence was associated with poor management style. Successful interventions that improved psychological health and levels of sickness absence used training and organisational approaches to increase participation in decision making and problem solving, increase support and feedback, and improve communication.

It is concluded that many of the work related variables associated with high levels of psychological ill health are potentially amenable to change. This is shown in intervention studies that have successfully improved psychological health and reduced sickness absence.[6]

The primary emphasis will be on the development and maintenance of healthy people within healthy organizations focusing on prevention of illness, disease, health problems, and injuries in the work environment. Specific topics covered include occupational safety and health hazards, organization of work factors and their relation to employee safety and health, safety climate and training, the etiology of job stress and burnout, workplace health promotion programs and the role of employee assistance programs, the interface of work and non-work factors in maintaining occupational health.[5]

**The Society for Occupational Health Psychology (SOHP)** is a learned society with as focal point the "generation, dissemination, and application of scientific knowledge in order to improve worker health and well-being." Moreover, understanding the significance of a healthy work environment can directly provide and contribute to work mastery and work ethic.[14]

**Employee assistance programs (EAPs)** are plans that help identify and resolve issues facing troubled employees through short-term counseling, referrals to specialized professionals or organizations.Occupational health is essentially preventive medicine.[12] The joint **International Labor Organization(ILO) & World Health Organization(WHO)** Committee-"occupational healthshould aim at the promotion and maintenance of the highest degree of physical, mental and social well being of the workers/employees in all occupations.

## Background of the Study

A number of individuals contributed to the foundation of OHP. The Industrial Revolution in the nineteenth century prompted thinkers to concern themselves with the nature of work. Marx'stheory of alienation of the industrial worker has been influential. Taylor's (1911) Principles of Scientific Management and Mayo's research in the late 1920s and early 1930s on workers at the Hawthorne Western Electric plant helped to inject work and its impact on workers into the subject matter psychology addresses and contributed to the development of OHP.Since 1950, the International Labour Organization (ILO) and the World Health Organization (WHO) have shared a common definition of occupational health.[13] It was adopted by the Joint ILO/WHO Committee on Occupational Health at its first session in 1950 and revised at its twelfth session in 1995. OHP is especially concerned with the dramatic transformation of work and employment that has been underway in industrial economies since the 1980s (e.g., flexible employment and production processes), and how changing organizational structures and processes are influencing the health and well-being of workers and their families.[4]

Many psychologists have argued that the psychology field needs to take a more active role in research and practice to prevent occupational stress, illness, and injury.[11]This is what the new field of Occupational Health Psychology (OHP) is all about.**OHP concerns the application of psychology to improving the quality of work life, and to protecting and promoting the safety, health and well-being of workers.**

### Problem Statement of the Study

Rapidly changing conditions of work and employment have brought the topic of work organization and health to the forefront of concern in occupational safety and health.[2] This paper begins with

a historical overview of psychology's contribution to the occupational safety and health field. It then argues that the changing work environment creates new and special needs for research and application by psychologists in the area of work organization and health.

This problem statement investigates the relationship between the physical and mental health of the employees and different parameters such as job performance, compensation, organization climate and culture etc.[15]

## Objectives of the Study

OHP research examines the impact of work on both physical and mental well-being. Knowledge derived from this research helps researchers and practitioners devise means for improving the lives of people who work.Occupational Health Psychology research and practice aim at developing interventions at individual and organizational level in order to create healthier organizations and healthier employees and to maximize employees' effectiveness and work performance. This can be the excellent opportunity to develop practical skills for working as organizational consultants in multinational environments.The main objective of this research study is know how to:

· To promote and maintain the highest degree of physical, mental and social well-being of workers in all occupations;

· The prevention amongst workers of departures from health caused by their working conditions;

· The protection of workers in their employment from risks resulting from factors adverse to health;

· The placing and maintenance of the worker in an occupational environment adapted to his physiological and psychological capabilities.

**Hypothesis**

**H0: Occupational health psychology of employees in IT sector is GOOD**

**H1: Occupational health psychology of employees in IT sector is not GOOD**

## Research Methodology

**Sources of Data**

Interaction with Respondents was in the form of face-to-face interviews with the help of questionnaire. The questionnaire consisted of a set of questions, asked to the respondent for his/her response, the questionnaire was structured and non-disguised. It was done in a prearranged order and the object of the research was revealed to the respondent. The questionnaire consisted of combination of open ended and close-ended question.

**Primary Data**

The primary data was generated through extensive use of a structured questionnaire, which had both the open end and close-ended questions.Primary data is facts and information collected specifically for the purpose of the investigation at hand.

**Primary Data**

- Questionnaire
- Interviews with employees

**Secondary Data**

Secondary sources are research reports that use primary data to solve research problems.Secondary data has been gathered by others for their own purposes, but the data could be useful in the analysis of a wide range of real property. In general, secondary data exists in published sources.

**Secondary Sources**

- Internet
- Magazine
- Newspapers and Journals

According to the Survey conducted on over 150 IT professional the various findings are as under.

Various factors which cause the occupational health psychological issues are found to as shown in the graph amongst all this , as per chart no.1 **Heavy workload** given to the employee is the major factor that causes stress on high level and apart from that and work schedules and work delegation are the factors which causes moderate level of stress to the majority of people.

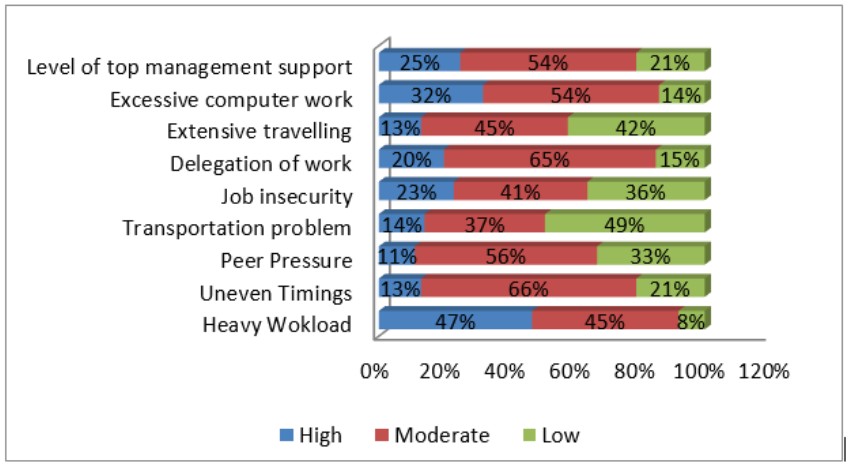

**Chart. 1. Causes of Occupational Health Pschology**

- During the survey that, in the ITindustry, the highest number of hazards i.e 66% are of technological types Viz excessive use of computers, the telephonic sounds etc.besides that 39% are affected by the psychological hazards.As per the chart no. 2 ,The lowest we found the percaentage of physical hazards.

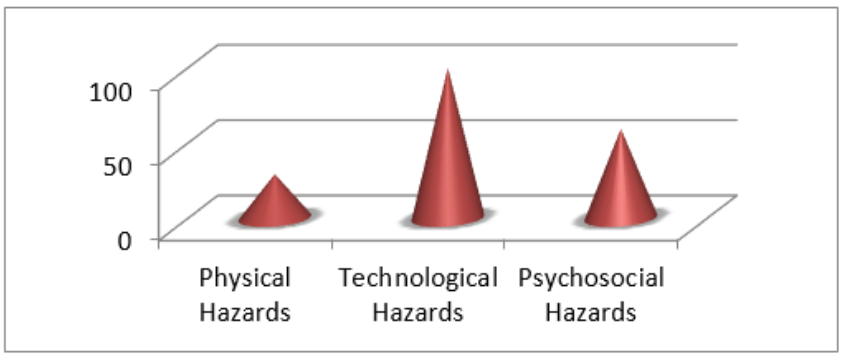

**Chart. 2. IT Industry Hazards**

- As per chart no. 3 we found that almost 48% respondents face job burnout due to excessive work and high pressure where as rest of the people never faced job burnouts. The other reasons for job burnouts may be unclear requirements, lack of personal control, poor communication, and insufficient compensation.

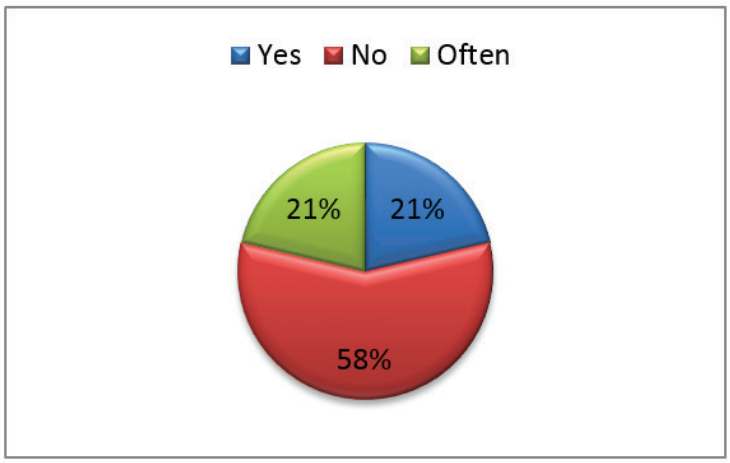

**Chart. 3.Job burn out**

**Hypothesis Testing**

**Pearson's chi-squared test between the Monthly Income and the Job Burnouts due to excessive stress and work pressure.**

**H0:** Income Level and Job burnouts are independent of each other.

**H1:** Income Level and Job burnouts are dependent of each other.

**Table. 1. Monthly Income and Job burnout**

| Job Burnouts | Monthly Income (in Rs) | | | | |
|---|---|---|---|---|---|
| | Less than 10,000 | 10,000-20,000 | 20,000-30,000 | Above 30,000 | Total |
| Yes | 4 | 15 | 7 | 6 | 32 |
| No | 9 | 26 | 33 | 18 | 86 |
| Often | 3 | 11 | 9 | 9 | 32 |
| Total | 16 | 52 | 49 | 33 | 150 |

**Table. 2. Chi-Square Tests**

| | Value | df | Asymp. Sig. (2-sided) |
|---|---|---|---|
| **Pearson Chi-Square** | **4.962[a]** | **6** | **0.549** |
| Likelihood Ratio | 4.924 | 6 | 0.554 |
| Linear-by-Linear Association | 1.432 | 1 | 0.231 |
| N of Valid Cases | 150 | | |

**Interpretation**

0.05 < 0.549 So H0 is Accepted.

Hence : Alternative Hypothesis H1 is Rejected

Hence the Income Level does not affect the level of Job burnouts and thus they are independent of each other.

Pearson's chi-squared test between the Overall satisfaction level and the adoption of changes in the working environment.

**H0:** Overall satisfaction level and adoption of changes are independent of each other.

**H1:** Overall satisfaction level and adoption of changes are dependent of each other.

**Table. 3. Overall satisfaction Level**

| Adoption of changes | Overall satisfaction level | | | | |
|---|---|---|---|---|---|
| | Highly Satisfied | Satisfied | Neutral | Dissatisfied | Total |
| 1 | 14 | 80 | 14 | 1 | 109 |
| 2 | 0 | 0 | 7 | 0 | 7 |
| 3 | 4 | 12 | 17 | 1 | 34 |
| Total | 18 | 92 | 38 | 2 | 150 |

**Table. 4. Chi-Square Tests**

| | Value | Df | Asymp. Sig. (2-sided) |
|---|---|---|---|
| **Pearson Chi-Square** | **42.720[a]** | **6** | **.000** |
| Likelihood Ratio | 41.361 | 6 | .000 |
| Linear-by-Linear Association | 14.673 | 1 | .000 |
| N of Valid Cases | 150 | | |

**Interpretation**

0.05 < 0.000 So H0 is Rejected.

**Hence :** Alternative Hypothesis H1 is Accepted. Thusoverall satisfaction level and adoption of changes are dependent of each other.

- Also I found that the age and gender does not affect the various factors which causes the occupational health psychological issues.
- I also found that a very less proportion of people are dis-satisfied with the income, reward and working environment of the companies.
- Out of 150 employees which I have surveyed, 71% of them are using work life policies provided by the organization, 29% of them do not use any kind of work life programs
- 91% of them are able to manage their personal and professional life

## Conclusion of the Study

Ahmedabad city is a fast developing city with all the amenities and facilities available. People of Ahmedabad lead a good life. After conducting the research in the city of Ahmedabad on the IT professional, I found that the there are some issues related to physical and psychological health but in manageable condition. Overall OHP of these employees can be considered as good enough and it can be improved taking initiatives using stress management techniques, physical fitness maintenance, technological monitoring etc.

## Limitations of the Study

- The opinion expressed is on response based.
- The sample size of model might not represent

perception of whole population as the sample size is small.

- ·The attitude of research might be biased.
- There is limitation of geographical research. As we know that the study is being carried out of the people of Ahmedabad only so a wider aspect and the wider scenario would be missing
- Last but not the least is that incomplete questionnaire, it is also a limitation means everyone is not taking interest in filling up the questionnaire.

**Conflict of Interest**- No

**Source of Funding -** Self

**Ethical Clearance** - NA

# Acupressure– A Review with a Current and Future Prospective in Dentistry

**Dharnappa Poojary[1], Diksha Singh[2], Rubina Anjum[3], Dieu Thuy Dao[4], Shailesh Kudva[5]**

*[1]Associate Professor, Department of Oral & Maxillofacial Surgery, Manipal College of Dental Sciences, Mangalore, Manipal Academy of Higher Education, Manipal, India, [2]Associate Professor, Department of Oral Pathology, KGMC, Lucknow, [3]Professor and Head , Department of Oral Pathology, Indira Gandhi Govt Dental College, Jammu, [4]Faculty, National Hospital Of Traditional medicine, Hanoi, Vietnam, [5]Professor & Head, Department of Oral Pathology, Srinivas Institute of Dental Sciences, Mangalore*

## Abstract

Alternative, collaborative, complimentary, integrative, natural, unconventional and holistic are the terms that are used to describe that do not conform to mainstream allopathic/western/orthodox health approaches.

WHO supports traditional and alternative medicines when these have demonstrated benefits for the patient with minimal risks.

In general, the harder a medical problem is to treat, the more treatment strategies exist. Patients and physicians are constantly looking for alternatives to drug therapy.

Empirical and scientific evidence exists to support the benefits of acupuncture, manual therapies and several medicinal plants for chronic or mild conditions. For instance, the effectiveness of acupuncture, a popular treatment for relieving pain, has been demonstrated both through numerous clinical trials and laboratory experiments. As a result, 90% of pain clinics in the United Kingdom and 70% in Germany include acupuncture as a form of treatment.

Acupressure is an easier form of Acupuncture wherein this technique of applying gentle pressure to various 'pressure points' on the body is used to cure various Diseases including relief of Pain.

The aim of this paper is to give a introduction to acupuncture/acupressure to the general dental practitioner and to understand its history, background, current trends, the relevance and the possibilities of its practice in dentistry.

***Keywords*** *– Acupressure, Acupuncture, Traditional Medicine, Dentistry, Alternative*

## Introduction

Health care can broadly be divided into modern (conventional, orthodox, Western or allopathic) and traditional (indigenous, complementary, alternative or integrative).

**Corresponding Author:**
**Shailesh Kudva** MDS
Professor & Head, Department of Oral Pathology
Srinivas Institute of Dental Sciences
Mangalore 574146, Email – drskudva@gmail.com

With the effective leadership of WHO, a number of countries have developed traditional medicine policies. Research efforts in Western countries have been largely concerned with the quality, safety and efficacy of only certain forms of TCAM, such as herbal medicine and acupuncture.[1]

WHO supports traditional and alternative medicines when these have demonstrated benefits for the patient and minimal risks. But as more people use these medicines, governments should have the tools to ensure all stakeholders have the best information about their

benefits and their risks. [2]

Empirical and scientific evidence exists to support the benefits of acupuncture, manual therapies and several medicinal plants for chronic or mild conditions. For instance, the effectiveness of acupuncture, a popular treatment for relieving pain, has been demonstrated both through numerous clinical trials and laboratory experiments. As a result, 90% of pain clinics in the United Kingdom and 70% in Germany include acupuncture as a form of treatment.

The Acupressure therapy was known in India even 5000 years ago (according to Sushruta Samhita). Unfortunately, it was not preserved properly and went to Sri Lanka in the form of Acupuncture. From Sri Lanka, this therapy was taken to China and Japan by Buddhist Monks or nomadic Aryans and at present China is dominating this field. This therapy was known to the Red Indians way back in the 16th century. [3]

Acupuncture involves inserting needles into certain locations, called acupoints, on the body. Research has shown that acupuncture may trigger the body to release pain-relieving chemicals in the body called endorphins. According to this traditional medicine, every person has vital energy, called "Qi" flowing through his or her body. This invisible energy, which travels along twelve major pathways called meridians, can become imbalanced, creating areas of deficient (less) and excess (more) Qi. It is thought that imbalanced Qi can cause illness.

Acupuncture/Acupressure works to restore the balance of Qi by stimulating certain points on the body that affect the flow of Qi. As a result, Qi is sent to areas of deficiency and removed from areas of excess, which allows the body to function at its best.

The body has such consists of five basic elements viz., Earth, water, Fire, Air, and space controlled by electricity known as Bioelectricity. As long as this current of electricity flows properly in the body, the body remains fit and healthy. If, for any reason this current does not reach any part of the body, there is malfunctioning of that part accompanied by pain in many cases wherein the illness has been initiated. The Acupressure, thus is the science of nature which teaches us to cure diseases through the inbuilt mechanisms of the body-the technique of how to send the current to all the desired parts of the body. [3]

Organized Dentistry has yet to focus attention on alternative medicine anywhere near as much as, say, the American Medical Association, which recently devoted a full issue of its highly regarded Journal to studies on holistic medicine as part of clinical practice. But a growing number of dentists are currently testing and using various alternative therapies in the mouth. [4]

Literature also suggests that Acupressure at its best can be considered also as a "Way of Life" like basic exercises and not just being therapeutic.

Most of the disadvantages of Acupuncture such as by needle usage, precision, time consumption are eliminated by Acupressure wherein the needle usage is replaced by finger pressure without having any side effects. Acupressure is an ancient healing art, parallel to acupuncture, that is easy to learn and suitable for self-management of pain. It does not require expensive equipment and large space to provide treatment to the patient.

**Review**

**Chapman et al [5] (1977)** found that the tooth pain threshold to electrical stimulation was significantly raised by acupuncture. Their research also explained the possible pathway of the relief of the dental pain.

**Shimura N et al [6] (1980)** stated in his study that by acupuncture stimulation, the total number of oral streptococci and the caries pathogenic bacteria, Streptococcus Mutans, in the rats decreased and the anti RC-20 titre of the rat serum increased as the result of acupuncture stimulation.

**Pomeranz[7] (1989)** stated that acupuncture promoted neural regeneration and reduced pain perception in those patients undergoing surgery. He explained the therapeutic effects which might occur because of modulation of the limbic–paralimbic–neocortical network.

**Silva [8] (1989)** in his study wherein patients with trigeminal neuralgia were given a course of daily low-frequency EA treatments for 10 days. The treatments were repeated three times, with 1 week intervening between treatments. Thirty-six patients experienced complete relief, 4 patients experienced partial relief, and

the treatment failed in 2 patients.

**WHO Draft report [9] (1996)** mentions the details in "Acupuncture: Review and analysis of controlled clinical trials" wherein its applications in Dentistry being mentioned, wherein its states the following;

Acupuncture has been widely used in dentistry. There are reports of randomized controlled trials on the analgesic effect of acupuncture for postoperative pain from various dental procedures, including tooth extraction, pulp devitalisation and acute apical periodontitis. It was concluded that acupuncture should be considered a reasonable alternative or supplement to current dental practice as an analgesic. Its use in the treatment of temporomandibular dysfunction was also supported in these studies.

**Ernst E, Pittler MH [10] (1998) and Bensoussan A. [11] (1999)** in their systematic review concluded that acupuncture can alleviate dental pain.

**P Rosted and Palle Rosted [12] (2000)** pointed out that Acupressure or acupuncture is not a miracle cure like any other therapies and has its own limitations ; In the general management of pain Acupuncture proves to be a very safe technique in the hands of a properly trained practitioner and hence should be regarded as supplement to conventional treatment.

**Zijlstra et al.[13] (2003)** in his review article by suggested the hypothesis for the anti-inflammatory action of acupuncture.

**World Health Organization (WHO)** in 1979, endorsed the use of acupuncture to treat 43 symptoms, which was later discussed by Wong.[14] In 1996, this was extended to 64 conditions. In the Geneva WHO 2003 report[2] (2004), pain in dentistry (including dental pain and temporomandibular dysfunction), facial pain and postoperative pain were listed among the conditions for which acupuncture has been proven to be successful through controlled trials, to be an effective treatment

**Kavoussi and Ross[15] (2007)** hypothesized as how acupuncture may produce its analgesic, antianxiety, and other therapeutic effects.

**Tavares et al.[16] (2007)** suggested that EA controlled postoperative pain following mandibular third-molar surgical removal; this could be because of efferent vagus-nerve activation and inflammatory macrophage deactivation.

**Karst et al.[17] (2007)** concluded that auricular acupuncture and intranasal midazolam were similarly effective for the treatment of dental anxiety.

**FDI Policy statement [18] (2008)** stated in their policy statement regarding "The Use of Acupuncture in Dentistry" that acupuncture has been used in treatment of a range of diseases/disorders and facilitation of dental treatments, particularly for analgesia associated with dental procedures and for the management of temporo-mandibular joint disorders, chronic oral-facial and myofacial pain syndromes, prominent gag reflex, and dental anxiety.

**Hüseyin Sert, et al [19] (2009)** reported a patient with Trigeminal Neuralgia who was treated successfully by acupuncture.

**Sari E [20] (2010)** stated in their study of the role of acupuncture for treating orthodontic patients with a gagging reflex. The researchers concluded that designated acupuncture points were efficient for controlling the gagging reflex.

**Albrecht Molsberger [21]** and **Gianni Allais et al [22] (2012)** concluded that, the application of acupressure for the control of Nausea and vomiting during a migraine attack seems to be justified.

**Purnachandrarao N. Naik et al [23] ( 2014)** stated in his review article that the role of acupuncture in dental pain may not involve removing the cause of the pain, but rather, serving as an adjunct in achieving pain relief.

**Ali Beikmoradi[24] (2012)** stated that his study provided a bright prospect for using complementary and alternative medicine, especially acupressure, to relieve patients' anxiety.

**Fengxia Liang, et al [25] (2015)** in their article "Acupuncture and Immunity" stated that acupuncture enhances resistance and is closely related with the immune system. More and more research has revealed that acupuncture enhances anti-cancer and anti-stress immune function and exert anti-inflammation effects.

**Rohmetra, Abhimanyu & Tandon, Ragni &**

**Singh, Kamlesh & Jaiswal, Ankita[26] (2017)** stated that in their detailed review of acupressure in orthodontics , many of the issues could be curbed in the dental clinics such as gagging, anxiety, TMJ pain in orthodontic and general dental setup.

**Priyanka Avisa et al [27] (2018)** concluded that Acupressure can be a viable alternative to reduce dental anxiety in children undergoing scaling and restorative procedures.

**Y. Sivinagini, Ashish R. Jain [28] (2018)** evaluated the role of role of acupuncture and acupressure in preventing gag reflex during prosthodontics treatment. They found that this method of controlling the gag reflex is simple, fast, and easier technique if the clinicians were trained in it and was found to be productive.

**Angela Adams, Joseph Eschman and Weiqing Ge [29] (2017) and Susan Murphy, ScD, OTR [30] (2019)** in their systematic reviews based on randomized controlled trials concluded that acupressure has been shown to be effective for relieving a variety of symptoms such as Low Back pain and can significantly improve function and decrease disability.

**Yihan He et al[4] (2019)** systematic review and Meta-analysis found that acupuncture and acupressure was significantly associated with reduced cancer pain and decreased use of analgesics, although the evidence level was moderate.

**NCCIH clinical digest[31] (2020)** · For patients with chronic low-back pain, recent evidence-based clinical practice guidelines from the American College of Physicians gave a strong recommendation that clinicians and patients should initially select non-pharmacologic treatment with exercise, multidisciplinary rehabilitation, acupuncture, or mindfulness-based stress reduction.

**Legality of Practice:** Govt. of India with the lead from chairmanship of Director General ICMR stated in its order no R.14015/25/96-U & H (Pt) dated 25th November 2003, addressing to relevant authorities including Dental Council of India regarding grant of permission for various streams of alternative medicines recommended that certain practices of Acupuncture and hypnotherapy which qualified as modes of therapy could be allowed to be practiced by registered practitioners or appropriately trained personnel.[32]

## Summary and Conclusion

To summarize, various conditions in dentistry have been regularly studied with and carried out with considerable relief to their symptoms related to Pain, Gagging reflux, Dental caries, Habits, Immunological disorders, Psychological disorders and also Occupational Hazards such as Fatigue, Cervical spondylosis / Neck pain, Insomnia, Chronic Low back ache and Migraines.

Acupressure focusses on the theory that prevention before the onset of the diseases or intervening in an early stage of diseases is much better than treating after the onset. Acupressure may prove to be beneficial to both patients and dentists, when used as an adjunct to conventional therapies. Thus this alternative traditional therapy with the support of WHO , being found to be beneficial in the various departments of dentistry, a further extensive research in these fields definitely would help to establish these therapies into the Medical and dental curriculum.

**It's a high time that utmost priority be given to these therapies, revisit, explore and to establish these Indian therapies, before they completely disappear along with its therapeutic benefits, it offers to the scientific world.**

# Does Cerclage wiring with Intramedullary Nailing in Subtrochanteric Fractures Improve the Final Outcome?

**Rajendra Annappa[1], Surendra Umesh Kamath[2], Sunil Lakshmipura Krishnamurthy[3], Sharan Mallya[4], Krithika Kamath[5], Pooja Kundapur Suresh[6]**

*[1]Associate Professor, [2]Professor and Head, [3]Senior Resident,[4]Assistant Professor, [5]Medical student, Department of Orthopaedics, [6]Associate Professor, Department of Pathology, Kasturba Medical College, Mangalore, Manipal Academy of Higher Education, Manipal, India*

## Abstract

Treatment of subtrochanteric fractures is challenging due to anatomical and biomechanical factors. Many methods have been suggested to achieve and maintain fracture reduction during operative fixation for subtrochanteric fractures. Open reduction and intramedullary fixation, clamp assisted reduction without cerclage wires and fracture reduction cables are suggested methods. We conducted a retrospective study to look for the results of subtrochanteric fractures managed by intramedullary fixation with or without cerclage wires. We reviewed all cases of subtrochanteric fractures operated with intramedullary fixation with long proximal femoral nail with or without cerclage wire fixation. All available data from patient's records available in medical records department were retrieved and evaluated. Statistical analysis were performed using SPSS software (v16). There were 86 cases of subtrochanteric fractures operated with intramedullary fixation at our Hospitals over a period of 5 years. Quality of fracture reduction of fractures are assessed good reduction was seen more often in cerclage group 64%. Cerclage wiring was done in 14 cases. Nonunion was seen in 8 cases overall, 3 in cerclage group and 5 in non Cerclage group. Implant failure was seen in 3 cases in no cerclage group and 2 cases of cerclage group. We conclude that anatomical reduction is the key factor for successful outcomes. Closed reduction with good to acceptable reduction had better results. Cerclage wiring should be considered in selected cases where reduction is poor after open reduction.

***Keywords**: Subtrochanteric fractures, cerclage wiring, complications of subtrochanteric fractures*

## Introduction

Fractures occurring between lesser trochanter and isthmus of femur are treated as subtrochanteric fractures. Subtrochanteric femur fractures are also defined as fracture of the proximal femur with fracture line within 5cm below the lesser trochanter. Treatment of these fractures is challenging due to anatomical and biomechanical factors. Flexion, abduction and external rotation deformity due to strong muscular forces of Psoas, abductors and gluteal muscles[1].

Adequate reduction and fixation is difficult even for experienced surgeons. These fractures are associated with high rate of complications due to deforming forces, decreased vascularity, instability and osteoporosis[2].

Fixation options in these type of fractures include intramedullary nails, dynamic hip screws, dynamic condylar screws, proximal femoral locking plates [3-6]. Achieving anatomical reduction by closed methods is difficult in these fractures. The fracture comminution and anatomy of proximal femur makes it difficult for indirect fracture reduction techniques. Intramedullary fixation has been associated with better clinical outcomes and biomechanically higher fixation strength in previous studies[3-6].

Many methods have been suggested to achieve and maintain fracture reduction during operative fixation for subtrochanteric fractures. Open reduction and intramedullary fixation, clamp assisted reduction without cerclage wires and fracture reduction cables are suggested methods [7-11].

We reviewed subtrochanteric fractures managed by intramedullary fixation with or without cerclage wires and analysed the results with regards to quality of reduction, union and complications.

## Materials and Method

We conducted a retrospective review of all cases of subtrochanteric fractures operated in our tertiary care hospital with intramedullary fixation with long proximal femoral nail (PFN,Matrix,India) or PFN Antirotation (Synthes,India) with or without cerclage wire fixation after obtaining approval for the study from institutional ethics committee. The study period was from August 2013 to August 2018. All cases with minimum 18months follow up were included. The AO foundation/Orthopaedic trauma Association (AO/OTA) classification system was used to classify fractures.

All fractures which were situated within 2 inches (5cm) from the lesser trochanter and fixed with intramedullary nail were included. Patients above 18 years below 75 years, isolated subtrochanteric fractures with configuration amenable to cerclage wiring like long oblique, spiral, were included

Patients below 18years, pathological fractures, open fractures, fractures sustained in patients treated with bisphosphonates, previous surgeries around hip and segmental fractures were excluded.

All available data from patient's records available in medical records department were retrieved and all available radiographs and clinical data were evaluated. Patients with data available for minimum 18 months were included. Major complications were identified and documented. These included non-union, infection, implant failure and return to surgery. The quality of reduction was assessed as good (both maximum cortical displacement <4mm and angulation $\leq 10^0$), acceptable (either maximal displacement <4mm or angulation $\leq 10^0$) or poor (maximum cortical displacement ≥4mm and angulation $>10^0$).

Statistical analysis were performed using SPSS software (v16). Data were analysed using mean and standard deviation for continuous and categorical data respectively. Chi square test was used for categorical variables and analysis of variance (ANOVA) was used to compare continuous variables. Statistical significance was significant when p value was <0.05.

## Results

We could identify 86 cases of subtrochanteric fractures for the period August 2013 to Aug 2018 operated with intramedullary fixation at our hospitals. Of them 55 met the inclusion criteria of our study. Mean age of the patients include in the study was 56.4 years and low velocity injuries were seen in 55% of the patients. Open reduction of the fractures was performed in 30 patients. Cerclage wiring was done in 14 cases. Cerclage wiring was used with cases treated with open reduction.

When quality of fracture reduction of subtrochanteric fractures are assessed good reduction was seen in 33% of the cases and more often in cerclage group 64% but was not statistically significant (Fig 1). Varus reduction was more frequently seen contributing to 29% of the cases and mostly when no cerclage was done. Of the 55 cases 18 cases were re operated again 10 of them were implant removal without complications and 8 cases were revised due to complications. There was no reported complications of passage of cerclage wire (Table 1)

Nonunion was seen in 8 cases overall, 3 in cerclage group and 5 in non Cerclage group. Implant failure was seen in 3 cases in no cerclage group and 2 cases of Cerclage group (Fig 2). Deep infection was seen in 2 cases each in both group and superficial infection in one case in no cerclage group which healed with antibiotics. Open reduction was done in all cases where infection was recorded (Table 1).

**Table 1: Outcomes of subtrochanteric fracture fixation**

## Discussion

Subtrochanteric fractures more often required open reduction for better anatomical reduction. Rates of non-union and revision surgery are determined by anatomical reduction intraoperatively. Anatomical reduction was key factor which results in early union and better functional outcomes. Cerclage wire fixation results in better reduction but is associated with few complications. In our study cerclage wiring was associated with complications like non-union and infection. Fractures managed with a

cerclage wire to augment intramedullary nail had less fracture displacement, less fracture angulation and improved quality of fracture reduction.

Subtrochanteric fractures require open reduction which has been reported in literature between 7-40%. Closed reduction preserves fracture hematoma and periosteal blood supply. But due to deforming forces achieving correct entry point is difficult. Minimal open reduction and maintaining with a reduction clamp[7] and intramedullary fixation has resulted in good functional outcomes and union. Judicial usage of cerclage wire has been recommended with minimal soft tissue disruption. Open reduction was done in 53% of our cases and in all cases of cerclage wiring and we could achieve good to acceptable reduction in 80% of cases [12].

Varus reduction results in poor functional outcomes, delayed and non-union[12-14] Varus reduction was present in all cases of non-union in our study. Cerclage wiring results in correcting varus reduction. With the cerclage wire passer, technique is simple and is not associated with any complications. The biomechanical advantage of cerclage wire has been studied and there was reduced varus deformation and cut out of proximal screws on cyclical loading. This is possible due to preservation of medial buttress and reducing fracture stress on lateral side [15]. Cerclage wiring being more invasive, was assumed to result in decreased blood supply to bone and fracture and eventually non-union but recent studies have suggested vascularity is preserved [16]. Every attempt should be made to preserve soft tissues and cerclage wiring with minimal soft tissue damage.

The limitation of the study was it was retrospective. All the data available were accumulated from patient's files and systematically reviewed. There was limitation in identifying all complications those who presented in other hospitals. Cerclage wiring technique could not be assessed for each surgery which may involve more soft tissue damage. Sample size was not adequate in detailed statistically analysis. Short term clinical and functional outcomes could not be assessed.

## Conclusion

We conclude that anatomical reduction is the key factor for successful outcomes. Closed reduction with good to acceptable reduction had better results. Cerclage wiring should be considered in selected cases where reduction is poor after open reduction.

## Abstract

Patients with chronic kidney disease with co morbidities (like diabetes mellitus, hypertension) undergoing hemodialysis are more prone to stress and anxiety. Aims and Objectives: The aim of the study was to evaluate the effect of acupressure on anxiety among patients undergoing hemodialysis. Methodology: The research includes quantitative approach and design was Basic pre-test post-test (with optional repeated follow ups). The tool used i.e. selected variables regarding study participants characteristics and DASS-42 (Anxiety-14 items). Results: After the administration of acupressure, two third of the study participants in experimental group were at normal level (no anxiety) whereas in control group study participants were at severe and extreme level of anxiety. There was significant difference between experimental and control group in post-test I and post-test II i.e. ('t'= 13.35, p=0.00) and ('t'= 13.79, p=0.00) respectively. Further results showed significant difference within groups in experimental and control group (in inverse direction) as calculated (F value 1.62, p=0.00) and (F value 3.69, p=0.03) respectively. Step wise regression analysis was used which showed the predictability of selected variables on anxiety. Conclusion: Findings of this study concluded that Acupressure intervention given for 30 minutes at once was effective in reducing anxiety among patients undergoing hemodialysis.

***Keywords**: Acupressure, anxiety, patients undergoing hemodialysis*

## Introduction

Chronic kidney disease (CKD) is a condition in which the kidneys are damaged or cannot filter blood. Adults with diabetes, high blood pressure, or both have a higher risk of developing CKD than those without these diseases. Other risk factors for CKD include heart disease, obesity, and a family history of CKD[1] and more than 1 million people die annually from ESRD [2]. The number of patients who do receive dialysis seems likely to double from 1.0 to 2.0 million between 2010 and 2030.[3]

Among the patients of end stage renal disease, about 90% of the patients require hemodialysis (HD) three times a week while 9% of the patients adopt home peritoneal dialysis.[4] It has been reported that the average anxiety rate among ESRD patients is 38%. [5] It was found that compared with HD patients with depressive disorders, HD patients diagnosed with anxiety disorders have improved quality of life.[6]

Acupressure Therapy is effective in the relief of stress-related ailments and ideal for self-treatment and preventive health care for boosting the immune system.[7] Psychological illnesses need non-pharmacological treatment along with the pharmacological treatment for

**Corresponding Author:**

Professor, HOD of Department of Medical Surgical Nursing, Maharishi Markandeshwar College of Nursing, Maharishi Markandeshwar Deemed to be University, Mullana- 133 207, Ambala District, Haryana, India , E-mail: nehukanu@gmail.com

the better recovery of the patient both physically and psychologically.[8]

To explore more about the acupressure and its effect on anxiety based on the previous research evidences researcher decided to do research on acupressure among patients undergoing hemodialysis.

## Methodology

The study was conducted during the period from March 2017 to July 2018 in the state of Haryana, India. A sample of 70 patients undergoing hemodialysis in this study with the prior permission from the medical superintendent of M.M.I.M.S.R & Hospital, Mullana, Ambala and civil surgeon of Civil hospital, Ambala, Haryana**.** The written consent from the patients was collected prior to the study. Quantitative research approach with true experimental (basic pre - test with repeated optional follow ups) design was used in this study. Patients those who were undergoing hemodialysis in selected hospitals, having complete four limbs, able to understand and speak Hindi, alert, oriented, and comprehend to respond were included for experimental group with the same criteria was included for control group. Patients have no anxiety (scored 0-7 in DASS) were not willing to participate were excluded from the study. Seventy hemodialysis patients (35 in experimental group and 35 in control group) were selected using random sampling technique who were randomized into experimental and control group with lottery method.

**Description of Tool**

***1. Selected variables:***

It consists of 14 items related to selected variables i.e. Age in years, Gender, Religion, Marital status, Education, Occupation, Family income (per month), Socio-economic class, Duration of taking Hemodialysis treatment, Type of family, Place of living, Associated health problems, History of kidney disease in family, History of taking benzodiazepines / anti-anxiety drugs.

***2.* DASS- 42 *Scale to assess the anxiety***

It consists of 42 items (14 items for anxiety) with 4-point rating scale with total ranging from 0-42 for anxiety with self-report (Interview) technique. The calculated Cronbach Alpha Internal consistency was 0.74 (Acceptable range is 0.7-0.9).

**Procedure**

Pre-test of both groups were done by administering the tool i.e. Selected variables and DASS-42 before the hemodialysis. At 30 minutes of hemodialysis acupressure was administered for the duration of 30 min in which first 5 minutes for deep breathing exercise and 25 minutes for acupressure, (5 minutes for each area) only in experimental group. Acupressure was applied in five areas starts from i.e. toe of both foot followed by midway between the medial ends of the eyebrow, at the ulnar end of the transverse crease of wrist, at the midway between the tip of the medial malleolus on both legs and two points on the both sole of the foot i.e. one point for each foot for its therapeutic effect i.e. reduction of anxiety At 1 hour of hemodialysis (immediately after the intervention) post-test I was taken from both the groups with DASS-42 scale and on the completion of hemodialysis post-test II was taken from both groups.

## Data Analysis

**Descriptive statistics:** Frequency, percentage distribution was used to describe selected variables and Chi-square was used to assess the homogeneity between the groups.

**Inferential statistics:** Independent 't' test, Repeated Measure ANOVA, ANOVA, Post hoc test and Multiple regression analysis was used in the study.

## Results

Homogeneity between the experimental and control group was checked by $x^2$ test was applied to compare the experimental and control group with respect to every selected variable. Both the groups were homogenous in terms of selected variables except family income per month (p=0.04).

Percentage distribution of experimental and control groups in terms of level of anxiety are shown in figure 1. 40% in experimental group and 62.85 %in control group were at severe level of anxiety as shown in Figure 1.

**Insert Figure 1 almost here**

In terms of anxiety, there was no significant difference between experimental and control group found before administration of acupressure as the calculated 't' value was 0.68, p=0.48 with mean difference of 0.65. Mean score after administration of acupressure in experimental

group was 6.80 and in control group was 18.71 with mean difference of 11.91. The calculated 't' value was found to be 13.35, p= 0.00 in post-test I. In post-test II mean score after administration of acupressure in experimental group was 6.20 and in control group was 18.80 with mean difference of 12.60. The calculated 't' value was found to be 13.79, p=0.00.

**Insert Table 1almost here**

In experimental group there was a significant difference in the mean score of anxiety in pre-test (17.66), post- test I (6.80) and post-test II (6.80) and computed F value was 1.62 with p=0.00, whereas in control group the mean score of pre -test (17.00), post-test I (18.71) and post-test II (18.80) was in reverse direction and computed F value was 3.69, p=0.03.

**Insert Table 2 almost here**

In experimental group there was statistically significant difference between pre- test – post- test I (p=0.00), pre- test – post- test II (p=0.00) and post- test I – post- test II (p=0.02), that showed at the time of pre-test, participants had higher anxiety than the post- test I and post- test II. The participants had higher anxiety in post- test I than post- test II in experimental group whereas in control group there was also statistically significant difference between pre- test-post- test I (p=0.00) and pre- test-post-test II (p=0.00) but in reverse direction, participants had lesser anxiety in pre-test than post- test I and post-test II.

In experimental group, anxiety was independent of selected variables in post-test I except family monthly income (18000 – 36016 had higher mean score), duration of taking hemodialysis treatment (>5 years had higher mean score) and others disease (no other disease had higher mean scores). Further Post Hoc test was applied to reveal the mean difference of significant association in experimental group with selected variable (family monthly income) i.e. mean difference (4.38) in the family monthly income category i.e. p=0.01. It concludes that family income category of 13495-17999 had higher anxiety than in category of 1803-5386 in post- test I.

In control group, anxiety was independent of selected variables except heart disease (presence of heart disease had higher mean score) among patients undergoing hemodialysis in post-test 1.

In experimental group, anxiety was independent of selected variables in post-test II except occupation (semi profession having higher mean score), duration of taking hemodialysis treatment (4-5 years had higher mean scores) and hypertension (having hypertension had higher mean score).

Further multiple regression- Step wise analysis was performed to predict the effect of multiple independent variables on anxiety.

On pre-test anxiety, presence of nuclear family having the prediction with variability of 24% ($R^2$ =0.24) as calculated F value 10.43. Nuclear family in addition to history of taking benzodiazepines having the prediction with variability of 33% ($R^2$ =0.33). On post-test I anxiety, presence of diabetes having the prediction with the variability of 17% ($R^2$ = 0.17) as calculated F value 7.0 Diabetes in addition to presence of history of kidney disease in family having the prediction with the variability of 36% ($R^2$ = 0.36). Diabetes, history of kidney disease in family and presence of urban place of living having the prediction with the variability of 50% ($R^2$ = 0.50) as shown in table 3.

On post-test II anxiety, presence of diabetes having the prediction with the variability of 25% ($R^2$ = 0.25) Diabetes in addition to presence of history of kidney disease in family having the prediction with the variability of 38% ($R^2$ = 0.38).

## Discussion

In the present study near about half of the study participants in control and less than half in experimental group were in the age group of 31-40 years i.e. 17 (48.6.3%) and i.e. 14 (40%) respectively. Less than 2/3rd of the study participants in control group and experimental group were male i.e.22 (62.9%). These findings were supported by a cross sectional study conducted by Ana Carolina Ottaviani et al (2016)[9] where they found more than half of the participants (60%) were in 18-59 years of age group and more than half of the participants (66%) were males.

In the present study in pre-test less than half of study participants in experimental group were at severe level of anxiety i.e. 14 (40%) and in control group 2/3rd of the study participants were also at the same level of anxiety as in experimental group i.e. 22(62.85%). These findings are contradictory to randomized controlled trial study conducted by Younes Mehrabi et al (2017) [10] on effect of Fordyce's Happiness Program on Stress, Anxiety, and Depression among the patients undergoing hemodialysis, where they found prevalence of anxiety among patients undergoing hemodialysis was 4.6% and 4.7% ($p > 0.05$) in trial and control group

In present study there was significant difference in terms of anxiety between experimental and control group after administration of acupressure the mean anxiety score in post-test 1 was 6.80±2.49 and 18.71±4.65 ($t=13.35$, $p=0.00$) in both the groups. In post-test II the mean anxiety score was 6.20±2.54 and 18.80 ±4.77 ($t=13.79$, $p=0.00$). These findings are similar to the previous randomized clinical trial study conducted by Ali Beikmoradi, et al. (2015)[11] on anxiety where they found mean anxiety score in the acupressure group after applying acupressure, in session 5 was 45.30 ± 7.14 and in session 10 it was 43.48 ± 6.82 ($p=0.00$) in experimental group which was significant in comparison to control group.

In present study there was a significant difference with in the experimental group from pre-test to post-test II in terms of anxiety as calculated by Repeated Measures ANOVA ($F$ value=1.62, $p=0.00$) which was significant at 0.05 level of significance. These findings are similar with the findings of the study conducted by Nant Thin Thin Hmwea et al. (2015) [12] where they found significant reduction in anxiety as the mean score reduced to 27.04 ± 20.4 from 34.37±22.61 after the administration of acupressure ($p=0.03$) in experimental group.

## Conclusion

Acupressure intervention was effective in reducing anxiety among patients undergoing hemodialysis.

# Self Esteem and Peer Group Relationship of Adolescent Children in Single Parent Families

**Anjaly Mohan[1], Priya V[2]**

*[1]PhD Scholar, [2]Assistant Professor, Department of Social Work, Amrita School of Engineering, Coimbatore, Amrita VishwaVidyapeetham, India*

## Abstract

As the family and its structure are in a descend form, children, especially adolescents may feel a sense of insecurity due to lack of proper care and support from their own imbalanced family system and other socialising agents. Therefore, the present study re-searches on the Self Esteem and Peer Group Relationship of adolescents from the Single parent families. This descriptive study emphasizes on Quantitative research, were the primary data was collected through the Survey Method using a questionnaire. The data was collected from two schools in Kollam District, Kerala, one from an aided school and another Government school and the sample size is 51 students from 8th to 12th standard. The tool consists of socio-demographic data, Peer Group Relation Scale by Hudson and Self Esteem Scale by Rosenberg. The study result shows as there is significant relation between Self Esteem and Peer Group Relationship of Adolescents from Single parent families.

***Key words**: Adolescents, Peer Group Relationship, Single parent family and Self Esteem.*

## Introduction

Sociological works on the family have long been dominated by two themes: Universality and Decline. The theme of Universality attests that the family exists in every single human culture. For various convincing reasons, individuals can't live as single animals nor would human be able to raise their young without anyone else as mother feline do. As a result, individuals live consistently in bunches containing grown-ups of both genders as well as children named as family and membership in the family are dictated by lineage and sexual associations(1).

The second subject in present day sociological work on the family is that, regardless of the universality of the family in current social orders, the family is in decline. Families are currently withered and unsteady, and the advanced family is progressively incapable to accommodate the prosperity of its individuals (1). Since, the family structure, preferably, gives a feeling that all is well with the world and security that is important for children. Be that as it may, the modern family is progressively unfit to accommodate the prosperity of its individuals. One of such change in the family structure is single-parent family. Single child rearing is a significant social issue that can make significant affect on a child's life. Consequently when there is a breakdown in the family structure, it might tremendously affect a child and their capacity to work usually.

In this modern world, children had to face and cross more complex and impersonal life today. Havighurst explained that the different types of problems faced by adolescents stem from pubescent development, their emotional life, the social groups with which the individual interacts, and other biological and cultural changes **(2).** Therefore any mishandlings in life's primary system itself will cause an interruption in an adolescent's life. Such malfunctions in the primary social system may even cause adverse effect on a child's mental

development and wellbeing. This develops low self esteem in children and more attachment towards other social groups.

Now a day adolescents spend most of their time with their age group than they do with their parents and other adults. As children enter into adolescence, the amount of time they spend with peers' increases. Peer groups become the most important socializing influence on adolescent behaviour and values. Peer relationships serve as a bridge as adolescents move away from their parents and toward independent adult functioning [(3)].

Along these lines, the motivation behind the current study is to figure out the adolescents in single-parent families who have been separated from their parents either by the passing of a parent, separation or divorce. This investigation further attempts to understand the relationship between the self – esteem and the peer group relationship.

## Method and Material

This descriptive study emphasizes Quantitative research and Survey research design has been adopted to understand Self Esteem and Peer Group Relationship of adolescents from a single-parent family. The primary data for the study was gathered using a questionnaire using Survey Method.

The data was collected from two schools in Kollam District, Kerala, one an aided school and another Government school. Samples for the study were easily identified from the Snehapoorvam Scholarship list (Kerala Government Scheme for children of a deceased parent) and with the help of class teachers (identify children of parents who are either divorced or separated) and the sample size is 51 students from $8^{th}$ to $12^{th}$ standard.

The tool consists of socio-demographic data, Self Esteem Scale by Rosenberg, Peer Group Relationship Scale by Hudson. Statistical analysis of the present study was done by simple percentage and chi-square using SPSS 20 Version.

## Result

The gathered information from the review was based on their Socio-segment profile, level of Self-regard and on the size of Peer bunch relationship. The discoveries from the examination show that 80% of respondents in the investigation are from the age of 13 to14 years. Henceforth most of them are concentrating in eighth and 9thgrade. 71%of the respondents are young ladies and the greater parts among them are 67% among them are between 13-14 years. About half (51%) of the respondents are from semi-urban, 31% from urban and the rest 18% from a rustic setting. In Semi-urban settings, 88% are females while the rest are guys.

To recognize the idea of schools that the juvenile from a solitary parent family picked, the analyst gave accentuation on the kind of schools. From the discoveries, it was recognized that the greater part (59%) of the respondents are from Government School. Among those concentrating in a Government school, it is discovered that there is an equivalent extent of male and female. Alongside these fundamental subtleties, a request about their vehicle of guidance was likewise included, where the outcome appeared as 2/third of the respondents is from English medium schools.

Further, the researcher concentrated on the familial and parental details of the respondents like their relationship with the caretaker, work status, the explanation behind being a solitary parent, family type and the number of siblings. Measurable proof of the above details plainly communicates a rated show of caretaker's status as follows: respondents having mothers as guardian scores a level of 58.8%, though those having father are 41.2%. Because of the parent's work status, 82% showed their single-parent as employed, though 18% are jobless. The move-in present-day days family framework likewise reflected in the research, which is featured in discoveries where 67% have a place with Nuclear family and 23% live in a more extended family. Be that as it may, all the more shockingly 10 % of the respondents asserted themselves as living in a joint family.

On breaking down the explanation behind the parent's single status, the prime explanation was passing of the life partner (74.5%), while divorce and separation came as the second and third explanation separately. Respondents were likewise enquired about the number of siblings they have, therefore, 21.6% of respondents uncovered themselves a single child, where 66.7% of

respondents make them kin and 11.8% have 2 and more kin.

The respondents were asked to rate their parents' attitude towards them in certain situations like whether his/her parent is proud of them, do parent takes an interest in their activities, do his or her parent listen when the child talks, whether the parent is accessible when the child needs, whether the child can talk to his/her parent about the things that really matter and if the child can comfortably share his or her thoughts and feelings

The respondents were approached to rate their respondents' mentality towards them in specific circumstances like whether his/her parent is proud of them, do parent takes an interest in their activities, do his or her parent listen when the child talks, whether the parent is accessible when the child needs, whether the child can talk to his/her parent about the things that really matter and if the child can comfortably share his or her thoughts and feelings. All the respondents collectively evaluated "Always" as their reaction to the parents' attitude, which just implies that their single parent deals with them.

**Table. 1: Showing level of Self Esteem and Peer group relation**

| Self Esteem | Percent | Peer group relation | Percent |
|---|---|---|---|
| Low | 29.4 | Low | 25.5 |
| Medium | 47.1 | Medium | 52.9 |
| High | 23.5 | High | 21.6 |
| Total | 100.0 | Total | 100.0 |

From the table.1, we can infer that nearly half (47%) of the respondents have only below an average level of Self-esteem & whereas, on the other hand, 52.9% of the respondents shows above an average level of Peer group relationship.

**Table. 2: Test of association shows that there is a significant association with the type of the school respondents studied and the involvement of parent's interest in child's activities with the Self-esteem**.

| Sl.no | Variable | | Value | df | Sig. |
|---|---|---|---|---|---|
| 1 | Type of school | Govt | 7.719[a] | 2 | .021 |
| | | Aided | | | |
| 2 | Parent's interest in child's activity | Never | 9.508[a] | 4 | .050 |
| | | Sometimes | | | |
| | | Always | | | |

86.6% of respondents studying in the Government school showed a low level of self-esteem. Therefore the association test of Self-esteem with the type of school shows .021level of significance.

Meanwhile, the level of parent's interest in the child's activities showed more than 50% of positive response which figures .050 level of significant association with Self Esteem and Parent's Interest in Child's activities.

**Table. 3: Test of association shows that there is a significant association with the medium of instruction in school, no of siblings and respondents' comfort for sharing their thoughts with parent with Peer group relationship.**

| Sl.no | Variable | | Value | df | Sig. |
|---|---|---|---|---|---|
| 1 | Medium of instruction in school | Malayalam | 10.628[a] | 2 | .005 |
| | | English | | | |
| 2 | No of siblings | 0 | 10.575[a] | 4 | .032 |
| | | 1 | | | |
| | | 2 & above | | | |
| 3 | Comfort in sharing their thoughts with the parent | Never | 11.755[a] | 4 | .019 |
| | | Sometimes | | | |
| | | Always | | | |

60% of the respondents study in English medium, 66.7% of respondents has 1 sibling and 78.4 % of respondents always feel comfort in sharing their thoughts with the parent. In whole, respondents in the study showed only an average level of Peer group relationship with .005, .032 and .019 level of significant association with Medium of instruction in school, No of siblings & Comfort in sharing their thoughts with the parent**.**

## Discussion

The period of pre-adulthood is viewed as the frailest condition in every youngster's life. In consonance with this, a pre-adult from a solitary parent family can be considered as twofold powerless. Through this investigation, the researcher makes an endeavour to contemplate the Self-Esteem and Peer group relationship of the immature respondents' by causing them to assess their own life after the nonappearance of a parent. From the study results, it is been distinguished that almost 50% of the respondents have a place with the age of 13 and 14 years, who are concentrating in their eighth and ninth grade. Among the respondents, female members are lion's share in number and they abide in a semi-urban setting. Almost 60% of the respondents in this study are from the government school, concentrating in English medium and the sexual orientation extent in this area stayed equivalent.

According to census 2011 there are about 27 million female headed household in India which constitute nearly 10.9% of all household[(4)], there are 13, 58,698 single ladies in the state, while, in the 2011 statistics report, there is an ascent by 39 percent of single ladies in India [(5)]. · Like these reports, this investigation additionally features a comparative sort of result by demonstrating an expansion in the level of female overseers because of the demise of companion, separation and partition. Alongside these socio-demographic details, respondents were approached to rate their parents' contribution and effect on their day by day life, which indicated a pleasingly moderate reaction.

The test of association of the respondents' social and demographic details with Peer group relationship demonstrated a wide range of significant association with both. 87% of respondents studying in the Government school showed a low level of self-esteem, where girls outnumbered the boys. Though the study has not given more emphasis on the socio-economic conditions of the respondents, it can be construed that low self-esteem among the children with single parents studying in Government school is a result of low socioeconomic status, poor family background and environmental factors when compared to the students of aided schools[(6)]. The level of single parent's interest and involvement over children's activities showed a positive response to their parenting which can be tinted as an excellent reply to sabotage the conventional societal thought towards single parenting which is considered to be a social taboo or a curse.

Also while considering their Peer Group Relation, 60% of the respondents concentrate in English medium, 66.7% of respondents have 1 kin and 78.4 % of respondents consistently feel comfort in offering their musings to the parent. In entire, respondents in the examination indicated just a normal degree of Peer group relationship with significant association with Medium of instruction in school, No of siblings & Comfort in sharing their thoughts with the parent.

## Conclusion

Children who are at their pre- adulthood stage are very much vulnerable and unstable in handling healthy relationships and psychological wellness. So when it comes to the matter of children from single parent family, the risk doubles. For a positive quest towards this dormant social and psychological condition, they need unique consideration and support from Family, School, Communities and Government for a better Psycho-Social and Economic background. These support systems, where he / she involve may help the child to create a safe environment for a better future.

# Skin Cancer Classification Using Dermoscopic Images based on Ranklet Transform, Co-occurrence Features and Random Forest Classifier

**Chithra Devi M**

*Assistant Professor, Annai Vailankanni Arts and Science College, Thanjavur, (Affiliated to Bharathidasan University)*

## Abstract

The skin cell which grows abnormally is known as skin cancer and it is caused due to sun rays in the uncovered skin. It spreads within a week, so the early diagnosis of skin cancer is required. Skin Cancer Classification (SCC) based on ranklet transform, co-occurrence features and random forest classifier is presented in this paper. Dermoscopic image in the PH2 database is used in this study for performance evaluation. Initially, the dermoscopic images of three categories normal benign and malignant images are preprocessed to smooth the images. Then the images are given to ranklet transform for decomposition. It produces subband coefficients. The Ranklet Features based Co-occurrence Matrix (RFCM) is used to extract the features and stored in database. The classification is made by Random Forest Classifier (RFC). The result shows better classification accuracy of 93.5% sensitivity is 92% and specificity is 95% is obtained by RFCM and RFC.

***Keywords:*** *Dermoscopy images, Ranklet transform, Co-occurrence matrix, Random forest classifier*

## Introduction

Skin cancer caused due to ultraviolet rays from sun light. Mostly all color peoples are affected by skin cancer and people with light color have a higher risk because the sun burn easily in the light skin. Melanoma classification using contourlet transform And naïve bayes classifier is described in [1]. At first, the input dermoscopic images are extracted by non-subsampled contourlet transform. Finally, the naïve bayes classifier is used to classify the melanoma images.

Automatic skin lesion detection and classification using dermoscopy images is described in [2]. Initially, the dermoscopic images are preprocessed by median filter to remove the hairs. After that the segmentation is made by k-means clustering. Then the features are extracted by subregion, color and text features. Features are selected by wilkis lambda method. The skin image classification is made by Support Vector Machine (SVM) classifier.

Skin cancer detection and classification using SVM is discussed in [3]. The input skin images are preprocessed by histogram enhancement and noise filtering. Segmentation of skin images is made by thresholding. The features are extracted by statistical feature extraction, border, diameter, color, asymmetry and Gray-Level co-occurrence Matrix (GLM). Then the features are selected by principal component analysis. SVM technique is used to classify the skin images.

Classification of skin lesion by novel regularizer and Convolutional Neural Network (CNN) is discussed in [4]. The input skin images are extracted by different layers of CNN. Classification is made by novel regularizer. Skin cancer detection using snake model and SVM is discussed in [5]. Initially, the skin images are extracted by snake model algorithm. The skin cancer templates are classified by SVM. Automatic SCC using multiclass SVM and GLM is described in [6-8]. At first, the input skin images are converted into grayscale. The features are extracted by GLM and texture features. Multiclass SVM is used for classification.

Skin lesion analysis using image processing technique is discussed in [9]. The input skin images are extracted by geometric features like diameter, border and asymmetric parameters. Classification is made by k nearest neighbor classifier. SCC for a robust approach is discussed in [10]. Initially, the input skin images are segmented by k means clustering algorithm. The features are extracted by local binary patterns and color coherence vector. Classification is made by multiclass SVM.

Melanoma skin cancer detection using dermoscopy images is described in [11]. Preprocessing is made by Gaussian filter to remove hairs in the skin. The features like color, irregularity, area and texture features are extracted. SVM is used for classification. Skin cancer nuclear segmentation using histopathological images is described in [12]. Initially, preprocessing is made by contrast limited adaptive histogram enhancement technique. Fuzzy clustering means algorithm is used for segmentation. The features extraction is made by elliptical descriptor analysis.

Classification and segmentation of melanoma skin cancer images is discussed in [13]. Adaptive linear filter is used for pre-processing to remove hairs in the skin. K means clustering is used for segmentation. Features like border, asymmetry, diameter and color variation are extracted. SVM classifier is used for classification. Early detection of melanoma for skin lesion classification is discussed in [14]. At first, image acquisition is made to convert the image into grayscale. The GLM features are extracted. Multiclass SVM is used for classification. Segmentation is made by k-means clustering algorithm.

An efficient method for SCC using ranklet transform, RFCM and RFC is presented in this paper. The organization of paper is follows: Section 2 describes the methods and materials used for SCC. In section 3 experimental results and discussion of SCC is presented. Section 4 concludes the SCC by ranklet transform based features and RFC.

## Methods and Materials

The overall workflow of SCC using ranklet features, RFCM and RFC is shown in figure 1. SCC system has three stages (i). Pre-processing, (ii). Feature extraction and (iii). Classification these stages are briefly explained below.

### Pre-processing using Wiener filter

The estimation of target random process for time invariant linear is made by wiener filter due to noisy process. It has an additive noise and noise spectra. Mean square error is minimized by the wiener filter between the random and desired process. Wiener filter is also used in processing of signals. Wiener filter used in other fields like image restoration [16] and video coding [15]. In this study, the input dermoscopic images are preprocessed by wiener filter to smooth the image and remove unwanted hairs in the skin.

### Feature extraction based on ranklet transform and RFCM

Ranklet transform is a non-parametric feature based on the non-parametric features and computation of Mann Whitney Wilcoxon in statistics domain. Ranklet has the similar form of Haar wavelets both has the same pattern of suitable notion of completeness, orientation selectivity and nature multiscale. The rank feature has high robustness in detecting the outliers and transformations like, gamma correction, brightness and contrast change.

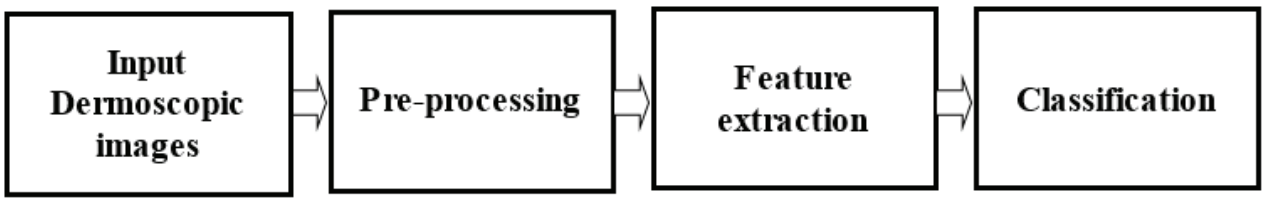

**Figure 1 Block diagram of SCC system**

The Wilicoxon ranket transform is defined by,

$$R_s = \sum_{m=1}^{K} \pi_m L_m \quad (1)$$

where $\pi_m$ is rank element of *m* and $L_m$. Then the Mann-Whitney statistics is defined by,

$$M = R_s - \frac{i(i+1)}{2} \quad (2)$$

where *i* is the no of treatment values. It is a statistical domain non-linear filter. The ranklets divides the image window *Win* into Two regions known as control and treatment which is shown in figure 2.

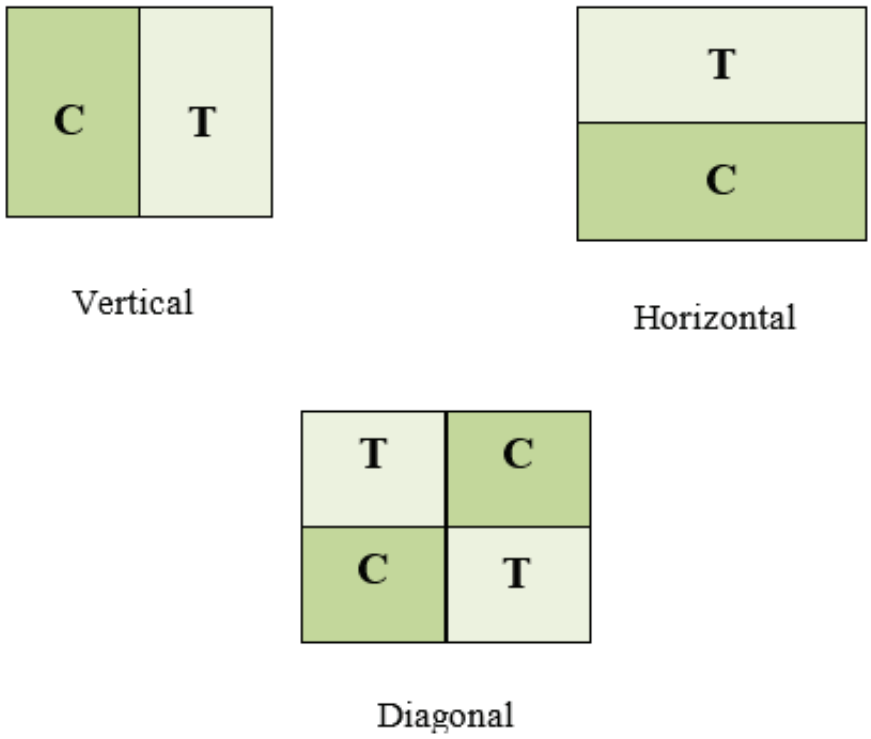

**Figure 2 Image Windows (*Win*) in ranklet transform**

The rank test statistics are employed to identify the variations in the given region samples in *Win*. The variations in each region are replaced by ranking scores. There is a pairwise comparison between the control and treatment regions. The variations are shown by the horizontal, vertical and diagonal shapes. The ranklet transforms counts the no of control and treatment pairs. The treatment values are brighter than the control values. The co-occurrence matrix is a statistical method the neighborhood values are accessed by the central pixels. Ranklet transform is also used in digital watermarking [17], mammogram classification [18] and texture classification [19]. In this study, ranklet transform is used to decompose the preprocessed images and produces the sub-band coefficients by different rank features. Then RFCM is used to extract the features and stored in the database for classification.

**RFC Classification**

RFC is an ensemble method for regression, classification and other tasks by constructing the multiple numbers of decision trees for the prediction of individual trees. Let us consider a decision tree combination of $\{M \ (k, \phi_i)\}_{i-1}^{R}$, where *k* is a input, $\phi_i$ is denoted as the random split of independent vectors which has equal distribution to other trees in a forest $\phi_1, \phi_2, \phi_3, \ldots \phi_{i-1}$. Here, *R* is the bootstrap of training data. Every tree is built by different bootstrap samples. The RFC algorithm

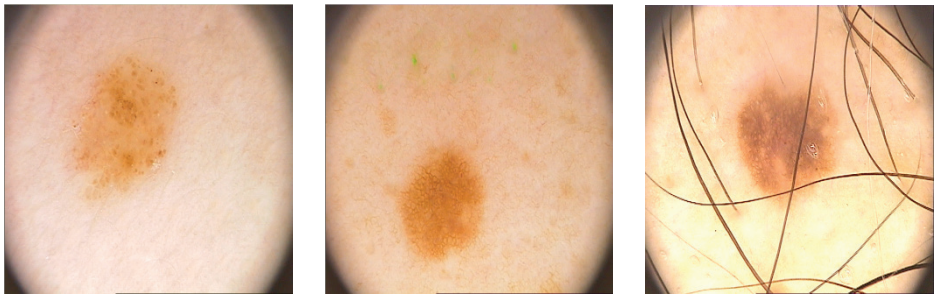
is defined by,

$$P(l)=1-\sum_{i-1} s^2\left(i/l\right) \quad (3)$$

Here $s^2\left(i/l\right)$ for $i = 1, 2,3,....n$ is the probability estimation for splitting the node. RFC is also used in the glaucoma image classification [20] and brain tumor segmentation [21]. In this study RFC is used for the classification of skin images.

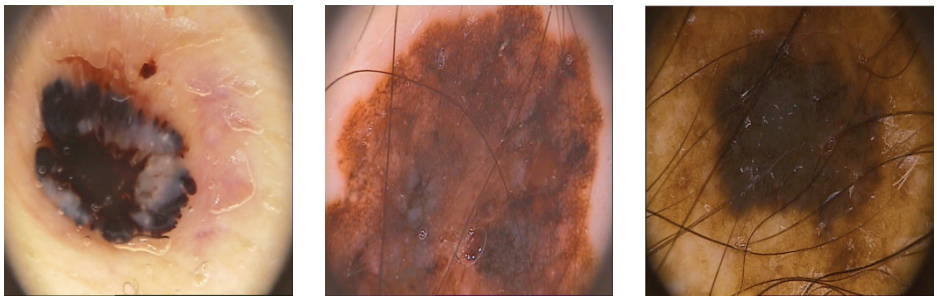
## Results and Discussion

The performance of SCC system is evaluated by PH2 database which is downloaded from PH2 database link [22]. Database contains 100 dermoscopic color image with lesions. The resolution of the image is 768x560 pixels. Figure 3 show the sample normal, benign and malignant images in the PH2 database.



(a) Normal

(b) Benign



(c) Malignant

**Figure 3 Sample images in PH2 database**

The input skin images are preprocessed by wiener filter to remove noise and hairs in the skin. Then the ranklet transform is given to preprocessed images for decomposition. It produces sub-band coefficients with different rank features. These different rank features are extracted by RFCM and stored in the feature database. Finally, classification is made by RFC. Figure 4 shows the Receiver Operating Curve (ROC) for SCC system using RFCM and RFC.

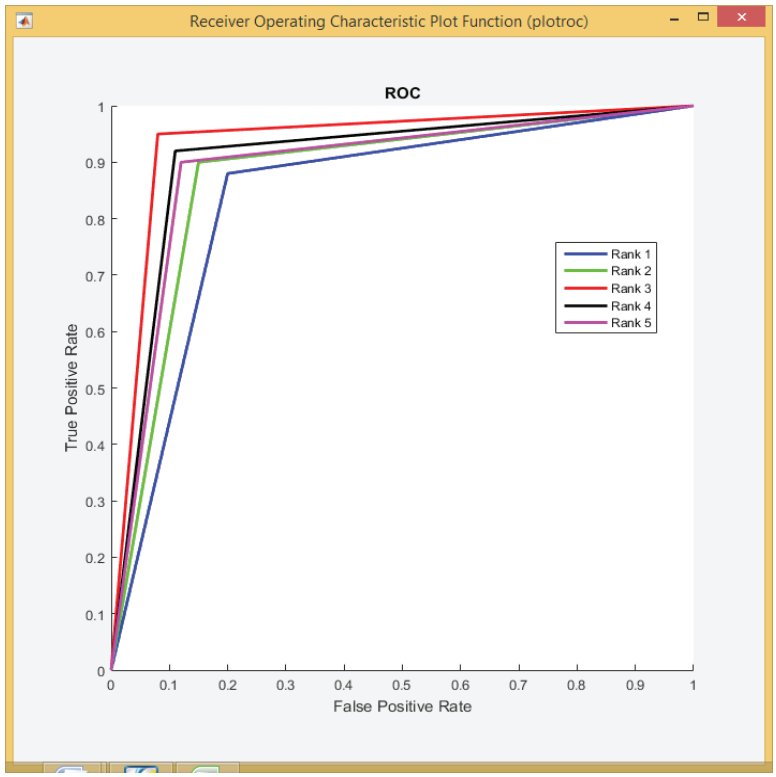


**Figure 4 ROC for SCC using RFCM and RFC**

From the above figure it is observed that, maximum area of 0.93 is obtained by ROC curve for 3rd rank feature. The minimum area 0.84 is obtained by the 1st rank feature by using RFCM and RFC. Figure 5 shows the performance metrics of the SCC system.

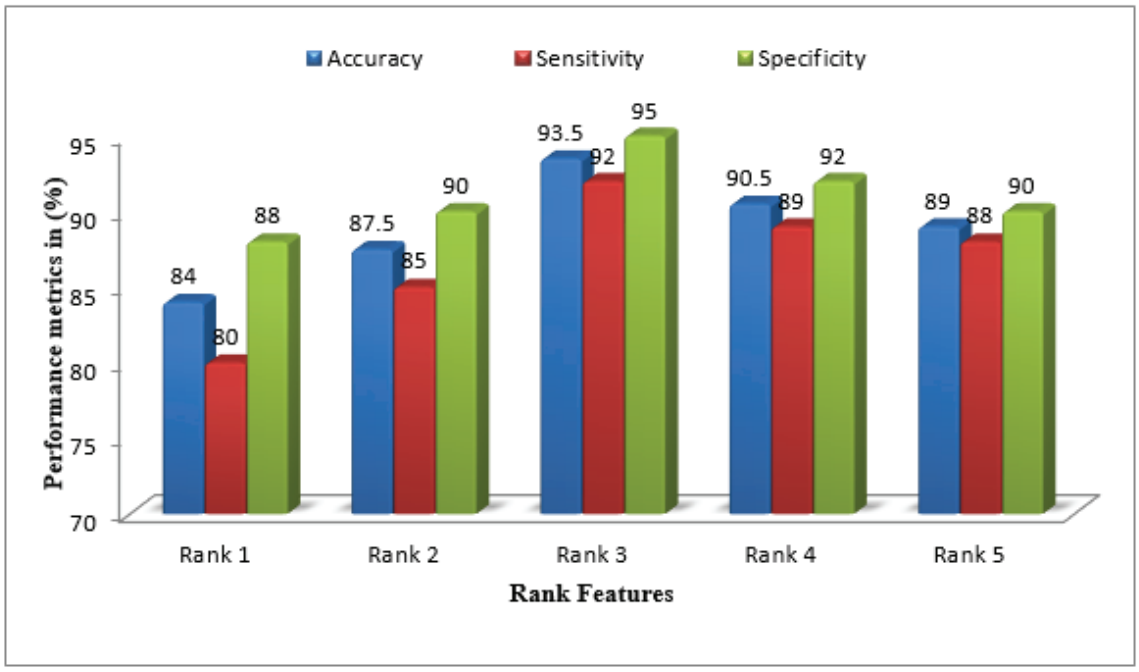

**Figure 5 Performance metrics of SCC system**

It is observed from the above figure the maximum classification accuracy of SCC system is 93.5 % at the 3rd rank feature by using RFCM and RFC. Also, the sensitivity is 92 % and specificity is 95 %. The minimum classification accuracy is 84 % obtained at 1st rank feature by using RFCM and RFC and its sensitivity and specificity are 80% and 88%. The classification accuracy is increased at first 3 rank features and decreased at last 2 rank features.

## Conclusion

The SCC system using ranklet transform, RFCM and RFC is presented. The dermoscopic images in the PH2 database are used for performance evaluation. The input dermoscopic images are preprocessed by wiener filter to remove noise and hairs in the skin. Ranklet transform is used to decompose the preprocessed images and produce subband coefficients with different rank features. Then RFCM method is used for extraction of subband coefficients with different rank features. These features are stored in the database and given as input for classification. The classification is made by RFC. Experimental results show the better classification accuracy of 93.5 % at the 3rd rank feature for SCC system.

## Abstract

In the recent years skin cancer skin cancer is emerging as one of the most complex diseases in which diagnosis is very challenging. Melanoma is generally characterized by the uncontrolled growth of body cells which might be caused due to prolonged exposure to UV rays produced by sun. Skin cancer can be categorized as basal cell carcinoma, squamous cell carcinoma and melanoma among which melanoma is considered as the most difficult to detect and if detected on time, melanoma is curable. Computer vision and Image processing toolboxes plays a pivotal portion in the field of medical imaging and diagnosis and is widely used. This paper focuses on a computer aided tool for skin cancer detection (i.e. melanoma). Dermoscopic images are used as inputs to the CAD system which is subjected to further image processing in which segmentation, feature extraction and classification is done to finally to differentiate between normal and melanoma images.

***Keywords:*** *Skin cancer, Computer Aided Diagnosis, Feature Extraction, Convolutional Neural Network*

## Introduction

Cancer is second is the ranked the second cause of worldwide deaths. Cancer is mainly caused by the uncontrolled growth and division of cells. A survey conducted by WHO shos that there are around 9.8 million deaths caused by cancer in the year 2018. Cancer is considered the cause of 1 out of 6 deaths throughout the world. In developing and poor countries (i.e. less and middle level income countries) nearly 70% of deaths are caused due to cancer. The human skin is the largest organ of the integumentary system and outer most covering layer of the body. Immunity which present in human skins plays a vital aspect or role in protecting our human body opposing to pathogens.

Skin cancer can be categorized as basal cell carcinoma, squamous cell carcinoma and melanoma among which melanoma is considered as the most difficult to detect and if detected on time, melanoma is curable. According to the WCRF (World Cancer Research Fund) survey in 2018, melanoma affects both men and women equally and also around 0.3 million of new cases were detected. The top countries which have highest levels of melanoma-skin cancer in 2018 (both male and female) are Australia, New Zealand, Norway, Denmark, Netherland, Sweden, Germany, Switzerland, etc.

Malignant melanoma is caused due to lesser amount of derma tint which is mainly caused by ultra violet (UV) rays from Sun (i.e.) pollution caused due to reduction in ozonosphere and exorbitant exposure to sun. The excessive use of cosmetics, radiation and pollution are major causes of skin cancer. Skin lesions can be categorized as either malignant or begnin based on various external characteristics as the nature of the lesion, whether the lesion is moving and also the size and shape of the lesion.

In paper [1], suggests the image segmentation process is performed based on snake active counter and support vector machine. It will help us to finding the parameters from SVM and Snake algorithm. To make the Snake algorithm effective appropriate selecting of the initial curve and snake parameters is done. The following shapes like rectangle, eclipse and curve are predicted by using the initial curve. In order to decrease the level of complexity, without any deterioration these shapes are chosen to keep the SVM implementation.

In testing the dataset, the images are used for template creation and also to determine the edges based on accuracy. These testing results of snake algorithms will show the finding of edge. To get the good results, segmentation and classification of these algorithms is required.

In paper [2] it describes about the detection the skin cancer from captured images of the affected tumor to determine the tumor is cancerous or normal. Diagnosis of melanoma at an early stage reduces the risk of death. Computer aided techniques will help the dermatologist to find out the skin cancer using image processing. In this work, graph cut algorithm type is used to detect the melanoma from the images and also the features like color, shape and geometry features are extracted from the images using image processing. Based on the extracted features, the images will be classified as malignant or benign stage by support vector machine using radial basis of kernel.

The paper [3] tells about the usage of segmentation of image based on lesion detection using deep learning of pixel wise labeling scheme. The architectural network is used for testing the public data and the ISIC database images are used for training. These results provide good accuracy rate and perform well even in the presence of hair, air and oil bubbles on images. The implementation of this process in GUI gives some additional weightage to the paper.

Paper [4] describes artificial intelligence and image processing techniques for melanoma detection. Image quality levels are improved by eliminating the noise in preprocessing stage. These skin images are segmented by applying the thresholding method. From that the features are extracted by2D wavelet transformation technique. These extracted features were applied as input for artificial neural network of back –propagation based and this method is used to classify their dataset into either cancer or non-cancer.

This paper [5] tells about the JSEG algorithm which was used to diagnose skin cancer by using the lesion boundary method.

In paper [6] the features like color and texture are extracted from gray level co-occurrence matrix (GLCM) and support vector machine (SVM) classifier which are used for classification and further diagnosis of malignant lesions. In this work, an accuracy level of around 90% by was achieved.

In paper [7] explains about the thresholding methods and maximum entropy methods, and these features such as correlations, energy, and unsymmetrical features are obtained from gray level co-occurrence matric [8-10]. And finally, feed forward and artificial neural network method is used for melanoma detection.

**Proposed Algorithms:**

The algorithm that is being proposed for the diagnosis of skin cancer is explained here.

- DB Image & Category Split/Count
- Load the Pre Trained Network
- Preprocess with CNN features
- Resize the Image & Visualize Weight
- Feature Layer &Train CNN Features by SVM
- Predict the Category with Trained Label
- Predicted Class & Accuracy finding

In our proposed scheme, melanoma classification is done through by using conventional neural network of deep learning technique. Here we are using the pre-trained network model for prediction and classification.

In this work, database contains melanoma and non-melanoma images which are separated from each other for analysis. These database images are split and number of images present in melanoma, non-melanoma is counted by their label or category wise and also the minimum number of images present in each class or type is identified. Then we load the pre-trained network model “Resnet-50” convolution neural network.

**Pre-Trained Deep Neural Networks**

We extract the powerful and descriptive features which are gathered from natural images using pre-trained image classification network. These pre-trained networks are trained by using the large scale visual recognition challenge using more than 0.001 billion images and then are classified into categories such as animal, car, bus, tea, cup etc.

**Resnet-50 (Network Model)**

It is also one of the type of pre-trained network model of Conventional neural network, it is trained by more than 0.001 billion images from the Image Net

database. This Resnet-50 pre-trained network which has 50 deep layers, classifies their corresponding database images into categories of 1000 objects. While loading the pre-trained network, it has some properties. In this pre-trained network, from input to output layer which has a huge number of fully connected layers or convolutional layers on path is known as network depth.

After loading the pre-trained network model, we go for image network classification (i.e. identify the prediction class) and preprocess the image on prediction class or label wise by CNN features. After that we resize the (i.e. 224 by 224) and visualize their weightage level. Then we initialize the feature layer of the pre-trained network model.

**Feature Extraction in Images on Pre-trained network model**

Without time investment and endeavor for complete network training, it's also a simplest and nimble approach for using the capability of deep learning technique. These features are extracted from images by using the pre-trained network and then it's trained by a classifier, like support vector machine (SVM).

**Test Image Features & Prediction**

Similarly, we can select the test or query image from any of the category in an image data store. We then resize the selected input image as per pre-trained network model (i.e. 224 by 224) and features are extracted from images by using the pre-trained network and then it's corresponding category is predicted by classifier and trained features, test features and trained labels. Finally, the classifier predicts the category and the accuracy rate are calculated from confusion matrix by taking the mean value of diagonal elements of confusion matrix.

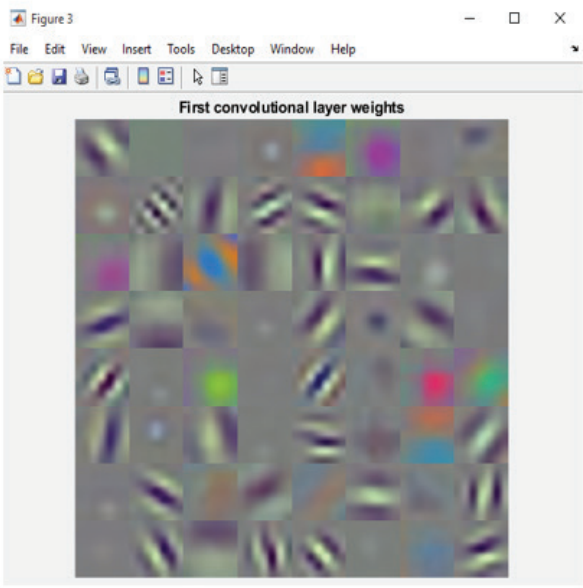

**Fig 1: Weighted Matrix**

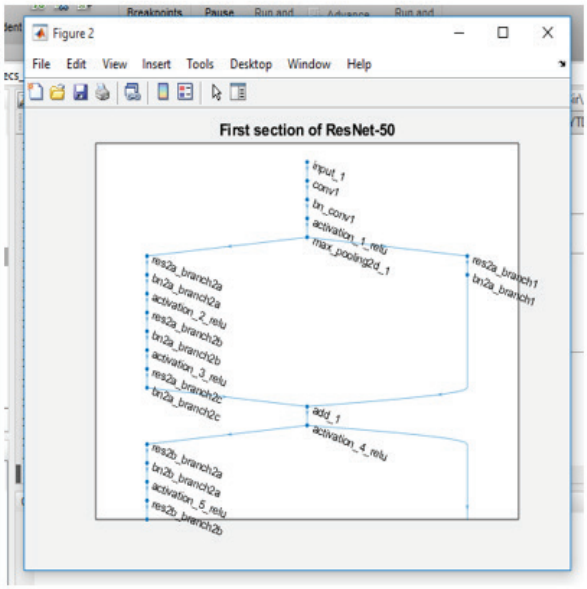

**Fig 2: Resnet-50 Layers**

Fig 1 & 2, describes about the Resnet50 (pre-trained network model) weightage allocation matrix & Layers connections

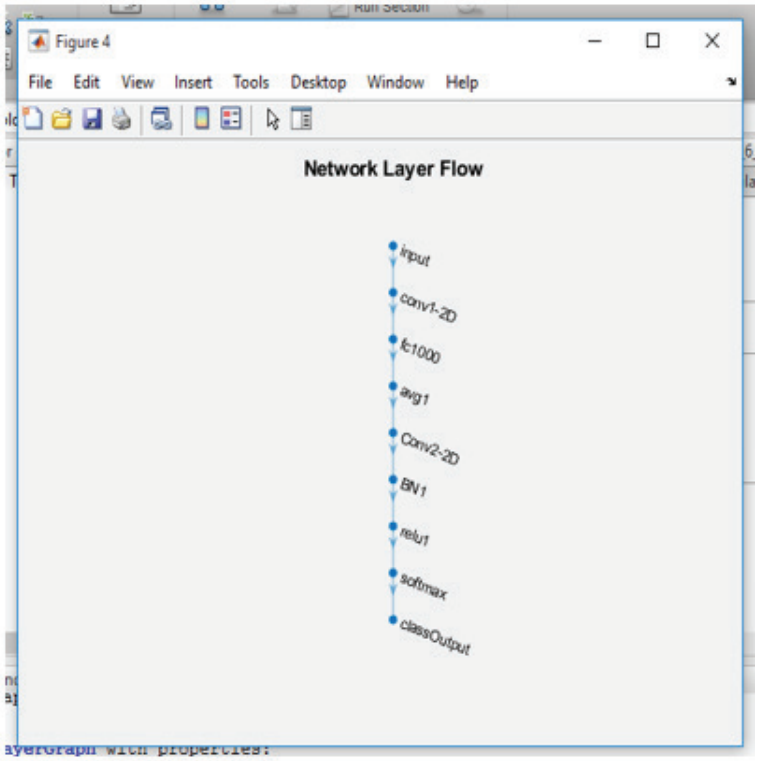

**Fig 3: Network – Layer flow**

Fig 3 describes about the Network Layer flow & class prediction by using classifier ofResnet50 (pre-trained network model)

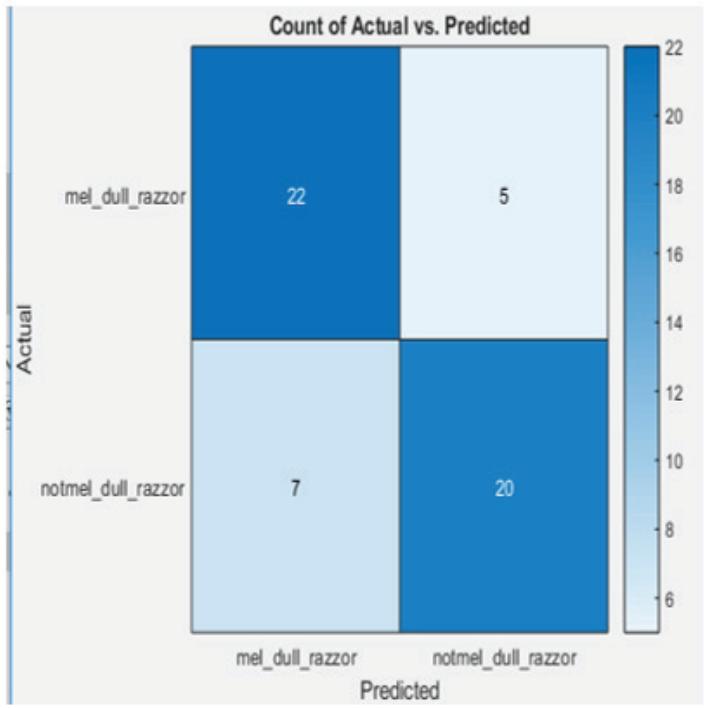

**Fig 4: Confusion Matrix**

**Fig 4, describe about our data prediction level for melanoma skin cancer classification by using Resnet50.**

## Conclusion

In this work, our aim is to finding the level of skin cancer in human body based on pre-trained network of (Resnet-50-categories of 1000 objects) model and CNN features. And these CNN features dataset and query image features are analyzed and its level is predicted by using deep learning, whether the query image which belongs to which category either melanoma or not. In our pre-trained network model (Resnet-50) getting 85.18 % accuracy. In future, creating the new network model can be done for skin cancer prediction.

# Cluster Analysis for MRI Brain Tumor Segmentation

**M. Rajmohan[1], M. Abraham[1], D. Sahaya Lenin[1],P. Pandiaraj[1]**

*[1]Assistant Professor, Hindustan Institute of Technology & Science, Chennai*

## Abstract

The abnormal tissues which are originated from the brain cells are known as brain tumor. It may be cancerous tumor or non-cancerous tumor; these can cause pressure inside the skull to increase the tumors. This damages the brain and become life-threatening. The main cause of brain tumor is still unknown. The early diagnosis is required otherwise it increases the mortality rate. The segmentation of tumor part is essential to identify the affected area in the brain. In this study, an effective method for Brain Tumor Segmentation (BTS) is presented. The BTS system uses Discrete Wavelet Transform (DWT), K-Means Clustering (KMC) algorithm and morphological operations for segmentation. Firstly, the input brain images are given to DWT for decomposition and it produces lower and higher frequency sub-band coefficients. Then the Inverse DWT (IDWT) is applied to reconstruct the image. The reconstructed image is given to KMC technique for segmentation. Then the unwanted regions are removed by morphological operations to detect the brain tumor in the given input image.

***Keywords:*** *Brain Tumor Segmentation, Discrete Wavelet Transform, Inverse DWT, K-Means Clustering*

## Introduction

BTS to calculate tumor percentage is described in [1]. Initially the input brain images are pre-processed by using median filter. Then the preprocessed image is given to segmentation algorithm like thresholding, watershed and cropping. Finally, the tumor area and brain area is calculated for the area percentage calculation. Dynamic Angle Projection Pattern (DAPP) features based BTS and classification using watershed algorithm is presented in [2]. Initially, the brain images are given to segmentation technique using watershed algorithm. Then the features are extracted by DAPP. Convolutional Neural Network (CNN) is used for classification.

Region growing approach based BTS to integrate symmetric property is presented in [3]. The brain images are given to geometric transformation and systematic analysis. Then the contrast stretching operation is performed and region growing operation is applied. Then the unwanted regions are removed by morphological operation to detect the tumor. BTS and detection for computer analysis is discussed in [4]. At first, brain image is given to preprocessing to remove noise. Then the preprocessed image is segmented by thresholding technique. Then the morphological operation is used to remove the unwanted regions. Windowing technique is applied to detect the brain tumor.

BTS method using U-net architecture is described in [5]. At first, the input brain image is given to loss function and optimized to perform the preprocessing and U-net model structure is used for segmentation. Then the feature recombination layer and convolutional layer are used for prediction. BTS for cuckoo search optimization algorithm is presented in [6]. Firstly, the input brain images are preprocessed by image acquisition, enhancement and preprocessing techniques. The map values are obtained by markov random field. The optimum thresholding algorithm is obtained by cuckoo search algorithm for segmentation.

BTS and classification for brain images using CNN is described in [7]. At first, the brain images are given to CNN for the prediction and segmentation of the affected area. Then the tumor area is separated. BTS based on features of separated local square is presented in [8]. Input brain images are given to image acquisition technique. The super pixels are segmented. Then features like statistical and texture features are extracted. Finally, the prediction is made by Support Vector Machine (SVM).

BTS using watershed and edge detection algorithm is discussed in [9]. The input image is converted into three different color formats. Then each region performs the contrast enhancement. Watershed transform is applied for each region. Then the three segmented region are combined to form the segmented image. Combined approach for BTS is described in [10]. The input brain images acquisition and pre-processed to remove noise. The gray level co-occurrence matrix and local binary pattern features and are extracted. Back propagation network is used for prediction.

Different wavelet analysis for brain image classification is described in [11]. The wavelet transform like Daubechies, symlet and biorthogonal wavelets are used for feature extraction. Then SVM classifier is used for classification. BTS using non-negative matrix factorization is presented in [12]. Firstly, the initial brain images are denoised by anisotropic diffusion filtering. Then the non-negative matrix factorization method and FCM is used for the feature segmentation.

BTS analysis using segmentation technique is presented in [13]. The brain image is acquiesced pre-processing technique using some filter. Then the segmentation is made by watershed method. Then the post processing also has done. Finally, the brain tumor area is detected. BTS for multimodal brain scans using expectation maximization algorithm is presented in [14]. The input brain images are pre-processed at first. Then the pre-processed brain image is segmented by using expectation maximization algorithm. Then KMC technique is used to identify the tumor region.

A novel method for BTS is presented in this study using DWT, KMC and morphological operations. The rest of the paper is as follows: In Section 2 the methods and materials used for BTS system is described. Section 3 describes the experimental results and discussions of BTS system. The BTS system using DWT, KMC and morphological operations is concluded in last section.

## Methods and Materials

Figure 1 shows the overall workflow of BTS system using DWT, KMC and morphological operations. Initially, the brain images are decomposed by DWT and IDWT is applied to reconstruct the brain image. Then KMC is used for segmentation. The unwanted background regions are removed by morphological operations to detect the tumor region.

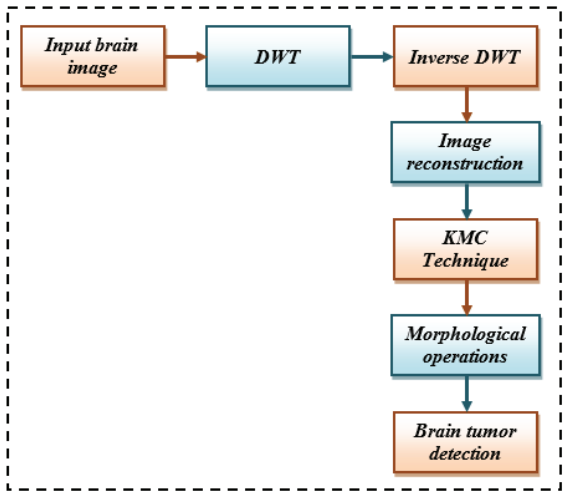

**Figure 1 BTS system – workflow**

### DWT Decomposition

The discretely sampled wavelets are known as DWT in both numerical and functional analysis. It has temporal resolution in a Fourier transform to capture both location and frequency information. DWT has large number of applications in computer science, mathematics, engineering and science. It produces familiar wavelet transform and produces the lower and higher frequency. DWT implements the rules under the translation scales and discrete set of wavelets. The discrete set of input images is decomposed into suitable size. The DWT is defined by,

$$\delta(k) = \sum_{m=\infty}^{\infty} (-1)^m P_{R-1-m} \psi(2k-m) \qquad (1)$$

where $R$ is defined as even integer, to decompose the set of wavelets. DWT is also used in other fields like object recognition [15] and speech emotion recognition [16]. In this study, the DWT is used to decompose the input images, then inverse DWT transform is applied to reconstruct the image.

### KMC Segmentation

KMC is a vector quantization method in processing an image for the cluster analysis in the data mining. The $n$ observations in $k$ clusters are belongs to nearest mean prototype. KMC has the cluster variances with irregular Euclidean distances. The geometric median minimizes the Euclidean distances in the optimized squared errors.

The Euclidean distances are minimized only by the geometric median. The convergence of efficient heuristic algorithm is local optimum. This algorithm is similar to expectation maximization algorithm for Gaussian mixture modeling. It uses clusters to model the data, and then KMC used to find the clusters in spatial extent. The expectation maximization mechanism allows clusters to have different shapes. The KMC is given by,

$$K(S)=\sum_{u=1}^{m}\sum_{v=1}^{m_u}\left(\left\|y_u - s_v\right\|\right)^2 \quad (2)$$

where, $\left\|y_u - s_v\right\|$ is Euclidean distance between $y_m$ and $s_v$, $m_u$ is the number of data points in $u^{th}$ cluster, $u$ is the number of clusters. KMC is also used in other fields like gene expression data [17] and tree identification [18] marine and rain removal images segmentation [19-20]. In this study, the reconstructed image is given to KMC for the BTS.

### Morphological Operations

The structural element in the morphological operation combines a 3 x 3 matrix. The neighborhood pixel values process the images into pixel by pixel. The morphological operation techniques are available for the gray level images or binary images. It performs operations like erode, reconstruct, dilate and other morphological operations. It process the images based on shapes. The value of the other pixel in the neighborhood is adjusted by morphological operations. The morphological operation is also used in other fields like licence plate localization [21] and shadow detection [22]. In this study, morphological operations are used to remove the unwanted region of brain.

## Results and Discussion

The performance of the BTS system is evaluated by REpository of Molecular BRAin Neoplasia DaTa (REMBRANDT) database [23]. The image size is 256x256 pixel resolutions. Figure 2 shows the some of the images in REMBRANDT database.

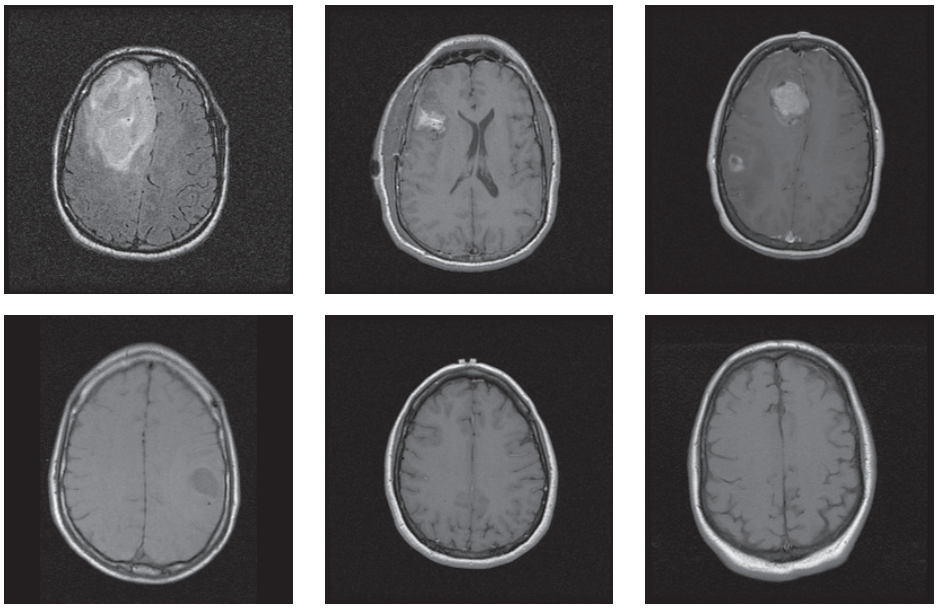

**Figure 2 Sample images in REMBRANDT database**

Initially, the brain image is given to DWT for decomposition, after that the inverse transform is applied for image reconstruction. Figure 3 and 4 shows the DWT decomposition and inverse DWT decomposition.

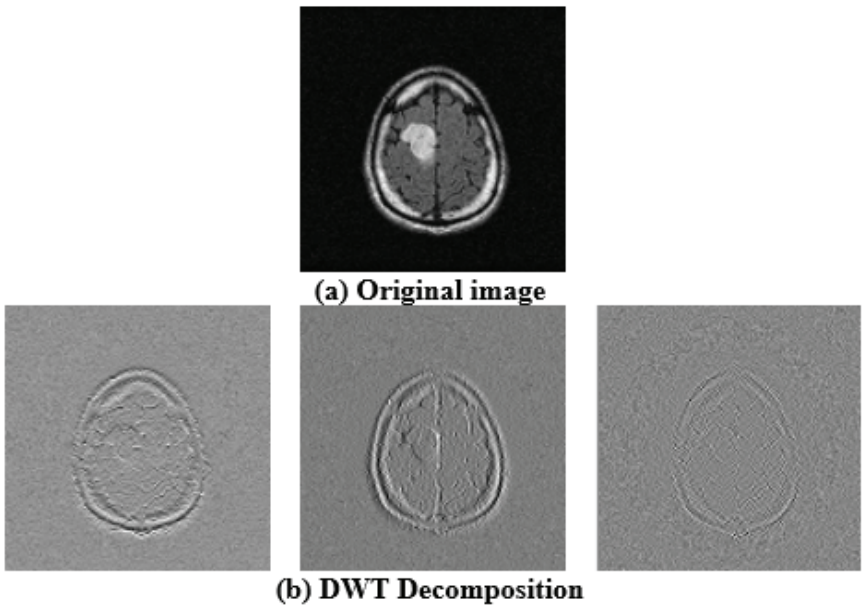

**Figure 3 DWT decomposition and its coefficients**

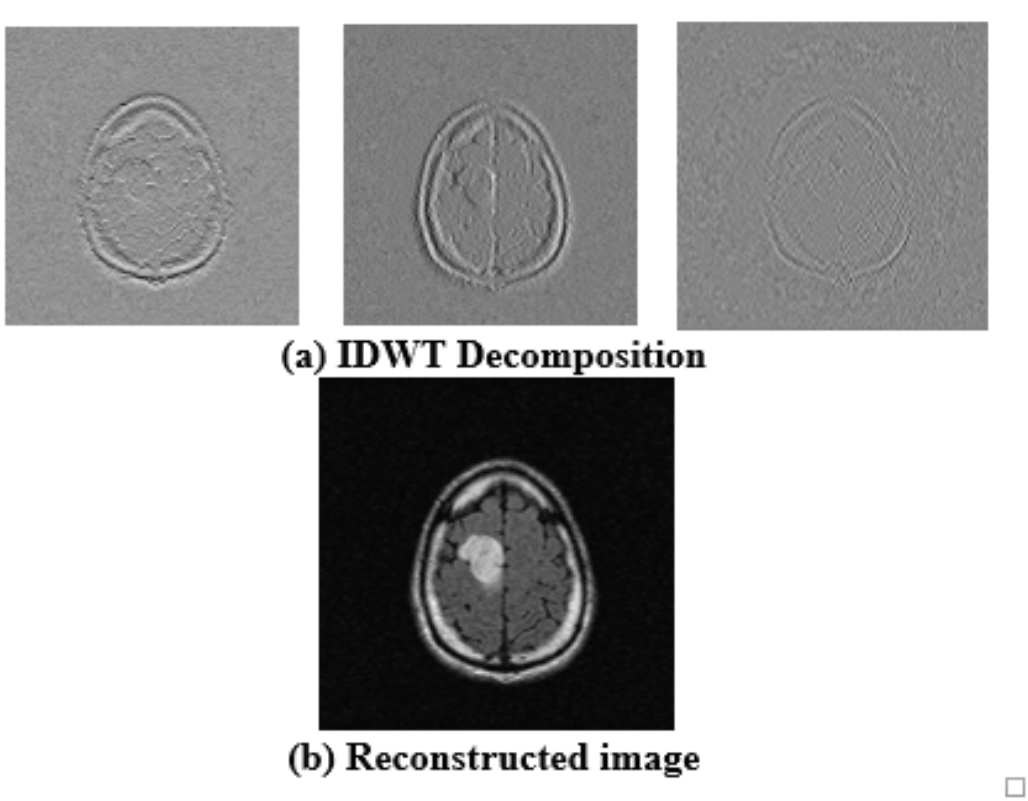

**Figure 4 Inverse DWT Decomposition and reconstructed image**

The reconstructed image is given as input for KMC technique for segmenting the tumor. Then the unwanted background areas are removed by using morphological operations. At first the reconstructed image is converted into grayscale image. KMC technique is applied for BTS. Then the morphological operations are used to remove the background region of tumor. Finally, the tumor is detected. Figure 5 shows the tumor detection using KMC and morphological operations.

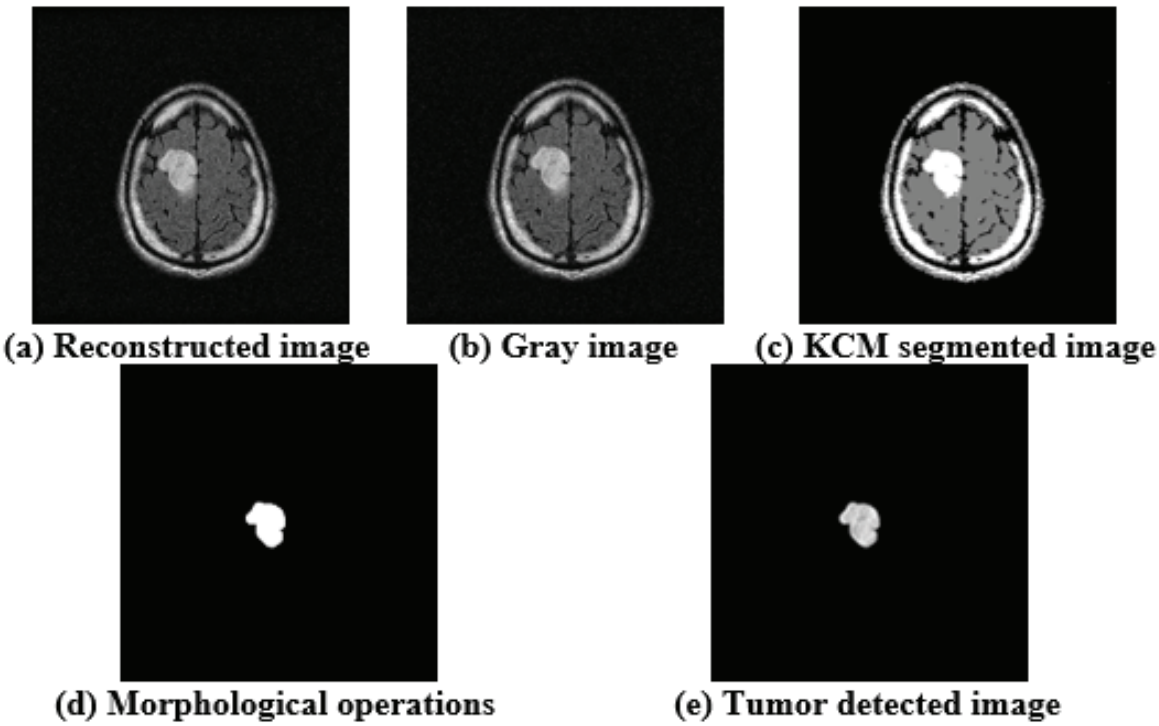

**Figure 5 Tumor detection using KMC and morphological operations**

## Conclusion

The cluster analysis for BTS system using DWT, KMC and morphological operations is discussed in this study. The performance evaluation of BTS system is made by using REMBRANDT database. The input image is given to DWT for decomposition and it produce sub-band coefficients and inverse DWT is also applied and it also produces the sub-band coefficients for brain image reconstruction. Then reconstructed brain image is converted into gray scale image then the KMC technique is used to detect the tumor region by using clusters for segmentation of tumor. Then the background region of brain image is removed by using morphological operations. Finally tumor region is detected.

# Effect of Posture on Electrical Axis of Heart During Different Phases of Breathing in Normal Subjects

**H. Vishnu Priya[1], S. Krishnan[2], Prem B[3]**

*[1] Assistant Professor, Department of Physiology, Aarupadaiveedu Medical College & Research Institute, Puducherry , [2]Assistant Professor, Department of Physiology, Mahatma Gandhi Medical College & Research Institute, Puducherry, [3]Assistant Professor, Department of Physiology, Govt. Thiruvannamalai Medical College & Hospital, Thiruvannamalai*

## Abstract

**Introduction:** Body postural changes are commonly used in the management of patients with acute cardiopulmonary dysfunction. Size, shape and position of heart are related to the body type, posture and respiration. Effect of change in body posture on electrical axis of heart has not been well documented. .The present study was conducted to study the effect of posture on electrical axis of heart during different phases of breathing in normal subjects.

**Aim:** To study the effect of posture on electrical axis of heart during different phases of breathing.

**Materials and Method:** With the help of INCO RMS Vesta 101 electrocardiograph, ECG was recorded in the following normal breathing, deep inspiration and deep expiration in supine, standing and sitting posture.

**Results:** The mean cardiac axis after deep expiration in supine posture was +47.29 degrees, in the sitting posture it was +32.67 degrees and in standing posture it was +30.69 degrees. The decrease in cardiac axis upon assuming sitting posture was significantly different from the value obtained during supine posture ($P<0.05$). The decrease in cardiac axis upon assuming standing posture was significantly different from the value obtained during supine posture ($P<0.01$).

**Conclusion:** It was found inter-individual variability in electrical axis of heart which can be explained on the basis of orientation of heart in the chest. In the present study, the decrease in cardiac axis due to postural variation from supine to sitting and standing was more pronounced after deep expiration. There was decrease in electrical axis of heart (shift to left) when subject changed the posture from supine to sitting and standing.

***Keywords:*** *Posture, Electrical axis, Breathing*

## Introduction

Electrical axis of heart or cardiac axis is altered in various physiological and clinical conditions, hence it is important to measure[1]. Body postural changes is commonly used in the management of patients with acute cardiopulmonary dysfunction[2]. Size, shape and position of heart are related to the body type, posture and respiration. Position of heart is determined by position and movements of diaphragm because the central tendon of diaphragm is firmly attached to pericardium. During deep inspiration, diaphragm becomes flat when it contracts. As it does, the heart descends, rotates to the right, moves backward and thus becomes more vertical, i.e. shift to right. During deep expiration, the diaphragm relaxes, elevates, and movements of the heart are converse to those occurring during deep inspiration. During normal breathing (eupnea), these changes are less pronounced. Effect of change in body posture on electrical axis of heart has not been well documented.

Also this study has not been done in younger age group (20-30 years). So this study was undertaken to determine the effect of posture on electrical axis of heart during different phases of breathing. Even slight movements of the body disturb the analysis of cardiovascular dynamics[3]. The position of heart has an influence on the shape of ECG. Body changes from supine to standing posture and phases of respiration have been attributed to the changes in ECG[4]. In patients with cardiopulmonary dysfunction, change in body position is commonly used intervention. These changes in body position are often manifested as axis shifts in the ECG which results in ST segment changes. Hence can be misclassified as acute ischemic events during ambulatory monitoring[5, 6]. In a study conducted by Swenson et al (2011), they concluded that even a few centimeter changes in heart position were sufficient to produce ST-segment changes which mimic acute myocardial ischemia[7]. Hence, the axis shifts during postural changes have important clinical applications. The above concept has been proven in many studies. Likewise, Mohan et al (1987), Dougherty (1970) in their study stated that the body postural change produces the change in anatomical orientation of heart within the thorax resulting in alteration of cardiac axis[8, 9]. This statement is also proven by Ng et al (2001) who concluded that these postural variations produce changes in QRS amplitude, ST segment and T-wave inversions. But when compared to QRS shifts, P-wave shifts are larger and poorly correlated with QRS axis shifts[10]. Another study by Jones et al (2003) showed that postural variation from lying to sitting and standing postures produces decrease in RWA (R-wave amplitude) which is due to shift of axis to right. The other reason being change in cardiac volume[2]. Also Marín et al (1988) have stated that the R wave voltage varies with changes in heart position and the body mass is not an important modifier of RWA in light overweight, normal and thin individuals[11]. MacLeod et al (2000) have stated that the geometric position of heart could be a large source of variation in body surface potentials[12]. In another study, Swenson et al (2011) concluded that the variations in surface potentials are not only due to body postural changes but also due to changes in respiration[7]. Hoekema et al (1999) have commented that there is inter-individual variability of ECG in normal healthy subjects. Part of this variability is due to position of heart in the chest and also due to orientation relative to the electrodes. However the changes made in moving the electrodes did not reduce the inter individual variations[13]. Engblom et al (2005) have stated that, as age advances, change in electrical axis of heart is not by the change in anatomical axis. They concluded that there is no simple relationship between anatomical and electrical axes of heart[14]. Also in another study by Grant (1953), it was found that when the mean QRS axis changed to 180 degrees, the anatomical position of left ventricle changed only to less than 45 degrees[15]. Similar study done by Dougherty (1970) concluded that for every 1 degree change in position of heart, the QRS axis altered to 3 degrees[9]. Madias (2006) commented that the standard ECG recorded in supine and standing postures are interchangeable with stress ECG recorded in sitting, standing and supine postures[16].

## Aim

To study the effect of posture on electrical axis of heart during different phases of breathing.

## Materials and Method

This was a cross-sectional study done on 45 normal healthy volunteers conducted in the Department of Physiology, Mahatma Gandhi Medical College & Research Institute, Pondicherry. Prior to commencement of study, approval from Institute Human Ethics Committee was obtained. Young healthy volunteers in the age group of 20-30 years were recruited. The nature of the study and procedure were explained to them. Informed written consent was obtained from them. The selected subjects were instructed to come for recording the next day, about 2-3 hours after a light breakfast. With the help of INCO RMS Vesta 101 electrocardiograph, ECG was recorded in the following manner. The subject was asked to lie supine and completely relaxed in a couch for 10 minutes. Before fixing the lead, skin was thoroughly cleaned with spirit over the left and right wrists and ankles after which ECG jelly was applied. All four limb leads were connected. The subject was instructed not to perform any movement while recording was being made. ECG was recorded in lead I and lead aVF for about ten QRS complexes. Markings were made on the ECG strip at the beginning of normal inspiration and expiration. If there was any artefact, recording was repeated. This completed the recording of ECG in supine posture during eupnea (normal quiet breathing). Then the subject was asked to hold his/her breath after deep inspiration (breathe in deeply to full capacity). ECG was again recorded in lead I as well as lead aVF. Then the subject was asked to hold his/her breath after deep expiration (breathe out to full capacity). ECG was

recorded in lead I and aVF. This completed the recording of ECG in lead I and aVF in supine posture during eupnea, after deep inspiration and deep expiration. In the same manner, ECG in lead I and lead aVF was recorded in sitting as well as standing posture also. The recorded ECG was gathered and the mean QRS amplitudes were measured for deep inspiration and deep expiration. For eupnea, the mean QRS amplitude was measured for the QRS complexes which were marked after normal expiration. Cardiac axis was measured using Einthoven triangle. The mean QRS amplitude (net potential) was measured from lead I and lead aVF in ECG by subtracting S wave from R wave. This net potential was plotted on the axes of respective leads and perpendicular lines were drawn from each. The point of intersection of these two perpendicular lines was joined to the centre of the triangle to give the vector. This line represents the amplitude and orientation of QRS vector or electrical axis of the heart. The exact value of cardiac axis in degree was measured using protractor. Statistical analysis was done using SPSS software (version 16). The data was presented as mean ± SE and was analysed by using ANOVA. Intra group differences of means between supine and sitting, and supine and standing during eupnea, deep inspiration and deep expiration were compared using post hoc (ANOVA). The differences were considered statistically significant if probability of chance was less than 0.05 ($P<0.05$)

## Results

The present work was conducted in the department of Physiology, MGMC & RI with the principal aim to study the effect of posture on electrical axis of heart during different phases of breathing. The study included 45 healthy volunteers in the age group of 20 – 30 years. The mean electrical axis of heart during eupnea in supine posture was +55.84 (Table 1), in the sitting posture it was +47.51 degrees and in standing posture it was +49.33 degrees. The decrease in electrical axis of heart upon assuming sitting posture was not significantly different from the value obtained during supine posture ($P>0.05$). The decrease in cardiac axis upon assuming standing posture was not significantly different from the value obtained during supine posture ($P>0.05$). The mean electrical axis of heart after deep inspiration in supine posture was +70.18 degrees (Table 1), in the sitting posture it was +70.22 degrees and in standing posture it was +70.80 degrees. The increase in cardiac axis upon assuming sitting posture was not significantly different from the value obtained during supine posture ($P>0.05$). The increase in cardiac axis upon assuming standing posture was not significantly different from the value obtained during supine posture ($P>0.05$). The mean cardiac axis after deep expiration in supine posture was +47.29 degrees (Table 1), in the sitting posture it was +32.67 degrees and in standing posture it was +30.69 degrees. The decrease in cardiac axis upon assuming sitting posture was significantly different from the value obtained during supine posture ($P<0.05$). The decrease in cardiac axis upon assuming standing posture was significantly different from the value obtained during supine posture ($P<0.01$). Hence the present study inferred that the difference in electrical axis of heart during various postures was significant only after deep expiration ($P<0.01$) but not during eupnea and deep inspiration (Table 2).

**Table 1: Effect of posture on electrical axis of heart in various phases of breathing.**

| | **Eupnea (mean±SD)** | **Deep Inspiration (mean±SD)** | **Deep Expiration (mean±SD)** |
|---|---|---|---|
| Supine | 55.84±2.73 | 70.18±1.71 | 47.29±2.96 |
| Sitting | 47.51±4.16 | 70.22±2.87 | 32.67±3.79 |
| Standing | 49.33±3.68 | 70.80±2.33 | 30.69±3.74 |

Data represented as (mean±SD)

**Table 2: Level of significance of electrical axis of heart between supine, sitting and standing postures during eupnea, after deep inspiration and after deep expiration.**

| | **ANOVA (P value)** | | | **Post hoc (P value)** |
|---|---|---|---|---|
| | | Supine | Sitting | 0.267 |
| Eupnea | 0.227 | Supine | Standing | 0.406 |

| | | Sitting | Standing | 0.917 |

*P<0.05, **P, <0.01

## Discussion

The present work was conducted to study the effect of posture on electrical axis of heart in different phases of breathing in young healthy subjects. The known concept of heart axis is that it varies from individual to individual, and also from time to time in the same individual. These variations are related to the body type, posture and respiration. In the present study, the electrical axis of heart in 45 normal subjects in different postures during different phases of breathing like eupnea, deep inspiration and deep expiration was compared. In the present study, it was found inter-individual variability in electrical axis of heart which can be explained on the basis of orientation of heart in the chest. The normal electrical axis of heart is generally said to be –30 to +110 degrees[17]. But in the present study on 45 normal subjects, the lowest value of electrical axis of heart was -21 degrees and the highest value was +135 degrees. Such "abnormal" axis may occur in some normal individuals. In such cases, thorough evaluation of all the parameters of ECG is to be made to exclude myocardial disease[18]. Though changes in electrical axis of heart were observed during different postures in the present study, they were not statistically significant. Other workers have observed that changes in body posture and movement lead to changes in cardiac axis[8–10]. In the present study, there was decrease in electrical axis of heart (shift to left) when subject changed the posture from supine to sitting and standing. Our observation is contrast to a study conducted by Jones et al (2003) in which the cardiac axis increased (shift to right) with postural variation from supine to sitting and standing postures[2]. In the present study, the decrease in cardiac axis due to postural variation from supine to sitting and standing was more pronounced after deep expiration. The probable cause for this could not be explained.

## Conclusion

It was found inter-individual variability in electrical axis of heart which can be explained on the basis of orientation of heart in the chest. In the present study, the decrease in cardiac axis due to postural variation from supine to sitting and standing was more pronounced after deep expiration. There was decrease in electrical axis of heart (shift to left) when subject changed the posture from supine to sitting and standing.

## Abstract

Alcoholism is one of the major health and social problem all over the world. It is the third leading psychiatric problem in the world today. Addiction is a family problem and is a major source of stress for family members.

**Objectives**: 1. To assess and compare the stress and coping before and after administration of Guided Imagery among wives of alcoholics. 2. To determine the relationship between stress and coping among wives of alcoholics. 3. To determine the association of stress and coping with the selected variables among wives of alcoholics.

**Methodology**: Quasi experimental study with one group pre-test post-test design. A total 33 wives of alcoholics were selected by using purposive sampling technique. Tools: selected variables, Modified Perceived Stress Scale and Brief COPE Scale were used. Guided Imagery intervention was given daily for six days and each session was of 30 minutes which includes 5 minutes deep breathing exercise before and after the active session of guiding with focused background music. Daily guided imagery sessions were divided on different themes. Post test was taken on 8$^{th}$ day. Reliability of tool was estimated with Cronbach Alpha (internal consistency). The descriptive and inferential statistics were applied by using SPSS version 16.

**Results:** Kolmogorov Smirnov test was applied to check the normality of the data and data was normally distributed; hence parametric tests were applied. Findings of the study indicated that Guided Imagery was effective in reducing stress ["t"(32)=20.05 (p=0.00)] and improving the adaptive coping ["t"(32)= 6.91(p=0.00)] and reducing maladaptive coping ["t"= 6.87 (p=0.01)] among wives of alcoholics. There was significant moderate negative correlation between stress and adaptive coping and there was significant association of stress, adaptive coping and maladaptive coping with selected variables such as number of children, age, monthly income and type of family. Further multiple regression was performed to check the predictability of selected independent variables on stress. **Conclusion:** Guided Imagery was effective in reducing stress and improving adaptive coping among wives of alcoholics.

## Introduction

Alcoholism was identified as a contributing factor in the deaths of 30 percent of those who died from alcohol poisoning from 2010 to 2012. (CDC). About 100, 000 people die each year from alcohol-related causes: drinking and driving crashes, other accidents, falls, fires,

alcohol-related homicides and suicides. (NCAAD).[1]

Addiction is a family problem and is a major source of stress for family members. Alcohol addiction causes family disruption as the addicted person ignores his responsibilities which further leads in disrupted family roles and impaired family communication.[2]

Stress is a common problem, so it is very important to learn how to identify stress and one must know about stress reduction techniques. Relaxation therapies help to reduce stress and in improving one's ability to cope with stress and stressful situations.[2]

## Methodology

A quasi experimental one group pre-test post-test research design was used for this study. Wives aged between 18 to 60 years, present at the time of data collection, willing to participate in the study and able to understand and speak Hindi, English and Punjabi were included in the study. The wives of alcoholics who were having no stress (scored 0 in perceived stress scale), suffering with mental illness and whose husbands had poly substance abuse without alcohol or abused with substance other than alcohol were excluded from the study. Thirty three participants were enrolled in the study with purposive sampling technique. Data was collected by using selected variables, Modified Perceived stress scale and Brief COPE scale.

**Description of Data Collection Tool**

***1. Description of Selected Variables:***

It consisted of 18 items related to selected variables such as age, religion, educational status of self (wife of alcoholic) and husband, occupation self and husband, monthly income (in rupees), Socio-economic class, place of living, duration of marriage, number of children, type of family, duration of husband alcohol use, duration of husband's stay in de-addiction centre, previous history of husband's stay in de-addiction centre, any other substance used, associated health problem/chronic illness (self) and (husband). The items were prepared with the help of literature, expert's opinions and investigators personal experience.

***2. Modified Perceived Standardized Stress Scale:***

A standardized scale was modified which consisted of 10 items with 5 point rating scale out of which 6 items were negative which was scored in direct order and 4 positive items was scored in reverse direction. The questions asked about the feelings and thoughts during the last month and were modified as the questions were asked about the feelings and thoughts during the last week. Tool was incorporated in the study after getting prior permission from the tool developer and the modification was done to be used in Indian setting.

**3. Brief COPE Scale:**

A standardized tool was used to assess the coping among wives of alcoholics. It consists of 28 items with 4 point rating scale (16 items of adaptive coping and 12 items of maladaptive coping). Interpretations were based on mean percentage for both adaptive and maladaptive coping. Higher the mean percentage resembles use of adaptive or maladaptive coping style.

**Procedure**

After obtaining the formal administrative approval from Chief Medical Officer of Civil Hospital Ambala city**,** final study data was collected from 9$^{th}$ September to 7$^{th}$ December 2017. Thirty three wives of alcoholics were selected by using purposive sampling technique from selected De-addiction centre of Ambala City, Haryana. Written consent was taken. On day 1 pre assessment was done by administering the tool selected variable, modified perceived stress scale to assess the stress and brief COPE scale to assess the coping with self-report (interview) technique. Guided imagery intervention was given daily for 6 days from day-2 to day-7. Application of GI was divided in three phases and each session was of 30 minutes which includes 5 minutes deep breathing exercise as a warm up, 5 minutes deep breathing exercise at the end and 20 minutes of guiding. Guided imagery was actively given by the researcher by her own voice in live session rather than recorded sessions. Guided sessions were divided on basis of different themes and were based on the previous research evidences. Themes: Day-1 Natural guiding for individual. Day-2 Natural guiding with loved ones. Day-3 Spiritual guiding. Day-4 Deep relaxation guiding. Day-5 Meditation guiding (to get rid of negative thoughts). Day-6 Individual choice. Accordingly on day-8 post assessment was done.

**Data Analysis**

**Descriptive statistics**

·Frequency and Percentage distribution to describe

selected variables.

· Range, Mean, Median, SD, and Mean Difference to describe in terms of stress and coping among wives of alcoholics.

**Inferential statistics**

· Paired't' test to check the pre-test and post-test score differences.

· Pearson's correlation to check the correlation between stress and coping.

· **ANOVA and independent 't' test to check the association**

· Step wise Multiple Regression to check the predictability of multiple independent variables on stress.

## Results

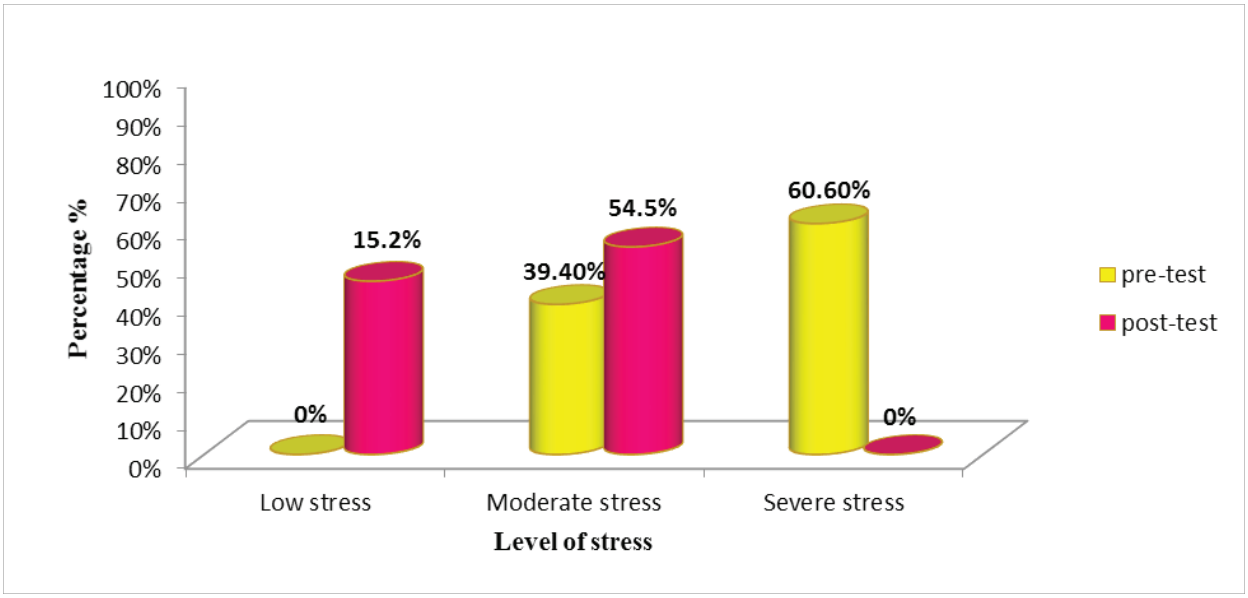

**FIGURE 1- frequency and percentage distribution of wives of alcoholics in terms of level of stress.**

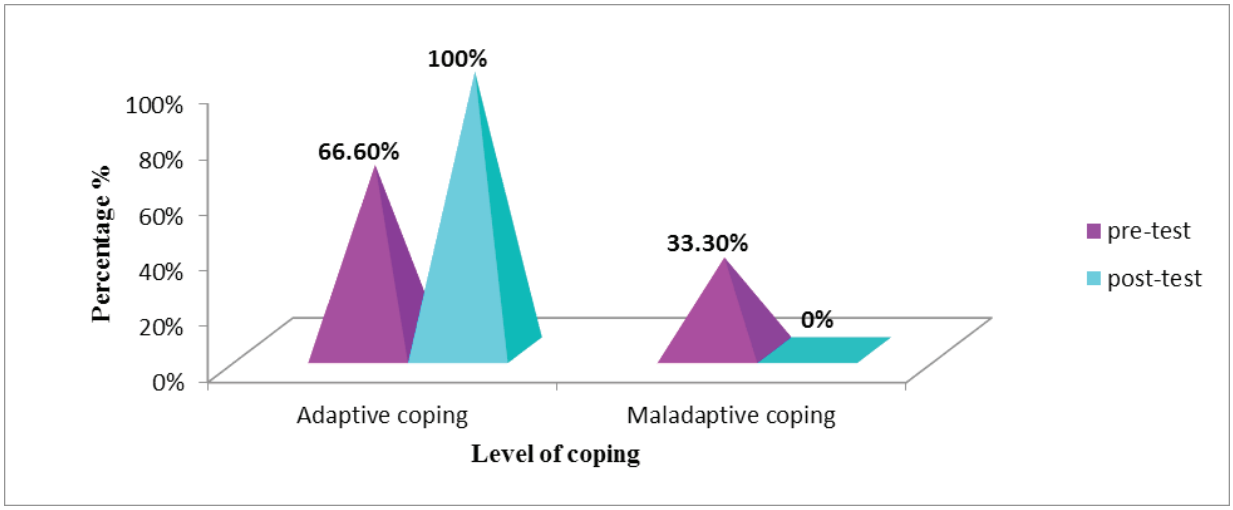

**FIGURE 2- frequency and percentage distribution of wives of alcoholics in terms of level of adaptive and maladaptive coping.**

**Table 1: Mean, MD, SD of difference, SE of mean difference and 't' value of stress and coping. N=33**

| Variable | Test | Mean ± SD | MD | SDD | SEMD | 't' value | df | P value |
|---|---|---|---|---|---|---|---|---|
| Stress | Pre-test<br>Post-test | 27.24 ±2.92<br>14.91 ±4.82 | 12.33 | 3.53 | 0.615 | 20.05 | 32 | 0.00* |

*Significant ($p \leq 0.05$) $t(32) = 2.037$

Above table-1, shows effectiveness of the Guided Imagery in reducing stress, increasing the adaptive coping and decreasing the maladaptive coping among wives of alcoholics.

**Table 2: Correlation between Stress and Coping among Wives of Alcoholics**

N=33

| Correlation | | Adaptive coping | Maladaptive coping |
|---|---|---|---|
| Stress | Pre-test<br>Post-test | -0.396(0.02*)<br>-0.458(0.00**) | -0.201(0.26)NS<br>-0.17(0.55)NS |

*- Mild/Weak negative Correlation * Significant ($p = \leq 0.05$)

**- Moderate Negative Correlation **Significant ($p = \leq 0.01$)

$r(31) = 0.291$ NS- Not Significant

There was positive association of stress among wives of alcoholics with number of children ($F=6.244$, $p=0.002$) {Wives who were having no children had higher mean (20.67) stress score than others}, adaptive coping with age ($F=4.304$, $p=0.013$) and monthly income ($F=3.964$, $p=0.008$) and maladaptive coping with type of family ($t=1.502$, $p=0.025$) at 0.05 level of significance.

Step wise regression analysis showing predictability of multiple independent variables (age and skilled worker - occupation of husband) on stress in pre-test (multiple correlation coefficient) table 3 which revealed that the age alone at 1st level of model had prediction with variability of 46.7% ($R^2=0.46$). When age is

combined with skilled worker – occupation of husband (reference group- unemployed) at 2nd level of model, then both variables combined had prediction with variability of 58.8% ($R^2$=0.58). Age alone had higher predictability in comparison to 2nd model.

**Table- 3: Step Wise Regression Showing the Predictability of Multiple Independent Variables on Stress (Multiple Correlation Coefficient) in Pre-Test N=33**

| Model | R value | R square | F value | d.f. | P value |
|---|---|---|---|---|---|
| Age | 0.68 | 0.46 | 27.16 | 1/31 | 0.000* |
| Age and Skilled worker (occupation of husband) | 0.76 | 0.58 | 8.77 | 2/30 | 0.006* |

*significant (p≤0.05)

Step wise regression showing predictability of Number of Children and any other substance used with alcohol on stress in post-test (multiple correlation coefficient) table-4. The number of children alone at 1st level of model had prediction with variability of 37.2% ($R^2$=0.37). When number of children is combined with any other substance used with alcohol at 2nd level of model, then both variables combined had prediction with variability of 45.8% ($R^2$=0.45) which means number of children alone had higher predictability in comparison to 2nd model.

**Table-4: Step Wise Regression Showing the Predictability of Multiple Independent Variables on Stress (Multiple Correlation Coefficient) in Post-Test N=33**

| Model | R value | R square | F value | d.f. | P value |
|---|---|---|---|---|---|
| Number of children | 0.61 | 0.37 | 18.37 | 1/31 | 0.000* |
| Number of children, any other substance used with alcohol | 0.67 | 0.45 | 4.75 | 2/30 | 0.03* |

*Significant (p≤0.05)

Regression coefficient was performed to check the predictability of individual independent variables (age and skilled worker - occupation of husband) in pre-test table 5. As there was predictability of age and skilled worker - occupation of husband in multiple correlation coefficient, the direction of predictability for variables is as if the variable at the first level of model when only age is included in the statistics, if the age is increasing in years by 1 point the stress level is decreasing by 0.2 points (-0.21). So when both the variables were combined at 2nd level of model, when age increases by 1 point then the stress among wives of alcoholics decreases by 0.24 points which is more in 2nd level of model as compared to 1st level of model and skilled worker as husband occupation (with unemployment as reference group) the direction of prediction for the variables is as if the skilled worker - occupation of husband is increasing by 1 point, then the stress in wives was increasing by four points (4.348).

**Table-5: Step Wise Regression Analysis Showing the Significant Predictability of Selected Individual Independent Variables on Stress in Pre-Test (Regression Coefficient) N=33**

| Model | Unstandarized Coefficients B Std Error | | Standarized Coefficients B | t | Sig. |
|---|---|---|---|---|---|
| 1.(Constant)<br>Age | 34.77<br>-0.21 | 1.49<br>0.04 | -0.68 | 23.28<br>-5.21 | 0.000*<br>0.000* |
| 2.(Constant)<br>Age<br>Skilled Worker<br>(Occupation of Husband | 35.55<br>-0.24<br>4.34 | 1.36<br>0.03<br>1.46 | -0.77<br>0.36 | 26.12<br>-6.40<br>2.96 | 0.000*<br>0.000*<br>0.000* |

*significant (p≤0.05)

Regression coefficient was performed to check the predictability of individual independent variable (number of children, any other substance used with alcohol) in post-test table-6. The direction of predictability for variables is as: if at the 1st level of model when only No. of children is included in the statistics: if the number of children is increasing by 1 point the stress level is decreasing by 2.4 points (-2.429). So when both the variables were combined at 2nd level of model, then number of children had less predictability as compared to 1st level of model. Any other substance used with alcohol, the direction of prediction is as: if the chance of consuming any other substance with alcohol is increasing by 1 point, then the stress in wives was decreasing by 3.5 points (-3.529) which further infers that if the husband uses any other substance with alcohol then the stress is decreasing among wives.

**Table-6: Step Wise Regression Analysis Showing the Predictability of Selected Independent Variables on Stress in Post-Test (Regression Coefficient) N=33**

| Model | Unstandarized Coefficients B Std Error | | Standarized Coefficients B | t | Sig. |
|---|---|---|---|---|---|
| 1.(Constant)<br>Number of Children | 19.69<br>-2.42 | 1.30<br>0.56 | -0.61 | 23.28<br>-5.21 | 0.000*<br>0.000* |
| 2.(Constant)<br>Number of Children<br>Any other Substance used with Alcohol | 19.81<br>-2.11<br>-3.52 | 1.23<br>0.55<br>1.61 | -0.53<br>0.30 | 16.06<br>-3.81<br>-2.18 | 0.000*<br>0.000*<br>0.003* |

*significant (p≤0.05)

## Discussion

In the present study, 60.6% wives of alcoholics were having severe stress, 66.6% were having adaptive coping and 33.3% were having maladaptive coping. These all findings was consistent with the findings of the study conducted by Nagesh V (2015)[3] where it was found that highest percentage 100% of the wives of alcoholics had Moderate stress, Further assessment of the overall levels of coping shows that highest percentage 98.33% of the wives of alcoholics were able to cope to some extent, 1% of wives were able to cope effectively.

In the present study, Guided Imagery was found to be an effective intervention in reducing stress among wives of alcoholics as there was significant reduction in stress score ('t'=20.056, p=0.00). This finding was consistent with the findings of the study conducted by Dell, Samuel's (2011) [4] where the results revealed that majority of the spouse of alcoholics [F(21,11)=1.05,p>.05] benefitted with the guided imagery technique to handle their life stress. Another study also well support the findings of present study conducted by James and Goldman's (2001)[5] where they found that Guided Imagery was effective in reducing stress among spouses of alcoholics. Further these findings are consistent with the study conducted by Divyabala S and Srinivasan P (2013)[6] which revealed that after intervention, there was a significant difference in the mean score of stress before and after guided imagery i.e the calculated 't' value was 19.613 and it was statistically significant at 0.05 level.

In the present study, Guided Imagery was found to be an effective intervention in terms of coping (adaptive coping 't'=6.91, p=0.00 and maladaptive coping 't'=6.87, p=0.00). This finding was consistent with the findings of the study conducted by vanitha rani, J Venkatesan and R Vijayaragavan (2016) [6] where the results of the study revealed that, the calculated 't' test value for stress ('t'=22.96) and coping ('t'=26.60) had a significant difference between the pre and post test levels of stress and coping among the caregivers of alcohol dependents at 0.05 level of significance.

In the present study, there was moderate negative correlation of stress with adaptive coping [r=-0.458, p=0.00]. The findings of the present study was partially supported by James and Goldman's (2001)[5] quasi experimental study where the study results (r(148) = .17, p =.07) revealed that there is a significant relationship between Guided imagery and intellectual life skill training and the stress reduction among the spouse of alcoholics. Another study also well supported the findings of present study conducted by vanitha rani, J Venkatesan and R Vijayaragavan (2016) [8] where the results revealed that there was moderate negative correlation between the post test scores of stress and coping i.e. r= -0.7 for both groups.

In the present there was significant association of number of children (p=0.002) with stress and type of family (p=0.025) with maladaptive coping. These findings of the study are consistent with the study conducted by Nagesh V (2015)[3] where they found that only age and number of children had significant association with perceived stress ($\chi^2_{(3)=}$ 8.67 and $\chi^2_{(3)=}$ 7.55) at 0.05 level of significance and in the coping type of family ($\chi^2_{(1)}$=5.455) had association.

## Conclusion

Guided Imagery was effective in reducing stress and improving adaptive coping among wives of alcoholics.

**Conflict of Interest:** NIL

**Funding Sources:** SELF

**Ethical approval:** The ethical clearance was obtained from university research ethics committee of Maharishi Markandeshwar University Mullana, Ambala (MMU/IEC/197) and the study was carried out in accordance with the guidelines laid by Indian Council of Medical Research ICMR(2006). The permission was taken to conduct the study in the De-addiction centre (from Chief Medical Officer of Civil Hospital Ambala city).

# Predicting the Existence of Brain Tumor in Mri Images by Applying FCNN

**Sylvester Ranjith F[1], Parveen Sultana H[2]**

*[1]Student, [2]Associate Professor, School of Computer Science and Engineering, Vellore Institute of Technology, 632014 Vellore, India*

## Abstract

Brain tumors are major causes of death in today's world and methods of detecting them prematurely require vast improvement. The objective of this project is to detect the tumors early from MR image scans by utilizing deep convolutional networks to locate the tumor.The tumor is divided at first in the main stage and the generated bounding box is utilized for the center of the tumor in second step. This is trailed by division based on the bounding box of the tumor center division result. Examinations are performed with the BraTS 2017 validation set. This is a numerous division issue.

## Introduction

Brain Tumors are one of the world's leading causes to high increase in mortality rate. Detecting tumors has always been a challenge to doctors. Predicting tumors in the brain has always been a hit or miss situation with most of the predictions being less accurate. To mitigate this problem and increase the accuracy we propose an automated solution by utilising image processing and segmentation techniques by which the rate of predicting tumors could be improved.

In this paper, we discuss about the various utilizations of CNN in the field of medical imagery and detection of brain tumors from Magnetic Resonance (MR) images. Convolutional neural network has demonstrated their fortitude in the field of Image Processing and Segmentation. The results provided by convolutional neural networks are reliable and accurate. The methods by which Deep Convolutional Neural Networks can be applied to the problem of predicting the existence of tumors in the brain is explained and discussed in detail. The images utilized for validation of our model is the BraTS 2017 MRI scan images.

In study conducted by Ronneberger et.al., they suggested a method of utilising a FCNN to segment the given images utilising the sliding window protocol to mark the region of interest in the image and later classify the provided images as scans of patients with cases of tumor and patients without tumor.[1] This method was promising as it was able to accurately predict the classifications.

In this paper, authors devised an innovative method in training the convolutional neural network by releasing Tensor Layer a high-level module that allows to extract the operations towards neuron layers, network models and dependent training jobs.[2] It offers a basic yet advanced interface enabling developers to implant low-level controls with a backend motor. It is profoundly versatile and gives an unrivalled performance.

In this paper, a method proposed for an automatic and reliable segmentation approach based on CNN by exploring small 3 x 3 kernels.[3] The utilization of small kernels permits developing more profound architecture other than evacuating the plausibility of over fitting

**Corresponding Author:**

given the smaller number of loads in the system. Through examination strategies including both CNN-based division techniques with information, enlargement demonstrated to be exceptionally powerful for MRI pictures.

The authors of this paper proposed a method to utilize K-means algorithm for color-based segmentation. In their proposed strategy, the procedure is utilized to follow tumor objects in MR brain pictures.[4] The procedure includes the transformation of given grey level MR pictures into a color space picture and separates the position of the tumor object from different things of MR picture utilizing K-means bunching and histogram clustering.

In this study, Pham et al. presented a critical appraisal and comment on the various automated and semi-automated methods for segmentation of anatomical medical images.[5] Current advances in segmentation approaches are viewed on basis of their respective advantages and disadvantages respectively.

In this paper, authors have described a methodology by which the brain scan is retrieved from the patient's database during which the noise and artifact of the image are removed.[6] This method utilizes HSom for image segmentation which is used to classify an image row by row. It improves on computational speed and ensures that noise is very less in the image before classification.

In this study, Kaus et al. proposed a mechanized brain tumor division approach which was trained and tested against manual division strategies with three-dimensional MR images with MGG and LGG.[7] The proposed strategy permitted quicker identification of brain and tumor tissue with great preciseness and reproducibility comparable to manual division.

In this paper, the authors have proposed a technique for detection of tumors in digital mammography.[8] This technique involves two strategies, division by which regions of intrigue are extracted from pictures by adaptive thresholding. By using an altered Markov Random Field-based strategy division is done precisely. The classification was done on the segmented images by a fuzzy binary decision tree to get accurate results.

In this work, Sharif et al. described the advantages and disadvantages of utilising Convolutional Neural Networks based on a series of classifications performed on ILSVRC13 dataset utilizing the over feat network model for object classification.[9] They conclude that convolutional neural networks are the best for image classification and object recognition tasks.

The authors of this work presented a flexible framework for object instance segmentation.[10] This strategy at the same time recognizes objects of interest and furthermore produces a great division cover for each example. This technique is named Mask R-CNN which expands Faster R-CNN by including an expectation branch alongside the current branch for bounding box acknowledgement. It is anything but difficult to prepare and doesn't include any computational overhead since it works in parallel with the current procedure.

In this work, Ren et al. proposed a methodology called Region Proposal Network which offers full-image convolutional features with the discovery network enabling nearly cost-free region.[11] An RPN is an FCN that all the while predicts object limits and objectless scores at each position. RPNs are prepared end to end to create top-notch locale recommendations, which are utilized by Fast R-CNN for identification. The preciseness of this model is significantly higher contrasted with different models and the ideal opportunity for preparing is likewise less contrasted with the nonexclusive convolutional neural net models

The authors discussed a methodology of extending the pre-existing CNN architectures in this paper for the purposes of medical imaging.[12] The method of annotating images and training the images on a convolutional neural network is discussed in great detail in this paper.

In this paper, Krizhevsky et al. discussed a method by which overfitting can be prevented in convolutional neural networks by employing a regularization method while training the network on high resolution images in the LSVRC-2010 ImageNet training set on 1000 different classes.[13]

In this study, creators have talked about an enhanced adaptation of image object identification and acknowledgement with a neural algorithm of artistic style that can isolate and recombine the picture substance and style of the normal image.[14] The algorithm enables new bits of knowledge to profound picture portrayals

learned by Convolutional Neural Networks and exhibit their potential for high-level image synthesis and manipulation.

The creators of this work explained the utilization of the 100-layer Tiramisu design for the division of cerebrum tumor from multi-modular MRI, which is developed by coordinating a densely connected FCNN, followed by post-handling utilizing a Dense Conditional Random Field (DCRF).[15] The system comprises of squares of thickly associated layers, progress down layers in down-examining way and change up layers in up-inspecting way. The proposed system accomplishes a mean entire tumor, tumor center and dynamic tumor dice score of 0.87, 0.68 and 0.65. Separately on the BraTS '17 approval set and 0.83, 0.65 and 0.65 on the Brats '17 test set.

## Material and Method

The comparative analysis utilizes a FCNN for the purposes of segmentation of the input image and several classifiers to get predictions on the possibility of a patient having a tumor. The additional classifiers were added to check for the possibility of increased accuracy in the prediction scores. The input image is fed into the FCNN and allowed to train on the network for 150000 epochs. At the end of the training process the image is segmented. The Convolutional Neural Network is able to extract features from the images. Each layer's output serves as an input for the other layer and so on. The implementation is done by using Keras framework with TensorFlow backend. To save time in training the network, both the LGG and HGG images are trained simultaneously on the network. The proposed method gets the confidence score from the FCNN and the confidence values are then fed into the above-mentioned classifiers to get an accurate prediction. The segmentation of the images results in accurate region localization of the tumors present in the scans. The results obtained are then fed into the rudimentary classifiers for post-processing and getting an accurate result. Figure 1 is the process flow of the proposed network for one epoch. The result of segmentation for one image is tabulated as follows in Table 1.

**Table 1: Values for Tumor Score Measures**

| **Volume ID: HGG/Brats17TCIA3741** | |
|---|---|
| **Measure** | **Value** |
| Dice Complete Tumor Score | 0.8921 |
| Dice Core Tumor Score | 0.8914 |
| Dice Enhancing Tumor Score | 0.8379 |

## Findings and Discussion

The following results are inferences which were got from the various classifiers utilized. Performance of the classifiers are measured by using standard measures like accuracy, F1-score, precision and recall.

Figure 2 describes the accuracy score of the various classifiers plotted on a bar-graph to show the best of the five chosen classifiers. Preciseness is one metric for assessing arrangement models. In our analysis Decision tree classifier was able to get a better accurate prediction while comparing the other classifiers. Multilayer perceptron performed the second best in accurately classifying the provided data samples.

Figure 2 also describes the precision score of the various classifiers plotted on a bar-graph to show the precision of the chosen five classification algorithms. Precision score is highest in Decision Tree Classifier and Multilayer Perceptron Classifier proving for the second time that these classifiers perform well for our testing dataset.

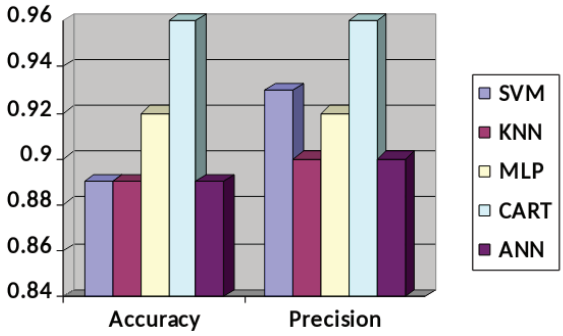

**Figure 2: Accuracy and Precision Charts for the Used Classifiers**

Figure 3 portrays the F1-score of the different classifiers plotted on a bar graph to show the F1-score of the picked five grouping calculations. F1-score is most noteworthy in Decision tree classifier and Multilayer Perceptron classifier. These classifiers are appropriate for our testing dataset.

Figure 3 also describes the recall-score of the various classifiers plotted on a bar-graph to show the recall score of the five classifiers used in this experiment. Recall-score is highest in Decision tree classifier and Multilayer Perceptron classifier. These classifiers are well suited for our testing dataset. From these results we can conclude that we can utilize a decision tree classifier or a multilayer perceptron classifier to augment the results obtained from the Fully Connected Convolutional Neural Network Architecture.

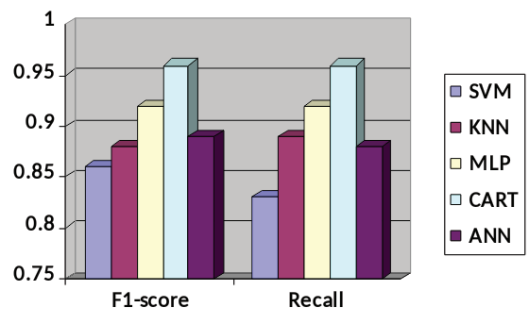

**Figure 3: F1-Score and Recall Charts for the Used Classifiers**

## Conclusion

We have discussed a method of improving the accuracy and precision of predicting a tumor present in the BRATS2017 Brain Scan images by utilising a FCNN to segment the image and further classify and predict using the rudimentary classifiers like SVM, KNN, CART and ANN. This combined methodology reduces the time taken to train and predict the tumor and provides a considerably accurate prediction. The results that we obtained show that utilising a decision tree classifier (CART) to augment the FCNN architecture results provides the best performance metrics.

# Effect of Video based Teaching on Knowledge and Attitude regarding ADHD of Children among Primary School Teachers

**Vijyeta Bhasin[1], Srinivasan P.[2], Uma J. Deaver[3], Jyoti Sarin[4]**

*[1] Nursing Tutor, Department of Mental Health Nursing, Maharishi Markandeshwar Institute of Nursing, Mullana, Haryana, India, [2] Former Associate professor, HOD of Depasrtment of Mental Health Nursing, Maharishi Markandeshwar College of Nursing, Mullana, Haryana, India and currently working as Nursing tutor at AIIMS Patna, India, [3] Professor, HOD of Department of Community Health Nursing, [4] Dean, Director- Principal of Maharishi Markandeshwar College of Nursing, Mullana, Haryana, India*

## Abstract

**Background:** Attention deficit hyperactivity disorder (ADHD) is the most pervasive disorder of childhood affecting about 3% to 5%. Early identification and intervention of this problem are very important to address issues at early age. **Materials and method:** Quantitative approach and quasi experimental non equivalent control group pretest-posttest design was used. Total 100 primary school teachers (54 in experimental group and 46 in comparison group) were recruited by convenience sampling technique. Tools in the study were selected variables, structured knowledge questionnaire and structured attitude scale. **Results:** Mean post-test knowledge score (t= 5.24, p=0.00) and mean posttest attitude score (t=4.10, p=0.00) was higher than mean pretest knowledge and attitude score in experimental group. There was a weak positive correlation (r=0.282) in experimental and a moderate positive correlation (r=0.406) in comparison group. There was no significant association of knowledge except gender (p=0.03) and teaching experience (p=0.04) in experimental group and except religion (p=0.03) in comparison group. There was no significant association of attitude in experimental group and except age (p=0.03) in comparison group. Regression shows teaching experience having predictability, R= 30.10% (0.301) on knowledge and qualification having predictability on attitude, R= 34.20% (0.342) in experimental group. In comparison group, number of children having predictability, R= 32.70% (0.327) on attitude. It was concluded that Video based teaching was effective to improve the knowledge and attitude regarding ADHD of children.

***Key words:*** *Video based teaching, Knowledge, Attitude, Primary school teachers, ADHD, children*

## Introduction

Attention deficit hyperactivity disorder (ADHD) is reportedly the most pervasive disorder of childhood affecting approximately 3% to 5% of school-aged children and its prevalence rate increasing significantly over the past two decades[1]

According to American Psychiatric Association, ADHD is defined as "the disorder, characterized by a persistent pattern of inattention and/or hyperactivity-impulsivity that is more frequently displayed and more severe than is typically seen in individuals at a comparable level of development."[2] ADHD is usually first diagnosed in childhood and many children who diagnosed with ADHD demonstrate symptoms that persist later into adolescence and adulthood.[1]

**Teachers have a main impact on children's health. Currently, the need of ADHD children in India is not being met in schools. These children could function very well in a regular school and learn valuable social skills from his peers.**[3]

**Corresponding Author:**
**Vijyeta Bhasin**
Nursing Tutor, Department of Mental health nursing
Maharishi Markandeshwar Institute of Nursing
Mullana, Haryana, India, vvvijyeta@gmail.com

If the special needs of these children are not met, it will result in poor academic performance and related psycho-social problems. Thus, early identification and intervention of these problems are very important. **Teachers must be trained to identify the symptoms of ADHD and learning disabilities in schools, so that issues can be addressed at early age.**[4]

Studies show that interventional programs have a role in an increasing knowledge of teachers regarding ADHD, improving awareness and understanding for this disorder which lead to better performance of these children in the classroom..[5]

## Methodology

The study was conducted during the period from March 2017 to July 2018 in the state of Haryana, India. A sample of 100 primary school teachers participated in this quasi-experimental study with the prior permission from District Education Officer. The ***ethical clearance*** was obtained from university research ethics committee of Maharishi Markandeshwar Deemed to be University Mullana, Ambala (MMDU/IEC/975) and the study was carried out in accordance with the guidelines laid by Indian Council for Medical Research ICMR (2006). The written consent from primary school teachers was collected prior to the study. Quantitative research approach with quasi-experimental non equivalent control group pretest post test design was used in this study. Primary school teachers who were working in selected Govt. primary schools of Ambala District, willing to participate in the study, able to read, write and understand Hindi were included for experimental group with the same criteria was included for comparison group. Primary school teachers who were working on part time basis and not available at the time of data collection were excluded. One Hundred participants were enrolled for the study. Out of which 54 primary school teachers were enrolled as experimental group with convenience sampling technique and 46 primary school teachers were enrolled as comparison group with convenience sampling technique. Data was collected by using structured knowledge Questionnaire and structured attitude Scale.

### Description of Tool

1. ***Selected variables:*** Age, gender, qualification, marital status, number of children, religion, teaching experience, exposure to children with ADHD and source of information.

2. ***Structured knowledge questionnaire:*** Structured knowledge questionnaire consisted of 25 items related to knowledge, which were collected from participants with self report (Paper and pencil) technique. The calculated KR20 internal consistency was 0.87

3. ***Structured attitude scale:*** Structured attitude scale (5- point Likert scale) consisted of 23 items on attitude, which were collected from participants with self report (Paper and pencil) technique. The calculated Cronbach's alpha internal consistency was 0.84

### Procedure

The permission was taken to conduct the study in the Government primary schools from District Education Officer of Ambala District, Haryana. Final study was conducted in the month of October 2017- November 2017. Hundred teachers were selected using convenience sampling technique. Conveniently 26 schools were selected that is 10 schools for experimental group and 16 schools for comparison group and then the sample was chosen by convenience sampling technique. The subjects were informed regarding the objectives of the study and written consent was obtained. In experimental group, pre test was taken on day 1 between 9 am to 2 pm by administering the tool (selected variables, structured knowledge questionnaire and attitude scale). Maximum 2 schools were covered per day. Video of 30 minutes duration was shown on same day after pretest in a group of minimum 3 to maximum 10 primary school teachers with the help of laptop. Post test was taken on day 15. In comparison group, pre test was taken on day 1 between 9 am to 2 pm by administering the tool (selected variables, structured knowledge questionnaire and attitude scale). Maximum 4 schools were covered per day. No intervention was given to comparison group. Post test was taken on day 15. The data was collected and analyzed as per the plan of analysis by using SPSS version 20.

## Results

Mean post-test knowledge score (t= 5.24, p=0.00) and mean posttest attitude score (t=4.10, p=0.00) was

higher than mean pretest knowledge and attitude score in experimental group. There was a weak positive correlation (r=0.282) in experimental and a moderate positive correlation (r=0.406) in comparison group. There was no significant association of knowledge except gender (p=0.03) and teaching experience (p=0.04) in experimental group and except religion (p=0.03) in comparison group. There was no significant association of attitude in experimental group and except age (p=0.03) in comparison group. Regression shows teaching experience having predictability, R= 30.10% (0.301) on knowledge and qualification having predictability on attitude, R= 34.20% (0.342) in experimental group. In comparison group, number of children having predictability, R= 32.70% (0.327) on attitude.

Before administration of video based teaching, In experimental group, more than half of the teachers (55.6%) were having poor knowledge, less than half of the teachers (40.7%) were having average knowledge and least number of the teachers (3.7%) were having poor knowledge whereas in comparison group less than half of the (43.5%) teachers were having average knowledge, approximately One third of the teachers(34.8) were having poor knowledge, One fifth of the teachers (19.6%) were having good and least number of the teachers(2.2%) were having very poor knowledge.

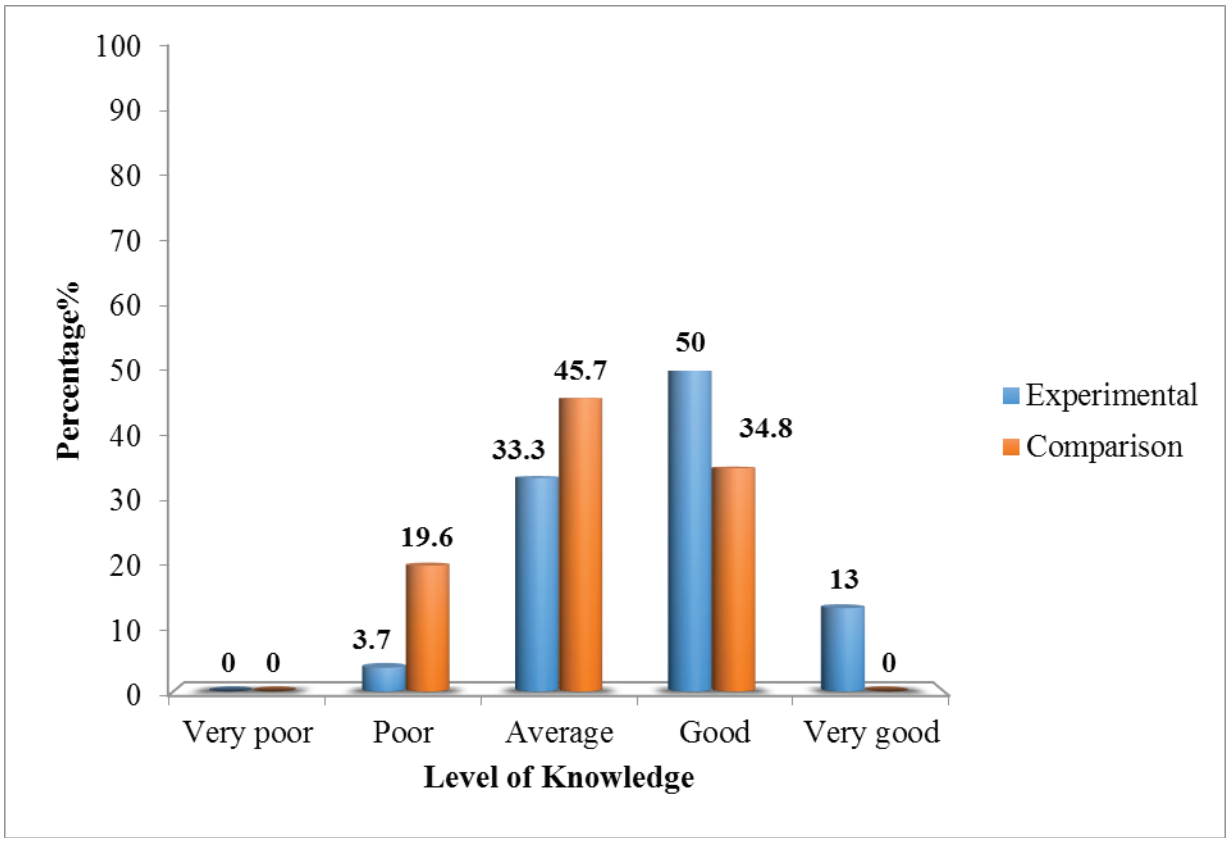

**FIGURE 1- LEVEL OF KNOWLEDGE AFTER ADMINISTRATION OF VIDEO BASED TEACHING**

After administration of video based teaching, In experimental group, half of the teachers (50%) were having good knowledge, one third of the teachers (33.3%) were having average knowledge, one third of the teachers (34.8) were having good knowledge, less than one third of the teachers (13%) were having very good knowledge and none of the teachers were having very poor knowledge. Whereas in comparison group less than half of the (45.7%) teachers were having average knowledge, one third of the teachers (34.8%) were having good knowledge, least number of the teachers (19.6%) were having poor knowledge and none of the teachers were having very good knowledge.

**Table 1: Mean, Mean difference, Standard deviations of difference, Standard error of mean difference and 't' value of Knowledge and Attitude among Primary school Teachers**

**N=100**

| Variable | Group | Mean± SD | MD | SEMD | 't' value | df | p value |
|---|---|---|---|---|---|---|---|
| Knowledge (pre-test) | Experimental (n=54)<br>Comparison (n=46) | 19.59±5.48<br>24.26±6.54 | 4.66 | 1.20 | 3.88 | 98 | 0.00* |
| Attitude (pre-test) | Experimental (n=54)<br>Comparison (n=46) | 150.63±13.26<br>167.70±13.67 | 17.06 | 2.70 | 6.32 | 98 | 0.00* |
| Knowledge (post-test) | Experimental (n=54)<br>Comparison (n=46) | 33.26±6.57<br>26.46±6.29 | 6.80 | 1.29 | 5.24 | 98 | 0.00* |
| Attitude (post-test) | Experimental (n=54)<br>Comparison (n=46) | 172.06±13.40<br>162.15±10.15 | 9.90 | 2.41 | 4.10 | 98 | 0.00* |

t(98)=1.90 *- significant (p≤0.05)

the calculated 't' value of knowledge (5.24) was more than table value i.e. 1.90 at df(98) which indicated that there was a significant difference in the mean score of knowledge between experimental and comparison group. The calculated 't value of attitude (4.10) was more than table value i.e. 1.90 at df(98) which indicate that there was a significant difference in the mean score of attitude between experimental and comparison group which inferred that difference in the mean score was of a true difference and not by chance that post-test knowledge and attitude score of experimental group was significantly higher than post-test knowledge and attitude score of comparison group.

**Table 2: Correlation between Knowledge and Attitude among Primary school teachers N=100**

| Correlation (Post test) | Group | Knowledge r (p value) | Attitude r (p value) |
|---|---|---|---|
| Knowledge | Experimental (n=54) | xx | 0.28 (0.039)* |
| Attitude | Comparison (n=46) | 0.40 (0.005)** | xx |

*- mild correlation (weak correlation) *- significant (p≤0.05)

**- moderate correlation **- highly significant (p≤0.01)

r(52)=0.202 r(44)=0.241

There was a weak positive correlation (r=0.282, p=0.039) between knowledge and attitude in experimental group and there was a moderate positive correlation (r=0.406, p=0.005) between knowledge and attitude in comparison group.

**Table 3: Post hoc value showing significant Mean difference in association of Knowledge regarding ADHD of children among Primary school teachers with Selected Variables**

**N=100**

| | | **Category** | **Mean difference** | **Standard error** | **P value** |
|---|---|---|---|---|---|
| Group Experimental group (knowledge) | Variables Teaching experience (in years) | <5 vs 6-10 | -4.385 | 2.447 | 0.79NS |
| | | <5 vs 11-15 | -7.231 | 2.447 | 0.005* |
| | | <5 vs more than 15 | -3.882 | 2.364 | 0.107 NS |
| | | 6-10 vs 11-15 | -2.846 | 2.447 | 0.250 NS |
| | | 6-10 vs more than 15 | 0.503 | 2.364 | 0.832 NS |
| | | 11-15 vs more than 15 | 3.349 | 2.364 | 0.163 NS |
| Comparison group (attitude) | Age (in years) | 21-30 vs 31-40<br>21-30 vs >40<br>31-40 vs >40 | 5.042<br>2.772<br>7.814 | 5.898<br>5.984<br>2.958 | 0.671NS<br>0.889NS<br>0.030* |

In experimental group, the calculated ANOVA and 't' test value between knowledge score and selected variables was found to be statistically non significant except total teaching experience (F=3.95, p= 0.04). Post hoc shows that as teaching experience was significantly associated with knowledge, category <5 vs 11-15 was having significant high mean difference (p=0.005).

In comparison group, the calculated ANOVA and 't' test value between attitude score and selected variables was found to be statistically non significant except age (F=3.52, p=0.03) Post hoc shows that as age was significantly associated with attitude, category 31-40 vs >40 was having significant high mean difference (p=0.030).

Multiple regression analysis was performed to predict the effect of multiple independent variables( selected variables) over the dependent variable i.e., knowledge and attitude among experimental and comparison groups

**Table 4: Stepwise regression showing Predictability of Multiple Independent Variables on Knowledge and attitude among Experimental and comparison group (Multiple correlation coefficient)**

**N=100**

*Significant (p≤ 0.05)

In pretest, the teacher those who are having <5 years of teaching experience (reference group- >15 years teaching experience) having prediction with variability of 9% ($R^2$=0.090) in knowledge among experimental group. The teacher those who are having qualification of elementary teacher training (reference group- other qualification) having prediction with variability of 11.70% ($R^2$=0.117) in attitude among experimental group. The teacher those who are having two children (reference group- more than two children) had prediction with variability of 10.7% ($R^2$=0.107) in knowledge among comparison group.

In post test, the teacher those who are having 11-15 years of teaching experience (reference group >15 years teaching experience) having prediction with variability of 11.20% ($R^2$=0.112) in knowledge among experimental group. Age having prediction with variability of 14.70% ($R^2$=0.147). Further if age combines with Hindu religion (reference group- Muslim religion), both variables together having prediction with variability of 23.10% ($R^2$=0.147) in attitude among comparison group.

## Discussion

In present study, half of the primary school teachers (50%) belong to age group of less than 40 years. These findings are consistent with the study conducted by Shobha Masih, Rajesh K and Atul Kumar (2014)[6] where they found that half of the primary school teachers (50%) belong to age group of less than 40 years.

In present study, pretest mean knowledge score (19.59) was lower than posttest mean knowledge score (33.26), p=0.00. These findings were consistent with the findings of Maloti DK (2006)[7] where it was found that pretest knowledge mean score (27.32) was lower than posttest mean knowledge score (34.76, p<0.00).

In present study, pretest mean attitude score (150.63) was lower than posttest mean attitude score (172.06), t=10.299 with p=0.00) These findings were consistent with the findings of various studies i.e., study conducted by Gopi D, S Deepa (2016)[8] where they found that pretest attitude mean score (27.72) was lower than posttest mean attitude score (46.95, t=21.92 with p<0.001).

In present study, there was a significant weak positive correlation between post knowledge and attitude score in experimental group and a significant moderate positive correlation between post knowledge and attitude score in comparison group (r0.282, p=0.039). These findings were consistent with the findings of Patil P (2013)[9] where it was found that there was significant positive correlation between knowledge and attitude of primary school teachers (r=0.27, p=0.003) at 0.05 level of significance.

In the present study, there was significant association of age with attitude regarding ADHD of children among primary school teachers (F=3.527, p=0.038) was significant associated with attitude. These findings were consistent with the findings of Naregal P (2015)[10] where it was found that age ($\chi^2$=14.769, p<0.05) was having significant association with attitude.

# Illegalities and Infirmities in Implementation of 'Ex-Servicemen Contributory Health Scheme: Public Audit Findings and Other Irregularities - An Analytical Study

**Bhupal Singh[1], Asha Verma[2]**

*[1] Ph.D. Scholar (Law), [2]Professor (Ph.D. Guide), Amity Institute of Advanced Legal Studies, Amity University, Noida (UP)*

## Abstract

The objective of the study is to find out the deficits in the Ex-servicemen Contributory Health Scheme (ECHS) that was introduced in 2003 by the Government of India as a panacea for all health needs of veterans' fraternity. The study also analyses these deficiencies and submit certain tangible recommendations with a view to improvise the existing health scheme which should enhance the satisfaction level of the ECHS beneficiaries availing the medical facility. The article critically examines various flaws and shortcomings in the implementation of contributory health scheme meant for retired armed forces personnel and their family members. Author focusses on the public audit findings on the performance of the healthcare scheme to evaluate the working of the medicare facility available under the health scheme.

***Key words:*** *ECHS, Health Schemes, Ex-servicemen' Health, CAG Audit*

## Introduction

*"To save your world you asked this man to die;*
*Would this man, could he see you now, ask why?"*

Epitaph for an unknown soldier
W.H. Auden, (1907-1973), Critic & Poet from USA

Till 2002, there was no appropriate healthcare scheme for Retired Armed Forces personnel (referred hereinafter as veterans) and their family members, and they were struggling to manage their medicare after hanging their uniforms. However, certain medical facilities were available under armed forces insurance schemes which were inadequate as compared to Central Government pensioners. For want of quality healthcare, veterans were agitated and even filed Public Interest Litigation (PIL) in the Apex court to claim "full and free medicare to ex- servicemen and their dependents as one of the fundamental rights guaranteed under the Constitution of India".[1] Although veterans failed to obtain free medicare rights, yet during the litigation, a health scheme namely Ex-servicemen Contributory Health Scheme (ECHS) was approved by the Central Government, in April 2003, to provide comprehensive healthcare on the pattern of Central Government Health Scheme (CGHS) to all ex-servicemen and their dependents.[2] The scheme is contributory and compulsory for all ex-servicemen.

**Spread of ECHS:** Ex-servicemen are mostly spread in villages and small towns all over the country. Presently, 353 districts of the country are covered under the health scheme which is administered with 28 regional centres and 427 ECHS polyclinics [PCs] catering approximately 56 lakhs beneficiaries.[3] Fixed Medical Allowance is granted for the ex-servicemen residing in non-coverage districts. Mobile medical units are also being planned to reach out to far flung and remote areas. 2634 medical facilities have been empanelled to provide treatment and hospitalisation to the beneficiaries. Polyclinic is a primary health centre which functions as Out-Patient Department (OPD)

for consultation, essential investigation and provision of medicines and also for referral to service hospital/ empanelled hospital for treatment and hospitalization of patients. Every year 55-60 thousand ex-servicemen add to the scheme making it a gigantic healthcare scheme and at the same time, an insurmountable challenge for the scheme's managers to run the show efficiently and satisfactorily.

**Evaluation of ECHS by Public Audit:** After more than 15 years of implementation of the medicare scheme, national auditor i.e. Comptroller and Auditor General of India (CAG), has decided to audit the performance of the health scheme and to examine whether ECHS was able to achieve its aims and objectives. Public audit was particularly concerned with the availability of healthcare infrastructure, patient referral procedure, payment to empanelled hospitals, supply chain of medicines to polyclinics and efficacy of Online-Bill processing system. CAG has found numerous deficiencies in the healthcare system that fails to achieve the desired results of looking after the healthcare of our veterans in their old age.

Public auditors have reviewed ECHS performance for the period of financial years 2012-13 to 2014-15 and has submitted its report to the Parliament on 22 December, 2015 under Article 151 of the Constitution. The audit report[4] is based on the examinations of various activities concerning ECHS at 7 Principle/ Controllers of Defence Account, 10 Regional Centres, 22 Polyclinics, 20 ECHS cells, 15 Service Hospitals and 2 Armed Forces Medical Supply Depots (AFMSD). Such coverage entails inspection of wide spectrum of operational activities of the health scheme so as to arrive at a holistic conclusion.

## Methods and Material

CAG report [ No. 51 of 2015] on ECHS performance is the primary material used in the analysis. Report [No.5] of Departmentally-Related Parliamentary Standing Committee on Defence (2019-20) which examined the budgetary estimates of the health scheme for the year 2020-2021 was also scrutinised. Origin of the ECHS was also traced to search the litigation behind the scheme. Parliamentary debates are also the primary data that show the valuable indicators to facilitate appraisal of the scheme. Government departments' websites were referred for information and data. Annual report (2018-19) of Ministry of Defence has also been studied and utilised.

Descriptive research has been applied to explain and describe 'is' aspects of the health scheme that has facilitated to reach at 'ought to be' factors. Inductive approach has also been utilised to arrive at conclusions. Health scheme has been evaluated and analysed specifically with normative perspective.

## Discussion

**Smart health cards**: Various flaws were found in the ECHS implementation which resulted into financial loss to the exchequer and low-level satisfaction amongst beneficiaries. Against the essence of the health scheme sanction, veterans were charged money for smart-cards without Government's approval while they were required only to pay membership fee of the health scheme at the rate applicable to the rank in which they had retired. Rs. 47.84 crores were collected from the beneficiaries and paid to the vendor, who manufactured 42 lakh smart-cards between January 2004 to February 2015.

ECHS renewed the agreement in May 2010 for five years with the same vendor at the higher cost of Rs.135 per card (initially it was 89.99 per card) without calling tenders. and even market rates were not verified. It burdened the beneficiaries and the health scheme financially. Presently, cost is Rs.177 per smart-card which ECHS beneficiaries have to bear unlike CGHS beneficiaries who are not required to pay for their health-cards. ECHS members have paid twice for cards as the health scheme has undergone technical upgradation for converting initial smart-cards to 64 kb smart cards.

**Multiple and ineligible enrollment:** Use of multiple cards by the same Ex-servicemen (ESM) having different IDs were observed. Smart-card data was found to be defective and unreliable that carries risk of fraudulent payment to hospitals and treatment to unauthorised persons. Internal control mechanism to verify multiple enrollment was lacking. 7431 smart-cards more than the quantity manufactured by the vendor were found extra and in circulation. It posed a risk of misuse and also resulted in extra payment of Rs6.69 lakh to the firm. Many ESM were enrolled more than once under different IDs whereas each ESM was to possess

only one unique ID.

**Excess load on polyclinics:** Medical infrastructure and manpower depend on the authorised capacity of the polyclinic. Many polyclinics were found functioning beyond their authorised capacity which resulted into poor quality of medicare services due to unavailability of medical staff and infrastructure.

**Benefits to ineligible dependent beneficiary.** An expenditure of Rs. 1.92 lakh was incurred on the treatment of ineligible beneficiaries. Sons of ESM on attaining the age of 25 years become ineligible to avail medical facility, but 22 referrals were provided by polyclinic after the beneficiaries had attained the age of 25 years, and 14 beneficiaries had attained the age of 25 years after issue of referral but before commencement of treatment. No mechanism existed (Dec,2015) to re-verify the dependency status of ineligible beneficiaries.

**Expired-medicines:** Life-expired medicines costing Rs. 73.44 lakhs (March 2015) were at AFMSD Delhi Cantt and Polyclinic, Lodhi Road which were required to be returned for replacement to the supplier before three months of expiry dates. This has resulted into wasteful expenditure and poor services to the beneficiaries.

**Excess payment in procurement of oxygen gas:** Receipt and consumption quantity of liquid oxygen found mismatch in the Army Hospital (R & R), Delhi in the records. In the documents maintained, consumption of liquid gas was shown more than what the quantity was received that involved excess payment of Rs. 28.15 lakh to the vendor.

**Diversion of ECHS medical stores:** ECHS medical stores were utilised for treatment of soldiers in military hospitals. Store accounting were not maintained separately to segregate the ECHS stores, which impacts the health services adversely to the entitled ECHS beneficiaries. Army Hospital (R & R), Delhi was found using ECHS medical store in violation of established laid down procedure. Serving personnel seeking treatment in service hospitals are not entitled to avail ECHS medical stores which is primarily meant for ECHS beneficiaries.

**Medical equipments but no technician to operate:** In some polyclinics, X- Ray and Ultrasound machines were authorised but there was no manpower sanction to operate such machines. Interestingly, 22 such machines for 13 polyclinics were procured knowing well that no staff would be available to operate these machines which resulted into avoidable expenditure and idling of machines in clinics. It is saddening to note such apathetic planning to run medical services.

**Shortage and deployment of manpower:** Persistent shortage of staff and medical officers/specialists was observed in polyclinics against authorised strength. ECHS could not fill up sanctioned posts. Recently, manpower level has improved but shortage of medical specialists and dentists still persist. Even, available manpower was deployed and utilised in irregular manner. Polyclinics' manpower was being utilised in ECHS offices against non-entitlement. Manpower from remote PCs were diverted to big cities that had adverse impact on the medicare being provided to veterans in remote areas. Technical manpower was being utilised to perform administrative duties. Lab reports were being signed by technicians at polyclinic, Delhi in violations of medical laws.

**No punitive action against defaulting hospitals:** Certain empanelled hospitals were found indulging in unethical practices like- unnecessary medical procedure, overbilling, medical negligence, refusal for cashless facility and higher charges from the beneficiaries. ECHS did not take punitive actions against the defaulting hospitals in conformity with MoU compromising the delivery of medical services to the beneficiaries.

**Anomalies in hospital bills:** Certain hospitals have raised inflated bills over the authorised package rates which were approved. Rs.1.92 crore was made to empanelled hospitals on this account. 29 empanelled hospitals under the jurisdiction of Chandigarh and Lucknow commands were paid approximately Rs.12 crore extra for not deducting 10%, as per applicable rules, on use of general ward accommodation by the ECHS beneficiaries. Empanalled hospitals in Dehradun, Jabalpur, Lucknow and Varanasi were found charging more room's rent from ECHS comparing to non-ECHS patients. Fortis Hospital has charged higher rates for knee replacement for the ECHS patients in comparison to non-ECHS patients which resulted into excess payment.

**Rebate and discount on medicines:** ECHS Cells at Jabalpur, Gwalior, Pune and Jodhpur failed to deduct 10% discount on Maximum Retail Price (MRP) of chemotherapy medicines supplied to ECHS beneficiaries in violations of applicable guidelines which caused avoidable loss to ECHS. Further, there was no stipulation in the MoA to provide discount on the medicines being supplied by empanelled hospitals and as a result, they were raising bills at MRP while few PCs were procuring medicines at discounted rates.

**Miscellaneous infirmities of the health scheme**

(a) Government had accepted in the Parliament (Nov2016) to have found 1.6 lakh ineligible beneficiaries. who have now been removed from the data. Thus, financial loss on misuse of the health facility cannot be ruled out. However, new cards are supposed to eliminate such problems before health facilities are availed by wily elements.

(b) New smart-cards are taking extremely long time for issuing to the beneficiaries. Many are struggling to get new cards for more than one year. As a result, temporary slips are issued to avail medical services. This is again an area of concern and alarm.

(c) Long queues are seen at certain polyclinics and beneficiaries are to wait for long periods at the clinics firstly for consultation and then for collection of medicines.

(d) Medicines are constantly in short supply, more so, in remote polyclinics. Government is aware about the problems and has stated to be taking remedial measures to improve the supply chains of medicines.[5]

(e) Substantial shortage of budgetary allocation to the health scheme and malpractices by the empanelled hospitals.

(f) Non-renewal of MoAs by the empanelled hospitals owing to deplorable delay in clearing the bills. 407 empanelled hospitals have been stated to have declined renewal of MoAs with ECHS over a period of time.[6]

(g) Manpower contractualisation in administrating the health scheme is the major root cause in its poor implementation and performance.

(h) Government has lodged a FIR against the previous vendor who was engaged in manufacturing smart-cards and has failed to return the data on completion of the contract.[7]

## Conclusion and Suggestion

ECHS has been in the service of veterans' fraternity for more than fifteen years but still, has been facing multitude of problems and has yet to achieve acceptable level of satisfaction amongst beneficiaries. Health scheme is being managed by the armed forces, known for its absolute professionalism and no-lax attitude, as such ECHS needs to perform better on all parameters in delivering of medicare facility not considering CGHS as bench mark. The following suggestions emerge from the analysis of the performance audit and other infirmities for consideration in the improvement of the health scheme.

(a) Technology should be extensively used at every stage and process of ECHS to reduce human intervention in delivering the services. Polyclinics should have emails and mobile numbers of all veterans/beneficiaries for faster communication of relevant information through emails/SMS.

(b) Payment of empanelled hospitals' bills well in time is *sine que non* to run the scheme effectively.

(c) Beneficiaries should be able to take appointment with doctors through a 'specialised app' and or web-based system to avoid crowds in polyclinics and better queue management.

(d) Spare capacity of service hospitals should be readily available on-line to the polyclinics so that beneficiaries can avail service hospital facilities as many polyclinics are co-located in the premises of the service hospitals.

(e) Polyclinics handling more beneficiaries than the authorised capacity be upgraded urgently, and till upgradation of polyclinic is achieved in all respect, manpower from polyclinic having low footfall, should be shifted to big polyclinic. But such manpower must be deployed for managing the health services in polyclinics.

(f) ECHS should be managed with regular manpower like CGHS on whose edifice this health scheme was envisaged. Policy framework for manpower contractulisation to manage such a huge health scheme is conceptually flawed. Reasons for engaging staff on contract are indefensible as staff requirement is of perennial nature. Contractual staff, being vulnerable in many aspects due to their service conditions, cannot be expected to provide first-rate medicare.

(g) Salary of medical specialists/ paramedical staff must be fixed considering the market trends to fill up the vacant posts. Polyclinics should be empowered to engage local doctors on the hourly-basis till medical specialists/dental specialists are recruited as polyclinics are expected to be well acquainted with local market.

(h) Super Specialist Hospital exclusively for veterans' fraternity should be established in few states depending on the ESM numbers. It would reduce the complete dependency on the private hospitals and in due course of time, would be 'special medicare centers' for veterans in the country.

(i) Full budgetary support would be essential as the health scheme is fully financed by the Government. Bills of empanelled hospitals for an amount of Rs.1900 crore are still pending as on February, 2020.

(j) Shortage of medicines at all polyclinics should be managed by appointing local pharmacists on the pattern of CGHS and till local pharmacists are appointed, beneficiaries should be reimbursed the cost of medicines purchased from the market.

(k) Preventive health check of beneficiaries of 50 years and above, should be carried out yearly to detect medical ailments well in time. Health Melas/ lectures by medical specialists on preventive healthcare should be organised in polyclinics and service hospitals.

# Attitude of Dental Faculty on Admissions to Dental Colleges through National Eligibility cum Entrance Test (NEET) - A Knowledge, Aptitude and Perspective Survey

**Saloni Kachhara[1], Deepak Nallaswamy[2], Subha M[3]**

*[1]Post-graduate Student, Department of Prosthodontics and Implant Dentistry,[2]Director of Academics, [3]Reader, Saveetha Dental College, Saveetha University, SIMATS, Chennai, India*

## Abstract

There are different admission tests around the world exclusively for admission to dental schools. NEET- National Eligibility cum Entrance Test (NEET) is a multiple choice entrance exam in India for medical, dental as well as paramedical courses, including nursing, physical therapy, pharmacy, and occupational therapy. There is no exclusive test only for dental admissions. There is no scientific literature on NEET and its effects on students, parents as well as the teaching faculty. Though there are a lot of news articles and blogs about it. There is no evidence on how the staff of dental fraternity perceived this change in admissions of students to dental colleges. There has been significant controversy around this change in the admission process. The aim of this survey is to understand the perspective of the dental teaching faculty about NEET, the admission procedure, the difference in the quality of students and the type of the questions in the exam.

***Key Words:*** *NEET, Dexterity Tests, Dental Admission Test, Dental Admissions*

## Introduction

There are different admission tests around the world exclusively for admission to dental schools. Admission committees for dental schools around the world have assessed the correlation between admission requirements and students' subsequent performance in order to decide what factors to use for predicting students' success.

In Korea, the Dental Education Eligibility Test (DEET) was developed to establish the criteria that would be applied to all dental applicants to determine which applicants have the necessary cognitive abilities to successfully complete dental education programs. Dental Admission Test (DAT) is a multiple-choice standardized exam taken by potential dental school students in the United States and Canada.[1] It is designed to provide dental education programs with a means to assess program applicant's' potential for success. The DAT consists of four tests based on: Survey of the Natural Sciences, Perceptual Ability, Reading Comprehension, and Quantitative Reasoning.[2]

Similarly, NEET- National Eligibility cum Entrance Test (NEET) is a multiple choice entrance exam in India for medical, dental as well as paramedical courses, including nursing, physical therapy, pharmacy, and occupational therapy. There is no exclusive test only for dental admissions[3]. It was first introduced in 2013 but met with a lot of opposition[4]. It was also considered unconstitutional by the Supreme court[5]. This proposal of a single entrance exam rather than individual exams of each institute was finally approved in 2015[6]. It includes 180 multiple choice questions from the fields of biology, chemistry and physics[7].

There is no scientific literature on NEET and its

effects on students, parents as well as the teaching faculty. Though there are a lot of news articles and blogs about it. There is no evidence on how the staff of dental fraternity perceived this change in admissions of students to dental colleges. There has been significant controversy around this change in the admission process. The aim of this survey is to understand the perspective of the dental teaching faculty about NEET, the admission procedure, the difference in the quality of students and the type of the questions in the exam.

## Materials and Methodology

A request to conduct this study was submitted to the Institutional Review Board of the Saveetha University. A survey with a mixed-methods research approach (using both quantitative and qualitative data collection) was formulated consisting of 16 questions to measure the study constructs namely the perspective of dental faculty on the content of NEET, additional tests along with NEET, its effect on students' performance and its effect on school life.

The initial questions were analyzed for content validity by the guide to ensure that the questions gauged the study constructs. The questions were then pilot tested with five faculty members who were given a chance to provide feedback on the clarity of questions and overall format. Alterations were accordingly made and final survey was created on the google forms (online). It was distributed to dental teaching faculty via email, whatsapp and other electronic media. A second follow-up e-mail was sent and telephone calls were made to those who had still not replied. All participants were assured at the beginning of the study that data collected would be kept confidential.

The faculty perception questionnaire consisted of two parts. Part A comprised of the demographic data regarding the personal and professional information of the respondents while Part B consisted of 15 questions with three response options (yes, no and may be) and one open ended question for the qualitative aspect of the survey. The open-ended question underwent thematic analysis that used a staged approach[5,8,9]. The responses were first exported to a Microsoft Excel program, potential themes were identified and the responses were categorized.

## Results

Out of 120 participants, 106 faculty members responded (88% response rate). Out of 106, only 39 replied for the open ended question (36.7% response rate) while the response rate was 100% for the remaining 15 questions. There was almost equal participation of male and female faculty members in the survey. The most common age group was 31- 40 years, maximum respondents were on the lecturer post (Fig 1) and the maximum participation was from deemed colleges (Fig 2).

The first study construct comprised of statements related to the type of questions involved in the NEET and a majority of participants responded yes to include questions related perceptual ability, quantitative reasoning and reading comprehension in the NEET syllabus. 40.6% respondents felt that NEET alone should not be the deciding criteria for dental admissions and 46.2 % felt newer additional evaluation criteria should be devised (Table 1) . The open-ended question asked faculty members about various different evaluation methods for dental admission process. There were only 39 responses to the question. The responses were reviewed to identify themes. Three themes emerged: 1) personal interviews, 2) non-cognitive factors and 3) marks of board exams. The responses were categorized into one of the 3 themes.

The second study construct considered the the effect of NEET on the graduation outcome of the batch. 45.3% respondents replied that they did observe difference in the academic performance of the NEET and NON-NEET batch while only 32.1% felt that there was overall difference between the two (Fig 3 and 4).

The third study construct analysed the effect of NEET on the school life of students. 57.5% respondents thought due to NEET, the co-curricular activities have reduced in school, 55.7% felt that one exam affects students' school life and 62.3 % felt that NEET has lead to increase in stress levels of the students (Table 2).

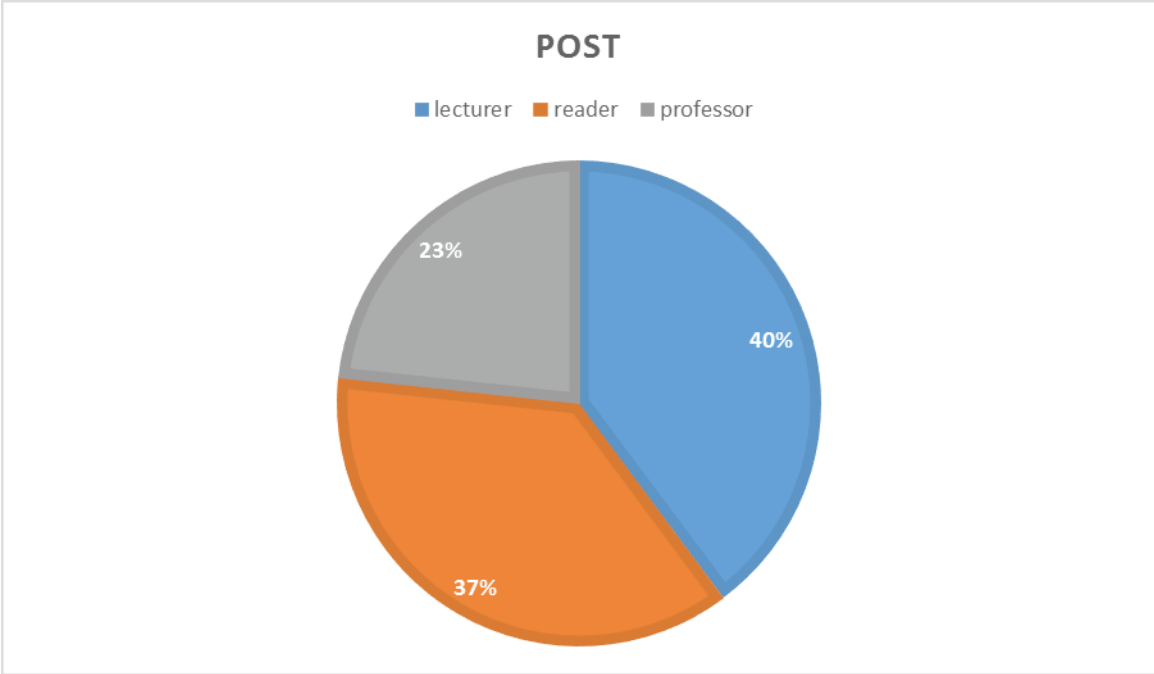

Fig 1: Pie chart showing designation of the faculty in the college.

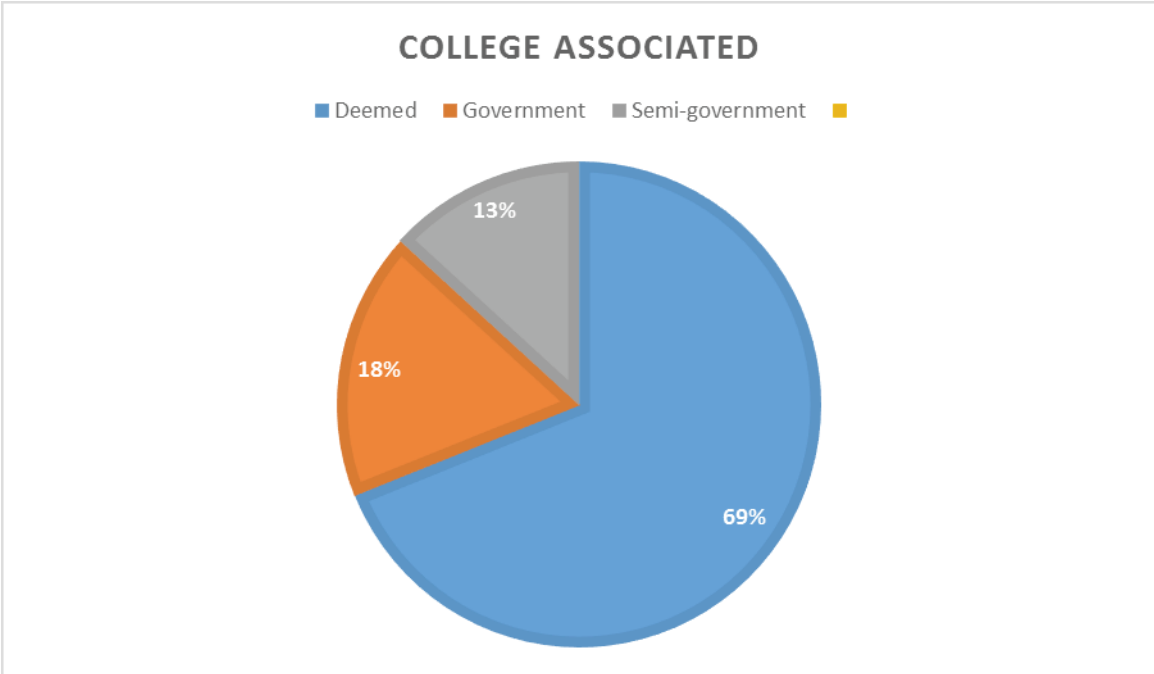

Fig 2: Pie chart showing type of college the respondent is associated with.

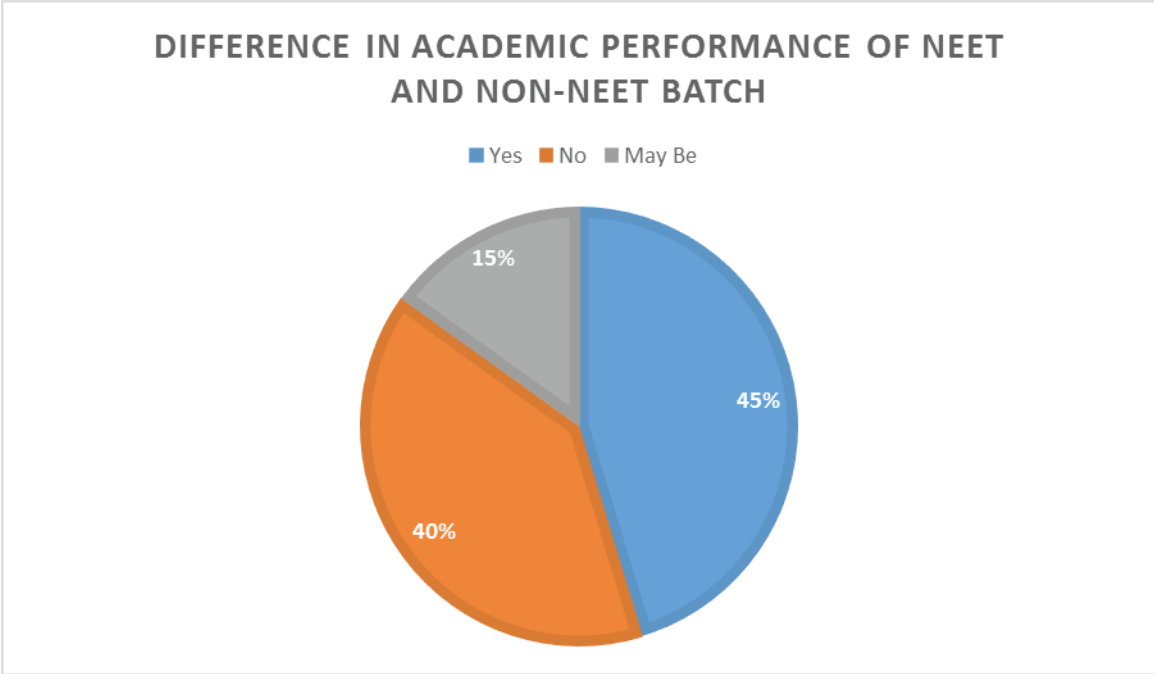

Fig 3: Pie chart showing the faculty view on the difference in the academic performance between two batches

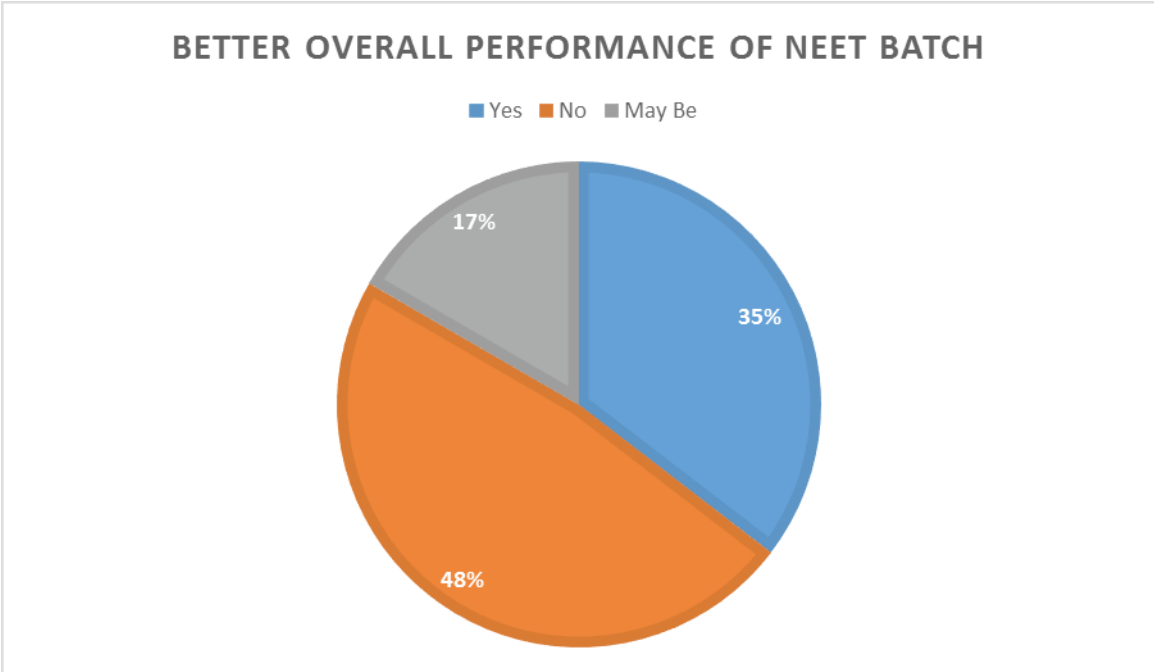

Fig 4: Pie chart showing the faculty view on the difference in the overall performance between two batches.

**Table 1: Questionnaire statements and responses of the first study construct , by percentage of total respondents (N=106)**

| Sr.No. | Questions | YES (%) | NO(%) | MAY BE(%) |
|---|---|---|---|---|
| 1 | Admission to dental school is alright with only NEET marks? | 46.2 | 40.6 | 13.2 |
| 2 | Any other method of evaluation should be considered for admission to dental school? | 46.2 | 30.2 | 23.6 |
| 3 | Have you heard about dexterity tests? | 53.8 | 39.6 | 6.6 |
| 4 | Dexterity evaluation should be included for admission to dental schools? | 46.2 | 15.1 | 38.7 |
| 5 | aptitude testing should be a part of admission to dental schools? | 75.5 | 12.3 | 12.3 |
| 6 | NEET should also include questions related to perceptual ability? | 67.6 | 14.3 | 18.1 |
| 7 | NEET should also include questions related to quantitative reasoning? | 67.9 | 11.3 | 20.8 |
| 8 | NEET should also include questions related to reading comprehension? | 59.4 | 25.5 | 15.1 |

**Table 2: Questionnaire statements and responses of the third study construct , by percentage of total respondents (N=106)**

| Sr. No. | Questions | YES (%) | NO(%) | MAY BE(%) |
|---|---|---|---|---|
| 1 | Having one exam after 12th for all fields affects students' school life? | 55.7 | 30.2 | 14.2 |
| 2 | NEET reduce the co-curricular activities in school? | 57.5 | 28.3 | 14.2 |
| 3 | Students' stress levels increased after introduction of NEET? | 62.3 | 22.6 | 15.1 |

## Discussion

The field of dental education is contemplated to be a coveted and challenged professional field[10]. Faculty members play an important role in moulding the life of a student and also understand their issues and problems[11]. The present study aimed to get perspective of dental faculty members on the national eligibility cum entrance test (NEET) which since its recent debut has caused a lot of turmoil in the aspiring medical students life. In India, NEET was finally accepted as the single exam for entrance to all the medical and paramedical fields after 12th standard in 2016. It comprises of multiple choice questions based only on the three basic science subjects - biology, physics and chemistry[12]. There is no exclusive entrance test for dental schools like Dental Eligibility and Entrance Test in Korea or Dental Admission Test in USA or Dental Aptitude Test in Canada.

106 faculty members responded to the survey questions related to NEET. A majority of them opiniones for the inclusion of dexterity tests, questions on perceptual ability, reading comprehension and quantitative

reasoning in addition to the current NEET syllabus. They also favoured addition of personal interviews and aptitude tests to be conducted before admission to dental schools. According to their responses, many of the faculty members found the NEET batch to be academically better than the NON-NEET batch. Overall, majority of them thought that NEET lead to increased stress amongst the students.

Manual dexterity is the ability of a person to make coordinated hand and finger movements to grasp and manipulate objects using muscular, skeletal, and neurological functions. It is considered to be a significant predictor of academic performance and clinical competency in dental schools[13]. According to Ranney et al, 2005, it is viewed as screening rather than predictive tool for dental admissions and may be used to set baseline scores below which a candidate would not be given consideration[14]. According to another study by Giuliani et al,2007 basic manual dexterity is not essential in the selection of dental students as it was seen that students could learn the skills by hard work during the dental course[15]. For the dental students at the ''Carl Gustav Carus'' School of Dentistry (Technical University of Dresden), it was statistically proven that students could be trained in manual skills within the framework of the pre-clinical training[16].

Questions understanding the students' ability of perceptual thinking, reading comprehension, and quantitative reasoning prepare the students for the further studies. It is important to include these for any admission test for graduate studies[17]. However, according to Kim and Lee et al, 2007, scores from reading comprehension and perceptual ability are not significant predictors of performance in the first year of the dental course, but they are related to the students ease of understanding the subject[18]. Non-cognitive measures like personal interviews and aptitude tests should be considered in the dental admission process as using only cognitive measures is insufficient in properly determining future student performance[19]. In the study by Virtue et al, 2017, the dental faculty members identified noncognitive factors in the terrains of communication, approach to learning, personal characteristics, and professionalism as important skills which contribute to the success of dental students[20].

62.3% dental faculty members who filled the survey felt that NEET lead to increased stress levels amongst the students. Whenever any change is introduced in the exam pattern, it is directly related to the stress levels amongst the students[21]. Since NEET is newly introduced exam, it could be one of the reason for increased stress levels. The stress levels between the current batch and batches to come in future should be compared for understanding the role NEET per se in raising the stress. Many faculty members found that the students who entered the course after appearing for NEET performed better than previous students academically. A study can be done comparing the mean marks of the NEET and the NON-NEET batches to understand the effect of NEET on the academic quality of dental graduates.

There is no scientific evidence available for understanding the limitations, the effects and repercussions of NEET. A lot of studies can be done in this field to evaluate the data with respect to NEET. This survey is just the beginning in this direction by understanding the faculty perspective on NEET.

## Conclusion

The present survey shows that most of the faculty members preferred the addition of dexterity tests, personal interviews, aptitude tests to the exclusive NEET exam for entrance to the dental school. Admission professionals should not totally abandon the cognitive measures

in their assessment of candidates but ought to include the non-cognitive indicators as well. An exclusive admission test only for dental schools would definitely guarantee better quality as well as passionate students in the dental field.

# Difference in the Academic Performance of NEET and NON-NEET batch- A Cohort Study At Saveetha Dental College

**Saloni Kachhara[1], Deepak Nallaswamy[2], Subha M[3]**

*[1]Post-graduate Student, Department of Prosthodontics and Implant Dentistry, [2]Director of Academics, [3]Reader, Saveetha Dental College, Saveetha University, SIMATS, Chennai, India*

## Abstract

In India, in 2016, the medical council of India introduced one single common entrance test called NEET- National Eligibility Entrance Test for admission to all the medical and paramedical courses after 12th standard. It allowed dental admission to all the colleges including the government as well as the private. Many developed countries have evolved dental admission tests based on the academic research surveys, student performances and other relevant parameters. Since NEET is the first attempt by the government of India to create a central admission process, it is clearly in its early process and there is an incredible need for scientific data to evolve the system. The aim of this study is to analyze if the admissions through NEET affected the quality of students with respect to their academic performance pursuing the undergraduate dental program, especially in the private colleges.

***Key Words**: NEET, Dental education, Dental school admissions, India, Dental graduates*

## Introduction

Dental education in India laid its foundation in 1920s, when Dr.Rafidin Ahmed started the first dental college in Calcutta.[1] Till the 1960s, all dental colleges were government-aided colleges. In 1966, first private dental college was established in India. Currently, there are 342 dental colleges in the country out of which 302 are privately owned and only 40 are run by the government.[2] The increasing number of dental colleges leads to a substantial increase in the number of dental graduates per year.[3] The number of graduating dental students in 2000 was 26,000 compared to 1,370 in 1960.

Formerly, an aspiring student could gain admission to a dental college in India via two ways:

1) Government-administered entrance exam or

2) Private school-administered entrance exam

Government entrance exams again were at two levels. One was state level, entrance exams- specific for each state (domicile students of that particular state) and second at all-India level, for which students from all over the country could apply. All the private colleges conducted their specific entrance exams.[4]

Due to this system, the students had to appear for various tests and anticipate the results in different exams. There was no standardized exam at one level. This led to loss of their time, money and energy. In 2013, the medical council of India introduced one single common entrance test called NEET- National Eligibility Entrance Test for admission to all the medical and para-medical courses after 12th standard. It allowed dental admission to all the colleges including the government as well as the private. It suffered a lot of opposition and finally was systematically conducted in 2016.

Many developed countries have evolved dental admission tests based on the academic research surveys, student performances and other relevant parameters. Since NEET is the first attempt by the government of India to create a central admission process, it is clearly in its early process and there is an incredible need for scientific data to evolve the system.

The aim of this study is to analyze if the admissions through NEET affected the quality of students with respect to their academic performance pursuing the undergraduate dental program, especially in the private colleges.

## Materials and Methodology

The study was conducted in Saveetha Dental College and Hospital, Chennai with the ethical approval of the education review board of the institute. Two cohorts of batches were selected for the study, the 2015 batch (NON-NEET) whose admissions were done according to the Saveetha protocols which included a multiple choice exam conducted by the institute along with personal interviews and dexterity tests, while the second cohort was the 2016 batch who acquired admission through NEET, the centralized common entrance test. The academic performance was measured by comparing the Anatomy subject marks acquired by the students in their university exam at the end of first year of their BDS course.

**The two cohorts:**

Group 1- 2015 NON-NEET batch

The total sample for the 2015 batch was 96. They acquired admissions through the Saveetha entrance test, personal interview and the dexterity tests.

Group 2- 2016 NEET batch

The total sample for the 2016 batch was 49. They acquired admissions to the Saveetha Dental College through NEET- National Entrance Eligibility Test.

The datafile consisted of the final exam marks of the Anatomy subject of the two batches. The marks were obtained out of 200.

IBM SPSS software was used for data analysis. The mean was compared between the two years using the independent students t-test. The data was checked for normality of distribution. The analysis consisted of comparison in the academic performance of the two batches.

## Results

The data followed a normal gaussian curve pattern (Fig.1). So the difference in sample size didn't interfere with the results.

There wasn't a significant difference (>0.05) in the academic outcome of 2015 and 2016 batch. The descriptive analysis is given in the table 1.

The mean score of 2015 ie the non NEET batch was 135.08 while that of 2016 ie the NEET batch was 131.78. A graph representing the means of Anatomy marks in 2015 (1) and 2016(2) is shown in Fig.2.

A comparison of marks based on the gender was also done between the two cohorts. The mean anatomy marks of females (0) decreased in 2016, while it increased for males (1). Following graph describes the difference in the marks within the gender (Fig.3).

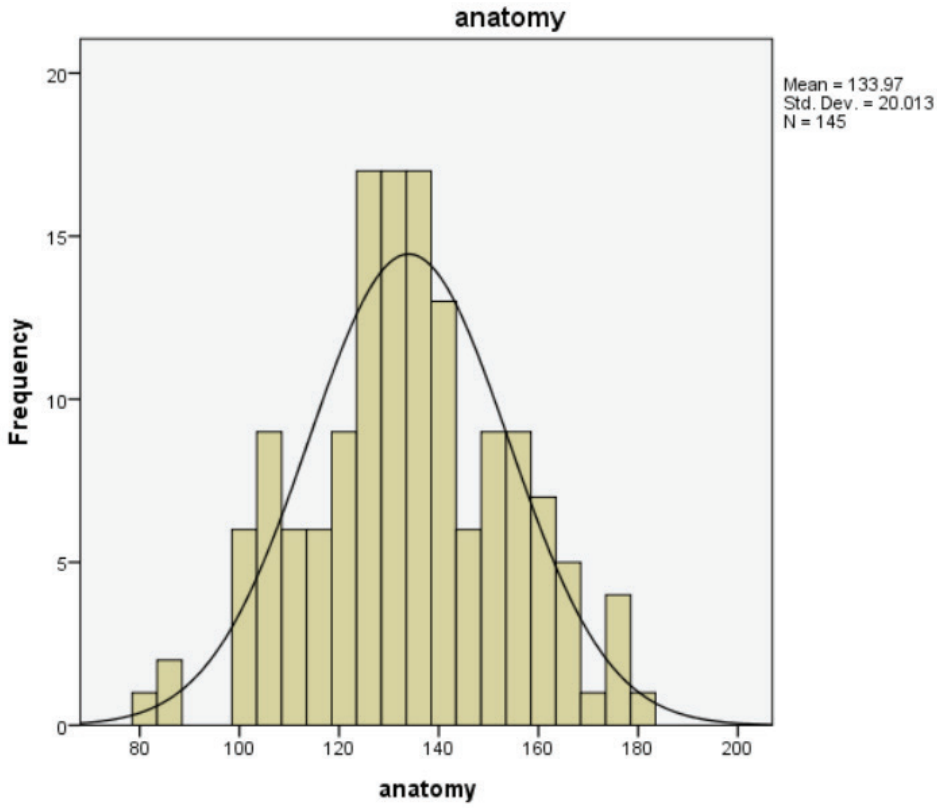

**Fig 1: The normal gaussian curve obtained between the the data of the two cohorts.**

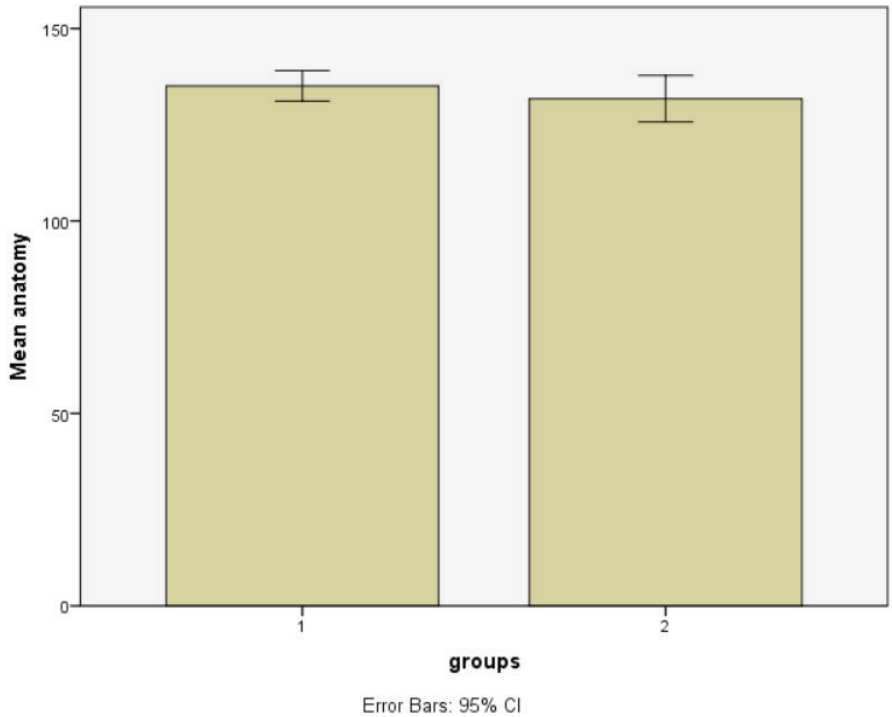

**Fig 2: A bar graph representing the means of anatomy marks in the two cohorts along with standard error bars.**

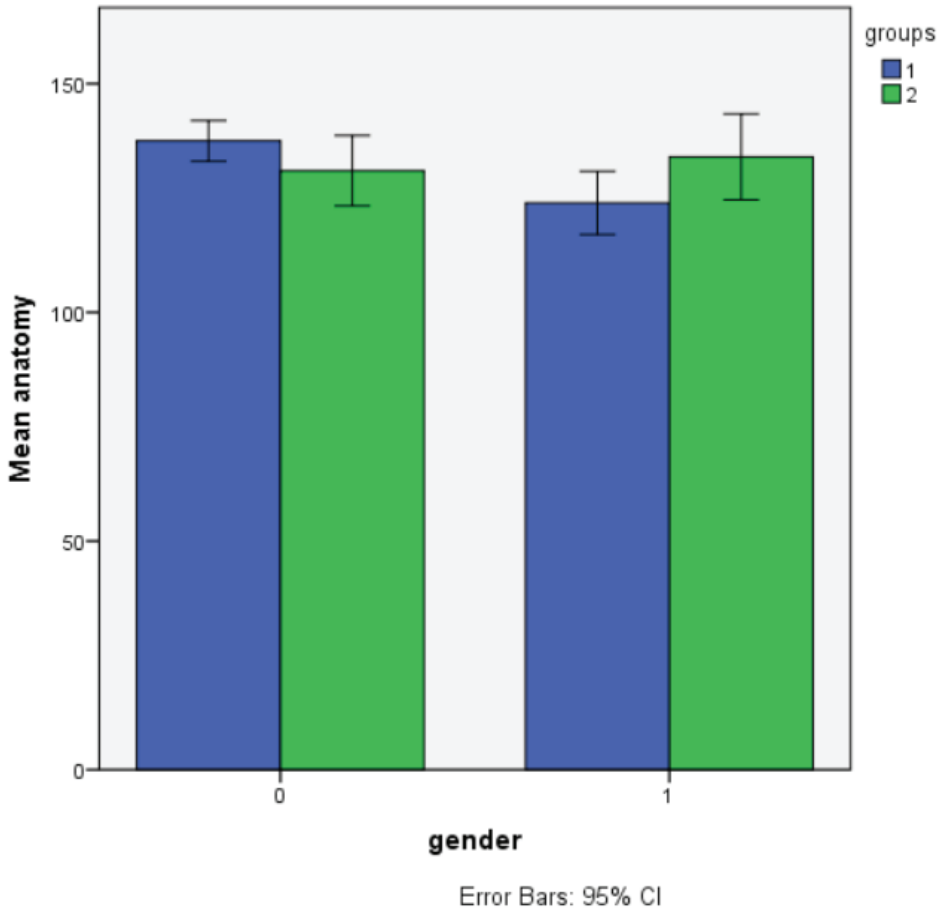

**Fig 3: A bar graph representing the mean scores of females (0) and males (1) between the cohorts, blue (2015 batch) and green (2016 batch)**

**Table 1: It shows the descriptive analysis of the two cohorts with the mean marks obtained by each group.**

**Anatomy**

| groups | N | Mean | Std. Deviation | Std. Error Mean |
|---|---|---|---|---|
| 1 | 96 | 135.08 | 19.499 | 1.990 |
| 2 | 49 | 131.78 | 21.015 | 3.002 |

## Discussions

From the above study, it is discovered that there is no significant difference in the mean anatomy marks of 2015 (NEET) and 2016 (NON-NEET) batches. Although, there is a significant difference in the academic performances of males and females, with males showing an improvement in the performance while vice versa for the females.

Admissions committees for dental schools around the world have assessed the correlation between admission requirements and students' subsequent performance in order to decide what factors to use for predicting students' success. The Dental Education Eligibility Test (DEET) was developed in Republic of Korea to establish the criteria that would be applied to all dental applicants. The DEET was designed to determine which applicants

have the necessary cognitive abilities to successfully complete dental education programs in Korea. Although the DEET has been shown to have the ability to predict performance in the first semester, its ability to predict tends to decrease as students' progress to the end of the dental course.[13]

Dental Admission Test (DAT) is a multiple-choice standardized exam taken by potential dental school students in the United States and Canada.[5] It is designed to provide dental education programs with a means to assess program applicant's' potential for success. The DAT consists of four tests based on: Survey of the Natural Sciences, Perceptual Ability, Reading Comprehension, and Quantitative Reasoning.[6] It measures the cognitive ability of students and is considered as a predictor of dental school performance but only in the first and second years of dental training in a traditional curriculum.[7] Similarly, NEET is a multiple choice entrance exam in India for medical, dental as well as paramedical courses, including nursing, physical therapy, pharmacy, and occupational therapy. There is no exclusive test only for dental admissions.[2]

There haven't been any studies in India which involve NEET. The present study assessed if the academic performance in the subject of Anatomy, of the first year dental program was affected by the introduction of NEET in turn indicating the difference in the academic quality of students enrolled in the dental school. There can be various other factors affecting the academic performance of the batches. These include the teaching methodology, exam pattern, exam toughness, examiners, the subject per se, the variety in the crowd due to national level exam and many more.

After the introduction of NEET, the total admissions of people from different states increased in colleges. This led to more people from outside state to be the part of institution which in turn increased the number of students staying away from their families. Studies have revealed that staying at a hostel away from family, has a significant effect on the academic performance.[11]This could be because a hostelite may come across various problems that could increase stress levels. Stress generated while staying in hostel is regarded as one of the main factors for under performance of medical students.[12,13] Living at home with family members make a student emotionally more stable and confident. This could possibly be one of the reasons for decreased performance in the NEET group of 2016. The other factors like the condition of the hostel, the culture of people in new area, the surrounding environment can be matched as both the groups belonged to the same institute.

Factors like teaching methodology and exam patterns were matched as there was no drastic change in them between the two years. The toughness of exam was matched for both the years by getting the papers analyzed by 5 examiners who graded the toughness of papers on a scale of 1-5. There was no significant difference in the results. There were different examiners for both the years and that could have created bias in the study.

The difference in the academic performances of males and females could have various factors affecting it. The improvement in the performance of males can be explained by their increased sincerity towards NEET which in turn implies better performance in the first year of BDS. Stress could be regarded as one of the factors affecting the performance of females. In an article by Lu Y et al,2015, wherein the author studied the effect of competitive experience between genders, it was stated that females tend to get more stressed compared to males on experiencing more competitive environment.[11] This could lead to decreased performance in the females under the pressure of NEET.

Anatomy as a subject includes the cognitive as well as the dexterity skills. Knowledge of anatomy is highly relevant to dentistry especially when performing anesthesiological or surgical procedures. The theoretical knowledge of anatomy helps in the clinical skills of the dentist.[12] The academic performance in this subject depends on the students hard-work and understanding of the subject.[13] Since there is no significant difference in the academic performances of both the batches, both the NEET as well as the NON-NEET students appear to be sincere and hardworking. One of the reasons for this could be as the NON-NEET batch in Saveetha was enrolled only after thoroughly clearing the various admission protocols as mentioned before.

The limitation of the study is that it was performed only in one institute and this could lead to bias in the results. An elaborate study needs to be conducted including all the dental institutes comparing the first year

marks of the BDS curriculum between the NEET and NON-NEET batches.

## Conclusion

NEET- National Entrance and Eligibility Test did not significantly affect the academic performance of the 2016 batch compared to the 2015 batch in Saveetha Dental College and Hospitals, Chennai. The academic quality of dental graduates in first year of the BDS course could be considered similar for both the batches 2015 (NEET) and 2016 (NON-NEET).

A better understanding of the effects of NEET on the academic performance of first BDS could be made by conducting this study at multiple dental institutes. This could also help in achieving the comparison of the two batches, especially in private dental institutes where the admissions before the commencement of NEET were taken by respective college protocols. The ultimate test of validity will not be available for some years, until the current cohorts of students graduate.

## Introduction

Indian education system in the field of healthcare is one of the largest in the world. Many of its graduated doctors emigrate, and create a global impact.[1] India is the seventh largest and the second most populous country of the world. Oral diseases form a huge part of public health issues in India. Around 60%–65% of the general population are being affected by dental caries.[2] The prevalence, incidence and severity of oral diseases in India lead to the need of an effective dental education methods and oral health care delivery systems.[3]

Dental education in India was formerly established in 1920s, when Dr.Rafidin Ahmed started the first dental college in Calcutta.[4] Till the 1960s, all dental colleges were government-aided colleges. At present, there are 342 dental colleges in the country amongst which 302 are privately owned and only 40 by the government.[5] The increasing number of dental colleges leads to a

Telephone Number: 7666237137

substantial increase in the number of dental graduates per year.[6] The number of graduating dental students in 2000 was 26,000 compared to 1,370 in 1960.

Formerly, an aspiring student could gain admission to a dental college in India via two ways:

1) Government-administered entrance exam or

2) Private school-administered entrance exam

All the private colleges conducted their specific entrance exams.[7] Due to this system, the students had to appear for various tests and anticipate the results in different exams. There was no standardized exam at one level. This led to loss of their time, money and energy.

In 2010, the medical council of India introduced one single common entrance test called NEET- National Eligibility Entrance Test for Admission to all the medical and paramedical courses after 12th standard. It allowed dental admission to all the colleges including the government as well as the private. It suffered a lot of opposition and finally was systematically conducted in 2016. Many developed countries have evolved dental admission tests based on the academic research surveys, student performances and other relevant parameters. Since NEET is the first attempt by the government of India to create a central admission process, it is clearly in its early process and there is an incredible need for scientific data to evolve the system.

The aim of this study is to analyze if the admissions through NEET affected the quality of students with respect to their academic performance pursuing the undergraduate dental program, especially in the private colleges.

## Materials and Methodology

The study was conducted in Saveetha Dental College and Hospital, Chennai with the ethical approval of the education review board of the institute. Three cohorts of batches were selected for the study, the 2015 batch (NON-NEET) whose admissions were done according to the Saveetha protocols which included a multiple choice exam conducted by the institute along with personal interviews and dexterity tests, the second cohort was the 2016 batch who acquired admission through clearing NEET, the centralized common entrance test as well as the personal interviews, while the third cohort was the 2017 batch who acquired admissions solely on the basis of NEET ranking (Table1). The academic performance was measured by comparing the Dental Anatomy (DA) subject marks acquired by the students in their university exam at the end of first year of their BDS course.

The datafile consisted of the final exam marks of the Dental Anatomy subject of the three batches. The marks were obtained out of 200.

IBM SPSS software was used for data analysis. The mean was compared between the three years using the Tukey HSD test. The data was checked for normality of distribution. The analysis consisted of comparison in the academic performance of the three batches.

## Results

The data followed a normal gaussian curve pattern. So the difference in sample size didn't interfere with the results.

There was a significant difference ($<0.05$) in the academic outcome of the NEET and NON-NEET batches, but there wasn't a significant difference ($>0.05$) between the two NEET batches ie between 2016 and 2017 batches (Fig 1).

The mean score of 2015 ie the non NEET batch was 165.36, 2016 ie the NEET batch was 204.69 and that of 2017 was 198.31. A graph representing the means of Dental Anatomy marks in 2015, 2016 and 2017 between both the genders is as follows (Fig 2).

**Table 1: Descriptive data of the three cohorts used in the study**

| Sr.No. | Year | Batch | Sample size | Admission protocol |
|---|---|---|---|---|
| 1 | 2015 | NON-NEET | 96 | Saveetha entrance test, interview, dexterity test |
| 2 | 2016 | NEET | 49 | NEET score and interview |
| 3 | 2017 | NEET | 76 | Only NEET rank |

**Table 2 : It shows Tukey HSD test depicting the comparison of means marks acquired by the three batches.**

| Years(I) | Years(J) | Mean Difference (I-J) | Std.Error | Sig. | 95%Confidence Interval | |
|---|---|---|---|---|---|---|
| | | | | | Lower Bound | Upper Bound |
| 2015 | 2016 | -24.172 | 3.159 | .000 | -31.63 | -16.72 |
| | 2017 | -22.703 | 2.762 | .000 | -29.22 | -16.18 |
| 2016 | 2015 | 24.172 | 3.159 | .000 | 16.72 | 31.63 |
| | 2017 | 1.469 | 3.296 | .896 | -6.31 | 9.25 |
| 2017 | 2015 | 22.703 | 2.762 | .000 | 16.18 | 29.22 |
| | 2016 | -1.469 | 3.296 | .896 | -9.25 | 6.31 |

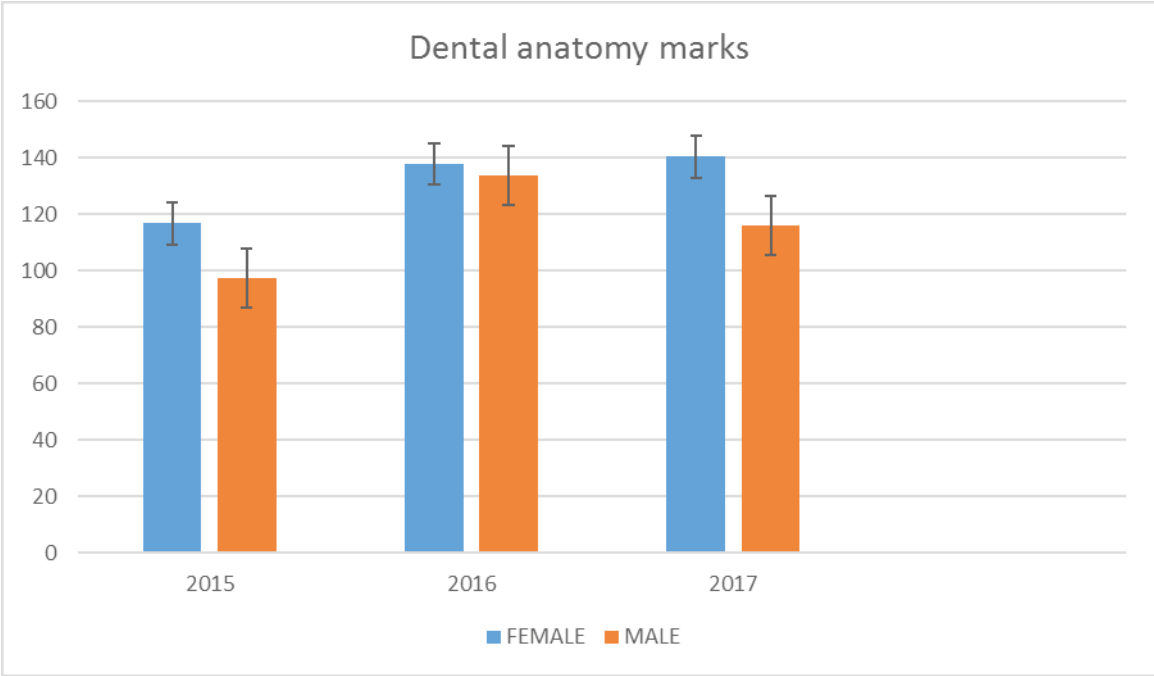

**Fig 1: A bar graph representing the means of dental anatomy marks of the three cohorts between both the genders, male ( dark blue) and female ( light blue) along with standard error bars.**

## Discussions

From the above study, it is discovered that there is a significant difference in the mean dental anatomy marks of 2015 (NON-NEET) and 2016 (NEET) batches and between 2015 (NON-NEET) and 2017 (NEET) batches. There is no significant difference in the mean marks of the two NEET batches although the marks of 2017 batch were comparatively lesser than 2016 batch.

Admissions committees for dental schools around the world have assessed the correlation between admission requirements and students' subsequent performance in order to decide what factors to use for predicting students' success. The Dental Education Eligibility Test (DEET) was developed in Republic of Korea to establish the criteria that would be applied to all dental applicants. The DEET was designed to determine which applicants have the necessary cognitive abilities to successfully complete dental education programs in Korea. Although the DEET has been shown to have the ability to predict performance in the first semester, its ability to predict tends to decrease as students' progress to the end of the dental course.[116]

Dental Admission Test (DAT) is a multiple-choice standardized exam taken by potential dental school students in the United States and Canada.[8] It is designed to provide dental education programs with a means to assess program applicant's' potential for success. The DAT consists of four tests based on: Survey of the Natural Sciences, Perceptual Ability, Reading Comprehension, and Quantitative Reasoning.[9] It measures the cognitive ability of students and is considered as a predictor of dental school performance but only in the first and second years of dental training in a traditional curriculum.[10] Similarly, NEET is a multiple choice entrance exam in India for medical, dental as well as paramedical courses, including nursing, physical therapy, pharmacy, and occupational therapy. There is no exclusive test only for dental admissions.[5]

Dental admission exams are a positive indicator of students' performance in other countries.[11] There haven't been any studies in India which involve NEET. The present study assessed if the academic performance in the subject of Dental Anatomy, of the first year dental program was affected by the introduction of NEET in turn indicating the difference in the academic quality of students enrolled in the dental school. NEET seemed to be a positive indicator. There can be various other factors affecting the academic performance of the batches. These include the teaching methodology, exam pattern, exam toughness, examiners, the subject per se, the variety in the crowd due to national level exam and many more.

Factors like teaching methodology and exam patterns were studied amongst the three years in Saveetha dental college. The toughness of exam was evaluated for the three years by getting the papers analyzed by 5 examiners who graded the toughness of papers on a scale of 1-5. There was significant increase in the toughness of 2017 exam paper. The exam pattern was similar for 2015 and 2016 batches while it changed for 2017 batch. The paper pattern for the two previous batches comprised of 2 long questions, 5 short questions and 30 multiple choice questions while for the year 2017 it was changed to 1 long question, 2 short questions and instead of multiple choice questions, 90 one word questions were added. Answering one word questions would be difficult for the students of the first year who have been preparing for two years for NEET which is multiple choice question based exam. This could be one of the reasons for decreased marks of the 2017 batch.

Dental Anatomy as a subject includes the cognitive as well as the dexterity skills. Learning dental anatomy builds the foundation for a dentist for all the future studies. It is a new subject for the students and does not directly depend on the previous knowledge. The theoretical knowledge of dental anatomy helps in the clinical skills of the dentist. [12]The academic performance in this subject depends on the students' hard-work and understanding of the subject.[13] Since there is a significant difference in the academic performances of the batches between the NEET as well as the NON-NEET, the students acquiring admissions through NEET appear to be more sincere and hardworking.

Factors like the condition of the hostel, the culture of people in new area, the surrounding environment could be matched as all the groups belonged to the same institute and thus had same surroundings.

The limitation of the study is that it was performed only in one institute and this could lead to bias in the results. An elaborate study needs to be conducted

including all the dental institutes comparing the first year marks of the BDS curriculum between the NEET and NON-NEET batches.

## Conclusion

NEET- National Entrance cum Eligibility Test does seem to improve the performance of the students in their first year exams in Saveetha Dental College and Hospitals,Chennai. The academic quality of dental graduates in first year of the BDS course could be considered better considering the marks of dental anatomy subject for both the NEET batches 2016 and 2017 compared to the NON-NEET batch of 2015.

A better understanding of the effects of NEET on the academic performance of first BDS could be made by conducting this study at multiple dental institutes. This could also help in achieving the comparison of the two batches, especially in private dental institutes where the admissions before the commencement of NEET were taken by respective college protocols. The ultimate test of validity will not be available for some years, until the current cohorts of students graduate.

# Medical Device Prototype for Planter Intrinsic Muscles: A Scientific Note

**Amit Sharma[1], Priyanshu V Rathod[2]**

*[1]Research Scholar, [2]Professor, School of Physiotherapy, RK. University, Rajkot-Bhavnagar Highway, Kasturba Dham, Rajkot*

## Abstract

**Background**: Intrinsic foot muscles are the contributors in the medial longitudinal arch and weakness of these muscle contributes to range of foot deformities but the level of weakness is still unknown as there is no valid and reliable method available to measure the strength of these muscles. Previous efforts to quantify these muscle strengths were done like toe dynamometry, planter pressure etc. All such instruments made do not consider two major biomechanical consideration 1. Position of Metatarsophalangeal Joint and 2. Position of Ankle joint which is very important for keeping extrinsic foot muscle in disadvantage and no effort was made to isolate the intrinsic muscle during measurement

**Methods**: The present prototype is designed to measure the forces of the planter intrinsic foot muscles for research and clinical purposes All the considerations which was not taking care of in previous design considered in the present design of our prototype.

**Conclusion:** Our device is one stop destination for the assessment and treatment of planter intrinsic muscle where we can measure their strength and also strengthen them on the same platform by various exercises and strengthening and therapeutic devices.

***Key words:*** *Ankle Joint, Metatarsophalangeal joint, Planter intrinsic muscle, Toe dynamometry*

## Introduction

According to Leonardo da Vinci 'The human foot is a masterpiece of engineering and the work of art' the reason he says so is possibly due to the complex nature of the foot with numerous articulations in its credit and its capacity to provide us a static posture as well as do important role in dynamic actions due to its various degree of freedom[1] In the process of evaluation from quadrupedal to bipedal stability component of foot overpower the grasping function with the development of arches [2,3] which require some external static (provide by ligaments and fascia) and dynamic (provide by extrinsic and intrinsic muscles of foot) support to prevent them from collapse

The concept of core stability to the arch of the foot and as there is local stabilizers and global movers in spine this article classifies the intrinsic muscle of foot as local stabilizers and extrinsic muscle of foot as global movers of foot.[1] Weakness of Intrinsic foot muscle can cause foot deformities and disorders [4,5]

For the measurement of the intrinsic muscles strength of the foot there is a need for exact measurements of these muscles in isolation. Earlier researchers had used a various direct method for the quantification of intrinsic foot muscles. Most studies have measured toe flexor force using fixed hand-held dynamometry, [6,7,8] force Plate, or various special test were used like Paper Grip and Intrinsic Positive Test. [9,10,11,12,13,14] The

different types of toe dynamometry which is used, a toe curling action can occur during toe flexor measurement, which activate the long (extrinsic) toe flexors. Position of ankle is another important consideration overlooked by the previous designs as most of the extrinsic toe flexor become short in plantarflexion of ankle and less likely to influence the movement. [15]

Apart from these direct methods some indirect methods were also used to assess the intrinsic muscle strength like Electromyography (EMG), Computerized tomography ultrasound and magnetic resonance Imaging.[16-18] all these indirect methods can differentiate intrinsic and extrinsic muscle but cannot quantify them. These literatures suggest that there is no valid and reliable method available to quantify the intrinsic muscle of the foot. The main challenges are to limit the role of the extrinsic muscle of the foot and also isolate the intrinsic muscle.

There is a need to design a mechanism which will take care of above discussed biomechanical consideration and also before finalize the design isolate the intrinsic muscle by the help of any of the clinical method so that device can efficiently measure the intrinsic muscle of the foot.

**Materials and Methods:** The present Prototype is a Novel Design which is not inspired by any other medical device designed to measure the intrinsic muscle strength. The device is made up of wooden and iron and the base is covered by the carpet. Quantification of the intrinsic foot muscle is done by the The Saehan Hydraulic Hand Dynamometer[19] device with a slight modification, that was securely kept in an angle on a wooden frame.

**Design**: The design of the instrument is according to the biomechanical consideration which are deficient in previous design before going forward for the design the force analysis of the instrument was done with the help of ANSYS designing software.

The structural analysis was done to validate the instrument and to prove the forces are in the direction which are desirable, to do that first the designing of the instrument was done in CRCO software and the designing of the instrument was done (Fig 1)

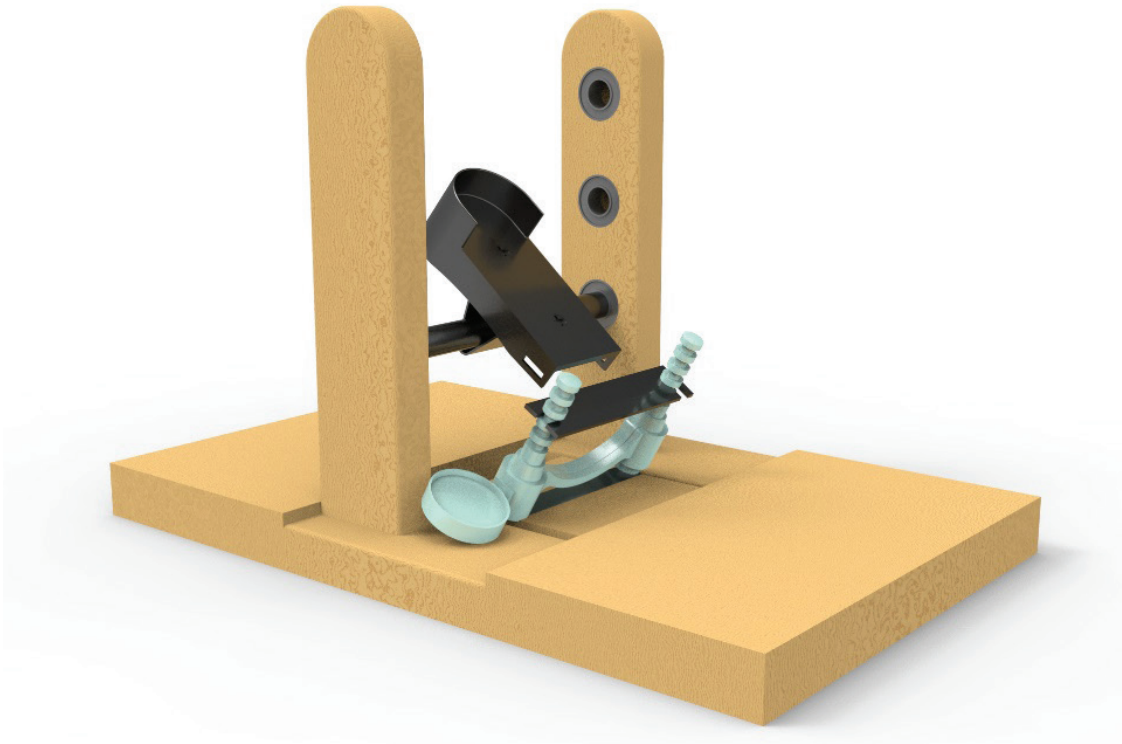

**Figure 1: Designing of the instrument in CRCO Software**

Once the designing of the instrument was done it is converted in to Finite Filament Analysis (FEA) in which the mashing of the design is done to analysis of the forces

Once the FEA was done the next stage is to do the structural analysis in which the hypothetical diagonal force of 100 N (9.8 Kg) was applied on the design to see the distribution of the forces. (Figure 2)

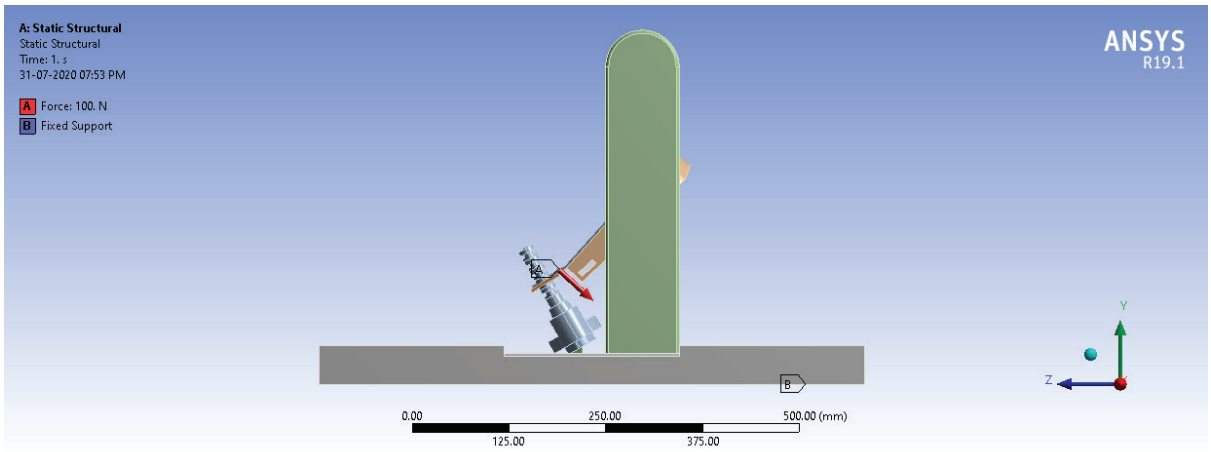

**Figure 2: Structural analysis with Diagonal Force of 100 N (9.8 Kg)**

The force analysis is explained with the help of different colour scheme where red shows the maximum Force and the Blue colour shows the minimum or no force, (Figure 3) This distribution is clearly shows the during the application of the force from the MTP joint the force is distributed on the direction of the intrinsic muscle that is inwards toward the planter aspect

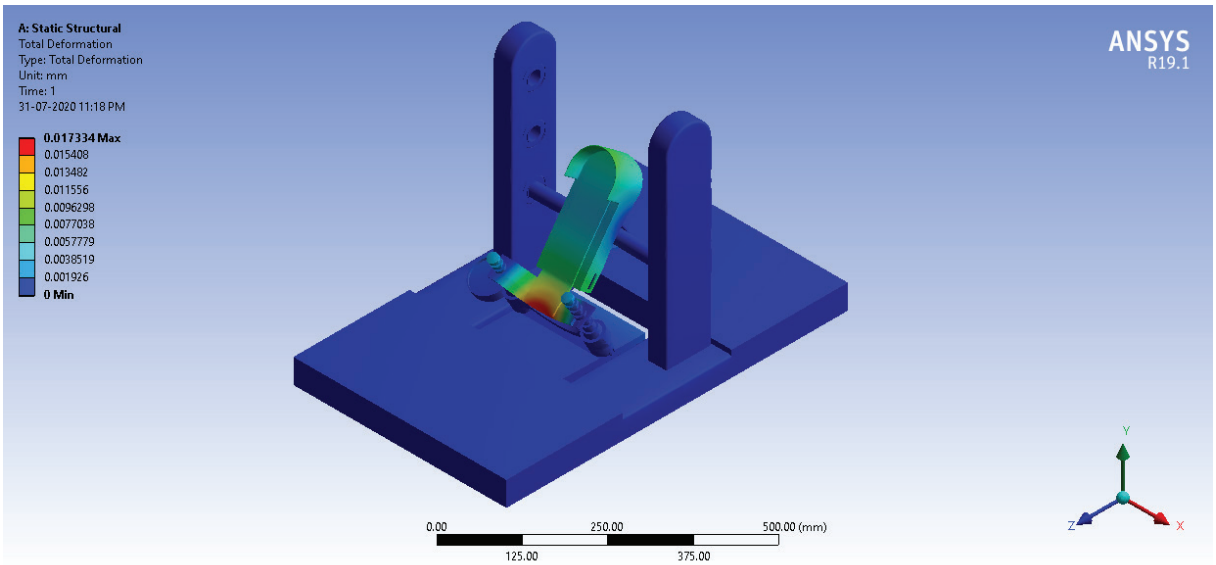

**Figure 3: Force Distribution of the device**

The design of the instrument is according to the biomechanical consideration which are deficient in previous design. The design has got 4 separate parts which are detachable and can be joined together to use the instrument these 4 different parts are:

A: Wooden frame

B. 2 Vertical wooden stirrups with 3 stainless steel bearing on each stirrup

C. A Metal footrest mounted in an iron road

D. Saehan Hydraulic Hand Dynamometer device

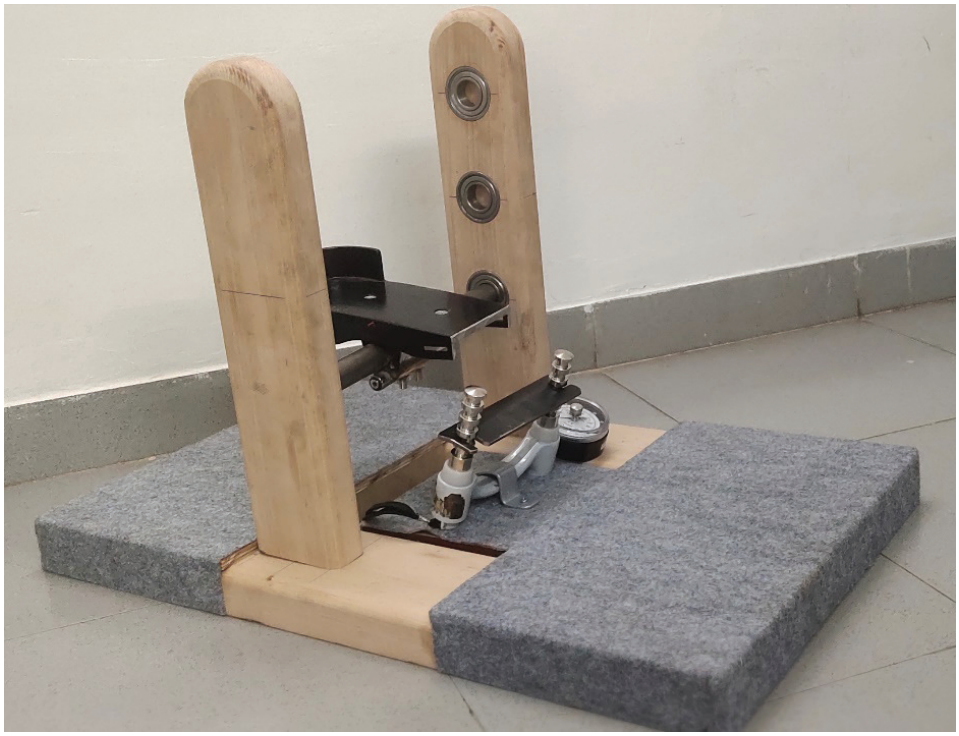

**FIGURE 4: Medical Device Prototype for Foot Intrinsic Muscles**

**Procedure**

The measurement of the muscular strength was done in the high siting with both the legs are parallel to each other and the testing foot is placed in the foot rest and maximum plantarflexion is achieved the ankle is scurred with the Velcro straps during the measurement, one the plantarflexion is achieved the subject should press the iron bar attached to the dynamometer and the reading can be measured. Subject should record 3 reading for each foot and the mean of these 3 reading can be taken as the value of intrinsic muscle strength in pounds (lb).

**Biomechanical consideration**

Design of the instrument is based on 2 major principles

1. We should provide the plantarflexion at ankle joint to cause disadvantage to extrinsic muscle[15]

2. Prevention of toe curling by using the iron strip as a force point in the dynamometer

**Isolation of intrinsic muscle**

To further strengthen our claim to position the foot in the plantarflexion the needle EMG was used to verify the activation in the intrinsic muscle while measuring the reading the abductor hallucis muscle is used for the insertion of needle. The Ethical Clearance of this procedure was taken from Ethics Committee, School of Physiotherapy, RK. University (ESR/259/Indt/GJ/2016) and the procedure is done by the Neuro physician. The movement of toe flexion with limit curling shows an activity in the testing muscle (Figure 7)

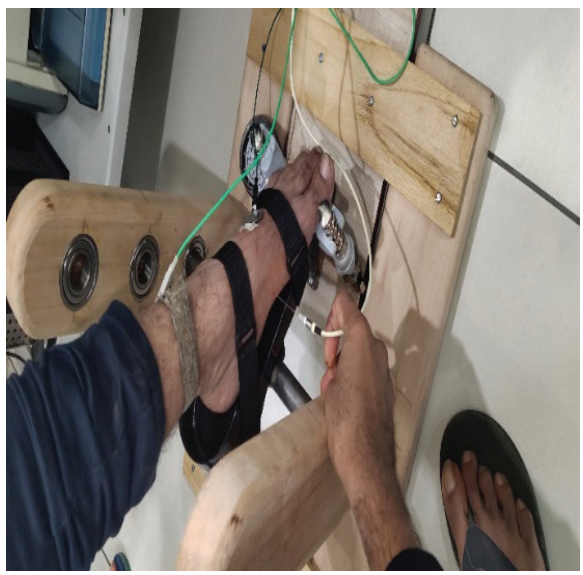

**Figure 5: Needle EMG for the Abductor Hallucis**

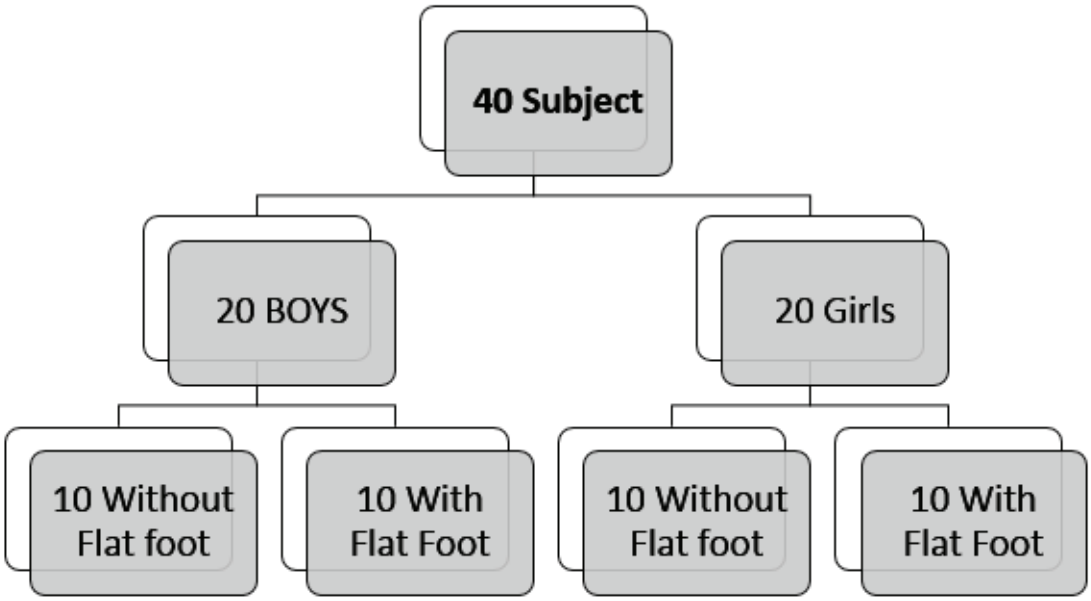
**One stop solution**

The purpose of designing this prototype is to provide one stop solution to foot intrinsic muscle impairments, this device not only quantify the intrinsic muscle strength but also provide a platform to demonstrate different exercise which are designed to strengthen or stretch the foot intrinsic muscle with the help of certain therapeutic devices

**Pilot Study**

To check the efficacy of the instrument a pilot study with this instrument to compare the planter intrinsic muscle strength of young boys and girls with and without Flat Feet. Total 40 subject were included in the study. All subjects BMI ranges between 18.5 and 24.9 Age is between 18-24 Years.

## Methodology



| **10 Boys without flat foot** | **10 Boys with flat foot** | **10 Girls without flat foot** | **10 Girls with flat foot** |
|---|---|---|---|
| BMI: 20.6 ±1.34 | BMI: 21.5 ± 1.0 | BMI: 20.3 ± 1.33 | BMI: 20.9±1.19 |
| Age: 20 years | Age: 20.4 years | Age: 20.8 years | Age: 20.8 years |
| Strength: 27.5 lb. | Strength: 21. lb. | Strength: 23 lb. | Strength: 15.3 lb. |

## Results and Discussion

The overall design of this prototype is convincing and fulfil all the biomechanical and clinical consideration apart from the testing and quantification of the intrinsic muscle the design also gives a therapist an opportunity to use this machine as exerciser for strengthening protocol and very beneficial in-home settings. The pilot study done to check the efficacy of the instrument in different gender and foot morphology also gave promising results described in the Table 1

Table 1: Description of the subjects in terms of BMI, Age and Strength

The result of this small pilot study clearly shows that the subjects with flat feet have less intrinsic muscle strength compared to the subject without flat feet or free from any foot deformity.

The initial results of the pilot study were encouraging and show the relationship between the intrinsic muscle strength and flattening of arch which will proved our claim that the the intrinsic muscle of the foot contributing in the maintaining of longitudinal arch and if the arch is flattened it is clearly reflected in the value of the strength compared to the subject having neutral healthy feet. The structural analysis of the machine also provide the support that the direction of the force is in the same direction as the direction of intrinsic muscle if they perform MTP Flexion. The quantification of these intrinsic muscle certainly opens the doors in the understanding the strength deficit associated with this muscle and we can design the strength program in accordance to the weakness of the muscle.

Further we should prove the reliability of this instrument in both the genders and various age group which is still not been done and we will be doing this research in the future as the validity of the instrument is already proved by the structural analysis also in the future there is a need to design a device to take care of other action of intrinsic muscle like abduction and also role of intrinsic extensor as per today understanding these extensor are rudimentary to the foot muscle function.

## Conclusion and Acknowledgement

We conclude that this porotype is an easy to use instrument providing not only the measurements of the intrinsic muscles of the feet but also provide the space for the exercise programme related to the intrinsic muscle and for the impairment associated with them.

The authors would like to thank Mr. Deepak Joshi, Mr. Rupesh M, Hardik wood Rajkot and Mechanical Engineering workshop at RK. University (students from the School of Physiotherapy) who made important contributions to this project.

# Fire Safety Related Challenges Faced by Existing Hospitals: A Review

**Abdul Hakim Choudhary[1], Mohammad Kausar[2], Sidhartha Satpathy[3], D. K. Sharma[4]**

*[1]Assistant Professor, Department of Hospital Administration, AIIMS, New Delhi, [2]Senior Consultant (Hospital Management), Department of Hospital Administration, AIIMS, New Delhi, [3]Head, Department of Hospital Administration, AIIMS, New Delhi, [4]Medical Superintendent, AIIMS, New Delhi*

## Abstract

**Background**: Hospital fires are real dangers and have historically caused life and property damages. A review of major research databases like Scopus, IEEE Xplore Digital Library, IET site, PubMed, Cochrane library and ASCE Library was conducted to explore fire safety challenges faced by existing hospitals and possible recommendations made thereof to overcome such challenges.

**Methods**: The review was conducted for key words- "Fire safety", "Hospital Fire", "Fire risk" and "Fire safety challenges". The search found 684 articles in total which were screened for relevance to research area and 27 articles were reviewed in detail.

**Findings**: There is poor enforcement of law by agencies. Retrofitting for conformance to fire safety regulations is difficult. Issue like faulty equipment, improperly kept inflammable material, evacuation difficulties due to higher acuity of patients, operational issues like maintenance of all fire safety equipment and installations, and training of staff, etc. are highlighted.

**Conclusion**: Focussed interventions and an all-encompassing fire safety risk management plan is the need of the hour. Significant insights into critical issue of fire safety is of immense benefit to healthcare professionals as a basis to make hospitals safe places.

## Introduction

Statutes, codes and quality programmes govern hospital fire safety. Hospital fire dangers are real, widespread, and ever present.[1.] Hospital fires are global pandemic (Table 1). Operating-room fires have potential catastrophic outcomes.[2] In 2011-2015, US fire departments responded to 1,130 hospital fires that left 32 injured and caused damages worth US$8.8 million.[8] U.S. fire departments responded to an estimated average of 5,650 structure fires in or on health care properties per year. These fires caused an average of four civilian deaths, 160 civilian injuries and $44.9 million in direct property damage annually. AMRI Hospital fire depicts true picture that exists in India. It had glass façade, lacked windows and mechanical ventilation of centrally air-conditioned building was missing. Fire department had served notice on dangerous use of basement (LPG cylinders, mattresses and wooden boxes). With three months deadline to comply, it did not. Staff didn't inform fire brigade for nearly $1^{1/2}$ hours. Smoke detector and fire alarm system were kept non-operative out of ignorance or oversimplification.[9]

Fire safety encompasses beyond building plan. Hospitals fail to incorporate basic components, viz. planning for critical supplies or ways to evacuate patients off-site. By drawing attention to these issues, hospitals can identify weaknesses in current plans and better prepare for a successful evacuation.[12] Catastrophic potential of fires and a tendency of history to repeat itself called for a review of fire safety challenges faced by existing hospital.

## Methods

A review of major research databases like Scopus, IEEE Xplore Digital Library, IET site, PubMed, Cochrane library and ASCE Library was conducted for key words- "Fire safety", "Hospital Fire", "Fire risk" and "Fire safety challenges" to explore fire safety challenges faced by existing hospitals. The search found 684 articles in total which were screened for relevance to research area and 27 articles were reviewed in detail to examine various challenges faced by existing hospitals and recommendations to overcome them.

## Results

### Challenges

There are problems with law enforcement.[3] Hospitals lack fire prevention measures. No objection certificates (NOC) from fire department were not renewed as it did not entail major penalty.[9] There are no follow-ups with fire department on maintenance of fire alarms/ sprinklers.[13] Health facilities do not fully complied with relevant construction codes and compartmentation for movement to safer area to await rescue.[14]

Facilities built on previous standards faced losing license due to new regulations of patient's room size.[15] Equipment sensitive to vibration/moisture, ongoing

patient procedures, and active HVAC systems are critical and cannot be easily shut down. Dust and water, containing bacteria and spores, when dispersed infect patients. Dirt on workers, contaminated carts and materials cause diseases such as aspergillosis. Poor ventilation/filtering of air affect indoor air quality of patient rooms.[15]

Emergency response mechanism did not meet international best practices (fire station every 3 kms). Response time sometimes exceeded beyond 30 minutes (upper limit of 3 minutes).[9] Funds are needed to upgrade fire equipment and manpower skills.[9] Mock fire drills take place occasionally and in metro cities only.[9] A woman died when rope snapped during mock drill.[9,16] Fire station facilities were not acquainted with facilities, its location and specific hazards.[6]

Heavy casualties occurred as patients on life-support couldn't be moved. Small hospitals have transformed into special care environments, ill-equipped to deal fire emergency due to inadequate fire protection facilities, fire safety equipment, and human resources.[5]

There is poor planning and management of fire safety issues.[3] Emergency preparedness plans did not exist, fire risk assessment not conducted and there was no fire safety planning or monitoring. Hospitals lacked "no smoking" policy and fire reporting procedures.[6] Health facilities lacked adequate fire risk assessments.[14] Role of security services is unclear.[3] Emergency contact details are not readily available with hospitals.[6] Fire extinguishers, automatic sprinklers,[3] fire/smoke alarms and sign boards for directing emergency evacuation were not available. Fire exits were either not available or exit signs/routes not illuminated. Electrical switches/ circuit breakers were not identified and electrical cords/ plugs were not maintained.[6] Combustible material were improperly stored and corridors were not free from clutter. Chemical containers were not labelled as "flammable".[6] Combustible construction material is an issue.[3] Competent persons for managing fire incidents were not deployed and firefighting employees were either not identified or inadequately trained.[6] Performance by hospital staff with respect to fire safety and management is poor.[3]

Newer technologies viz. linear accelerators and robotic surgical tools pose problems as these require larger space and sometimes located in areas already tight and not specifically designed.[17] Alcohol-based disinfectants are located throughout facilities, including exit corridors.[17] For security of infants, children and psychiatric patients, egress doors are kept locked.[17]

Laser and electrocautery have reintroduced risk of surgical fires.[18,19] Many otolaryngologists (25%) have experienced operating room fire.[20] Most OR fires involve cautery/lasers. [21] Most fires (81%) occurred while supplemental oxygen was in use. [20] Airway fires result from combination of oxygen-rich environment, flammable material, and heat source during surgery.[19, 21] Each healthcare worker owns a part of fire triangle. Fuel source is typically provided by circulating nurse, e.g. flammable prepping agents,[2] tinctures; drapes[2], other combustibles, GI gases (mostly methane), etc.[21,22] Surgeon supplies ignition source through fibreoptic light sources, sparks from surgical drills/burrs, flexible endoscopes, etc.[21, 22] High fire risk surgeries are oropharyngeal surgeries; surgeries on head or neck[2], face, cataract; endoscopic laser surgeries; cutaneous/ transcutaneous surgery; tracheostomy and burr hole surgery.[20, 23]

Evacuation time draws major attention because of diverse population, mix of patient conditions, and multiple units on one floor.[24] Internal movement challenges included non-functioning elevators, compromised access to stairwells/evacuation routes, and failed lighting and electrical circuits. Finding appropriate transport mode for patients to alternative site were complicated, esp. where multiple evacuations occurred simultaneously.[25] In case of non-functional elevators, vertical evacuation is compromised.[12] Health facilities lacked adequate ability to evacuate.[14]

Communication is the major contributor to evacuation success.[12] Challenges include congested telephone circuits, failure of emergency equipment, and difficulties communicating fire/police agencies. False information about a non-existing tent hospital at evacuation site led to patients being dropped there.[12] Absence of sheltering agreements led to widespread confusion tracing patients following evacuation.[12] A central command post or a pre-arranged transfer agreement facilitated search for appropriate shelter sites.[25] Confusion of roles and no designated decision

makers pose major problems in disaster response.[26]

Non-availability of medical records has led to rescuing hospital receiving patients without basic identifying information, illness unawareness and mismatch of services, e.g. evacuation of dialysis patients to a hospital not having such services.[12] Failure to maintaining an accurate visitor, patient and staff census during an evacuation can leave hospitals vulnerable to significant disruptions during evacuation.[12] Post evacuation, a system is required to ensure return of equipment.[12]

There is a dilemma about evacuated priority, healthiest or sickest.[12,27] It is difficult to determine evacuation mode if no plan exists.[28] Some evacuated sickest first and others healthiest.[12] Critical patients can only be moved to specific locations. Mix and changing patient acuities pose difficulty in planning evacuation.[28] Impaired patients cannot evacuate without assistance.[17,29]

Functional ability of staff is compromised due to the threat itself. Since continuing care requires resources, it further complicates evacuation.[28] Training is not provided for temporary staff.[30] Weaknesses in unit design with inadequate escape routes, ventilation cut-outs and fire doors; and lack of portable monitoring equipment and emergency drug supplies are reported. Evacuation plans were often limited in scope for e.g. staff expected to remain on floor and plans were not rehearsed.[30] Anxiety impairs evacuees' ability to select appropriate routes.[31] Occupants don't know how to react to a fire alarm. For wayfinding, occupants seek help of staff who should be well trained to instruct patients.[32] Return to a facility that is under repair or missing staff poses different set of challenges.[12]

A systematic review found that strength of evidence was insufficient, and effect for interventions like education, equipment, patient safety course or team training and risk assessments was not estimable.[19]

## Discussion

Lessons from history signify that even old hospitals should comply with existing laws.[3] Knowledge of and implementation of codes/standards are recommended for keeping a hospital fire from becoming a disaster.[1]

Installation and maintenance of automatic fire systems are critical in fire safety.[1,3] Sprinklers lead to 75% reduction in property damage.[8] Fire alarm systems must be designed for early detection, accurate location annunciation, fire department notification, and control of high voltage alternating current system, and elevators.[33]

There should be a strategy for fire prevention and emergency response procedures, including counter-measures for fire risk assessment, management, and emergency response, in order to improve fire safety.[5] More practice implementing plan would be beneficial.[26] Staff should be prepared in handling myriad complexities of evacuation, including ethical considerations. A physician was accused of killing four sickly patients with sedatives.[12] Standardisation as Code Red is recommended.[34] Staff training is critical to fire safety.[3] Conducting frequent drills is recommended.[1]

A unified, centralised command structure, single authority and clearly responsibilities contribute to successful evacuation. Simple, flexible disaster plans with minimum staffing is needed. Development of "fire-safe" elevators to assist evacuation is recommended.[35] Policies should guide order of evacuation.[12] Switching policy is suggested beginning with non-critical (never optimal to split evacuation teams).[27] Robust evacuation planning should address changing patient acuities.[28] For patients unable to evacuate without assistance "defend-in-place" strategy may be developed.[17,29] For vertical evacuations, methods include dragging patients on sheets using mattresses on stairwells, formalised sheet and mattress method, specialised med sleds, plastic sheets, etc.[12] There should be established escape route plans.[3] Effective guidance help reduce negative impacts of anxiety on route choices.[31]

Communication protocols should be established in advance with multiple redundancies (messengers, telephones, portable radios, cellular telephones, satellite communications, runners and volunteer radio operators).[12] Short text messages may be used. Public information officer and liaison with media can avoid miscommunications.[12]

Local NGOs can assist hospitals in evacuations.[12] MoUs with other hospitals and vendors allows smooth evacuations and availability of critical goods/services.

Central log at Incident Command can help

effective tracking and ensuring that medical records are available.[12] Evacuation packs may contain worksheets, phone numbers, medication, transport equipment, and disposable supplies.[12]

Operating room fire safety guidelines have been recommended such as, nonconductive plastic clamp, adjusting setting to avoid sparks, never using cautery to enter trachea, using air or air/oxygen mixtures in anaesthetic gases, avoiding nitrous oxide especially during bowel surgery, avoiding "tenting" of drapes, stopping supplemental oxygen one minute before using cautery on head and neck, etc. [21]

A centralized reporting system should be developed to catalogue events. Standardized root cause analysis will help to elucidate circumstances by which a sentinel event took place.

## Conclusion

Multiples challenges compromise fire safety in hospitals- law enforcement, retrofitting, modifications in facilities, poor preparedness, newer hazards, etc. Hospitals need focussed interventions and an all-encompassing fire safety risk management plan is the need of the hour. Significant insights into critical issue of fire safety is of immense benefit to healthcare professionals as a basis to make hospitals safe places.

## Abstract

**Introduction:** All through the world, induction of labour fails in 20% of cases and thus cesarean section is performed. Obesity is a risk factor for undesired results of pregnancies. Although the Bishop score is simple and easy to apply, it is a subjective evaluation method and results may vary according to the clinical experience of the person applying it. Transvaginal cervical measurement can be more objective criterion in assessing the success of labor induction. We aimed to identify the proper characteristics of the pregnant women, which can go for successful induction of labour.

**Method:** Induction of labor for 100 women using vaginal misoprostol was done following identification of their BMI, modified bishop score and transvaginal cervical length. All women were pregnant ≥38 weeks, singleton, cephalic presentation, intact fetal membranes.

**Results:** About 92 women had successful induction of labour (group 1) while the remaining eight women had failed induction (group 2). BMI did not show statistical significance however, the modified Bishop score and the transvaginal cervical length showed high statistical significance. Using the modified bishop score 2 as a cutoff value showed sensitivity 89.1%, and specificity 62.5% while using the transvaginal cervical length 2.65 as a cutoff value showed sensitivity 72.8% and specificity 100%.

**Conclusion:** Induction of labour by vaginal misoprostol is very promising in term women providing identification of their modified Bishop score and their transvaginal cervical length.

***Keywords:*** *Induction of labour; BMI; modified Bishop score; transvaginal cervical length; misoprostol.*

## Introduction

Induction of labour is a method of timed delivery of the fetus that can be requested in certain circumstances. It was obviously seen how the induction of labour differ from an area to other and is applicable is an increasing manner. In the United States and Canada, it reached more than 20% [1].

Assessment of the cervix is a crucial prognostic factor for the outcome of labour induction. Once labour starts, many changes were detected in the cervix matter involving the influx of certain chemicals into the cervix and efflux of special materials that dismantle the collagen, remodeling the cervical tissue. In addition, it has been detected prominent changes in the level of glycosaminoglycans and release of cytokines [2].

In 1964, a "pelvic score" was published, now known as the Bishop score, which described a patient's suitability for elective labor induction. This idea was based on the assessment of cervical factors including dilatation, effacement, consistency, position and station. He concluded that labour induction was successful if the total Bishop score reached 9 or beyond. Time induction of labour was suitable for multiparous women who reached 37 weeks gestation and this examination showed an adequate size fetus with head down presentation. Despite that, this scoring system was in common use in any pregnant woman not strictly the term. Although all the changes to the original Bishop' score, this first score stand to the common one used in practice [3].

Successful induction was closely related the woman weight. It was prominent that candidates with a weight on the lower side have more the chance to have a vaginal delivery within 12 and 24 hours of start of induction and those with weight on the higher side are more prone to end up by a cesarean n delivery even if multiparous [4].

Many obstetricians have been in circumstances requiring a timed delivery of their patients and so they tried a plenty of methods. The main idea was to deliver their patients by vaginal delivery and this occur by bringing uterine contractions in a uterus already in a quiescent state. The rate of labour induction has risen up in the United States in the last decades and the number of induced women has reached more than the double by 2009. These enormous changes in practice were related to many factors including from one side the candidate compliance and from the other side the plenty of methods used for induction [5].

Our study was aiming to identify the proper criteria of the candidate, which can go for successful induction of labour.

**Methods:**

This prospective study was conducted on 100 women who attended a private hospital between October 2012 and December 2015 after approval of the ethical committee of the national research centre. The inclusion criteria involved full-term pregnancy (≥38 weeks) with a single, living fetus of cephalic presentation, intact fetal membranes. The exclusion criteria involved women with previous caesarean section, cephalopelvic disproportion, placenta previa or vasa previa, transverse fetal lie, prolapsed umbilical cord, multifetal gestation, abnormal fetal heart rate patterns requiring emergency delivery, estimated fetal weight ≥4 kg, fetal demise, chorioamnionitis, and previous uterine scar.

First, each woman was assessed, by taking full history and examination, to check her age, weight, height, parity, gestation and for any medical problem. The study population was categorized into six classes of BMI=weight/height$^2$ (kg/m$^2$), based on the WHO definition; underweight <18.5, normal weight 18.5–24.9, overweight 25–29.9, class I obesity 30–34.9, class II obesity 35–39.9 and class III obesity ≥40.

Via the ultrasound machine Sonoace R7 (Samsung Medison, Korea), transabdominal ultrasound was performed for each woman to obtain the fetal biometry as well as the fetal weight using the formula by Hadlock. Using a 5 MHz transvaginal probe, the cervical length was measured twice in the sagittal plane along the length of the endocervical canal with simultaneous visualization of the internal and external cervical os, and then the mean of the two measurements was calculated.

All women were informed about the induction procedure including the use of misoprostol and its potential risks (hyperstimulation, uterine rupture and the possibility to fail and go for caesarean section). A digital vaginal examination was done to identify woman's modified Bishop score, which includes; the cervical dilatation, station, consistency, position as well as the cervical length, which has replaced the item "effacement" in the original Bishop score.

Each woman was subjected for external cardiotocography (CTG) for 30 minutes before starting induction. A dose of 50 micrograms of misoprostol is put intravaginally and repeated after 6 hours if no progress occurs (maximum dose of misoprostol was 100 mcg). External cardiotocography (CTG) was performed intermittently (every 30 minutes) to assess the fetal well-being and the uterine contractions. Once the woman started to have efficient contractions (3-4 contractions during 10 minutes), cervix dilated 3 to 4 cm and the patient started to feel pain, no more misoprostol was given.

A Foley catheter was inserted as a full bladder may interfere with fetal head descent and it was a way of assessment of the patient degree of hydration. Continuous CTG tracing was done and vaginal examination was repeated every 2 hours to assess the progress of labour. Amniotomy was done once the patient reached 5 cm as a mean of accelerating the progress of labour. All data

were registered in a portogram to follow the progress.

When oxytocin augmentation was required, a minimum interval of six hours was recommended after the last misoprostol dose. However, augmentation with oxytocin was not used in this study except if the patient did not experience regular uterine contractions during the 1st hour following amniotomy. Oxytocin was used mainly during the second stage of labour.

All data were properly collected, tabulated and statistically analyzed using computer program SPSS (Statistical Package for the Social Science; SPSS Inc., Chicago, IL, USA) release 25 for Microsoft Windows. Data were statistically described in terms of mean ± standard deviation, or frequencies (number of cases) and percentages when appropriate. Comparison of numerical variables between the study groups was done using Student t-test for independent samples in comparing normally distributed data. Accuracy was represented using the terms sensitivity and specificity. Receiver operator characteristic (ROC) analysis was used to determine the optimum cut off value for the studied diagnostic markers. P values less than 0.05 was considered statistically significant.

## Results

This study involved 100 women that fulfil the inclusion criteria. Regarding the patient characteristics, the mean ± SD for age and gestational age for all participants were 29.65 ± 2.63 (in years) and 39.06 ± 0.75 (in weeks) respectively. There were 74 primigravida women and 26 second gravida women.

Successful induction using vaginal misoprostol was approved in our study when the patient reached the second stage of labour (fully dilated cervix) without fetal or maternal distress. About 92 women had successful induction of labour and reached the second stage of labour (group 1) while the remaining eight women had failed induction (group 2). Among group 1, 89 cases ended by successful vaginal delivery and only three women failed to deliver vaginally and delivered by CS due to arrest of fetal head descent despite fully dilated cervix, as the trial of instrumental delivery was not an option in our study.

The BMI of all women was 29.6 ± 3.72, and only 4% of them had normal weight, 49% were overweight, 38% were class I obesity and 9% were class II obesity. This diversity in BMI did not affect the success of labour induction. As regards the modified Bishop score, 4% of women had score 0, 11% had score 1, 2% had score 2, 44% had score 3, and 21% had score 4. The modified Bishop score showed a significant statistical difference. As regards the transvaginal cervical length, 13% of women had cervical length ≤2 cm, 61% had cervical length 2.1-3 cm, and 26% had cervical length >3 cm. The transvaginal cervical length showed a significant statistical difference as shown in table 1.

Figure 1 shows that using the modified bishop score 2 as a cutoff value showed sensitivity 89.1%, and specificity 62.5% while using the transvaginal cervical length 2.65 as a cutoff value showed sensitivity 72.8% and specificity 100%.

**Table 1: Comparison between both groups as regards age, gestational age, BMI, modified Bishop score, and transvaginal cervical length:**

| | **Successful Induction (Group 1, n=92)** | **Failed Induction (Group 2, n=8)** | **P-value** |
|---|---|---|---|
| Age (in years) | 29.67 ± 2.64 | 29.38 ± 2.67 | 0.760# |
| Gestational age (in weeks) | 39.07 ± 0.77 | 39 ± 0.54 | 0.757# |
| BMI | 29.79 ± 3.6 | 27.49 ± 4.67 | 0.211# |
| Modified Bishop score | 2.77 ± 0.99 | 1.5 ± 1.07 | <0.001* |
| Transvaginal cervical length | 2.46 ± 0.47 | 3.34 ± 0.26 | <0.001* |

Normally distributed variables are represented as mean ± SD and paired t-test was used

#: No significant difference (P-value > 0.05)

*: Highly significant difference (P-value < 0.001)

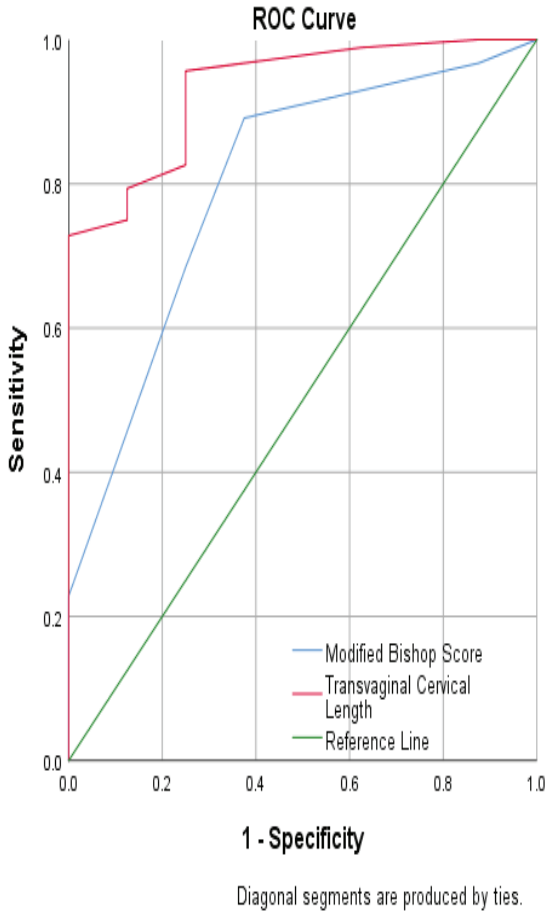

**Figure 1: ROC curve of modified Bishop score and transvaginal cervical length**

## Discussion

The idea of our study was to determine the proper criteria of the candidate, which can go for successful induction of labour, and avoid waste of time or risky trial for induction of labour if the candidate is better to go for caesarean section from the first assessment.

We had chosen 100 women of smooth antenatal course, no medical comorbidity, with singleton pregnancy of cephalic presentation and intact fetal membranes. Counseling was in details. We identified 3 parameters from each patient (BMI, transvaginal cervical length and modified Bishop score) before starting the induction by vaginal misoprostol. Each patient was under close monitoring using CTG tracing to follow the progress of labour. We had 92% success of induction.

The choice of vaginal misoprostol for induction agreed with Sareen who conducted a study on term patients by vaginal misoprostol 50 mcg. He concluded that the use of misoprostol showed an evident decrease in the time to the delivery of the baby following using the insert, without causing harms to him or changing in the number of caesarean sections [6]. Besides, Danielian used the misoprostol vaginal insert as a method of induction in his study and put down a conclusion that misoprostol with a dose 50 µg inserted in the vagina is more effective than 1 mg dinoprostone vaginal gel, with no apparent drawbacks on the route of delivery, or on the baby [7].

Regarding each of the 3 selected parameters, the BMI didn't show in our study any statistical significance (p value=0.093) which means that it is not advised to take BMI of the patient before induction of labour as it doesn't show any impact on its success. However, the modified Bishop score and the transvaginal cervical

length showed significant statistical difference as shown previously (P value were 0.001 and < 0.001 respectively).

Yousuf et al, in 2016, agreed with our previous findings, as they ran a retrospective study to assess the drawback of obesity on pregnancy and labour. They recruited data of all patients who booked in the end of their first trimester and required timed delivery during the year 2012. The candidates were divided into two groups; the first group involved those with BMI less than 23 and the other group included the cases whose BMI 23 or more. They denoted that increased weight required induction of labour due to medical condition. The study showed that the primigravida women had more chance for caesarean section(odds ratio 1.45), the length of caesarean section and loss of blood during the procedure were not obviously associated with body mass index on the higher side(p>0.05). Obesity may have some concerns in primigravida women, but it did not have major effect [8].

Pevzner et al, in 2009, disagreed with our findings. Their study idea was to appraise the different features either maternal or pregnancy related that solely expect to end up in vaginal delivery and is what they meant by the target of induction of labour. The study was a secondary analysis of the data collected during the Misoprostol Vaginal Insert Trial, a multisite, double blind, randomized trial of women requiring cervical remodeling before induction of labor. The study first aim was to collect the candidate criteria who deliver by vaginal route following induction. About 72 % of the induced patients subsequently had vaginal deliveries. The parous candidates (P<.001, statistically significant), BMI below 30 (P<.001, statistically significant) and height exceeding 5'5" (statistically significant) baseline modified Bishop score of 4 (P=.047, statistically significant), and fetal weight below 4,000 g (P<.001, statistically significant) were identified as strong prognostic factors once seeking a successful induction of labor. Each of these criteria was subjected to logistic regression analysis independently. Besides that, it was perceived that the age group beyond 35 and the Hispanic race favor a successful induction in contrary to the African-American race which was linked to a higher incidence of delivery by caesarean section (P value less than 0.05 so it is statistically significant). Therefore, they affirmed lastly that the candidate 's characteristics such as BMI, parity and age are crucial parameters to be checked once looking for a successful induction of labor, and this disagreed with our findings. On the other hand, they confirmed that neonatal birth weight is an important prognostic variable regarding the success of induction and this finding agreed with ours [9].

Pandis et al., in 2001, agreed with our findings. They used to identify the rapport between the cervical length as measured by the transvaginal ultrasound as well as the bishop score. Following that, they matched these data to candidates who were induced for delivery and end up with successful vaginal delivery. This idea rose from the process that the decision to timing delivery under certain situations is overspreading. Despite that, around 20% of induced candidates end up by a caesarean delivery [10].

## Conclusion

Induction of labour by vaginal misoprostol in term pregnancy is a highly promising decision. However, counselling of the woman should be based upon identification of her modified bishop score and her transvaginal cervical length. Assessment of BMI of the candidate before induction of labour is not feasible. Further studies on larger prospective studies are required to emphasize our conclusion.

**Acknowledgment**: We would like to thank our colleagues from Faculty of Medicine, Cairo University who provided insight and expertise that greatly assisted our research.

**Ethical statement**: This study was approved by the Medical Research Ethics Committee of the National Research Centre, Cairo, Egypt, and all subjects gave their informed consent.

**Consent for publication:** The manuscript has not been previously published or submitted to another journal for publication. All authors have seen and approved the manuscript being submitted.

**Conflict of Interest**: None of the authors has a financial or any conflict of interest.

**Funding:** This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

# In Potential Siliko Simulation of Clorogenic Acid in *Coffea canephora* to Transfering Macrophage Polarization of M1 in Tuberculosis Infection

**Christina Destri[1] , Jusak Nugraha[2], Muhammad Amin[3], Djoko Agus Purwanto[4]**

*[1]Doctoral Program of Medical Science, [2]Department of Clinical Patology, [3]Department of Internal Medicine, Faculty of Medicine, Airlangga University, Indonesia, [4]Department of Pharmaceutical Chemistry, Faculty of Pharmacy, Airlangga University, Indonesia*

## Abstract

The aim of this study to determine the potential of *Coffea canephora* by using chlorogenic acid (CGA) compound associated with macrophages polarization in tuberculosis condition. Exploration of compound by using the Knapsack database and Dr. Duke. Analysis of CGA by using a PASS server with the results ranged score 0-1 probability to be active score. Molecular binding docking receptor and ligand were used Autodock PyrXv9.5 and interactions between molecules using CLUSPRO 2.2. Potential activities of CGA compounds was 3,5-*dicaffeoylquinic acid*, *feruloylquinic acid*, and *p-coumaroylquinic acid* with Pa value close to 1, this indicates that the accuracy of prediction of antioxidant activity was quite high. The results of docking through the attachment pathway of several amino acids showed the potential for side methylation activity 'which is able to reduced DNMT1 activity thereby suppressing the anti-inflammatory process. Protein interactions based on affinity values were higher among DNMT1 and STAT1 bonds compared to STAT6. The results of the study concluded that the active compound in *Coffea canephora* was involved in the function of the immune system and it related to the inflammatory process. It is triggers the delivery of antimicrobial cytokine signals and increased antioxidant, it is very necessary in healing tuberculosis disease process.

***Keywords:*** *Coffea canephora, Chlorogenic acid, Inflamation, DNMT1, STAT1, Tuberculosis*

## Introduction

Tuberculosis (TB) is an infectious disease caused by *Mycobacterium tuberculosis* (Mtb) that attacks the lungs and causing pulmonary TB and if it affecting other parts of the body is called extra pulmonary TB [(1).]

The prevalence of TB patients in Indonesia was 297 per 100,000 people, with a mortality rate of 69,000 people per year [(2)]. In 2013 an estimated 480,000 people worldwide progressed towards MDR-TB and an estimated 210,000 died due to this disease [(3)]. The number of new TB cases in Indonesia was 420,994 cases in 2017 with male are more dominance than women[(4)].

XI. Mtb is an intracellular pathogen that lives and develops in macrophages where the stages of immune response to bacterial infections are complex. Inflammatory cytokines such as tumor necrosis factor alpha (TNF-α) and IL-1 play a major role in the defense of immunity against (Mtb) [(5)]. Innate immunity plays an important role as a host defense against Mtb that begins the process of introducing Mtb by innate immune cells against pathogen associated with molecular patterns (PAMP) through their pattern recognition receptor (PRR) [(6)].

Mtb hijacks host mechanisms defense by using manipulating host cellular pathways, innate immune responses, and cell death pathways to take an advantage [(7)]. Macrophages are very important cells in TB infection because their will involve in Mtb phagocytosis process and as an initiation of immunity by adaptive T cells. Elimination of Mtb by macrophages can also through the reactive oxygen forms and nitrogen species, phagosome acidification, and phagosome lysosomal fusion [(6)].

Involvement of macrophages (M) is a complex process with two types of macrophages, it are

macrophage1 (M1) and macrophage2 (M2) was described the main activities that contradict each other and innate immunity controls toward adaptive immunity and not vice versa [8]. The M1 and M2 communication lines in the polarization direction are based on the activities of STAT1 and STAT6. The main activities of NF-κB and STAT1 are promote polarization towards M1 producing pro-inflammatory function [9].

Coffee contains large of CGA, it is a group of quinic acid esters of phenyl propenic acid, especially caffeic acid and ferulic acid. 5-O-caffeoylquinic acid (5-CQA) is the largest of chlorogenic acid of 3-O-caffeoylquinic acid (3-CQA) and 4-O-caffeoylquinic acid (4-CQA) in coffee [10]. *Coffea canephora* species are coffee species that have the highest variability in the genus coffea [11]. Empirical data showed that the average levels of chlorogenic acid were lower in Arabica coffee extracts, while average levels of *coffea canephora* was higher [12].

Based on previous studies in vitro CGA induced LPS or IFNγ but inhibited gene response to IL-4 production by promoted STAT1 signaling and inhibited STAT 6 signaling [13]. In silico test described that CGA has a potential to interact with DNA methyltrasferase enzyme and several proteins associated with transducer sinyaling and transcription activators such as STAT1 and STAT6 and IFNGR1 genes that affected transcription of IFNγ cytokine proteins.

## Method

Exploration of the content of the Chlorogenic acid compound Coffea canephora

The compound content of the coffee family is explores by using KnapSack database (http://knapsack3d.sakura.ne.jp/) and from the duke database (https://phytochem.nal. Usda.gov/p hytochem/search/list), which obtained from various published literatures.

**Potential of Chlorogenic acid**

To find out the potential of CGA, an analysis carried out using a PASS server (http://www.pharmaexpert.ru/passonline/index.php). The score obtained from the PASS server in the form of Pa (probability to be active) has a range of 0-1. The higher the score or more than 0.7 is interpreted the more accurate the prediction of its potential activity with the in vitro / in vivo test.

**Sample acquisition and molecular docking analysis**

3D samples of DMNT1 protein (PDB ID 4WXX), STAT1 (PDB ID 1YVL chain A), and STAT6 (PDB ID 5D39 chain A) were obtained from RCSB GDP database (https://www.rcsb.org). While the 3D structure of CGA (ID: 1794427) was obtained from the PubChem compound database (https://pubchem.ncbi.nlm.nih.gov).

To find out the binding affinity between CGA and DNMT1 protein, molecular docking analysis was carried out between receptors and ligands by using Autodock PyrX v9.5, while molecular interactions occurred between DNMT1 and STAT1; STAT6 and NFKB1 and STAT1; STAT6 were performed docking by using CLUSPRO 2.2 software. The approach taken form of blind docking without using an active side receptor. To determine the bond strength parameter is the highest score from the docking results in form of binding affinity scores. Docking should specifically by imitating the binding site DNMT1 inhibitor 5-Aza-2'-deoxycytidine as a control. The more negative docking result, mean that the stronger the bond occurred. Ligplot software was used analyzed the determination amino acids.

## Findings

**Potential of Chlorogenic acid as an anti-inflammatory**

Based on the analysis, CGA and several major groups of CGA include 3, 5-dicaffeoylquinic acid, feruloylquinic acids, and p-coumaroylquinic acids which have a high potential for anti-inflammatory activity, with score more than 0.6. Pa value or close to 1 indicates the accuracy of the prediction of anti-inflammatory activity.

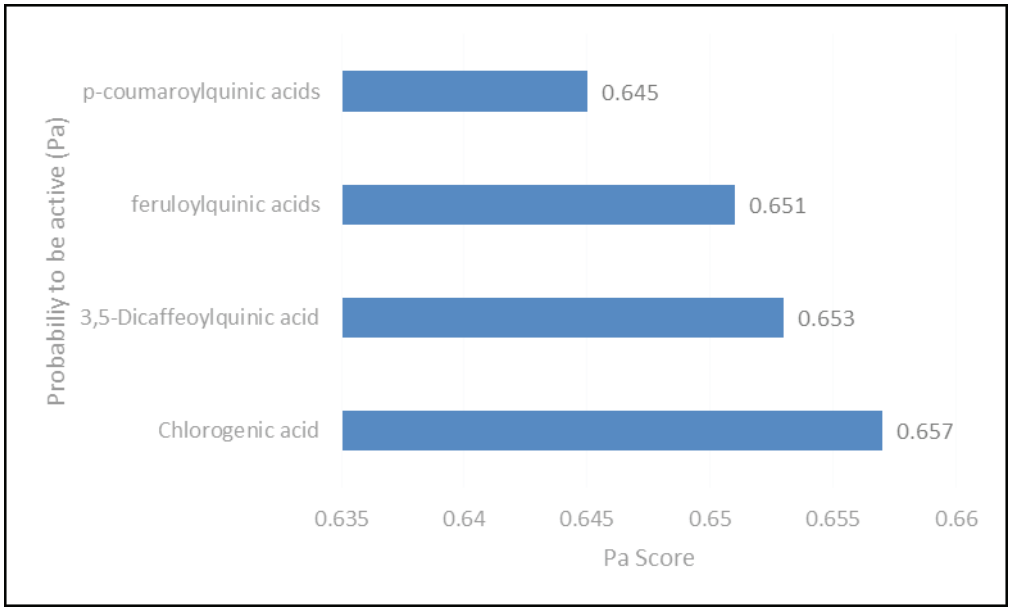

**Figure 1. Potensial prediction of anti inflamatory of CGA.**

### Molecular docking of Chlorogenic acid and DNMT1

Based on molecular docking results, CGA had a stronger binding affinity compared to DNMT1 inhibitors, 5-Aza-2'-deoxycytidine, with -8.3 kcal / mol of score (Table 1). The adhering side of CGA and DNMT1 inhibitors were in the same place (Figure 2), namely in amino acid GLU 562, ASP 565, GLU 566, ASP 569, SER 570, PRO 574, GLY 593, GLN 594, VAL 658, GLN 687 , ARG 690 (Figure 3). This showed that CGA had same potential as DNMT1 inhibitors which is it can carry out methylation activity on the 5 'side of cytosis so it can reduce DNMT1 activity and suppress the inflammatory process in macrophages

**Table 1 Binding affinity between DNMT1 and Chlorogenic acid**

| **Receptor** | **Ligan** | **Binding affinity (kcal/mol)** |
|---|---|---|
| DNMT1 | 5-Aza-2'-deoxycytidine (control) | -6.6 |
| | Chlorogenic acid | -8.3 |

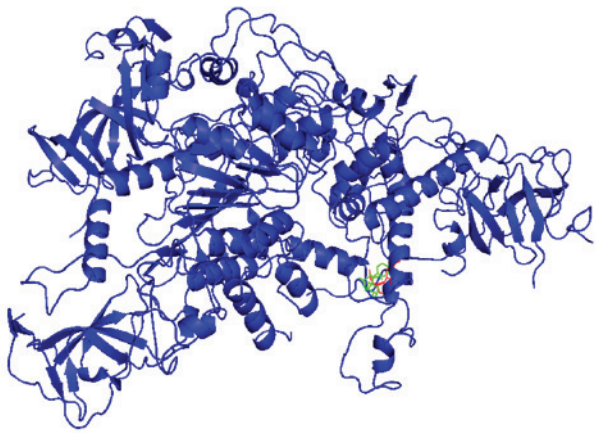

**Figure 2. Docking complex between DNMT1 (ribbon; blue) and CGA (lines; green) also DNMT1 inhibitor (lines; red)**

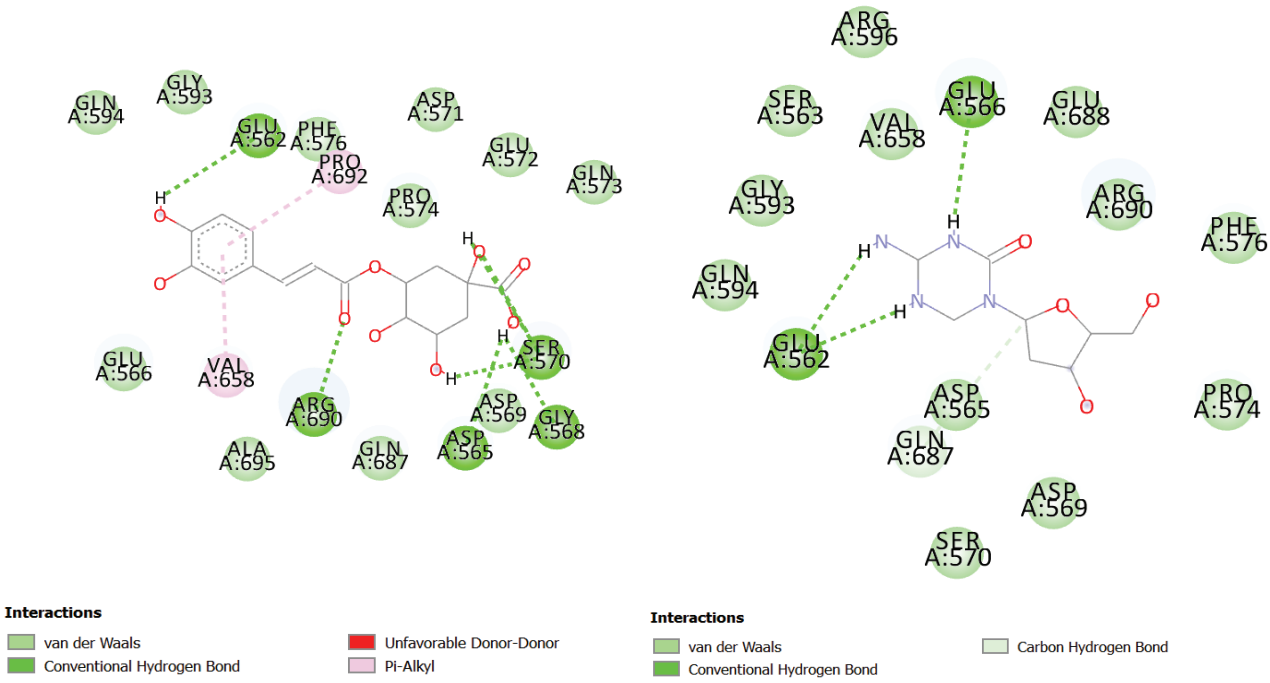

**Figure 3. Amino acid Interaction between DNMT1 - 5-Aza-2'-deoxycytidine (let) and DNMT1- Chlorogenic acid (right)**

**The interaction of macrophage polarization proteins DNMT1 and STAT1, STAT6**

The results showed that DNMT1 had a tendency to bind STAT1 compared to STAT6, this indicated by the results of a higher affinity value -1118.6. The same thing is observe in NFKB interactions that tended to bind STAT1 with an affinity value -941.1 (Table 2).

**Table 2 Interaction of DNMT1 protein, STAT1 and STAT6**

| Receptor | Ligand | Binding Affinity (E-Total) |
|---|---|---|
| DNMT1 (blue; cartoon) | STAT1 (red; cartoon) | -1118.6  |
| | STAT6 (green; cartoon) | -1045.5  |

**Pathway Analysis of Chlorogenic acid, DNMT1, STAT1 and STAT6**

Based on pathway analysis, the interaction between CGA and DNMT1 were not seen directly, this indicated by

a gray line. DNMT1 connected with STAT1 and STAT6 through binding with the HDAC1 protein shown by a blue line (Figure 4).

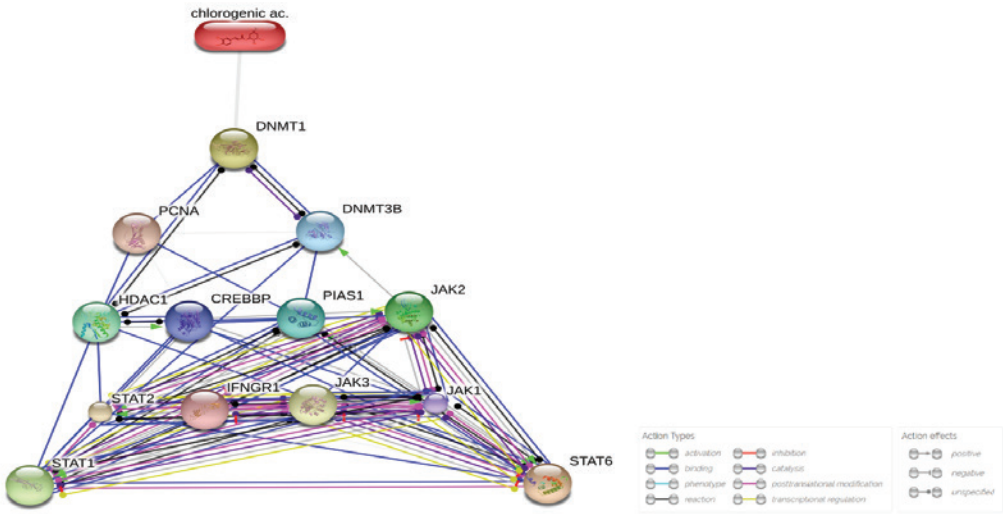

**Figure 4. Pathway prediction form between Chlorogenic acid and DNMT1**

## Discussion

Molecular docking results based on binding affinity showed that CGA had a stronger bond than 5-Aza-2'-deoxycytidine (DNMT1 inhibitor) with a score of -8.3 kcal / mol against several of the same amino acid. CGA compounds as they are known are not a classic form of treatment, but these compounds have the potential alternative pharmaceutical benefits that can exert a physiological good effect [14]. CGA phenolic compounds have a low molecular weight which has anti-tumor effect [13].

DNMT1 is DNA methyltransferase 1 and it plays a role in maintaining the composition of the methylation formulation during DNA replication [15]. The most important epigenetic activity is the ability to modulate the defense of the host immune system against microbial pathogens and it carried out through the process of DNA methylation, histone modification and non-RNA coding activities [16]. Cellular functions such as inflammatory gene expression, DNA repair and cell proliferation were regulated changes in acetylation of histone and non-histone proteins, as seen in cancer, this is associates with changes process in histone acetylation patterns [17].

Indirect NF-κB activation by 5-Aza-2'-deoxycytidine occured in upstream phosphorylation inhibition [18]. Responsive NF-κB influence cellular processes such as apoptosis, cell survival, and often directly plays a role in the control of pathogenic infections [19]. Signaling of stressed cells results in the formation of reactive oxygen intermediates (ROI) which is contribute to the activation of NF-κB [20]. Pattern recognition molecules released by physically stress of cells or metabolically will provide innate adaptive responses to threat the pathogens [21]. NF-κB is a gene target for transcription factors and the factors involved in the progression and development of inflammation [22]. NF-κB is the main regulator of innate immune response and it plays an important role in the activity of inflammatory response process in pathogens. The aim of the innate immune system is to regulate and adjust the inflammatory response to pathogens so that a balance of pathogenic destruction results and limits hyper inflammation are potential to endanger the host [23].

Mtb infection can cleare by innate immune system before the initiation of the adaptive immune response [24]. The first step of activating an innate immune response to Mtb infection is the introduction of pathogens [25]. Mtb adapts by replicating in macrophage cells and subverting cell function. This situation is able to inhibit phagosome maturation, avoid the autophagial process, or weaken the production of proinflammatory cytokines

[26]. Mtb infection induces polarization of macrophages from monocytes. Moreover, Mtb also has the potential to modulate macrophage polarization. In the first stages is tubercle granuloma formation, polarization of macrophages is M1 [27].

Transcription factors such as NF-kB are located in the cytoplasm, before further activation undergoes a transfer to the cell nucleus and as a response to influencing the signals to activate the target gene transcription, whereas the STAT protein must phosphorilation before being bound to DNA [28]. Mtb inhibited the transcription of inflammatory NF-kB and it is causes a decreasing of lysosomes enzyme into phagosomes so that there was a decreation in the ability to kill bacteria [29]. Previous studies of macrophage polarization in tuberculosis suggested that non-classical IFN-γ responses on macrophages were come from monocytes in tuberculosis patient [30]. Signal transduction and activator transcription (STAT) play an important role in cytokine production [31]. The activation of STAT1 and STAT6 are two important signals in polarization of macrophages, and it significantly pushed and suppressed in macrophage cells by influenced the CGA [13].

## Conclusion

In this research can conclude that in Silico CGA is able to influence the transfering towards polarization of M1 macrophages to modulates are more strong on innate immune system in tuberculosis infection. Experimental laboratory studies are need to prove the results.

## Abstract

Photoaging is an extrinsic skin aging caused by ultraviolet radiation. It may affect patients' quality of life. Ultraviolet radiation causes increasing of Kelch-like ECH-associating protein1-nuclear factor erythoid 2-related factor 2 (Keap1-Nrf2) protein, that plays role in photoaging pathogenesis. Many substances, such as green tea catechins, have been developed in photoaging prevention. The most abundant catechin in green tea is epigallocatechin-3-gallate (EGCG). This study was an in silico study, aimed to obtain the effectiveness of EGCG through molecular docking on Keap1-Nrf2 protein. The bioinformatics tools used in this study, were Protein Data Bank (PDB), ChemDraw, Chem3D, and Molegro Virtual Docker (MVD) software. Mol Dock and ReRank score was evaluated in this study, reflected the interaction between Keap1-Nrf2 protein and compound molecules. The prediction of EGCG pharmacokinetics were performed using pkCSM On-Line Tool. The result of molecular docking between Keap1-Nrf2 protein with a candidate ligand (EGCG), a control ligand (arbutin), and a reference ligand (FB2_1615[A]) using MVD software, showed that the binding affinity of Keap1-Nrf2 protein with EGCG to be the lowest. The prediction of skin permeability of EGCG using pkCSM On-Line Tool was -2.735 cm/h and it was predicted that EGCG did not cause skin sensitization and AMES toxicity. EGCG has higher potential than arbutin and reference ligand to be an alternative agent in photoaging prevention. EGCG was predicted to have good skin absorption profile, without toxicity effect.

***Keywords:*** *photoaging, EGCG, Keap1-Nrf2, in silico, docking.*

## Introduction

Aging is a generalized impairment of function, resulting in an increasing vulnerability to environmental challenge and a growing risk of disease. Photoaging is an extrinsic skin aging, that mostly caused by ultraviolet radiation from the sun exposure. Photoaging manifests as wrinkle and dryness of the skin, and affect patient's quality of life, because skin is the outer organ seen by others.[1,2,3] Nowadays, the number of geriatric population increases. The geriatric population in Indonesia was 9.03% of all population in 2017. This fact plays role in the increasing of photoaging problems.[2,4]

**Coresponding author:**
**Damayanti**
Email: dr_damayanti_bs@yahoo.com

Ultraviolet radiation causes increasing of Keap1-Nrf2 protein, that plays role in photoaging pathogenesis. The number of free Nrf2 that translocates from cytoplasm to nucleus and the transcription of antioxidant response element (ARE) will decrease in photoaging.[5,6]

The effort in photoaging prevention have been developed, but the incidence of photoaging is still high. One of the biggest problems in photoaging prevention is the effectivity and the efficiency of the drugs. The new drugs that were needed, should have effective targets and easily to produce.[7,8]

Many plants, such as green tea, have been developed in photoaging prevention, but it still used multicompound approach. Green tea from tea plant *Camelia sinesis* has been planted since thousand years ago in Asia and it has been consumed by two-third of world population.

There were several studies showed the role of green tea in photoaging prevention.[7]

An in vitro study using human living skin equivalent about green tea polyphenol at 5 hours before and after ultraviolet B irradiation, showed that green tea polyphenol decreased the ultraviolet B irradiation induced apoptosis.[9] An animal study in SKH-1 hairless mice that were ultraviolet irradiated twice a week for 2 months and treated with green tea polyphenol in water orally, showed that green tea polyphenol inhibited the production of $H_2O_2$.[10] An in vivo study in SKH-1 hairless mice that were irradiated by ultraviolet B (5 times a week for 4 weeks) and were given green tea extract topically, showed that green tea extract decreased the wrinkle depth and decreased MMP-3 expression in irradiated group compared with control group.[11] A study about topical green tea extract that was topically administered on mice skin receiving ultraviolet B (UVB) irradiation, could prevent the increasing of matrix metalloproteinase-1 (MMP-1) and the decreasing of collagen number in dermal layer. The modern drug design uses single compound approach, and one of the most abundant compound in green tea is epigallocatechin-3-gallate (EGCG). EGCG is the main source of biologic activity of green tea. EGCG is the most abundant catechin in green tea.[7,12]

The drug discovery and development is a complicated process. It needs high cost in a long duration of process. Nowadays, the modern drug design was started with virtual screening (in silico study) in order to decrease the cost. The in silico study in drug design or computer aided drug design (CADD) is one of bioinformatics branch. The in silico study consists of protein structure analysis; and docking interaction between protein and the new drug. The docking interaction can predict the drug action potential in a disease prevention or treatment.[13,14] This study was aimed to predict EGCG as potential agent for photoaging prevention through in silico study by evaluating the docking interaction between EGCG and Keap1-Nrf2 protein.

## Material and Method

The molecular structure of Keap1-Nrf2 protein was downloaded from protein data bank (PDB), and PDB ID: 5FZN was selected. The structure of ligands was drawn using ChemDraw software application, version 11 and copied into Chem 3D software application, version 11 to create the 3D structure and measure the minimum energy using Molegro Virtual Docker, version 5.5.

The docking study of EGCG on the Keap1-Nrf2 protein was conducted using Molegro Virtual Docker software, version 5.0 (processor: Intel (R) Pentium (R) CPU N4200 @1.10GHz; installed RAM: 4.00 GB; system type: 64-bit-operating system). The best docking results were detected visually by comparing the structure of the docked molecules with the structure of reference ligand (FB2_1615[A]) in the binding site. (15) The MolDock and ReRank scores were presented the energy needed in receptor-ligand bond. The lowest energy visualized the best binding pose between the ligand and amino acid residue of the protein.

The prediction of pharmacokinetics and toxicity of the ligands were performed using pkCSM On-Line Tool. The molecular structure of ligands were drawn as 2D molecular structures with ChemDraw software, copied into Chem3D software, stored as a .sdf file, and translated into SMILE format using SMILE Translator Online Help. The SMILE format was processed using the pkCSM Online Tool to predict the pharmacokinetics and toxicity of compounds.(16,17,18,19)

## Findings

Target selection was obtained using the PubChem compound database. Molecular docking was performed to evaluate the mode of binding between the compound and Keap1-Nrf2 protein. The result of molecular docking 3D structure between candidate ligand (EGCG), control ligand (arbutin), and reference ligand (FB2_1615[A]) in Keap1-Nrf2 cavity showed, that the ligands were able to interact with Keap1-Nrf2 protein as the target protein (PDB ID: 5FZN) on the same binding site (Figure 1).

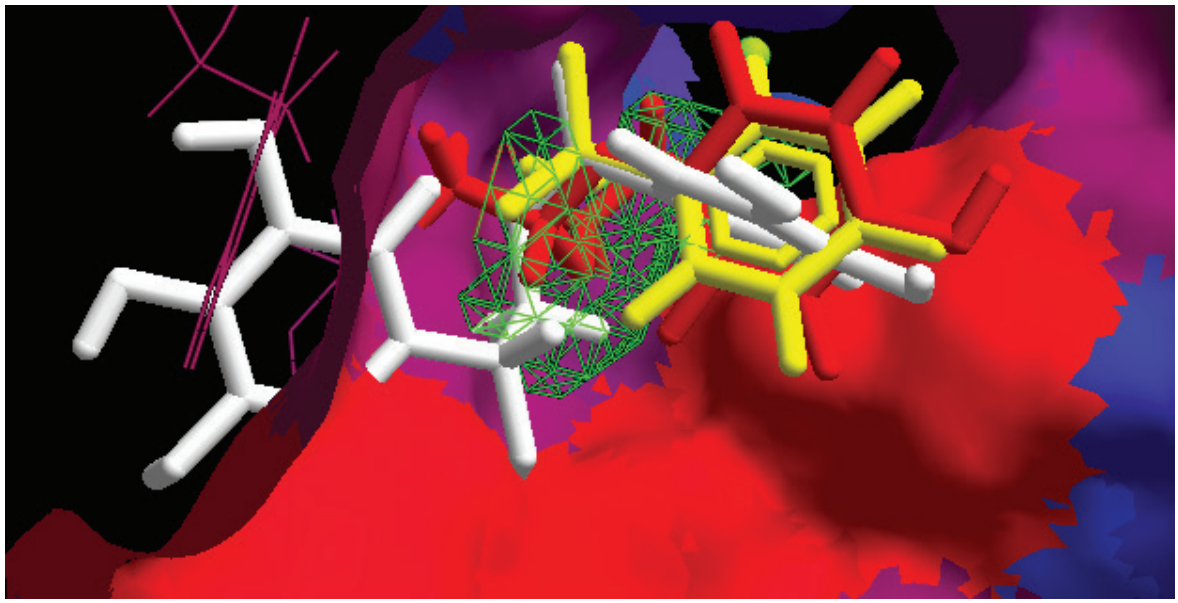

**Figure 1. The result of molecular docking 3D structure between candidate ligand (EGCG), control ligand (arbutin), and reference ligand (FB2_1615[A]) in Keap1-Nrf2 cavity. Description: green (Keap1-Nrf2 cavity), white (EGCG), red (arbutin), yellow (FB2_1615[A]).**

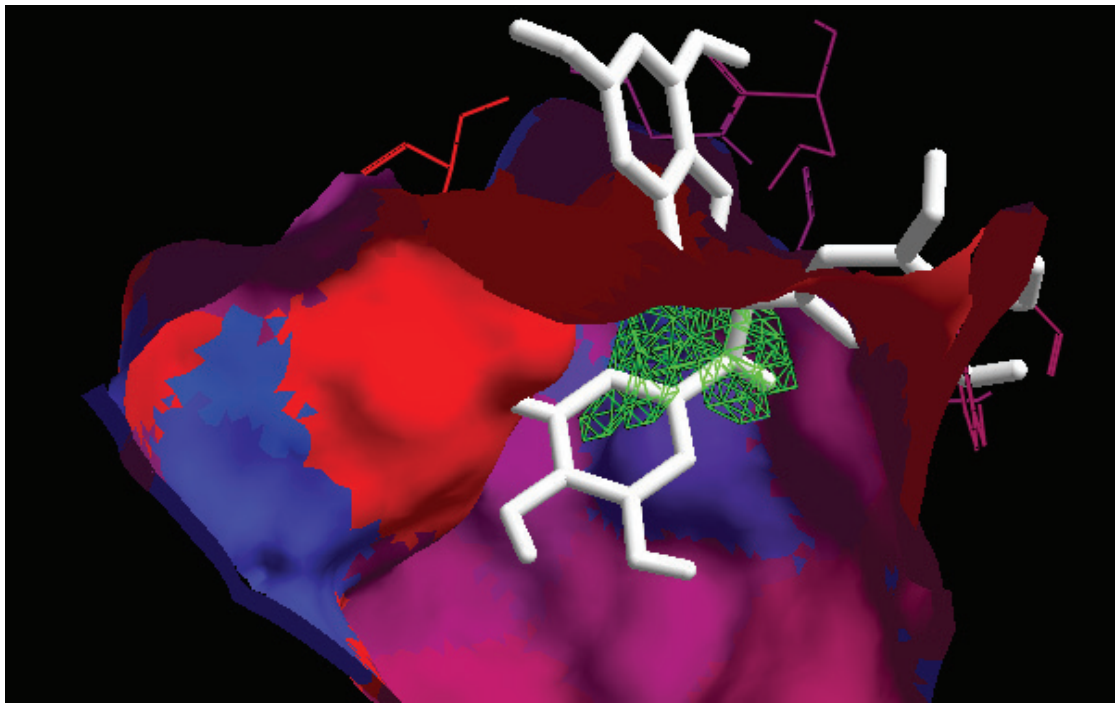

**Figure 2. Hydrophobicity view of EGCG in Keap1-Nrf2 cavity using Molegro Virtual Docker software. Description: white (EGCG); green (Keap1-Nrf2 cavity).**

The best docking position in the 3D structure molecules of EGCG to Keap1-Nrf2 protein as the target protein (PDB ID: 5FZN) can be seen in Figure 2. The docking was carried out at cavity 2, vol. 23.552. The bond location of the ligand binding site and target protein showed, that EGCG interacted with Keap1-Nrf protein through 54 number of bonds. Hydrogen and steric bond from 12 amino acids (Arg 415, Phe 335, Arg 336, Gln 337, Ser 338, Tyr 334, Asn 382, Ser 602, Gly 379, Asp 389, Arg 380, Asn 414) were showed at Figure 3.

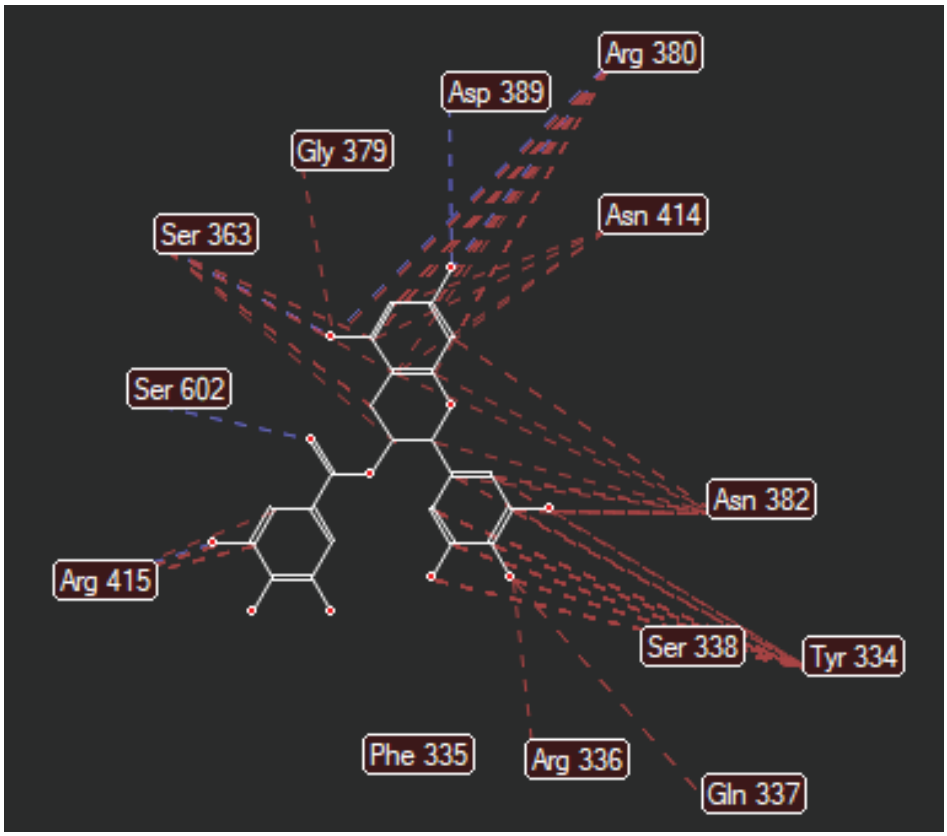

**Figure 3. Hydrogen and steric bound between EGCG and target protein (Keap1-Nrf2 protein) using Molegro Virtual Docker software. Description: blue line (hydrogen bound); red line (steric bound).**

The best docking position in the 3D structure molecules of arbutin (as the standard therapy of photoaging) to Keap1-Nrf2 protein as the target protein (PDB ID: 5FZN) can be seen in Figure 4. The docking was carried out at cavity 2, vol. 23.552. The bond location of the ligand binding site and target protein showed, that arbutin interacted with Keap1-Nrf protein through 36 number of bonds. Hydrogen and steric bond from 6 amino acids (Arg 415, Ser 363, Tyr 334, Ser 602, Gly 603, Gly 364) were showed at Figure 4.

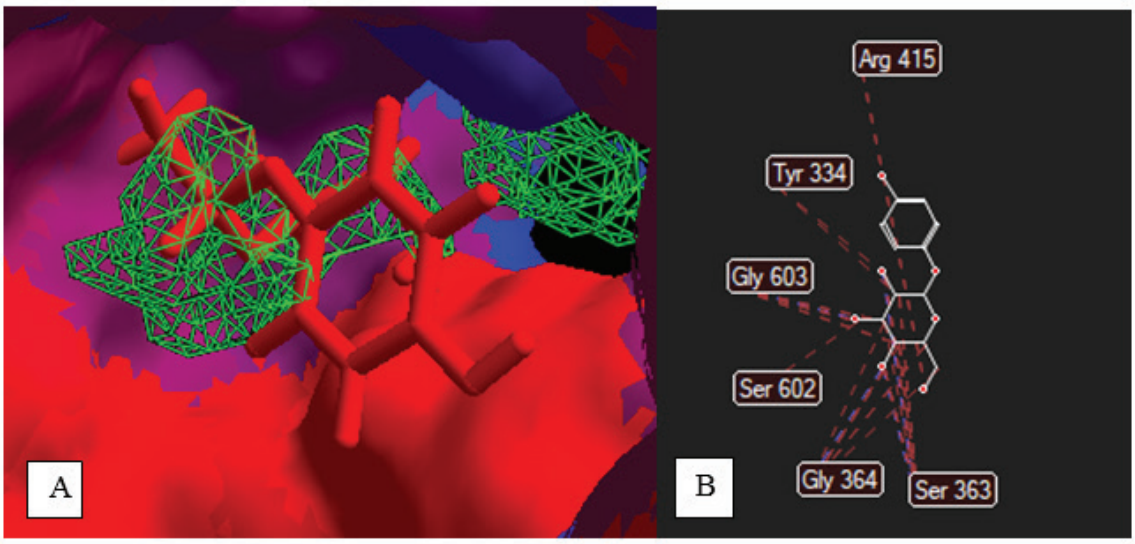

**Figure 4. A. Hydrophobicity view of arbutin in Keap1-Nrf2 cavity using Molegro Virtual Docker software. Description: red (arbutin); green (Keap1-Nrf2 cavity). B. Hydrogen and steric bound between arbutin and target protein (Keap1-Nrf2 protein) using Molegro Virtual Docker software. Description: blue line (hydrogen bound); red line (steric bound).**

The Mol Dock score and ReRank score of interaction between EGCG and 5FZN in Nrf2 cavity were shown in Table 1. The result of molecular docking between Keap1-Nrf2 protein with a candidate ligand (EGCG), a control ligand (arbutin), and a reference ligand (FB2_1615[A]) using Molegro Virtual Docker software, showed that the binding affinity of Keap1-Nrf2 protein with EGCG to be lower than that of arbutin and the reference ligand. The average Mol Dock and ReRank score of interaction between Keap1-Nrf2 protein and EGCG were -142.53±0.37 kcal/mol and -122.39±0.89 kcal/mol; between Keap1-Nrf2 protein and arbutin were -88.46±0.79 kcal/mol and -86.52±0.67 kcal/mol; and between Keap1-Nrf2 protein and FB2_1615[A] were -66.16±0.03 kcal/mol and -58.70±4.08 kcal/mol.

**Table 1. MolDock Score and ReRank Score of interaction between 5FZN protein and the compounds**

| The compounds | MolDock Score (kcal/mol) | ReRank Score (kcal/mol) |
|---|---|---|
| EGCG | -142.53±0.37 | -122.39±0.89 |
| Arbutin | -88.46±0.79 | -86.52±0.67 |
| FB2_1615[A] as reference ligand | -66.16±0.03 | -58.70±4.08 |

**Table 2. Pharmacokinetics properties of EGCG and arbutin**

| Pharmacokinetics properties | Model name | Predicted value (EGCG) | Predicted value (Arbutin) | Unit |
|---|---|---|---|---|
| Absorption | Skin Permeability | -2.735 | -2.743 | Log Kp (Numeric) |
| Toxicity | Skin Sensitization | No | No | Yes/No (Categorical) |
| | AMES toxicity | No | No | Yes/No (Categorical) |

The prediction of pharmacokinetics and toxicity were performed using pkCSM On-Line Tool. The prediction result using pkCSM On-Line Tool showed that the molecular weight value of EGCG was 458.375 (<500), and the value of the log of octanol/water partition coefficient (log P) was 2.2332. The result of pharmacokinetic prediction of EGCG can be seen in Table 2. The skin permeability of EGCG that were performed using pkCSM On-Line Tool was -2.735 cm/h. It was predicted using pkCSM On-Line Tool that EGCG did not cause skin sensitization and AMES toxicity.

## Discussion

The result of molecular docking between Keap1-Nrf2 protein with EGCG, arbutin, and a reference ligand (FB2_1615[A]) using Molegro Virtual Docker software, showed that the binding affinity of Keap1-Nrf2 protein with EGCG to be lower than that of arbutin and the reference ligand. These results showed the prediction of EGCG having higher potential in photoaging prevention than arbutin and the reference ligand.

The administration of topical formulation depends on the skin permeability. The skin permeability using pkCSM On-Line Tool was expressed as constant log Kp (cm/h). The skin permeability of EGCG was -2.735 cm/h. It was predicted, that EGCG has good skin permeability, because low skin permeability was expressed as log Kp more than -2.5 cm/h.[17,18]

Toxicity of compound can be predicted from AMES toxicity and skin sensitization. The mutagenic potential of the compounds can be predicted from the AMES

test. Mutagenic indication of compound is indicated from positive AMES test, and also indication that the compound has potential as a carcinogenic agent. The most important adverse effect from topical agent application is skin sensitization. The safety consideration of topical drug is the evaluation of whether a compound can induce allergic contact dermatitis.[17,18] The result of pkCSM On Line tool showed, that EGCG has no mutagenic and skin sensitization potential.

This study showed Keap1-Nrf2 protein as the potentially interactive target protein with EGCG. The Keap1-Nrf2 plays role in photoaging pathogenesis. Ultraviolet radiation causes increasing of Keap1-Nrf2 complex, that plays role in photoaging pathogenesis.[5,6] It was predicted in this in silico study, that binding of EGCG to Keap1-Nrf2 protein would be able to prevent photoaging. The prediction of pharmacokinetics and toxicity using pkCSM On Line tool showed that EGCG has good absorption profile without toxicity effect.

## Conclusion

This in silico study showed, that EGCG has potential in photoaging prevention, by interacting with Keap1-Nrf2 protein (PDB ID: 5FZN). The binding affinity of EGCG to Keap1-Nrf2 protein was lower than that of arbutin and reference ligand (FB2_1615[A]), it showed that EGCG has higher potential to be an alternative agent in photoaging prevention, with good phamacokinetics profile.

# The Effect of Buzz Group Modification Method on Exclusive Breastfeeding Against Self Efficacy in Pregnant Women: A Quasi Experiment

**Febyana Dwi Cahyantia[1], Lailatun Nimah[1], Retnayu Pradaniea[1]**

*[1]Faculty of Nursing, Universitas Airlangga, Surabaya, Indonesia, Universitas Airlangga Kampus C, Jl. Mulyorejo, Surabaya, Kota SBY, Jawa Timur*

## Abstract

**Background:** Exclusive breastfeeding for six months is an effort to increase the breastfeeding benefits and reduce infant mortality rate. Self efficacy is one of the factors that can influence the level of confidence exclusive in breastfeeding.

**Aim:** This study aimed to identify the level of self efficacy before and after given modified buzz group method and to the influence of modified buzz group method about exclusive breastfeeding against self efficacy in pregnant mother

**Method:** This study was designed using quasi-experimental design. The study was conducted in the working area of the health center. The total population used in this study was 42 pregnant women. A total sample of 38 respondents was taken according to purposive sampling. BSES-SF (Breastfeeding Self Efficacy Scale Short Form) questionnaire was administered at pre-test and post-test. Data analysis was performed using the Wilcoxon Signed Rank test and the Mann Whitney test.

**Results:** The results showed that the Wilcoxon Signed Rank statistical test obtained p value of 0,000 in the treatment group and p value of 0.355 in the control group. The Mann Whitney statistical test obtained a significant value of p = 0,000 at the post-test. The modification of the buzz group method took effect to increased self efficacy about exclusive breastfeeding for pregnant mother because this method was organized by four sources of self efficacy that was direct experience, indirect experience, verbal persuasion, and emotional condition.

**Conclusion:** With the modification of the buzz group method and self efficacy for pregnant mother can increase of value for breastfeeding exclusive coverage.

***Keywords:*** *Buzz Group Modification, Buzz Group Method, Self-Efficacy, Breastfeeding Self-Efficacy*

## Introduction

Breast milk can help infants to start life well, the content in breast milk can meet all food needs such as nutrition and immunology. Giving exclusive breastfeeding for 6 months and continued with breastfeeding for 2 years can enhance spiritual (SQ) and emotional (EQ) abilities[1]. Problems that cause mothers not to exclusively breastfeed are lack of knowledge about the breastfeeding benefits, proper breastfeeding, lack of lactation counseling services and support from health workers, socio-cultural perceptions against breastfeeding, and lack of motivation to breastfeed. Psychological factors are one of the factors that influence one's level of confidence. Self efficacy is a person's belief to do a specific task or behavior[2].

Self-efficacy or self-confidence is one important factor in the success of giving exclusive breastfeeding. There was study examined that the lower the self-efficacy of a person, the lower the success rate. Until now there are still mothers who are worried that the production of breast milk is a little, thus, the reality that occurs mothers really experience disruptions in the production

of breastfeeding[3,4]. Many ways have been done by the government to socialize exclusive breastfeeding, namely the formation of government regulation number 33 of 2012 concerning exclusive breastfeeding and various kinds of study on exclusive breastfeeding have been done, but until now Indonesia has not been able to achieve the target that was set by the government in 2010, namely coverage exclusive breastfeeding for infants aged 0-6 months is around 80%. This can be seen from the results of a health service survey in 2015, the coverage of exclusive breastfeeding in Indonesia from 0-6 months of infants was 55.7% with an increase of 3.4% from the previous year which was 52.3%[5,6]. Self-efficacy for breastfeeding is an action that cannot be separated by the mother's belief in giving breastfeeding to her infant. There are various factors that make up self-efficacy such as direct experience, the experience of others, verbal persuasion, physical, and emotional state[7].

Pucang Sewu Public Health Center is one of the public health centers in the Surabaya city area of Indonesia that has low breastfeeding coverage rates. Pucang Sewu public health center has a class of pregnant women which is held once a month. The number of pregnant women in attendance is not proportional to the number of pregnant women recorded in the public health center. This happens because of many factors, one of which is the absence of a companion during a class of pregnant women, the lack of motivation of mothers to come, and less varied learning methods. The use of the buzz group method is a considered as appropriate way to eliminate these factors because this method has never been used during a class of pregnant women and considered as an update way of teaching material. The results of the study mentioned the role of the buzz group method in an effort to improve learning outcomes in fiqih material can be stated sufficient or moderate. Other study results revealed that there was an influence of the buzz group discussion method with the uno card game on student collaboration and the ability to solve student problems.

Based on this background the writers intended to provide a buzz group method modification in the class of pregnant women aimed at increasing the self-efficacy of pregnant women related to exclusive breastfeeding, hence it is expected that after giving birth mothers will exclusively give breast milk.

## Method

This study used a quasi-experimental design. The independent variable in this study was the buzz group on the dependent variable, namely the self-efficacy of pregnant women in exclusive breastfeeding. Buzz group was a large group which was divided into several small groups, consisting of 4-5 people. An impromptu group consisting of no more than five people will make all group members actively involved in the discussion. The place was arranged so that participants can have their faces covered and exchange ideas easily. Buzz groups also assigned each large group member and group leader. The next stage, small groups gathered and discussed, then returned to the large group, which then conveyed ideas that arise in the group. At the end of the session, the facilitator asked each group to actively participate in delivering the results of the discussion. This method can build an atmosphere of mutual respect for differences of opinion and also increase the participation of participants who still did not talk much in broader discussions and can develop a common opinion or agreement to find a best formulation of an issue.

The population in this study was pregnant women in the working area of the Pucang Sewu Public Health Center. The population in this study was 42 pregnant women. Based on the formula, the minimum sample size used was 38 respondents. The 38 sample results were divided into 2 groups: 19 for the control group and 19 for the experimental group, with inclusion criteria: (1) Mothers can read, write and hear (2) Late trimester pregnant women recorded in the Pucang Sewu Puskesmas. Furthermore, the exclusion criteria are: (1) Pregnant women with chronic or infectious diseases (HIV, TB, cancer, hepatitis). (2) Pregnant women who did not have permanent residences.

The sampling used by writers was nonprobability sampling that was purposive sampling. Data collection instruments used in this study were in the form of informed consent, questionnaire sheets, stationery, booklets and turning sheets about exclusive breastfeeding, and respondents. The instrument in this study used the Breastfeeding Self Efficacy Scale Short Form (BSES-SF) containing 14 questions about confidence and confidence in breastfeeding. Each question has a 5-point Likert scale and summed. This instrument was compiled

by Dennis in 2003 and has been declared valid and reliable[8].

The data collected was analyzed the differences in self-efficacy changes before and after the intervention was given, such as buzz group method modification with the Wilcoxon Signed Rank Test. The Mann Whitney test was carried out to analyze the differences between the two groups, the treatment group and the control group, with significance level $p \leq 0.05$ meaning that if the statistical test showed the value of $p \leq$ then H1 is accepted. This study has been through a review and has been declared "Eligible Ethics" with a Certificate of Ethical Feasibility from the Faculty of Nursing, Universitas Airlangga, Surabaya Indonesia.

## Results

### Characteristics of Respondents

The following is the respondent's characteristic data.

**Table 1: Characteristics of Respondents**

| **Control Group** | | | **Treatment Group** | |
|---|---|---|---|---|
| | **F** | **%** | **f** | **%** |
| Age | | | | |
| 20-30 | 15 | 78,9 | 9 | 47,4 |

## Discussion

The results examined that self-efficacy of the control group and the treatment group before getting the intervention got the same score that was moderate. Self-efficacy was a person's belief to do positive things, thus it affected motivation, thought processes, emotional conditions, and social environment that shows a habit. Self-efficacy for mothers was considered as important for breastfeeding activities and can provide an illustration, especially for health workers about mothers' readiness in providing nutrition with breast milk for their babies. The level of self-efficacy of a person in each task varies greatly. This arises due to factors that influence the perception of an individual's abilities such as gender, age, level of education and experience[9].

Based on the results of the study, respondents with primary education have low to moderate self-efficacy, such as control group respondents number 10 who have low self-efficacy because mothers cannot read fluently and also lack of knowledge about breastfeeding. Control group respondent no. 1 and 2 were respondents with a high education level, namely tertiary institutions with high self-efficacy scores, this was due to the large amount of information that mothers have obtained from various books and internet sources. Individuals who have higher levels have higher self-efficacy, because basically they learnt more and receive more formal education, besides individuals who have higher education levels will get more opportunities to learn in overcoming problems[10].

The number of children was one thing that influenced the practice of breastfeeding. Most respondents were mothers with more than one child. This will increase the experience of mothers in breastfeeding. The number of children influenced the mother's knowledge because the practice of nursing mothers was closely related to the learning process of the practice of the previous child. The results revealed that self-efficacy after intervention in the treatment and control groups were different. These results were reinforced by the post-test conducted 1 week after the intervention. This referred to a theory that explained that the effective time to carry out a post-test should be within a week after the intervention. The treatment group, which initially had an average level of self-efficacy after being intervened, became a high average, in contrast to the control group which had no significant changes after the intervention[4,11].

The experience of success or direct experience can increase the confidence and strong desire of the respondent. A sense of success can also increase the persistence and persistence of respondents during the process, so as to reduce failure. Mothers who have direct breastfeeding experience tend to be more confident to continue breastfeeding. There were 6 respondents who gave non-exclusive breastfeeding to their children, and the six respondents had a moderate level of self-efficacy. There were 3 respondents who had successfully provided exclusive breastfeeding and the three people had high self-efficacy. The learning pyramid theory Edgar Dale explains that a person's learning outcomes were obtained by direct experience (concrete). Learning that referred to Edgar Dale's pyramid theory reinforced direct experience, through direct experience practice will provide information and ideas contained in that experience, because it involved the sense of sight, hearing, feeling, smell, and touch[8].

Someone's self-efficacy can increase especially if she believes she can do the action because she sees that other people have succeeded in doing so. Individuals will have a tendency to increase motivation and confidence to take action if they see that those who have already been able to succeed through the problem. Small groups when implementing the buzz group modification get problems that were discussed in groups, this allowed for mothers who have experience in giving breastfeeding to tell the inexperienced, thus it can bring self-efficacy to inexperienced mothers[3,12].

Buzz group modification activities can encourage shy individuals to contribute thoughts to participate in discussions and create a pleasant atmosphere so that pregnant women can receive information with happy feelings[12,13]. Respondents from the treatment group got an increase with high self-efficacy values, there was only 1 respondent did not experience it. This was because respondent number 10 was in a hurry to go home soon because her first child was sick. In terms of age, the respondent was 34 years old enough, in terms of the experience of the respondent she also has 2 children and now his third pregnancy, the first child was not exclusively breastfed because of work and the second child was exclusively breastfed, in terms of education.

The control group did not experience a significant increase in self efficacy about exclusive breastfeeding. The increase in self efficacy about exclusive breastfeeding in the control group only slightly increased, it happened because after the pre-test the control group followed the class of pregnant women who also coincided with discussing the material of breast milk, namely understanding breastfeeding, understanding exclusive breastfeeding, and how to express milk. The activity was one form of verbal persuasion, where verbal persuasion was one source of self-efficacy. Another factor that made the increase in the control group was that the writers gave a handbook on pregnancy to respondents as souvenirs during the pre-test and every Monday and Thursday there was an examination of pregnant women, meaning that there were pregnant women who received additional information when attending examination. Therefore, after a post-test one week later there was still a shadow about breast milk making a slight increase in the control group.

## Conclusion

Submitting material with a modification of the buzz group method was a powerful way to increase self-efficacy about exclusive breastfeeding to pregnant women, because at home pregnant women can re-study the material discussed.

# Tobacco Smoke and Pregnancy Outcome: Literature Review

**Haerani Harun[1], Anwar Daud[2], Veni Hadju[3], Ridwan Amiruddin[4], Anwar Mallongi[2], Rosmala Nur[5]**

*[1]Student of Doctoral Program, Faculty of Public Health Hasanuddin University, Makassar, Indonesia, [2]Professor, Department of Environmental Health Faculty of Public Health Hasanuddin University, Makassar, Indonesia, [3]Professor, Department of Nutritional Sciences Faculty of Public Health Hasanuddin University, Makassar, Indonesia, [4]Professor, Department of Epidemiology, Faculty of Public Health Hasanuddin University, Makassar, Indonesia, [5]Faculty of Public Health, Tadulako University, Palu, Indonesia*

## Abstract

**Introduction**. Pregnant women have a risk for tobacco smoke both actively and passively. Pregnant women are usually exposed to enviromental tobacco smoke (ETS) in various places with different duration of time. Cigarette smoke has a severe effect not only on pregnant women but also on the fetus.**Methods** This is a literature review. Various references were collected from online database including reports, journals, mostly in the last 10 years. The journals were mostly from the scholarly journals.

**Results**. Tobacco smoke can effect the immunity, hormonal and metabolic system of the pregnant woman, therefore disturbing the growth of the fetus. Tobacco smoke also known to increase the risk of premature birth and reduce gestational age. Tobacco smoke cause several problems in newborn such as respiration distress, low birth weight (LBW), neural disorder, sudden infant death syndrome (SIDS) and congenital anomaly.

**Conclusion**. The effect of tobacco smoke, actively of passively, have worse outcome for the pregnant women and their babies.

***Keyword**: Pregnancy Outcome, tobacco smoke, ETS, LBW, preterm birth.*

## Introduction

Smoking pregnant women have an increased risk of having an ectopic pregnancy, spontaneous abortion and other complications leading to pregnancy complications as well as the placenta. The fetus also has the risk of exposure to tobacco smoke, more than thousands of types of hazardous chemicals, especially nicotine, tar and carbon monoxide can have an effect on the fetus and cause unwanted disorders or abnormalities[1].

Environmental tobacco smoke (ETS) is a complex mixture consisting of most of the smoke emitted from the smoker's body, the smoke produced by burning cigarettes and the surrounding air[2]. Exposure of ETS in pregnant women causes increased levels of carbon monoxyde (CO), nicotine and cotinin in maternal serum or urine, in the fetus and in amniotic fluid. The effect of ETS on pregnant women can occur from the first semester to the third semester. Pregnant women are usually exposed to ETS in various places with different duration of time. Places that have the potential to become ETS exposure locations include at home, at work and the outside environment[3].

### Tobacco smoke and pregnancy

One effect of the cigarette smoke exposure on pregnant women is its effect on the mother's immune system. In pregnancy changes occur in the mother's immune system to prevent rejection of the fetus. Exposure to ETS can cause changes in the immune system of pregnant women. Changes include an increase in activated leukocytes and a decrease in the percentage of regulator T lymphocyte cells (Treg cells). Smoking

during pregnancy also affects the function balance between Th1 cells (T helper lymphocytes) and Th2 cells, causing an increase in the production of cytokines, proinflammatory chemokines and Th1 growth factors. In addition, the percentage of macrophages and NK cell residues is higher in smokers in the first semester (4)

The activation of nicotine receptors causes the release of acetylcholine, dopamine, serotonin, growth hormones and adrenocorticotropic hormones and glutamate, these hormones significantly influence fetal growth. Smoking is also associated with changes in metabolism during pregnancy.[4]

Exposure to nicotine in pregnant women can cause vascular placental vasoconstriction, decrease placental blood flow and reduce trophoblast invasion which results in inhibition of good placental circularization leading to placental hypoxia causes disruption of placental invasion. Placenta previa is a form of placental invasion disorder[4]. Nicotine can cause a significant decrease in the mitotic potential of cytotrophoblast tissue in vitro. This effect is also found in smoker women. This effect can explain the mechanism of impaired placental development during the early phases of pregnancy due to placental ischemia which can cause fetal death[5]. Low placental weight strongly related with LBW[6].

Beside nicotine and cotinin, CO levels are also the found highest in smokers. The presence of CO in the body causes oxygen binding to hemoglobin decrease due to the higher affinity of hemoglobin for CO. CO Exposure to the fetus prevents the release of oxygen and then converted to carboxyhemoglobin. The result is a decrease in tissue oxygenation through competitive inhibition with oxyhemoglobin. Prolonged CO exposure in pregnant women can cause significant permanent damage to the brain of a fetus which sensitive to hypoxia. Nicotine is also considered to have a bad effect due to the stimulation of nicotine cholinergic receptors and their neuroteratogenicity effects.[4,7,8] Nicotine also interferes with the micro RNA which is important for the maturation of fetal stem cells.[9]

The effects of tobacco smok on the fetus are considered to be multifactorial, including indirect effects such as poor nutritional status associated with anorexiagenic effects of nicotine exposure, and CO. Placental blood flow decrease is associated with the vasoconstrictive effect of catecholamines released from adrenals and nerve cells after nicotine exposure.[10]

**Tobacco Smoke and Preterm Birth**

In Europe rates of preterm births are reported between 5 - 9%, while in developing countries and the United States the rate of preterm births reaches 12%. The cause of preterm birth is often difficult to determine. Some risk factors associated with preterm birth include excessive distension of the uterus, low economic status and smoking[11]. Elective preterm birth may be associated with cigarette-related obstetric complications such as placenta previa, placental abruption and impaired fetal growth. Research shows that smoking during pregnancy increases the risk of preterm birth by 25%. The exposure of ETS also specifically has an influence on preterm birth[12,13].

Active smoker mothers have been accepted as a risk for preterm birth, for around 14% of preterm births. One mechanism that links cigarette exposure with preterm birth is the CYP1A1 genotype and GST (glutathione S-transferase). Abnormalities in these genes make mothers more vulnerable to exposure to hazardous substances such as cigarette smoke.[14] Cotinin levels as an indicator of cigarette exposure are also strongly related to preterm birth[4] The danger of non-smoking tobacco is also seen in the research of Munmun et al. Which shows that non-smoking tobacco (chewed and swallowed) increases the risk of preterm birth.[15]

There are four mechanisms proposed by Goldstein et al explain relationship between smoking and preterm birth: (a) Decreased maternal appetite caused by smoking leading to a decrease in nutrition for the fetus, (b) vasoconstriction caused by smoking results in decreased blood supply to the fetus, reduced fetal nutritional supply and slowing the release of catabolism results, (c) cigarettes may have a direct effect of toxins on the fetus and (d) increase in fetal CO levels causes reduced oxygen transport capacity and teratogenic properties.[11,16]

Prostagladin has been known to trigger labor. Prostaglandin levels such as F2-isoprostane as a marker of oxidative stress are found in the amniotic membrane and amniotic fluid in smokers. F2-isoprostane levels increased 3 times compared to non-smokers. Increased

F2-isoprostane levels is considered as a mechanism that associated smoking and preterm birth. Smoking is also considered to increase the sensitivity of the uterus to contractile hormone. Research by Egawa et al in mice shows that inhalation of cigarette smoke increases the contractile activity and sensitivity of myometrium to oxytosis.[11,17] Cadmium found in tobacco smoke interacts with calcium and effects myometrial activity. Cadmium may modulate the function of the oxytocin receptors in the myometrium. Increased levels of cadmium in pregnant women are found to be associated with an increased risk of preterm birth.[11,18] Another condition associated with preterm birth is necrotizing-enterocolitis (NEC)[19]

**Spontanious Abortion**

Spontaneous abortion or miscarriage is one of the most common pregnancy complications, about 12-26% of known pregnancies. Generally the literature on the relationship between smoking and abortion does not show any consistency although some studies have concluded that smoking can cause abortion. A meta-analysis study by Pineles et al. Showed the relative risk of abortion during pregnancy is 1.32. The risk of abortion increases with the number of cigarettes. One cigarette per day increases the risk of abortion by 1%. Secondary smokers have an 11% increased risk of abortion.[20]

**Tobacco Smoke Effect on Newborn**

Various studies provide an overview of the effects of cigarette smoke on fetal growth and development during pregnancy and infant growth and development after birth

**Respiratory Disorder**

Smoking during pregnancy can cause the newborn's lungs failed to reach maximum function and continues with decreased lung function. Preterm births in most smokers also cause disruption of lung maturation. Diseases caused by these infants include wheezing, bronchitis, hospitalization due to lung infections and asthma in children.[21]

Generally, children who are exposed to nicotine during pregnancy also experience exposure to cigarette smoke in childhood. This raises the question whether the increased risk of asthma is caused by exposure to prenatal or post natal cigarette smoke. Research by Pattenden et al showed that exposure to cigarette smoke during pregnancy without post natal exposure still shows an association with an increased risk of asthma.[22,23] Exposure to cigarette smoke pre natal and post natal also shows an imbalance of Th1/Th2 causes susceptibility of airway reactivation.[24]

The mechanism of exposure to nicotine causes various pathological conditions in the lungs is not yet fully understood, but based on some data it was found that nicotine causes various anomalies in the lungs. Histological studies in animals show goblet cell hypertrophy after nicotine exposure, and it is associated with asthma in the community.[22,25,26]

***Low Birth Weight***

Low birth weight babies are the variables most widely studied the effect of smoking mothers during pregnancy or exposure to cigarette smoke in pregnant women on pregnancy outcomes. Data shows that LBW is more common in smokers (12.4%) compared to nonsmokers (7.7%). Women who smoke have a 1.5 to 3.5 times greater risk of giving birth to LBW, and the risk increases along with the cigarette consumption.[1]

Lee et al study showed that exposure to ETS in pregnant women also has the potential to cause LBW, and the effect of smoking on LBW from active smokers has the same mechanism as the effect of smoking on LBW in secondary smokers. The risk of small infants according to pregnancy is also increased in the group of mothers with high ETS exposure compared with mothers with low ETS exposure[27]

**Behaviour and Neural Disorder**

Nicotine exposure to the fetus can affect fetal brain development[10]. A study in Finland shows that heavy nicotine exposure caused the infant born with attention deficit / hyperactivity disorder (AHDH) or attention deficit / hyperactive disorders.[28] Fetuses exposed to tobacco smoke during pregnancy ware found to have a risk of cardiac autonomic abnormalities during sleep especially in preterm babies. Changes in autonomic activity are at risk of causing neurological and cardiological complications[29].

Sudden infant death syndrome (SIDS)

One of the most severe complications of nicotine exposure in pregnancy is sudden infant death syndrome or SIDS. The cause of SIDS is not clearly known in infants less than one year old suddenly die without definite explanation even after a thorough investigation. Exposure to nicotine is known to be a risk factor for SIDS, but the mechanism of nicotine exposure that causes infant death is unclear and is still being debated. But some animal studies provide some clues.[22,30,31]

**Congenital Anomaly**

The effects of tobacco smoke on infanst congenital anomalies have been investigated. Exposure to tobacco smoke is known to be associated with fetal heart defects including atrial septal defects, atrioventricular septal defects, transposition of large arteries, craniosynostotic cleft palate and gastroschisis.[4,33.]

## Conclusion

Tobacco smoke effect the immunity, hormonal and metabolic system in pregnant women. The substance found in tobacco smoke were found to be the cause of some pregnancy complication leading to poor pregnancy outcome such as preterm birth, spontaneous abortion, and adverse effect on tha infants. The infants could suffer respiratory disorder, behavior and neural disorder, SIDS and another congenital anomaly.The effect of tobacco smoke, actively of passively, associated with poor outcome for the pregnant women and their babies.

# Identifying and Revealing Active Compound from Green Tea (*Camellia sinensis*) for Curing Systemic Lupus Erythematosus by Acting as CASPASE 1 Inhibitor

**Herin Mawarti[1,5], Jusak Nugraha[2], Djoko Agus Purwanto[3], Joewono Soeroso [4]**

*[1]Doctoral Program of Medical Science, Faculty of Medicine, Airlangga University, Indonesia, [2] Department of Clinical Patology, Faculty of Medicine, Airlangga University, Indonesia, [3]Department of Pharmaceutical Chemistry, Faculty of Pharmacy, Airlangga University, Indonesia, [4] Department of Internal Medicine, Faculty of Medicine, Airlangga University, Indonesia, [5] Department of Nursing Science, Faculty of Health Sciences, University of Pesantren Tinggi Darul Ulum, Jombang, Indonesia*

## Abstract

This research aimed to reveal the potency of green tea (*Camellia sinensis*) as immunomodulator, anti-apoptosis agent and anti pyroptosis agent in Systemic Lupus Erythematosus.. The rest samples was downloaded from KNAPSACK Database. Biological activity prediction was conducted by PASS SERVER. Molecular Docking analysis was performed by Autodock Vina in PyRx software v.0.9.3. Complex docking was analyzed and visualized using Discovery Studio Software. The result showed that Camellia sinensis has the main potency as immunomodulatory, antioxidant and anti-inflammation. The highest activity of this herbal is antioxidant. There are few bioactive that have role as immunomodulator. The result of molecular docking can explain the mechanism of active compound as anti-apoptosis and anti-pyroptosis. Docking result showed that Theaflavin has the highest affinity to both activities. It can be concluded that bioactive from *Camelia sinensis* is promising for curing Systemic Lupus Erythematosus by acting as antioxidant and inhibit apoptosis and pyroptosis mechanism.

***Keywords**: Camellia sinensis, anti-apoptosis, pyroptosis, Systemic Lupus Erythematosus*

## Introduction

Systemic Lupus Erythematosus (SLE) is a chronic inflammatory of autoimmune disease where the immune system was mistakenly attacks healthy body cells. The production of autoantibodies damage many organs including the joints, skin, kidneys and nervous system [(1)]. This disease occurs nine times more among women than men. The cause of SLE is unknown, but some occur due to genetic susceptibility [(2)] and environmental factors [(3)] have been showed to be involved in its pathogenesis.

**Corresponding author:**
**Jusak Nugraha**
Email: jusak-n@fk.unair.ac.id
Faculty of Medicine, Airlangga University, Surabaya, East Java, Indonesia, 60286

SLE was associated with impaired apoptotic cleansing. While initial triggers were varieties, excessive accumulation of apoptotic debris, especially microparticles containing nuclear material, activate antigen presenting cells including dendritic cells and B cells, which initiate cellular interactions that lead to the generation of antinuclear antibodies through interactions with autoreactive T cells [(4)]. T cells not only activate B-cell responses but also infiltrate te target tissue and cause type I and type II interferon (IFN I/II) damage, tumor necrosis factors (TNF), B-lymphocyte stimulators (BLys), interleukin 6, interleukin 17, interleukin 18, interleukin 21 and many other cytokines involved in autoimmune priming and inducing inflammation-mediated tissue injury in patients with SLE [(1)].

Apoptosis in the model of SLE, the nuclear material driving autoreactivity translates to the extracellular space as a consequence of cell death. In this case

apoptosis as a source of selfantigen in lupus. Another cell death that underlies the pathogenesis of SLE is pyroptosis. Pyroptosis release of nuclear and cellular autoantigens, release of inflammatory cytokines (IL-1b, IL-18) and release of danger molecules (HMGB1, ATP) thus triggering inflammation and inducing autoimmune [(5)]. Caspase activation by the apoptotic pathway results in activation of effector caspase (caspase-3) whereas caspase-1 can cause piroptosis, a form of programmed cell death accompanied by cell lysis [(6)].

New agents being developed by specifically target the intracellular signaling pathway, inflammatory cytokines, chemokines, surface costimulation molecules, and proteasomes as new drug options in the treatment of SLE. Nowdays, belimumab (anti-BLyS) is the only biologic drug approved by the FDA to treat SLE. Drugs representing various therapeutic strategies are moving into phase III clinical trials [(7)]. New agents with potential as SLE treatment are needed to support the development of SLE therapy.

Another natural therapy as an alternative treatment and prevention of SLE complications is use tea. Camellia sinensis tea is classified according to processing used into four different subtypes: green tea, black tea, white tea and oolong tea. Green tea is a product without fermentation process and thus the oxidation of polyphenol components can be prevented. White tea is a product by using minimal fermentation of new shoots and young leaves are harvested only once a year in early spring [(8)]. The making of black tea carried out by fermentation ensures a high level of oxidation of enzymatic catalyzed polyphenols followed by a series of chemical condensation [(8-9)].

Green tea is beneficial for health such as cancer prevention, obesity, diabetes and neurodegenerative diseases. And some studies showed that the benefits of Green tea for autoimmune diseases such as SLE. All studies proved that the effect of EGCG on autoimmune pathogens such as EGCG preventing and reversing defects in autoimmune encephalomyelitis by inhibiting T cell proliferation by suppressing CDK4 and regulating I kB-α and directly inhibiting nerve cell death by impairing ROS formation [(10)]. Inhibits autoimmune arthritis by Inhibition of STAT3 and HIF-1a with Th17 / Treg [(11)]. Repairing autoimmune encephalomyelitis by changing the balance between CD4 T cell subsets by activating MAPKs and NF-κB signaling pathways [(12)].

Camelia sinensis tea has many active compounds that have potential as anti-inflammatory, antioxidant and immunomodulatory agents. For this reason, this research explored the potential of tea and green tea (camellia sinensis) as an immunomodulatory, anti-inflammatory, antioxidant and anti-apoptotic and antipyroptosis agent as agents for SLE worship. This research will evaluate using computational process in the early step. Computational analysis or in-silico can reveal the potential of herbal before testing in the laboratory. This technique could explain the mechanism of action by conducting the molecular docking process. *Camellia sisnesis* was used for treatment in rheumatoid including Systemic Lupus Erythematosus. Camellia sinensis has EGCG bioactive that popular for responsible in many mechanism

## Method

### Retrieval Data from Database

Bioactive compounds from *Camellia sinensis* were collected from KNAPSACK (http://kanaya.naist.jp/KNApSAcK/ ). The SMILE format and 3D structure of *Camellia sinensis* of Bioactive was downloaded from PubChem (www.pubchem.ncbi.nlm.nih.gov) (Supplementary Data 1). Moreover, the 3D structure of Caspase 1 and Caspase 3were downloaded from Protein Data Bank (PDB) (www.rcsb.org/pdb/home.home.do). The 3D structure was provided for molecular docking process

### Analysis of Biological Activity

The active compounds of *Camellia sinensis* were analyzed using PASS online server to determine the biological activity. It depended on the compound structure. The analysis will be resulting Pa (Probability of active) and Pi (Probability of inactive) score with range from 0 to 1. If Pa > Pi mean it is potential for specific therapeutic candidate [(13)].

### Molecular Docking

The docking process was carried out using Autodock vina in PyRx 0.9.3 to compute the binding affinity between ligands (active compounds of *Camellia sinensis*) and protein target. Each of active compounds

were docked to specific active site of protein target [14].

### Molecular Interaction

The molecular interaction between active compound and protein target was analyzed by Discovery Studio Program. The result determination was based on the amino acid interaction. The active compound would be determining as potential inhibitor if they had interacted to amino acid in the active site of protein target.

### Molecular Visualization

All biomolecules were visualized using Discovery Studio to generate the representative figure.

## Findings

Interaction between theaflavin with caspase 3 and caspase 1 showed that this complexed was stabilized by hydrogen bond and hydrophobic interaction. The active site of Caspase 3 tends to more hydrophobic than caspase 1 (figure 2).**gure 2.** Theaflavin bind to Caspase 1. (figure 2).

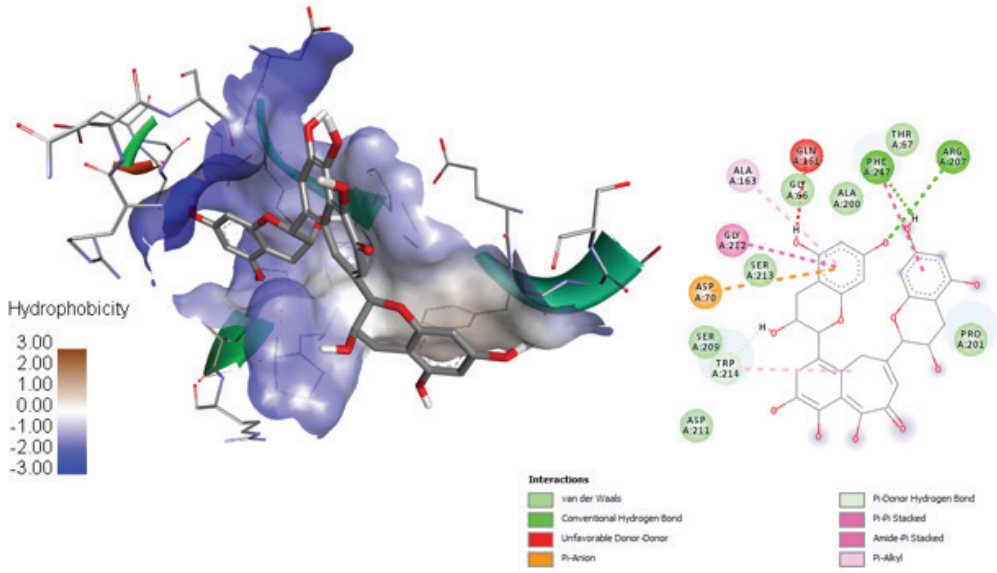

**Figure 2. Theaflavin bind to Caspase 1**

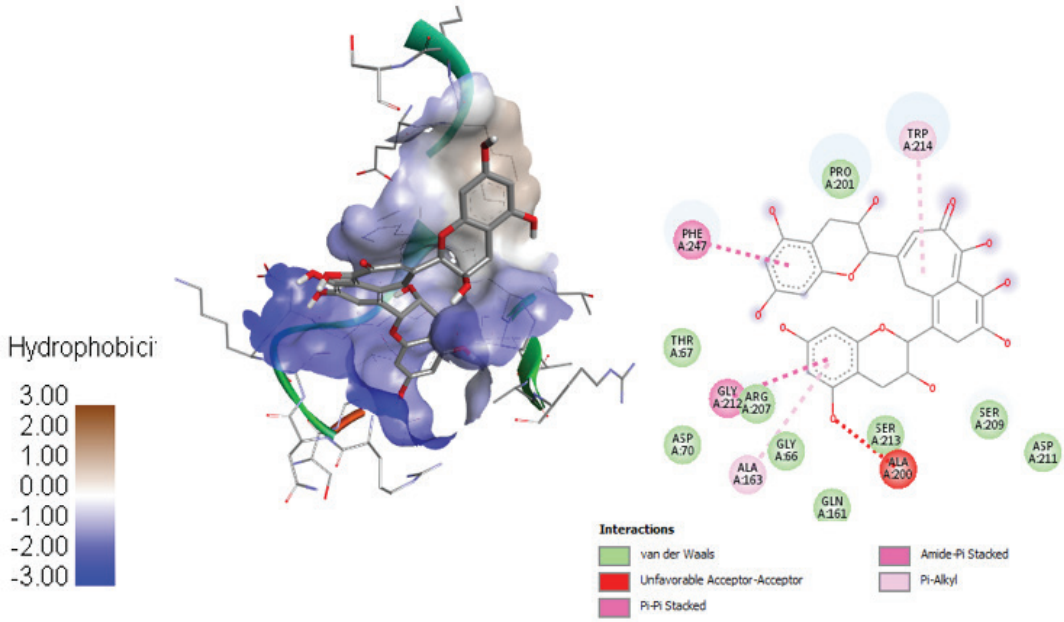

**Figure 3. Theaflavin bind to Caspase 3**

## Discussion

Biological activity prediction of *Camellia sinensis* showed that this herbal has three potentials as immunomodulator, antioxidant, and immunomodulator. Most of compounds have antioxidant activity with the score probability activity (Pa) above 0.7 (Pa>0.7). This result followed by anti-inflammation activity and immunomodulatory activity. Both activities have probability activity above 0.3 (Pa>0.3) (Figure 1). The value of Pa and Pi can be considered to be measures of the compound to study belonging to active and inactive compounds respectively [14].

Molecular docking is widely used to identify and predict a new ligand for substrate or protein target in specific site. Generally, the potential of active compound (ligand) is determined by binding affinity value in docking process. Table 1 shows that each of active compound of *Camellia sinensis* has strongly

bind to protein target of Caspase 1 and Caspase 3. The highest affinity is Theaflavin that has binding affinity -7.5 Kcal/mol to Caspase 1 and -8.7 to caspase 3. Apoptosis process is mediated by Caspase 3. To inhibit this mechanism, bioactive compound of *Cammellia sinensis* should bind to the active site of Caspase 3. One of bioactive compound from *Camellia sinensis* that promising for inhibitor is theaflavin. Other target is Caspase 1. this protein has the main role in pyroptosis. Surprisingly, the result of molecular docking is theaflavin could bind to this protein as well as caspase 3. The multi-target mechanism of herbal is commonly well-known. This mechanism can reduce the adverse effect and has more benefit than synthetic drug. Systemic Lupus Erythematosus pathogenesis related to innate and adaptive immune response such as inflammasome, apoptosis, clearance apoptosis, pyroptosis [5; 6; 15].

*Camellia sinensis* can strongly bonded with Caspase 1 as a target for the treatment of systemic Lupus Erytematosus by using the mechanism of Pyroptosis. Pyroptosis is one of the mediator for SLE pathogenesis. Pyroptosis begins an inflammatory process in SLE. The inflammation occurs due to an increasing of immune comlexes antinuclear antibodies (ANA) with nuclear antigens. This will triggers the damage of tissue and cell death. Pyroptosis is a form of cell death that occurs SLE. Pryroptosis can be induced by an inflammatory process during the pathogenesis of lupus. Pyroptosis can be characterized by the presence of HMGB1 and ATP where it acts as an inflammatory DAMP. The product of pyroptosis is the release of intact nuclei and the formation of LE cells [5, 16, 17, 18].

Caspase 1 is an enzyme that processes interleukin-1 (IL-1) and IL-18 into its active form during the inflammatory process. In the presence of autoantibodies, the immune complex activates the inflammasome machine in monocytes [19-22]. It can be concluded that the precipitating factors for autoimmune if nuclear and cellular autoantigens are found, the release of inflammatory cytokines such as (IL-1 and IL-18) and the release of danger molecules such as HMGB1 and ATP. The changes of immune system during the inflammatory process will trigger to lose of tolerance and induce autoimmune [5, 16, 17, 18].

The process of cell death through pyroptosis or apoptosis will have an impact on tissue damage and immune dysregulation, especially developing into lupus nephritis [23]. Considering the process of inflammation and cell death in pathogenesis SLE, a therapy to prevent inflammation and cell death, proven effective in the treatment of SLE.

## Conclusion

It can be concluded that Camellia sinensis is promising for Systemic Lupus Erythematosus by acting as antioxidant, antiinflammation, antiapoptosis, and anti pyroptosis. Experimental analysis is necessary for proving this result.

# Herpes Virus, Causes of Infections and Preventive Methods

**Huynh Tan Hoi**

*FPT University, Innovation Building, District 12 Ho Chi Minh City, Vietnam*

## Abstract

Herpes simplex virus (HSV) usually has two groups, including HSV1 and HSV2. HSV1 often causes skin and mucous membranes in the upper part of the body like the nose and mouth. HSV2 group causes skin disease in the genital mucosa. This type of virus is quite common in our life today, has a great influence on human health and needs certain attention. The paper was based on previous research as well as conducted with the collected data from surveys of 40 patients infected with herpes simplex virus among 250 people who were asked at two dermatology hospitals in southern Vietnam between March and April 2019. Thanks to the analysis method developed by Hancock, this research aims to verify some causes of infecting herpes simplex viruses, effective treatment methods as well as ways to prevent this kind of disease in order to enhance common knowledge for the prosperity of human beings. Accordingly, some solutions have been recommended with the purpose of making our world a better place to live.

***Keywords****: Health, Herpes Viruses, Infections, Prevention.*

## Introduction

The proceedings are the records of the conference. ACM hopes to give these conference by-products a single, high-quality appearance. Herpes virus is thought to be a very wise and stubborn. Once they reside in the body, they will never leave the host. During the initial exposure, herpes virus quickly invades neurons in place and occupies there. They may not work immediately but are always ready to start at any time. Researchers always believe that there will be a way to completely remove them from the body. The CRISPR / Cas9 gene modification technology is being used to target specific DNA sections of herpes virus, applying techniques to eliminate the ability of the virus to cross-copy with the goal of completely removing the virus from the body. Researchers are working on animal models to be able to apply this technology to practice in the most effective ways[1].

## Content

### Definition of herpes virus and its types

Herpes simplex virus includes types 1 and 2 which can infect both skin and nerves of human beings. These viruses are rather common and infect both children and adults. In fact, herpes simplex virus consists of more than 80 types that are found in not only humans but also animals ranging from domestic ones such as cats, dogs or birds to other bigger ones such as monkeys, cows or horses[7, 9].

Of the 80 types, types 1 and 2 are the most concerned ones due to their harms. After infecting the immune system of the patient, they will intrude neurons of the dorsal root ganglia and stay there as their lifelong location[9]. Herpes simplex virus type 1 is often the cause of sores around the mouth and lips (sometimes called vesicles or cold sores). Moreover, HSV-1 can cause genital herpes athough most cases of genital herpes are caused by type 2 herpes. People infected with HSV-2 may have ulcers around the genitals or rectum. For the diseases and symptoms induced by HSV-2, sores may be present in other locations but are often detected under the waist[5].

### The signs and symptoms of herpes disease

Oral herpes is often asymptomatic, and most people infected with HSV-1 do not know they are sick. Symptoms of oral herpes include sore or blisters appearing in or around the mouth. Sores on the lips are often called cold sores. Infected people often have tingling, itching or burning sensations around the mouth before the appearance of sores. After infecting, blisters

or ulcers can recur at a different time of the year. The frequency of relapse in each person is very different [Fig 1].

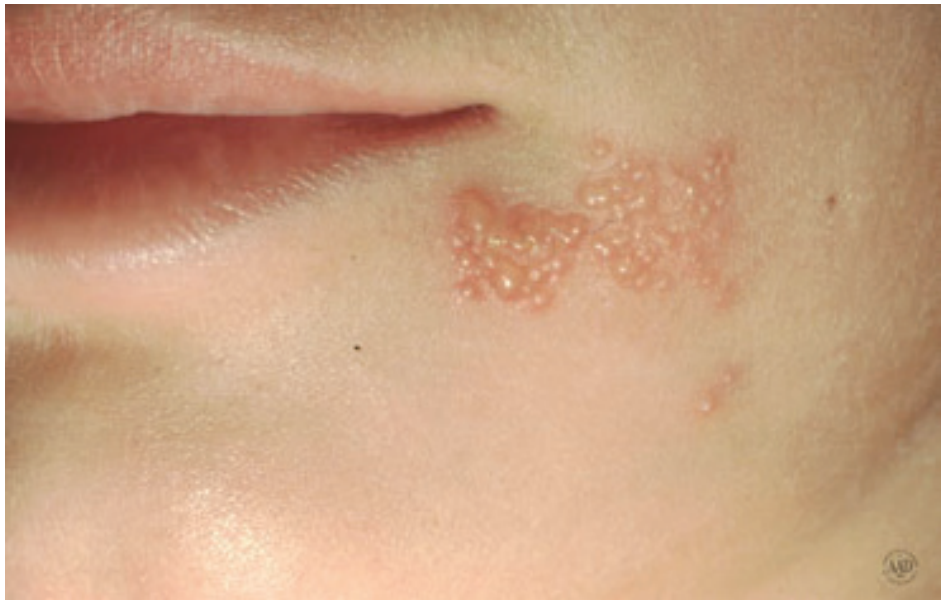

**Fig 1. The image of herpes**

Genital herpes usually has no signs, light symptoms or unnoticeable symptoms. Most patients do not know they have an infection. Normally, about 10-20% of people with HSV-2 have previously had genital herpes.

When symptoms appear, people with genital herpes will definitely have a lot of genital, anal or ulcerative ulcers. In addition to ulcers, symptoms of new genital herpes infection usually include fever, body aches and swollen lymph nodes [Fig 2].

**Fig 2. The image of swollen lymph nodes**

Humans are commonly infected with chronically genital herpes through sexual transmission and there is no cure for it[9]. Most of the patients hardly ever know that they suffer from genital herpes. The viruses can also be passed from parents to their children during birth. Moreover, if there is no appropriate treatment, most infants may not be alive or at least they will suffer from brain damaging.

**The cause to the illness**

Herpes simplex virus is a direct, infectious virus. Children will often be infected with HSV-1 when they are exposed to an infected adult and will always become infected if they are left untreated. Adults can also be infected with HSV-1 via sharing eating utensils or kissing lips. The virus will spread very fast when a person is infected with it. In addition, there will be genital herpes caused by HSV-1 if there is a cold sore and sexual activity during that time. We should also note that HSV-2 is likely to infect the reproductive organs, so we need to be careful to avoid the infection[4, 6].

**Risks of getting herpes**

According to WHO, an estimated 3.7 billion people under 50 years old (67%) are infected with HSV1 and about 417 million people aged 15-49 (11%) are infected with HSV2. People will be at high risk of having unprotected measures such as condoms. In addition, a number of other factors increase the risk of disease HVS-2, for instance, contacting with many sexual partners, especially for female; having a sexually transmitted infection (STI) and the weak immune system.

**Modern treatments and traditional therapies**

Although there is no absolute cure for herpes, some treatments can relieve its symptoms. Drugs can reduce pain, shorten the healing time and reduce the number of subsequent outbreaks. Doctors can use some medicines like Famvir®, Zovirax® and Valtrex® to relieve the symptoms[8].

However, using purple echinacea daisies to treat herpes is also a rather effective way. Purple chrysanthemum tea is believed to help boost the immune system since it supports the body's natural immune response while fighting the viruses

We can also take supplements up to 4 times a day with 300mg each to boost our immune system. Children are not allowed to use purple daisies without consulting a doctor. People with autoimmune disease, diabetes, tuberculosis, connective tissue disorders, multiple sclerosis, liver dysfunction, HIV or AIDS should not use purple daisies. Besides, people who are allergic to chrysanthemum may also be allergic to purple daisies because their its side effects[7].

Using lemon balm or aloe vera is considered to be another choice. Studies assume that these plants help reduce redness and inflammation in herpes and decrease the risk of re-infection as well. Lemon balm and aloe vera is available in most nutritional and herbal stores as a form of a supplement, topical cream, tincture and herbal tea[2, 4].

## Methodology

Thanks to the framework compiled from previous studies. The study was conducted under surveys of interviews with 40 patients who have been suffered from herpes simplex virus at two big hospitals in Vietnam, the HCMC Hospitals of Dermato Venereology and Can Tho Hospital of Dermato Venereology in Vietnam. Only patients who have diagnosed to be infected with typical symptoms were asked to join our interviews. After aspects of the problem under information had been collected, an analysis method developed by Hancock was applied to analyse the statistics.

RESULTS AND RECOMMENDATIONS

In 250 patients at the hospitals who were asked, various types of dermatological diseases were recognised. They are illustrated in Figure 3.

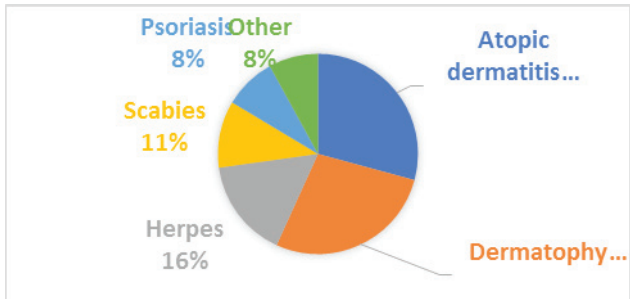

**Fig 3. The frequency of dermatophytosis diseases between March and April 2019.**

According to the graph, atopic dermatitis and dermatophytosis are the most two common

dermatological diseases, occupying 29 percent and 28 percent respectively. Meanwhile, 16 percent of patients were infected with herpes virus. The least common were Scabies (11 percent) and Psoriasis (8 percent). The other diseases such as tinea captitis, hives larticaria, juvenile plantar dermatosis, etc. shared 8 percent.

Causes of herpes virus infection found out from the 40 interviews are not surprising. To limit the progression of herpes, our living habits should be carefully concerned. First, avoiding direct contact with people who are sick is important. Besides, we must not share any items that may transmit viruses around such as glasses, towels, jewelry, clothing, makeup, lipsticks and personal belongings. However, most people recognize that avoiding any kinds of sexual activity with an infected person is a vital thing to prevent infection. If the person has no signs and symptoms but was previously diagnosed with the virus, they should use a condom when having sex. A lot of patients said they had seen the similar signs of herpes on their sexual partners before they recognised them on their body parts. However, eye touching is another thing they should take into consideration as they do not realize the harmful effects of this action whether they will be infected or not [Fig 4]. In order to avoid being infected with the virus, each reason for herpes infection should be strictly kept away.

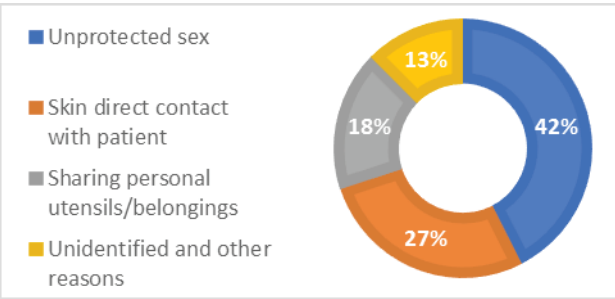

**Fig 4. Reasons for genital herpes infection.**

The pie chart shows the means of infection with herpes simplex virus. Having unsecure sexual activities was the most popular one, at 42 percent, followed by skin direct contact with infected people (27 percent) and sharing personal utensils between the healthy people and the patients (18 percent). 13 percent of people were infected with other reasons and some had no idea why they were infected because not only did they have unprotected sexual activities but they also lived and used the same utensils with the patients.

Some people have bad habits such as using saliva to wet contact lenses. They are not careful when applying makeup and removing makeup. Meanwhile, other people believe that they use cream or makeup powder can help cover herpes or sores or they will be prone to bacterial infections in the surounding environment. In fact, the sores will no longer cause infection once they have healed completely and the affected skin has returned to normal.

**A breakthrough in modern medicine about future treatments for herpes**

Acyclovir was developed and used in 1982. It has been shown to be effective and inhibit viral growth. Next, nucleoside antiviral and its derivatives are the first drugs that can fight this disease[8].

It is reported that the drug is only effective in reducing symptoms, there is no inhibitory effect on viral replication because the drug is not strong enough. Using this drug for a lomg time only reduces the transmission by about 50% and it is not effective for severe herpes infections, high risk of death such as encephalitis, neonatal herpes infection. In fact, most patients were advised to use acyclovir to treat their disease [Fig 5].

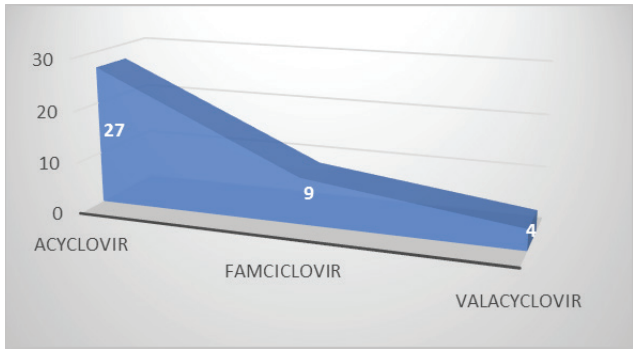

**Fig 5. The frequency of suggested three different types of medicine in presciptions.**

Therefore, a new generation called the helicasse inhibitor group was born that has helped contribute to the improvement of herpes treatment. The first experiment of the helicase inhibitor group, pritelivir with a daily dose of 75 mg, showed that the decrease in viral transmission in the drug group was only 2.1% compared to 16.6% of the placebo group.

**Vaccines to treat Herpes**

Most of the body's immune systems are able to

fight the herpes virus and make it exist in a hidden state, which is not dangerous to the body. Therefore, the researchers based on that to develop a kind of genital herpes treatment vaccine called GEN-003. This vaccine reduced the ability to spread across the skin by about 50% for at least 12 months. This result is equivalent to taking nucleoside daily. Patients do not need to take medicine daily, but only use three divided doses for each 21 days apart, which is effective in preventing and is suitable for those who have difficulty in taking drugs. In fact, the vaccine is planned to be submitted to the US Food and Drug Administration and is expected to be available by 2020[3].

**Using 10 natural methods for treating herpes ulcers**

Chinese have used traditional ways to treat herpes virus. Such methods with their positive effects are not groundless. If we are patient and apply herbs or other trivial things, the effect will be sometimes relatively good. More significantly, it is convenient in case we have no time to go to the hospital, have no good conditions, or are psychologically afraid to see a doctor [4, 10].

Among the traditional methods, ice is approachable. Cold sores often have a little pain and swelling. Patients just need to rub ice directly onto the pain. This simple measure will temporarily reduce the discomfort by the disease.

The next method is milk since it may be resistant to cold virus-like viruses. In addition, milk containing lysine which can fight ulcers. Milk should be drunk in order to fortify the body.

Aloe vera also has its great impact on treating herpes ulcers. Cold ulcers can be very painful and the aloe vera's gentle anti-inflammatory effect is good for relieving pain while direct gels do not produce much results[7].

Peppermint oil is considered as a smart choice if we want to kill the virus causing herpes. Patients should try using some peppermint oil every day, applying it directly to the wound and the oil will help heal the disease faster[4].

Corn flour is normally seen as a food but grafting cornstarch can neutralize the acidity of the ulcer, making the virus unable to thrive.

Then, melissa officinalis, known as lemon balm, is often used for food or juice in some Asian countries. In fact, it can promote rapid healing of ulcers, make the wound tighten and this process becomes more quickly [Fig.6].

**Fig 6. The image of melissa officinalis**

Glycyrrhiza uralens (Chinese liquorice) can be used to make dough or made into a paste. By applying it on the ulcers, the patient can soothe ulcers, fight inflammation, reduce swelling as well as redness.

Honey works very well with cold sores due to its powerful anti-inflammatory effect. We only need to use a cotton cloth to apply honey to acne and wash it after 30 minutes.

Finally, a peeled garlic clove can be one of the good methods. It can be applied onto the location of the acne and hold for 10 minutes. After that, the patient has to rinse the location with warm water. It requires the patient to conduct it once every two hours for several days.

## Conclusion

All patients diagnosed with herpes virus should receive medication as soon as possible and get advice on the risk of relapse as well as how to reduce recurrence. The purpose of antiviral therapies including Western medicine and Oriental remedies is to reduce symptoms by the disease. However, to determine exactly whether or not we are sick with the herpes virus, we should seek medical advice for specific treatments and prevention of sequelae.

**Limitations of the Research**

Research scope is among limitations in the current

study and we hope that the future research should expand the number of respondents as well as diversify research questions in order to find out different aspects of better medications.

**Ethical Clearance:** I am ensuring the quality and integrity of our research. The ideas and opinions expressed in this paper are our effort. By writing this paper, we surely respect the confidentiality and anonymity of our research respondents since they participated in our study voluntarily.

**Conflicts of Interest:** No conflicts of interest noted in the paper.

**Source of Funding**: The paper was completed thanks to the support of FPT University

# Association between Inactive-Gymnastics and Active-Gymnastics Elderly towards Cognitive Functions Measured by The Mini-Mental State Examination (MMSE)

**Muhammad Hamdan[1], Raini Wisnujono[1], Yudha Haryono[1], Abdulloh Machin[1], Ichwanuddin[1]**

*[1]Department of Neurology, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo General Hospital, Surabaya, 60285 Indonesia*

## Abstract

**Background** : The decline of cognitive function is a problem that often experienced by the elderly. **Objectives :** to determine the role of elderly gymnastics towards cognitive function.

**Methods :** A total of 50 elderly patients that fulfilled the inclusion and exclusion criteria in Kedurus village, Surabaya, from September to October 2013 were conducted. The cognitive function was examined using The Mini-Mental State Examination (MMSE) and the results were allocated to two groups: the case group with the MMSE score less than 26/30 while MMSE control group from 27/30.

**Results :** During the study, 50 subjects were enrolled (25 case groups and 25 control groups). It was obtained in case group that did inactive-gymnastics was 15 (60%) and active-gymnastics was 10 (40%), with P = 0.047 and OR 3.188 (CI 0.99-10.17)

**Conclusion :** There was no significant correlation between inactive-gymnastics elderly and active-gymnastics towards cognitive function.

***Keywords:*** *Cognitive Function, Elderly, Gymnastics Elderly*

## Introduction

The structure of the world's population including Indonesia is currently towards the aging process that characterized by the increasing number and proportion of the elderly population. The proportion of elderly people in Indonesia has increased significantly over the last 30 years with a population of 5.3 million people (4.48 percent of the total Indonesian population) in 1971 to 19.3 million (8.37 percent of the total Indonesian population) in 2009[1].

**Corresponding Author:**
**Muhammad Hamdan**
Corresponding author's address : Department of Neurology, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo General Hospital, Mayjen Prof. Dr.Moestopo Street 47, Surabaya City, 60131, Indonesia e-mail : muhammadhamdan.md@gmail.com

The aging process is a natural process that characterized by a decrease or changes in physical, psychological and social conditions in interacting with others. The aging process will occur continuously naturally from birth to aging. The aging process is not a disease but is a process of decreasing the body's resistance in the face of internal and external stimuli of the body[2].

However, most of the elderly process is still within normal limits due to the plasticity process. This process is the ability of a related brain structure and function to keep developing because of stimulation. Therefore, in order not to quickly back off this plasticity process, it must be maintained[3].

One attempt to inhibit cognitive deterioration due to aging is by doing sports movement or physical exercise. Truthfully, someone grows old because they do not want to move. Exercise could increase the potential work of

the brain is improving general physical fitness in the form of brain exercise that intellectually stimulating activity who aims to maintain brain health by doing bodybuilding[4].

Structured and programmed movement learning is used to stimulate different learning centers in the brain. Movements that cause left and right hemisphere functions work together is to strengthen the correlation between the two hemispheres. Movements across the midline of the body could integrate the two hemispheres of the brain so that the brain is able to organize itself[5]

There are many factors that affect cognitive abilities in elderly. It is stated that by living a healthy lifestyle and exercising the body and mind of the elderly could slow down the process of mental decline. In general, we could argue that activity is a key factor in maintaining a quality of life in elderly. Maintaining mental fitness is considered to be important in the continuous quality of life of the elderly[6].

Other studies have reported that some physical activity might cause the changes in the brain structure (increasing the number of neurons and branched dendrites). It also reported that in the elderly through aerobic exercise (brisk walking of an hour walking) or yoga-type stretching could improve their cognitive function on cognitive tests[7],

Provision of exercise in the elderly began with the light intensity and time then increased slowly and ut tend to uncompetitive/compete. Sports exercise for the elderly has great benefits because it could increase aerobic ability that will increase the flow and volume of blood supply that carries oxygen to the organs of the body especially to the brain organ[8].

This study aims to determine the correlation between inactive-gymnastics elderly and active-gymnastics elderly toward cognitive function as measured by The Mini-Mental State Examination(MMSE).

## Methods

This research was an observational analytic research using case-control design which implemented in September 2013 to October 2013 in Kedurus District of Surabaya. All elderly people who follow both inactive and active-gymnastics that meet the criteria for inclusion and exclusion were used as the samples.

The control inclusion criteria were; Aged 60-70 years, Men and Women, more than 27 for MMSE scores. The exclusion criteria for the control of this study were among others were; Brain tumor, moderate to severe brain injury, stroke, Not willing to participate in the research. Exclusion criteria of case research were; Experiencing cognitive impairment with obvious causes of structural lesions (brain tumor, moderate to severe brain injury, stroke), Unwilling to take part in research.

The independent variables were inactive-gymnastics elderly and active-gymnastics elderly. The dependent variable was the cognitive function that measured by MMSE while confounding variables were diabetes mellitus, hypertension, heart disease, uncontrolled dyslipidemia, education, smokers, alcohol drinkers.

Prior to conducting this study, the researcher had a data retrieval procedure as well as a pickup flow that began by selecting the appropriate elderly in the inclusion criteria and given an explanation of the purpose and usefulness about this study research, then asked to participate without coercion. At the end of the explanation, the subject asked to read, ask about things that have not been understood yet. If they have understood and agreed, then they were required to sign an approval letter. Examination of cognitive function was performed by MMSE. If there were things that have not been understood or less clear, it could be asked back to the doctor who gives an explanation (Resident in-training I neurology by giving a phone number).

All recording results were collected for further data tabulation and statistical analysis. Collected categorical data were analyzed by using chi-square test while numerical data were analyzed by unpaired t-test. This study used SPSS 17.0 program.

## Results

All study subjects performed to recording demographic data including sex, age, last education, and type of jobs. All elderly were-examined for cognitive function by using MMSE. There were 50 subjects consisting of 25 subjects with normal MMSE results that called as controls and 25 subjects with disturbed MMSE results that referred to as cases.

**Demography data**

There were 50 subjects which consist of 25 subjects for case group and 25 subjects for the control group.

Characteristic of Research Subject Based on Mean Age

The mean age of case study subjects was 63.60 ± 4.093 years, while the control group was 63.40 ± 3.617 years (P = 0.333) shown in table 1.

**Table 1. Characteristics of study subjects based on mean age**

| | **Cognitive Function** | | | | **P** |
|---|---|---|---|---|---|
| | **Case** | | **Control** | | |
| | Mean | Std.Intersection | Mean | Std.Intersection | |
| Age | 63,60 | 4,093 | 63,40 | 3,617 | 0.333 |

Clinical data

**Characteristics of Research Subjects Based on Mean of Systolic Blood Pressure**

Characteristics based on blood pressure was in table 4, in the case group the mean of systolic blood pressure was 137.60 ± 7.234 and in the control group was 133.20 ± 10,693 with p = 0.051.

**Table 2. Characteristics of research subjects based on mean systolic blood pressure**

| | **Cognitive Function** | | | | **P** |
|---|---|---|---|---|---|
| | **Case** | | **Control** | | |
| | Mean | Std.Intersection | Mean | Std.Intersection | |
| TD | 137,60 | 7,234 | 133,20 | 10,693 | 0.051 |

**Characteristics of Research Subjects Based on Mean of Systolic Blood Pressure**

Characteristics based on smoking risk factors in case group was 3 (12%) and control was 1 (4%), while non-smokers in case group was 22 (88%) and control was 24 (96%) with P = 0.297, in table 3.

**Table 3. Characteristics of research subjects based on smoking risk factors**

| | **Cognitive Function** | | **Total** | **P** |
|---|---|---|---|---|
| | **Case** | **Control** | | |
| Smoking<br>Yes<br>No | 3 (12%)<br>22 (88%) | 1 (4%)<br>24 (96%) | 4<br>46 | 0.297 |
| Total | 25 (100%) | 25 (100%) | 50 | |

**Mean of Random Blood Glucose Level (GDA) on study subjects**

Characteristics of subjects based on random blood glucose levels have obtained the mean in the case group was 115.32 ± 55.426 and in the control group was 101.92 ± 45.767, with P = 0.101.

**Table 4 Mean of Blood Glucose Ratios (GDA) in the study subjects**

| | **Cognitive Function** | | | | **P** |
|---|---|---|---|---|---|
| | **Case** | | **Control** | | |
| | Mean | Std.Intersection | Mean | Std.Intersection | |
| GDA | 115,32 | 55,426 | 101,92 | 45,767 | 0.101 |

**Characteristics of subjects based on mean serum LDL levels**

Characteristics of subjects based on serum LDL levels, in the case group, have obtained mean was 120.12 ± 20.547 and in the control group was120.60 ± 29.364 with p = 0.177.

**Table 5. Characteristics of subjects based on mean serum LDL levels**

| | **Cognitive Function** | | | | **P** |
|---|---|---|---|---|---|
| | **Case** | | **Control** | | |
| | Mean | Std.Intersection | Mean | Std.Intersection | |
| LDL | 120,12 | 20,547 | 120,60 | 29,364 | 0.177 |

**Correlation of inactive-gymnastics elderly and active-gymnastics elderly toward cognitive function**

The differences in cognitive function in case group inactive-gymnastics elderly was 15 (60%) and 10 (40%) of active-gymnastics elderly, (p = 0.047).

**Table 6. Correlation of inactive-gymnastics elderly and active-gymnastics elderly toward cognitive function**

| | **Cognitive Function** | | | | **p** | **RO (IK 95%)** |
|---|---|---|---|---|---|---|
| | **Case** | | **Control** | | | |
| | **N** | **%** | **n** | **%** | | |
| Active-gymnastics<br>Yes<br>No | <br>10<br>15 | <br>40<br>60 | <br>17<br>8 | <br>68<br>32 | 0.047 | 3,188 (0.99 – 10.17) |
| Total | 25 100 | | 25 100 | | | |

There was also an OR of 3,188 - (CI 95% 0.999 - 10,171), so the subjects of inactive-gymnastics elderly had OR for cognitive impairment by 3.18 times compared to the active-gymnastics elderly, but not statistically significant

because they contained a number 1 in the interval confidence (95% CI 0.999 - 10,171).

## Discussion

In the basic data characteristic of subjects, there was no significant difference in some basic variables, in this study was attempted to all subjects in almost equal condition, wish to minimize the influence of other factors that will affect cognitive function.

In one study linking physical activity and decreased risk of Cognitive Impairment (CI), in elderly there was a difference between women who did high physical activity to decreased risk of Cognitive Impairment (CI) (OR 0.58; 95% CI, 0.40-0.82) and at men no significant difference, this was due to the elderly women occur menopause which very influential on lipid profiles, so that physical activity in elderly was very useful to keep the occurrence of decreased cognitive function, especially in women[9].

From age characteristic in both groups, there was no difference of mean age between case group and control. According to WHO a person has been categorized as elderly at age 60 years and above. In this research was limited to the age range of 60 to 70 years, and the mean age of study subjects was almost the same (63.60 ± 4.093 years) compared to the control group (63.40 ± 3.617 years). There was no significant difference between case group and control group with p = 0.333.

Characteristics of education level were divided into four groups; elementary school, junior high school, senior high school, and college. The higher the level of education then the cognitive function will be better[10]. Characteristics of education level were divided into the level of education; elementary school, junior high school, senior high school, and college. The higher the level of education then the cognitive function will be better[10]. The comparison of the level of education obtained at the level of elementary education was 13 (52%) people in the cases group larger than the junior high school and senior high school level but in this study, there was no significant correlation P = 0.163.

The characteristics of the type of job status were; unemployed in case group was 23 (92%), in control group was 22 (88.0%). In the employee was obtained in case group by 2 (8,0%) and the control group by 3 ( 12%) while in the unemployed group, the percentage of cases was greater and in the working group. This in accordance with studies that stated, still working after retirement could sustain the elderly cognitive function, unemployed elderly have poor cognitive performance, which found from 41% of 50-60 year unemployed have the ability to recall memory compared to that the employee one[11].

Smoking as a confounding factor against cognitive dysfunction, in a study that conducted to search at the smoking correlation with cognitive function, was found that smoking causes a 0.13 point/year drop in MMSE values compared to non-smokers. There was no significant correlation with P = 0.297, this might be due to men smoke more and most of them inactive at gymnastics.

Mean of systolic blood pressure, in case group was 137,60 ± 7,234 and in control group was 133,20 ± 10,693, there was no significant difference in both groups with p = 0,051. In a study that looks at the correlation between hypertension and cognitive function, the mean of MMSE values was lower in the hypertension group by 25.9 ± 3.9 than in the normal blood pressure group. This decrease in cognitive function was correlated to vascular damage by arteriosclerosis in large vessels and stress oxidative properties in blood vessel walls[12].

Mean of random blood sugar level with cognitive function has no significant difference in both groups, in case group by 115,32 ± 55,42 and in control group by 101,92 ± 45,767 with value p = 0.101. In a study that correlates blood sugar level and cognitive function has obtained the correlation between high blood sugar levels with decreased cognitive function[13].

Mean of serum LDL level with cognitive function has no difference in both groups, in case group was 120,12 ± 20,547 and in control group was 120,60 ± 29,36 with p = 0.177. In a study that linking Lipid profile and cognitive function with LDL case group 130.5 ± 29.6 and control 112.3 ± 35.6 has a significant correlation to cognitive function decline with p = 0.038[14].

Examination of cognitive function was by using MMSE score which one of cognitive aspect examination of mental function, orientation, registration, attention,

vigilance recall, visuospatial and language used was to assess the change of cognitive function[13], ideally, a measuring instrument has sensitivity and high specificity. The MMSE values was under 27/30 considered as abnormal and indicate cognitive impairment, while the values under 24/30 were suspected of a Dementia Syndrome[15].

In this study, there was no statistically significant correlation between inactive-gymnastics elderly and active-gymnastics elderly to cognitive function, with CI 95% (0.999 - 10.171). According to WHO (2010), there were various activities that could perform by elderly to maintain cognitive function such as walking activity, cycling, doing daily tasks at home and play activities, so gymnastics was not the only physical activity that required by elderly to maintain cognitive function and fitness, activity is a key factor in maintaining quality of life in old age[6]

## Conclusion

There was no correlation between inactive-gymnastics elderly and active-gymnastics elderly with cognitive function.

**Ethical Clearance**: The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, nonmaleficence, and justice.

**Conflict of Interest:** None declared

**Source of Funding:** This study is done with individual funding.

# The Politics of Judicial Law in the Development of the National Health Law

**Irfan Nur Rachman[1], Arief Hidayat[2], and Lita Tyesta[3]**

*[1]Doctoral Student Diponegoro University, Indonesia, [2]Professors Diponegoro University, Indonesia, [2]Associate Professor Diponegoro University, Indonesia*

## Abstract

Normatively, the follow up on the Constitutional Court's Decree has been regulated in the Constitution No.12 of 2011. Yet, the mentioned norm has not optimally regulated the follow up of the Constitutional Court's Decree as one of the main sources in the planning and the renewal of the national law. This is shown by the fact that there was a norm which was annulled by the Constitutional Court, yet it was still written in the new Constitution. Because of that, the Constitutional Court's verdict, especially those regarding the politics of judicial law, is crucial to be included in the national law planning and development documents as a guide for the lawmakers in the form of the Constitution. This is because the Constitutional Court's decree includes the politics of the judicial law, which determines the road of the national health law's development, so that the constitution in the aspect of health will not be against the 1945 Constitution.

This research is a qualitative study, by using the post-positivism paradigm and the juridical-normative approach. The research approach used is statute approach and case approach. The research approach is used to see the politics of the judicial law contained in the Constitutional Court's Decree which should have been the guide of the national health law development.

## Introduction

The constitutional change which happened in the period of 1999-2002 has changed the design and the structure of the governance in Indonesia. The birth of some new stately institutions such as the Constitutional Court, the Regional Representatives, and the Judicial Commission are the means to strengthen the check and balance mechanism between the stately institutions. The Constitutional Court was created in the third amendment of the constitution's change. Yet, this institution was only effective in carrying out its constitutional tasks after the issuing of the constitution which regulates the Constitutional Court, which was the Constitution No. 24 of 2003 regarding the Constitutional Court on August 13th, 2003. The Constitutional Court consists of nine judges in which each three were appointed by the President, the Legislative House, and the Supreme Court with a five-year term of office. They may then be reappointed for one term of office.

Based on the stipulations of Article 24C of the Republic of Indonesia's 1945 Constitution, *juncto* of the Constitution No. 8 of the years 2011 the Constitutional Court has four rights and one responsibility, which are:

(1) Testing the Law against the Republic of Indonesia's 1945 Constitution;

(2) Making the verdict upon stately institution power dispute, in which its power was given by the Republic of Indonesia's 1945 Constitution;

(3) Making the verdict on the dissolution of political parties; and

(4) Making verdict on the disputes of the general election results.

The presence of the Constitutional Court and its constitutional review is aimed to create the check and balance mechanism between the stately institutions so that there are no misuses of power in the establishment of the state, as stated by Lord Acton[1], *"power tends to corrupt, absolute power corrupt absolutely.* Because of that, as the executor of the check and balance mechanism, if the health constitutions as the legislative house's products are proved to be against the constitution, it can be revoked by the Constitutional Court. Apart from undergoing constitutional trials, the Constitutional Court is also known as undergoing norm trials. This is because there is the Constitutional Court's power in testing the constitutionality of a constitution.

In its development, especially after the change of the 1945 Constitution, there are new legal sources which must become the guide in undergoing the national law renewal, which is the Constitutional Court's verdict. Normatively, the Constitutional Court has the role as the negative legislature, which functions in annulling the norms in the constitution, including those regarding health. According to Hans Kelsen[2]*," The annulment of a law is legislative function, an act-so to speak-of negative legislation. A court which is competent to abolish laws-individually or generally-function as negative legislature".* Meanwhile, according to Siahaan[3] the Legislatives and the Presidents act as the positive legislature who creates the law.

Generally, Bagir Manan states that the efforts to renew the colonial law are not only limited by the formation of the constitutional regulations. Yet, it may also be done through the judge's verdict[4]. In that verdict also, this article aims to explain and to discuss the politics of the judicial law in the Constitutional Court's verdict in the process of creating law, especially those regarding health.

## Discussion

In general, the Politics of Law's definition according to experts and specialists is substantively and basically the same. According to Moh. Mahfud MD[5], politics of law is legal policy or formal line (policy) concerning health law which will be enacted by formulating a new law or by replacing the old law, in order to achieve the State's goals. From several existing definitions, the core of Politics of Law's definition is legal and health policy that will or has been nationally implemented by the Indonesian government. That is namely: *first,* a legal development in which its main point is making and updating the legal materials so that they can meet the needs; *second,* the implementation of the existing health legal provision, including the affirmation of the institution and the guidance functions by the law enforcers. From these definitions, it showed that politics of law encompasses the process of legal making and legal implementation that can indicate the nature and the direction in which health law will be established and enforced.

In its development, Politics of Law is not only made by legislators, namely it is made by the People' Representative Council and the President. It can also be carried out by the Constitutional Court as a judicial institution whose one of its authorities is to test the constitutionality of a constitution against the 1945 Constitution. The Constitutional Court's decision often determines in which direction the legislators must direct their legal politics.

In fact, it is not uncommon for the Constitutional Court to act as a positive legislature, because the Constitutional Court does not only state that a legal norm is contrary to the constitution so that it does not have binding legal force, but the Constitutional Court also takes the role of a law-maker because it participates in formulating new norm in its conditionally constitutional or conditional unconstitutional decisions. According to Stone, the Constitutional Court's involvement in the legislative process by formulating norm in its decision can also be referred to as judicialization of politics. The following is Stone's[6] full opinion.

"Judicialization of politics is the intervention of constitutional judges in legislative processes, establishing limits on law-making behavior, reconfiguring policy making environments, and sometimes, drafting the precise terms of legislations"

Therefore, the Constitutional Court must now be seen as a law-making body other than the President and the People's Representatives Council. According to Asshiddiqie[7], this is seen as a convergence between the legal systems. This is because, recently there is a strong tendency in the environment of countries that adopt the system of judge-made law to give a greater role to the

Constitution as in the civil law system. Conversely, in the civil law environment there is also a desire to enlarge the court's role as a law-making institution.

The Constitutional Court acts as a positive legislature. Because the Constitutional Court is involved in formulating new norm by making the interpretation so that the norm referred to does not conflict with the constitution. Morover, the Constitutional Court gives an interpretation of the health constitution when the rules in the constitution do not clearly regulate something in question or give orders to the legislator to revise the norms in a constitution until a certain time limit. If the legislator does not make the revision to a norm in a constitution as instructed in the decision of the Constitutional Court, then that norm directly becomes unconstitutional. The order in the decision of the Constitutional Court was termed by Paczolay[8] as a constitutional mandate. However, the term used by the author is judicial legal politics because the Constitutional Court has given directions of the national legal development which will be addressed.

On the other hand, based on Laksono's[9] research examining the decisions of the Constitutional Court from 2003-2015, there are several variants of the constitutional mandate contained in the Constitutional Court's decisions, they are as follows:

1. The Decision of the Constitutional Court that contains suggestion, recommendation, advice, or encouragement to make amendment, improvements, or formulation of the Constitution;

2. The Decision of the Constitutional Court that provides the alternatives normalization in formulating the Constitution;

3. The Decision of the Constitutional Court that contains prohibition to contain a certain norm;

4. The Decision of the Constitutional Court that must contain a specific norm in formulating Constitution;

In the rule of law perspective, disregarding judicial decisions is considered as a bad precedent. Law supremacy doctrine within the conception of the rule of law has obliged all parties to obey the judicial decision. Although there are some parties which argue, from the perspective of authority separation theory, the institution with authority to make laws is the parliament, therefore the judiciary may not function as a parliament. However, in the development of the idea of judicial review, it turns out that the function of the Constitutional Court is not only limited as negative legislature, but also functions as positive legislature. According to Stone, the involvement of the Constitutional Court in the legislative process by drafting norms in its decisions may be referred as judicialization of politics.

This matter is also in accordance with Asshiddiqie's opinion that currently, there is a tendency for countries which adopt civil law system to broaden the role of the judiciary in making laws. Conversely, in countries which adopt common law system, there is a tendency to give major roles to the law. This is also an indicator that the constitutional doctrine in one country always develops following the development of law and society.

Within the period 2013-2019, there were at least 26 times the testing of laws in health sector which included laws on health, laws on medical practice, laws on animal husbandry and animal health, laws on health personnel, hospital law. There are 6 (six) issues which are often disputed by their constitutionality according to Junaidi[10], namely:

1. Phrases regarding health caution;

2. Revocation of criminal sanctions for nurses who perform medical and pharmaceutical services;

3. Safeguarding the use of addictive substances so as not to interfere and endanger public health and public environment;

4. Provision of a designated space to smoke;

5. Health warning in cigarette production alongside with the sanctions;

6. Related to health financing sources originating from the government.

Below are several decisions which contain important guidelines which are considered by legislators in constructing laws, particularly in the development of health law. The examples of the Constitutional Court verdicts where the application grants the Petitioner's and contains constitutional mandate, include:

1. Decision Number 4/PUU-V/2007 concerning the testing of Constitution Number 29 Number 2004 regarding Medical Practices. In this decision, the Constitutional Court stated that the provisions of criminal sanctions in Article 75 paragraph (1), Article 76, Article 79, letter a of the Medical Practices are contrary to the constitution. The Constitutional Court eradicated criminal sanctions and only applied a fine to doctors or dentists who practiced without having registration certificate and practice permit as stipulated in Article 75 paragraph (1) and Article 76 of the Constitution and the threat of imprisonment as regulated in Article 79 letter a Medical Practice Constitution. Within this decision, Constitutional Court also provides guidelines to legislators in regulating criminal sanctions, to uphold criminal law which is humanist and closely related to the code of ethics. Therefore, the provision of criminal sanctions has to uphold the following guidelines: (i) criminal threats may not be used to achieve any particular goal which fundamentally might be able to be achieved in other ways which are as effective yet with less suffering and loss, (ii) criminal threats may not be used if the side effects are more detrimental than the actions to be criminalized, (iii) criminal threats has to be rational, (iv) criminal threats has to maintain harmony between order, in accordance with law, and competence (order, legitimation, and competence), and (v) criminal threats has to maintain the equality between community protection, honesty, procedural justice. Thus, the provision of appropriate sanction for doctors or dentists who practice with neither registration certificate nor license to practice would be a fine sanction.

2. Decision Number 12/PUU-VIII/2010 concerning the testing of the Constitution Number 36 of 2009 regarding Health. In this decision, the Constitutional Court has revoked the provisions of Article 108 paragraph (1) of the Health Constitution regarding the elucidation of the following phrase "health personnel" which contained in the elucidation section of Article 108 paragraph (1) of the Health Constitution and enclose the definition of "health personnel" in Article 108 paragraph (1) of the Health Constitution instead. This means, the Constitutional Court has repositioned the norms from the elucidation into the Article 108 of the Health Constitution. Under its consideration, Constitutional Court stated that the placement of exclusion provisions in the Explanation is considered as an improper placement, because such provisions are also included in the category of normalization and are not supposed to merely be explained. Moreover, the normalization contained in the said elucidation may have implications for the imposition of criminal sanctions, despite the existence of said sanction provisions may be found in another article. Norms are supposed to be placed within the article. Exception provisions are highly limited as they do not provide neither protection to patients in emergency nor provide protection to health workers. The test begun when Misran, a nurse who was also the head of the Community Health Center (Puskesmas) and was assigned in a remote area in East Borneo in where no doctor and pharmacist felt disadvantaged by the enactment of Article 108 paragraph (1) of the Health Law and its explanation. With this provision, Misran, as both of the head of Puskesmas and a nurse was unable to optimally carry out their duties in providing health services to patients, notably when there are patients who need emergency measures as one of the impacts of the narrow definition of health personnel and be jotted down in the article instead of in the explanation. With the eradication of norm regarding who are referred to as health workers in the elucidation of Article 108 paragraph (1) of the Health Constitution, then was placed in the Article 108 paragraph (1) section has guaranteed legal certainty for health workers in providing optimal services to the community.

3. Decision Number 57/PUU-IX/2011 concerning Testing of Constitution Number 36 of 2009 concerning Health. In this decision, the Constitutional Court has revoked the phrase "may" in the Elucidation Article 115 paragraph (1) of the Health Constitution which states, "For several specific places such as workplaces, public places, and other places **may** provide designated area to smoke". Therefore, the provision of designated smoking areas at workplace, public places, and other places is no longer optional, but considered as a necessity.

From this provision, it can at least be concluded that the decision of the Constitutional Court was accounted for the making of a law. In other words, the Constitutional Court's decision should be an important source of law which has to be considered to form a national health law.

## Conclusion

The presence of the Constitutional Court after

the constitutional amendment has a significant role in striving to form a national health law. As the decision of Constitutional Court often contains judicial legal politics which has to be a ground rule for the legislators, which in this case are President and the House of Representatives. The decision of Constitutional Court has to be upheld in making a law related to health sector, thereby such laws will not contradict the constitution as the supreme law (the supreme law of the land).

**Ethical Clearence:** Yes.

**Conflict of Interest:** No

# Pattern of Fatal IntraAbdominal Injuries in Autopsy Cases- A 3 Year Retrospective Study

**Khaja Azizuddin Junaidi[1], Kashif Ali[2]**

*[1]Tutor, Department of Forensic Medicine, GIMS, Gulbarga, Karnataka, [2]Senior Resident, Department of Forensic Medicine, Jawaharlal Nehru Medical College, AMU, Aligarh, Uttar Pradesh*

## Abstract

**Introduction-** Abdominal trauma is an injury to abdomen and is a common presentation in the emergency room if it is caused by blunt force. According to WHO, in few years trauma will become the first or second leading cause of loss of productive years of life for both developed and developing countries. The most common cause of blunt abdominal trauma are road traffic accidents, fall from height, assaults, industrial accidents, etc.

**Objective-** To study the pattern and prevalence of abdominal injuries in relation to the various epidemiological factors.

**Materials and Method-** This retrospective study was conducted over a period of 3 years from January 2016 to December 2018. The total number of cases studied were 120 showing abdominal injuries. This study on medicolegal autopsies was carried out at mortuary of Jawaharlal Nehru Medical College, Belagavi, Karnataka.

**Results-** A total of 120 cases were included in this study who presented with blunt abdominal trauma. In our study males (83 cases) outnumbered females (37 cases) and majority of the cases were in age group of 21-30 years (38.3%). Most of the cases were from rural background (57.5%). Road traffic accidents (75.8%) were the most common reason behind the abdominal trauma. The most common cause of death was shock and haemorrhage (69.2%). Liver was involved in majority of the victims followed by spleen.

***Keywords-*** *Abdominal injuries, Blunt trauma, Road Traffic Accidents*

## Introduction

Abdominal trauma is an injury to abdomen and is a common presentation in the emergency room if it is caused by blunt force. The incidences of blunt abdominal trauma are increasing day by day due to the modern industrial era alongwith the development of automobiles. The trauma to abdomen usually occurs due to Road Traffic accidents, fall from height, assaults, industrial accidents, etc. Road Traffic Accident (RTA) is one among the top 5 causes of morbidity and mortality in South East Asian countries.[1] The fatality rate in road traffic accident in India is one of the highest in the world and reported to be 20 times more than that reported in developed countries.[2] The abdominal cavity contains the vital organs like liver, kidneys, spleen, stomach, small intestine, large intestine, etc and trauma to this region challenges the integrity as well as the viability of an individual. These injuries deserve more detailed thought process as many of these lesions are not immediately fatal and present difficult clinical problems for the surgeon to solve. The solid organs such as liver and spleen are more readily lacerated by blows as compared to hollow organs like stomach, intestine, etc. The most important reason for the increase in mortality and morbidity in such cases is either the delay in early diagnosis or misdiagnosis. The extent of blunt abdominal trauma is increasing at an

**Corresponding Author-**
**Dr. Kashif Ali**
Senior Resident, Department of Forensic Medicine, Jawaharlal Nehru Medical College, AMU, Aligarh (UP)- 202002

alarming rate as increasing population is relying more on motor vehicles for the transportation. This study was conducted to study the pattern and frequency of intra abdominal injuries seen in autopsy cases with the blunt abdominal trauma.

## Materials and Method

This retrospective study was conducted over a period of 3 years from January 2016 to December 2018. The total number of cases studied were 120 showing abdominal injuries. This study on medicolegal autopsies was carried out at mortuary of Jawaharlal Nehru Medical College, Belagavi, Karnataka. The study included data regarding age, gender, cause of accident, type of victim in road traffic accident, cause of death and incidence of visceral injuries of abdomen. All observations were recorded in specially designed proforma for study. Data was collected and then analyzed to determine the results. Statistical analysis was done by using SPSS software version 25 and the results were calculated in percentages.

## Results

A total of 120 cases were included in this study who presented with blunt abdominal trauma. Since there is minimal bony protection for underlying organs, the abdomen is more vulnerable to fatal injuries. In our study males (83 cases) outnumbered females (37 cases) and majority of the cases were in age group of 21-30 years (38.3%) followed by 31-40 years (15.8%) as depicted in Table 1.

**Table 1- Distribution of cases according to age and sex**

| Age Group | Males | Females | Total no. of cases | Percentage |
|---|---|---|---|---|
| 0-10 | 1 | 1 | 2 | 1.7 |
| 11-20 | 7 | 4 | 11 | 9.2 |
| 21-30 | 34 | 12 | 46 | 38.3 |
| 31-40 | 11 | 8 | 19 | 15.8 |
| 41-50 | 12 | 6 | 18 | 15 |
| 51-60 | 13 | 4 | 17 | 14.2 |
| 61-70 | 3 | 1 | 4 | 3.3 |
| >70 | 2 | 1 | 3 | 2.5 |
| Total | 83 | 37 | 120 | 100 |

**Table 2- Distribution of cases according to Place of Residence**

| Place of Residence | Number of cases | Percentage |
|---|---|---|
| Rural | 69 | 57.5 |
| Urban | 51 | 42.5 |
| Total | 120 | 100 |

As depicted by Table 2, the majority of cases were from rural background (69 cases, 57.5%) as compared to urban background (51 cases, 42.5%).

**Table 3- Distribution of cases according to type of accident**

| Type of Accident | Number of cases | Percentage |
|---|---|---|
| Road Traffic Accidents | 91 | 75.8 |
| Fall from Height | 18 | 15 |
| Direct Impact of Blunt Object | 6 | 5 |
| Others | 5 | 4.2 |
| Total | 120 | 100 |

According to Table 3, the most common reason behind the abdominal trauma was road traffic accidents (91 cases, 75.8%) followed by fall from height (18 cases, 15%). 6 cases (5%) were due to direct impact of blunt object over the abdomen.

**Table 4- Distribution of cases according to type of victims in Road Traffic Accidents**

| Type of Victims in RTA | Number of cases | Percentage |
|---|---|---|
| Bike Rider | 35 | 38.5 |
| Pillion Rider | 29 | 31.8 |
| Pedestrian | 12 | 13.2 |
| Four wheeler | 11 | 12.1 |
| Cyclist | 4 | 4.4 |
| Total | 91 | 100 |

As depicted in Table 4, the majority of the victims in Road Traffic Accidents were bike riders (35 cases, 38.5%) followed by 29 cases of pillion riders (31.8%) and 12 cases of pedestrian (13.2%). 11 cases (12.1%) were occupant of four wheeler while 4 victims (4.4%) were cyclist.

**Table 5- Distribution of cases according to Cause of Death**

| Cause of Death | Number of Cases | Percentage |
|---|---|---|
| Shock and Haemorrhage | 83 | 69.2 |
| Septicaemia | 37 | 30.8 |
| Total | 120 | 100 |

Shock and haemorrhage was the most common cause of death seen in 83 cases (69.2%) as compared to 37 cases of septicaemia (30.8%) as depicted in Table 5.

**Table 6- Distribution of cases according to incidence of visceral injuries of abdomen**

| Visceral Injuries | Number of Cases | Percentage |
|---|---|---|
| Liver | 21 | 17.5 |
| Spleen | 18 | 15 |
| Kidney | 15 | 12.5 |
| Small Intestine | 10 | 8.3 |
| Stomach | 5 | 4.2 |
| Liver, Kidney | 15 | 12.5 |
| Liver, Spleen, Kidney | 13 | 10.8 |
| Liver, Spleen, Small Intestine | 12 | 10 |
| Spleen, Kidney | 11 | 9.2 |
| Total | 120 | 100 |

As depicted in Table 6, Liver was involved in majority of the victims (61 cases) followed by spleen (54 cases). Kidney was involved in 54 cases as compared to 22 cases of small intestine. 5 cases of stomach injury were also reported.

## Discussion

In our study, males (69.2%) predominated females (30.8%) which is similar to the studies conducted by Khajuria et al.[3] This could be due to the risk taking behavior of males and indulging in outdoor activities as they are the earning members of the family. This study has found that majority of the victims were in the age group 21-30 years (38.3%) followed by 31-40 years (15.8%) because of the fact that persons in this age groups have tendency to take unnecessary risk thereby subjecting themselves to danger of accidents and injuries. This observation is consistent with the studies conducted by Suresh et al.[4]

Most of the cases were from rural background (69 cases, 57.5%) as compared to urban background (51 cases, 42.5%) which is similar to the study conducted by Reddy et al.[5] This could be due to the reason of ignorance of road safety rules and traffic sense. In this study, the most common cause of abdominal trauma was road traffic accidents (91 cases, 75.8%) followed by fall from height (18 cases, 15%) which is consistent with the studies conducted by Panchal et al.[6] Among road traffic accidents, bike riders (38.5%) constituted maximum number of cases followed by pillion riders (31.8%). These results are similar to the studies conducted by Gupta et al[7] and Norton et al.[8]

The most common cause of death in our study was shock and haemorrhage (69.2%) which is similar to the studies conducted by Ravindra et al.[9] Liver was involved in majority of the victims (61 cases) followed by spleen (54 cases). Kidney was involved in 54 cases as compared to 22 cases of small intestine. This observation is consistent with the studies conducted by Bakkannavar et al[10] and Maurice et al.[11] Among solid organs, liver was most affected as it is more anteriorly placed and hence more susceptible to injury by blunt trauma.

## Conclusion

In our study abdominal trauma is a major cause of mortality among young adult males of age group 21-30 years. Most of the cases were from rural background. Road Traffic Accidents were the most common cause of injuries followed by fall from height. Liver was involved in majority of the victims followed by spleen. The main cause of death was haemorrhagic shock due to multiple injuries. A thorough examination should be done in all road traffic accident cases as many of them show fatal visceral organ damage without external injury. In

order to help the authorities to plan better availability of health care on road, the offending agent in Road Traffic Accident should be identified. Awareness of road safety measures, proper attention towards accurate diagnosis and prompt treatment of the accident victim is the need of hour to bring down the mortality as well as the morbidity.

# ARM Diagnosis with Distal Colostography on Anorectal Malformations

**Naely Rahma[1], Bambang Seprijanto[2]**

*Department of Radiology,Faculty of Medicine, Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya, Indonesia*

## Abstract

**Background:** Anorectal Malformation (ARM) is a common congenital disorder and clinically recognizable, however, there has been no successful therapy. Establishment of ARM diagnostic is based on clinical and radiological of perineum USG, invertogram and distal colostography. A low-ARM handling requires an immediate post-natal repair and a high position requires a preliminary colostomy to prevent intestinal obstruction.

**Objectives:**To determine the establishment of ARM diagnosis with distal colostography, evaluate the ARM management, and its accompanying complications.

**Methods:** This study used secondary data that derived from medical records. Consecutive sampling obtained 38 medical records that fulfilled the inclusion criteria from July 2012 to June 2013. Then samples were analyzed statistically.

**Results:** The number of ARM referrals from other hospitals was 92.1%. The number of ARM which performed by preliminary colostomy was 89.5% and 26.5% of it was accompanied by complications. Based on the distal colostographic results, the number of high ARM location was 54.1% and the low location was 45.9%. The number of low-ARMwhich performed by preliminary colostomies was 88.2%. Twenty-eight subjects who had performed anorectoplasty obtained suitable colostographic results of 71.4% and unsuitable results of 28.6%.

**Conclusion:** Distal colostographic results obtained by high-ARM by 54.1% and low location by 45.9%. The number of low-ARM that has been performed of colostomy by 88.2%. The number of distal colostographic results that in accordance to the findings of anorectoplasty was 71.4% and unsuitable was 28.6%.

***Keywords:*** *Anorectal Malformation (ARM),ARM types, distal colostography, congenital disorder*

## Introduction

Anorectal malformation (ARM) is a congenital disorder of anal malformation and or rectum due to abnormal separation of urogenital structures with hindgut during early embryogenesis. The etiology of ARM is allegedly related to genetic and multifactorial mutations.[1, 2]

The incidence of AMR reached 1 per 2500-5000 of live births and increased annually (0.2-0.3% to 1.2% of all live births). The AMR incidence was also higher in developing countries. Naser reported that the incidence of AMR in Chile (2000) reached 1 case per 1,298 live births, it was allegedly related to high rates of birth, malnutrition and low antenatal care of pregnant women in the country[3].

Based on data at Surgery Department of Dr. Soetomo General Hospital Surabaya, there were 43 ARM cases which treated in surgery unit for a year (January-December 2012) and 99 cases of ARM have been performed surgery (colostomy, anorectal repair and colostomy stoma closure) in operating room of Dr. Soetomo General Hospital Surabaya for a year(July 2012 – June 2013).

The ARM diagnosis is based on clinical abnormalities of anus and fistula during anamnesis and perineal examination meanwhile, photo of X-ray prone cross-table lateral view and/or perineal ultrasound are used to determine the type of ARM whether in low or high position[1, 4, 5].

Treatment that given to low-ARM is immediate post-birth repair of the perineum, whereas the preliminary colostomy is performed in high-ARM to prevent intestinal obstruction. It also as a pathway for colostography in order to know precisely the location of the distal rectum and the fistel rektourinarius. This requires a pediatric surgeon for determining the surgical techniques, thus normal physiologic postoperative anus can be achieved[6-10].

Based on medical data survey of ARM patients who treated at child surgery unit of Dr. Soetomo General Hospital Surabaya (March-April 2013), it was found that >80% of MAR patients were referral from other hospitals and >50% of them had performed preliminary colostomy without distinguished whether low or high ARM. Moreover, there was also a prolonged delay of definitive repair (weeks to months) caused by physical limitation of the patients and hospital resources, thus it increased the risk of colostomy complications such as prolapse, infection, fistula, and other complications. The existing problems could be caused by the difference of ARM management in Dr. Soetomo General Hospital with literature findings, thus it could encourage the authors to determine the diagnosis of ARM based on distal colostography; and to evaluate the ARM management and its accompanying complications.

## Method

Subjects of this study were 38 data of patient medical record in Dr. Soetomo General Hospital Surabaya from July 2012 to June 2013. Consecutive sampling was conducted during the study period. Subjects were selected based on the inclusion criteria, such as all medical records of patients with Anorectal Malformations with completed and accessible data.

This study was a retrospective observational study which used secondary data from medical records. The study protocol was approved by Dr. Soetomo Teaching Hospital Surabaya Indonesia. Research data was analyzed with descriptive statistics, then it was displayed in tabular form.

## Results

ARM patients who fulfilled the inclusion criteria were 38 children consisted of 26 males (68.4%) and 12 females (31.6%). Patients aged ≤1 year were 9 children (23.7% ) and >1 year were 29 children (76.3%). The age range of patients was between 4 months-9 years 11 months with the mean age of 2 years 8 months. We found 35 ARM referral patients from other hospitals outside Dr. Soetomo General Hospital (92.1%) and 3 ARM patients from Dr. Soetomo General Hospital Surabaya(7.9%).

ARM patients who have performed preliminary colostomy were 34 children (89.5%) and 4 children without preliminary colostomy (10.5%). ARM patient with preliminary colostomy and complications was 9 children (26.5%) and those with no complication were 25 children (73.5%). We obtained distal colostographic images of high-ARM by 20 children (54.1%) and low-ARM by 17 children (45.9%). In low-ARM, it was found that 15 children (88,2%) have performed preliminary colostomy and only 2 children (11,8%) were not performed with colostomy. Anorectal abnormality was found in colostography of 28 children, it was suitable with the anorectoplasty results of 20 children (71.4%) and an unsuitable results of 8 children (28.6%).

There were ARM patients with single disorder (Isolated MAR) of 24 children (63.2%) and ARM patients with other malformations of 14 children (36.8%).

## Discussion

Anorectal Malformation (ARM) patients were 38 children with age range of 4 months-9 years 11 months that consisted of 68.4% male and 31.6% female. This finding was similar to several previous studies [1, 11, 12] who reported that ARM incidence was more common in the male. The number of ARM referral patients from other hospitals outside Dr. Soetomo General Hospital Surabaya was 92.1% meanwhile, patients from Dr. Soetomo General Hospital Surabaya was 7.9%. This results showed the unequal distribution of competency-based child health services particularly in East Java due to the limited resources and facilities required in the diagnosis and treatment of ARM.

We obtained 89.5% of ARM patients who have been performed of preliminary colostomy (mostly performed in the original hospital) and 10.5% of patients without preliminary colostomy. This result was one of the causes of improper management of ARM in Dr. Soetomo General Hospital Surabaya. It was contrary to recommended therapy in the literature that indicated preliminary colostomy only on high-ARM and other special cases.

Indications of preliminary colostomy included the decompression needs in the emergence of neonatal intestinal obstruction. It enabled the colostography to be performed for further diagnosis of anorectal disorders and protect the pasca repair of a distal colorectal tract. ARM patients with preliminary colostomy and complications were found in 26.5% of patients and those with no complications were 73.5%. The most common complications were prolapse stoma, retraction stoma and fecaloma. Several causes of complications were the location of stomas in the transverse colon and the length of patient waiting time from the implementation of definitive repair to colon anastomosis due to availability of operating room and limited number of pediatric surgeons[13-15].

Distal colostographic results from this study obtained a high-ARM of 54.1% and a low-ARM of 45.9%. The most types of abnormalities were ARM with rectourethral fistula in male and rectovaginal fistula in the female, this was in accordance with the results of some previous studies[1,11]. There was 88.2% of low-ARM patients with the preliminary colostomy, these results indicated the need for an evaluation of preliminary indication of colostomy at low-ARM in Dr. Soetomo General Hospital Surabaya. It was due to the literature of low-ARM that suggested anorectal repair without preliminary colostomy. The anorectal abnormality was found in colostography of 28 children, it was suitable with the anorectoplasty results of 20 children (71.4%) and unsuitable results of 8 children (28.6%). These

results showed that colostography was a quite accurate examination to determine the location of the distal rectum while detecting the fistula that a surgeon needs in the selection of surgical techniques. The differences between the results of colostographic and anorectoplasty might be due to improper colostography techniques, less experienced radiology officers and the presence of fecalomas that block contrast to achieve the distal rectum and fistula.

The number of Isolated ARM patients obtained in this study was 63.2% and patients with other malformations were 36.8%. This result was different from previous studies that reported ARM incidence with other malformations was 45% and 66% [11, 12]. This was due to the domination of low-ARM in this study meanwhile some studies mentioned that co-morbid malformations were more commonly found in high-ARM [12]. Other comorbid malformations found in this study were congenital heart defects, spina bifida with myelocele and down syndrome.

## Conclusion

Distal colostographic results in Dr. Soetomo General Hospital Surabaya obtained high ARM of 20 children (54.1%) and low-ARM of 17 children (45.9%). The number of low-ARM who has performed the preliminary colostomy was 15 children (88.2%). The number of anorectal disorder in distal colostography that was in accordance to the findings on anorectoplasty was 20 children (71.4%) and unsuitable results was 8 children (28.6%).

# Multiplanner Measurement to the Clicked Tempromandibular Joint (Condylar Process and Articular Dick) with Conbeam Computed Tomography

**Nameer Fadhel[1], Manar Abd Alrazaq Hassan[2], Nour Abd Alrazaq Hassan[2]**

*[1] Department of Human Anatomy, College of Medicine, Dyiala University, Iraq,*
*[2]Department of Physics, College of Science, Dyiala University, Iraq*

## Abstract

Background: The purpose of the current study was to actualization, the relationship of condyle-fossa position, in clinically symptomatic untreated in first dental special center in baquba, and by cone-beam computed tomography (CBCT). Objectives: Cone-beam computed tomography was superior to conventional radiography and conventional tomography for estimating internal disorders of temporomandibular joint. Cone-beam computed tomography demonstrated excellent evaluation of bony structures. Methods: fifty patients were examined in this study. Temporomandibular Joint with cone-beam computed tomography of the patients. Width and shape of glenoid fossa, width and shape of condyle, symptoms of the patient, soft tissue and clicking in both the right and left TMJs were measured. Data were analyzed using ANOVA test. Results: A statistically significant differences in the position right and left condyles were found among the patients that complete edentulous, partial edentulous, and fully erupted teeth. In patients, significant statistical differences were found between right and left TMJs in both values the X axis and the Y axis values. The difference between the right and the left X axis values in patients was also statistically significant. Conclusion: Cone-beam computed tomography is most commonly used in oral and maxillofacial surgery, implant dentistry and orthodontics. Cone-beam computed tomography examination not accepted unless its medical necessity is established and the benefits superimposes the risks.

***Key Words:*** *mandibular condyle, glenoid fossa, Temporomandibular joint*

## Introduction

Pain related to the temporomandibular joint (TMJ) was mutual in the most population. Only about 3%-7% of the patients with pain linked to TMJ disorder and seek to the medical care [1,2]. Although TMJ disorders or dysfunctions were the most popular clinical conditions that refer to the imaging examination, pathologies that specific to the bone and the joints also common. Cone-beam computed tomography was the most widely technique of choice that used for diagnostic. Cone-beam computed tomography (CBCT) is a new medical imaging technique that creates 3-D images at a lower absorbed dose and cost comparing with conventional computed tomography (CT). This imaging technique based on a X-ray beam with cone-shaped that concentrated on a 2-D detector that achieves by one rotation around the object, and produced a series of 2-D images [3]. These images are re-constructed in 3-D using a modification developed by Feldkamp *et al.* in 1984 that modified original cone-beam algorithm. Craniofacial region images were often collected with a advanced resolution than those collected with a conventional CT. In addition, the new systems were more practical, due to come in smaller sizes [2]. Considerably TMJ underdeveloped at birth in comparison to other diarthrodial joints making it more exhibit to perinatal and postnatal abuses. TMJ has an articular surfaces, disk, synovial fluid, fibrous capsule, synovial membrane, and ligaments. TMJ are comprises from mandibular condyle inferiorly and the glenoid fossa superiorly and articular eminence of the temporal bone[3].

The mandibular condyle appearance was awfully variable between patients and in different age groups. The cranial component of the TMJ lies beneath the

squamous portion of the temporal bone anterior to tympanic plate [4]. The articular fossa was formed entirely by the squamous portion of the temporal bone. Along the medial aspect of the glenoid fossa was the petrotympanic fissure anteriorly and the petrosquamous fissure posteriorly. The articular eminence (AE) forms the anterior boundary of the glenoid fossa [5]. The AE is a transverse bony bar anterior to the glenoid fossa and medial to the posterior margin of the zygomatic process. The articular disk was biconcave, round or oval, avascular fibrocartilage located between the condyle and glenoid fossa. The disk was significantly thinner centrally in the intermediate zone [6]. Instead, the disk is firmly attached to the medial and lateral poles of the mandibular condyle. This allows simultaneous movements of the disk and the condyle. The muscles of mastication (medial and lateral pterygoids, masseter, and temporalis) in addition to other accessory muscles help opening and closing of the jaw [4,6].

**Biomechanics of TMJ movements**

Jaw movement comprises the high level of coordination and interaction between bilateral mandibular condyles, muscles, disk, and ligaments of the joints [7]. The functional interactions within the TMJ are complex and incompletely understood [8, 9]. A basic view of the complex interactions in open and closed mouth positions was describe, in a normal joint, the thin intermediate zone of the disk always interrupted between the condyle and the temporal bone in both the closed-mouth and open-mouth situations, for prevention articular damage. In the closed position of the mouth, the condyle fixed in the glenoid fossa. The disk was interposed between the glenoid fossa superiorly and the condyle inferiorly. The articular eminence located anterior to the articular disk. The normal disk positioned in front of the condyle and the junction of the posterior band and bilaminar zone located immediately superior to the condylar head near the 12 o'clock position [1, 3,4,9,10-11]. However, some controversy exists over the range of normal position of the disk [1, 3, 4, 11-12]. The junction of the posterior band and bilaminar zone should located within 10 degree of vertical to be within 95 percentile of normal. There was significant relationship variation of the posterior band and bilaminar zone in normal people, resulting in incongruous classification the displacement of the anterior disk [13, 14]. Rammelsberg et al [15] proposed the disk positions of up to +30° from the vertical be considered normal. Many other authors have suggested that the intermediate zone be the point of reference so that in a normal joint it was interposed between the condyle and the temporal bone in all joint positions [16, 17]. Comparing to the different disk positions of 12, 11 and 10 o'clock, and establish the intermediate zone criterion for disk displacement to be more stringent. Recently [17] have proposed parallel conclusions the inferior belly alternately contracts, this produces lateral movement of the jaw.

**Imaging techniques**

CMCT is suitable to assess the bony elements of the TMJ. CT is perfect to evaluation the fractures, erosions, infection, degenerative changes, invasion by tumor, as well as most bony congenital anomalies [18]. A typical imaging protocol is: 120 kV, 100 mA, 1 mm collimation, 1 mm/rotation (pitch), and imaged with a closed mouth[18]. CT is principally done when the suspicion of bony involvement from the MRI and if primary bony pathologies were suspected clinically. Cognate advantages of CBCT over MRI include, fascinating bone details and 3D evaluation of congenital, traumatic, pathological and postsurgical conditions.

## Materials and Method

A hundred patient were identified by gender, age, were used in this study. To undertake the measurements 10 linear distances were selected in the maxilla and mandible. The selected lines were orientated vertically, horizontally, and obliquely to account for linear measurements made in all three dimensions [8]. The gold standard was obtained for each of the 10 lines by physical measurements using a digital caliper with an accuracy of 0.01 mm (Gamma, Amsterdam, and the Netherlands). The physical measurements were repeated twice by three independent observers. The normal disc position of the 100 subjects was confirmed by history, clinical examination and cone-beam computed tomography (CBCT) [9]. Then, the images of the TMJ of the subjects were taken using CBCT to evaluate the optimal Shape of the condylar and fossa.

## Statistical Analysis

The gold standard accuracy of the selected distances was established by averaging the physical measurements

of the three observers (double blind examination). The mean of each measurement for each image type was compared with the mean of the gold standard using analysis of variance of repeated measurements. The significance level was set to $P \leq 0.05$. Corresponding image types were measured for all scan positions to minimized interaction with the statistical results. ANOVA test were used for each measurement to evaluate the average differences between the right and left side for each element of the sample [6].

## Results

The measurements were processed and analyzed using SPSS 20.0. For all values of the variables, the mean and standard deviation were reckon, based on patient's gender, ratios of male to female, shape of condyles (Table 1, 2, 3,4 and 5). The distribution of quantitative variables (condylar shape, condylar fossa) was measured for normality using the Shapiro-Wilk test before analysis. The ANOVA test was used where appropriate to examine the difference in mean between gender (male and female). P-values was determine the difference between the right and left sides of the mandible.

**Statistical data for the result:**

The results in table (1) show the percentage of males to female.

**Table (1) ratios of male to female**

| Male | Female |
|---|---|
| 68% | 32% |

However, revealed a significant difference between genders when shape of condyles and gleniod fossa were compared.

The ratios of the shape of condyles in left side of the males was showed high percentage of rounded shape of condyles in left side compared to other shapes as a 16% flat, 8% oval and 4% irregular shape. Nevertheless in the females the shape of the left condyle was estimate 12% oval shape, 10% rounded, 8% flat and 2% irregular shape.

The shape ratios of the condyles in right side of males was: irregular 0%, flat 20%, oval 4% and high [percentage of rounded 44% and in left side of the females: irregular 0%, flat 14%, oval 8% and rounded 10%, respectively as show in table (2).

**Table (2) show shape of condyles**

| | Male | | | | Female | | | |
|---|---|---|---|---|---|---|---|---|
| | **Irregular** | **Flat** | **Oval** | **Rounded** | **irregular** | **Flat** | **Oval** | **rounded** |
| Left | 4% | 16% | 8% | 40% | 2% | 8% | 12% | 10% |
| Right | 0 | 20% | 4% | 44% | 0 | 14% | 8% | 10% |

The ratios of the shape of glenoid fossa condyles in left side was in males irregular 4%, flat 26%, oval 6% and rounded 36% and in left side of the females irregular 0%, flat 8%, oval 6% and rounded 14%, respectively.

The ratios of the shape of condyles in right side was in males: irregular 6%, flat 20%, oval 20% and rounded 28% and in left side of the females: irregular 0%, flat 8%, oval 8% and rounded 10%, respectively as show in table (3).

**Table (3) show shape of gleniod fossa**

| | **Male** | | | | **Female** | | | |
|---|---|---|---|---|---|---|---|---|
| | **Irregular** | **Flat** | **Oval** | **Rounded** | **Irregular** | **Flat** | **Oval** | **rounded** |
| Left | 4% | 26% | 6% | 36% | 0 | 8% | 6% | 14% |
| Right | 6% | 20% | 20% | 28% | 0 | 8% | 8% | 10% |

There was significant difference between males and females when condylar shape and glenoid fossa was compared. In addition, the mean values of condylar shape in males were higher compared to females (Table 4).

**Table (4) statistical analysis of condylar shape.**

| **Variable** | **number** | **Mean** | **SE** | **Maximum** | **Minimum** | **P Value** |
|---|---|---|---|---|---|---|
| Left | 100 | 18.9 | ± 4.2165 | 23.1 | 14.9 | 0.04 |
| Right | 100 | 17.85 | ± 5.2765 | 24.5 | 14.4 | 0.03 |

The glenoid fossa shape of the left and right side of the mandible were showed, and the values were predisposes to statistical analysis include (mean, stander error, maximum, minimum and *P* Value) as show in (Table 5). P-values were used for each measurement to evaluate the average differences between the right and left side for each element of the sample.

The results showed significant difference among males and females in left side glenoid fossa but showed non-significant differance among males and females in right side glenoid fossa diminsion.

**Table (5) statistical analysis of glenoid fossa shape.**

| Right | 100 | 22.1 | ± 4.9870 | 27 | 16.9 | 0.06 |

**Figure (1): CBCT picture of a normal TMJ**

## Discussion

Academy of Dento-Maxillo-Facial Radiology has developed the basic principles of CBCT uses of in dentistry [13]. CBCT examinations must not be carried out unless a necessary use have been performed and must be justified for each patient to reveal that the benefits outrun the risks. CBCT offer a choice of volume, sizes, and examinations must use the smallest and compatible with the clinical situation, if this offers a lower radiation dose to the patient [12] and the resolution compatible with an adequate diagnosis and the lowest achievable dose should be used.

The results showed highest percentage in patient that severing from clicking symptom in rounded shape condylar process and glenoid fossa in both left and right side and in both gender (males and females), comparing with other shapes of the two variables agree with [19]. These population that sever from clicking symptom with irregular shape showed lower ratio when comparing with other shape, but also showed uneven percentage between both flat and oval shape of condyle and glenoid fossa.

When comparing of two structure of TMJ showed, in males showed rounded shape left condyle represented about 40% and 36% rounded shape left glenoid fossa, this disproportion in the percentage of the shape of two structure cause difficulty in joint movement during opening and closing of the mouth agree with[20] round shape condyle represented higher percentage . While in irregular shape left condyle and glenoid fossa represented about 4% of patients that severing from clicking, this low percentage of patient that showed clicking during joint movement due to disharmony in the shape of two anatomical structure. Nevertheless oval shape of left condyle represented about 8% while the glenoid fossa represented about 6%. While the flat shape left condyle constitutes 16% while the left glenoid fossa that has flat shape constituted 26%. When examined the right side of all males showed the highest percentage represented by round shape of both anatomical structure. Round right condyle represented about 44%, while its glenoid fossa represented by 28% all patient. Nevertheless the second percentage of the patients that have flat shape condyle and glenoid fossa, that represented by 20%. While the other shape "oval and irregular showed different percentage "condyle 4%-0% and joint fossa 20%-6%) all these different percentage in different shapes of anatomical structure causes painful symptom like concurrent with joint clicking. In females also showed different shape of

condylar process and glenoid fossa when examined by CBCT and also the high percentage of the patient that have clicking in round shape joint structure agree with [20].

## Conclusion

CBCT is most frequently applied in oral and maxillofacial surgery, CBCT examination must not be carried out unless its medical necessity is proven. Large percentage of population had clicking with round shape condylar and glenoid fossa, and lower percentage had irregular shape TMJ unit Difference in the shape of TMJ units increase the risk of the clicking.

## Abstract

Screening of growth in each child's routine is a occurrence of early developmental delay in children. However, often these activities could not be implemented due to lack of health human resources. Therefore, it needs to involve the active participation of communities, especially cadres health. Generally, this research aims at monitoring the program of growth and development of children after training. This research was conducted in the Public Health of Abiansemal II. Study population was all health cadres. The research was carried out by total sampling on each selected village health centers in the region. The study design is quasi-experimental methods (quasi-experimental research) with a model of one group pretest-posttest design. Instrument data collection using questionnaires and observation sheets. The statistics are using the Wilcoxon analysis (non-parametric). The results of the study noted that there were differences in the median pre-post knowledge (75 to 90, p value ≤ 0.0 5 ), attitude (72.7 to 80, p value ≤ 0.0 5 ), and skills (78 to 91.3, p value ≤ 0.0 5 ). This study concludes that an increase of of knowledge, attitudes and skills of health Cadres after training. Need to do the continuous training for health cadres and fully involving them in stimulating and early detection of growth and development of children .

***Keywords*** *: Early detection, growth, development, performance, cadre*

## Introduction

The era of globalization requires quality human resources, therefore children must be prepared in order to grow and develop optimally. An important period in child development is toddlerhood, because at this time the basic growth that will influence and determine further developments such as cognitive abilities, creativity, psychosocial, emotional, and behaviors that run very fast, in this period the parents' active role is very important[1].

The development of a child is the result of the interaction of various interrelated factors, namely genetic factors, the bio-physico-psycho-social environment, and behavior. Disruption of developmental delay is a serious problem for countries in the world[2]. In 2004 it was estimated that around 23% of children in the world experienced developmental disorders. In the United States, an estimated 12-16% of children experience developmental and behavioral disorders. Communication disorders and cognition disorders are part of developmental disorders that occur in about 8% of children. The number of toddlers in Indonesia is 10% of the population, with the prevalence (on average) of developmental disorders varying from 12.8% to 16% so that it is recommended to observe / growth screen for each child[3].

Delay of development is often too late to be known so that healing takes longer. The Indonesian Ministry of Health launched the Early Growth and Development Stimulation, Detection,Intervention Program (SDIDTK) for children 0-72 months. However, in implementation

**Correspondent Author**
**Ni Wayan Armini**
email: amiarmini81@gmail.com

there are still obstacles so that this program cannot run as expected[4]. Study in Semarang City found that the SDIDTK program is not correctly disseminated, the supporting facilities were still inadequate and there was a lack of support from the Head of the public health[5].

A comprehensive and coordinated of SDIDTK program for toddlers can be carried out in the form of partnerships between families (parents, child caregivers and other family members), communities (cadres, community leaders, professional organizations, non-governmental organizations, etc.), with professionals (health, education, and social)[6]. Cadres have a very important role in society because they are health care workers who are in the midst of the community[7].

Interviews with officers at the public health of Abiansemal II said that the SDIDTK program in *Posyandu* is not well implemented even though visitors reaches 80%. This is due to the limited human resources who have the ability to carry out these activities. One of the efforts that can be done is by involving the active participation of health cadres who have been trained in SDIDTK. Generally the purpose of this study is find out the differences the performance of health cadres in the toddler growth and development monitoring program after training.

## Method

The research is quasi experimental research with one group pretest-post test design that is giving questionnaires before and after being given treatment[8]. The respondents were health cadres involving 50 respondents. Instrument data collection is used questionnaires and observation sheets. To ensure the consistency of the respondents' answers in the knowledge statement, the questions are arranged that are *favorable* and *unfavorable*, so that they are not always positive statements and are often the right answers[9]. Data analysis techniques include descriptive analysis, normality test data and Wilcoxon analysis.

## Results

Characteristics of respondents showed the highest age in respondents was> 35 years (56%), secondary education (54%), employment as a housewife (70%), number of children 2-3 people (80%), highest income > 3 million IDR (38%).

## Discussion

The level of knowledge of respondents varied, meaning that there was a difference in knowledge that was quite far between respondents. This condition occurs because of the varied information obtained by respondents regarding stimulation and early detection of developmental growth in children. Respondents also had not received health education about SDIDTK from both health workers and health institutions.

Based on the facts, even though health counseling has never been held about SDIDTK but there were five respondents who received a knowledge score of 85 at the time of the pretest. Apparently, the respondents knew about SDIDTK from electronic media (through browsing on the internet) and by reading health articles to stimulate and detect child growth and development. The source of information is one of the factors that can affect one's knowledge to broaden their horizons so that they can improve knowledge and ability[10].

The knowledge posttest shows median value of 90 with a standard deviation of 9.6 . The training carried out by the lecture method, audio visual media, modules can arouse the attention of health cadres to listen. Thus the information submitted can be received well and clearly by the respondents. Some respondents get a low value of knowledge due to low individual motivation factors both internal motivation and external motivation. This was revealed when the respondents stated that the activities to examine infants and toddlers were solely the duties of midwives. Mubarak (2007) states that motivation is a process of linkages between business and satisfaction of certain needs. Motivation is a process for achieving a goal[11].

The respondents were 56% are over 35 years of age which are middle adulthood periods. According to Werner in Hurlock (2002), achievement in middle adulthood is a positive picture of individuals. Individuals over 40 years of age generally have sufficient experience in education and association so that they have sufficient knowledge, definite attitudes and values about social development that are well developed[12].

Based on education, 54% of respondents attended high school. The respondent's education level can influence the respondent's knowledge after training so that there are differences in the results of the *pretest* and *posttest*. This result is reinforced by the theory by Irmayanti (2007) that educational factors influence one's knowledge so that the higher a person's education is the easier they are to receive information and the more knowledge they have[13].

The level of education of a person can influence the learning process in accepting new knowledge. The higher education, the easier the person receives information so that the more knowledge he has. Knowledge is very closely related to education where it is expected that someone with higher education will have more extensive knowledge[14].

The results of the pretest attitude, respondents obtained a median value of 72.7 with a standard deviation of 7.17. This indicates that respondents still consider stimulation and early detection activities not yet important and are carried out only when there is a disruption of child growth and development. This is because their knowledge is still lacking, so that readiness

and motivation to do stimulation and early detection of growth and development is also less. The posttest shows median value of 80 with a standard deviation of 7.3 . Value of respondent's attitude range after training 60-98. This attitude improvement was caused by cadres who had gained knowledge about SDIDTK toddler in training . Attitude is not always fixed, because attitudes can develop when they get positive and impressive influences from both inside and outside. The statement is in accordance with Wawan's theory (2010 that aspects of knowledge will determine a person's actions (practices), the more positive aspects of an object are known, the more positive attitudes toward the object will be generated. This means that the better the level of one's knowledge, the better the attitude or practice[15].

Personal experience factors is one of the main parts that influence attitudes so someone will experience that has been passed. Other people also influence a person's attitude who are considered important. As in Allport's theory that a person is determined by various various factors outside of a person play a role as determinants and even modifiers of behavior[16]. Extrinsic motivation has a role when individuals do something[17].

Based on some research results it can be concluded that knowledge influences the attitude of each person, if the person's knowledge is good then that person will have a positive attitude. Knowledge is an important component to form positive attitudes and behaviors[18]. Attitudes are very closely related to the level of knowledge[19]. The results obtained with the theory which how well one's knowledge of objects will determine their attitude towards the object. The higher a person's knowledge of an object is expected to produce the right attitude (positive) on the object[20].

The results of the pretest-posttest skills obtained a median value of 78 vs 91.3. This illustrates that respondents are able to learn and practice the skills given so as to achieve the expected goals. During the training use module, audio visual and also demonstrated. In accordance with Hamalik's research (2005), which states that the use of learning media at the learning orientation stage will greatly help the effectiveness of the learning process and the delivery of messages[21]. Knowledge from the results of not knowing to know, this happens after someone does sensing a particular object and the stimulus. Most human sensing is obtained through the eyes and ears, but the more the five senses are used in learning an object, the better and more knowledgeable in learning an object[18].

The research by Rahmat (2012) in Menden Village, Central Java shows that counseling can influence and increase one's knowledge to understand something, also influence attitudes and actions in an activity[22]. The change in skills from before and after training is also influenced by characteristic factors, such as age and parity. Most of the respondents are middle adulthood and have 2-3 children. This period is a period of establishment for individuals so that they will be able to play an active role in society and social life. They will spend more time sharing their experiences. Intellectual ability, problem solving and verbal abilities have almost no decrease in individuals in the middle adult period[12]. Majority of cadre jobs were housewives so they have free time to learn new skills. The average family income is IDR 2,800,000 so income of the respondent's family is above the UMR Regency of Badung[23].

The cadres mostly have children 2-3 people so that they have sufficient experience to care for children and have skill of SDIDTK well. SDIDTK can be carried out properly if the examiner can cooperate with his children and caregivers. They like to train themselves with new skills and enjoy sharing with the community. Nirwana, Utami IH, and Utami HN (2015) research in Malang shows cadres had dedicated themselves as health promoters in their villages and were very motivated to help other women to maintain their health, such as cervical cance desease[24]. It seems with study by Peter NA et al (2015) who examined *training* to health cadres in conducting the first pertologan on accidents in Africa. Cadres become competent and able to do help after training[25]. Similar research by Gutnik L (2016) in Malawi that training can increase competence of health cadres to conducting breast cancer screening to the community[26].

## Conclusion

There was an increase in knowledge, attitudes and skills of health cadres before and after training on SDIDTK . Knowledge with a median of 75 to 90 ( $p\ value \leq 0.05$ ) . The attitude with a median of 72.7 to 80 ( $p\ value \leq 0.05$ ) and Skills with a median of 78 to 91.3

( *p value* ≤ *0.05* ) .

Health workers, especially midwives may conduct ongoing training so that cadres always get refreshments and skills about SDIDTK. The policy holder of the Puskesmas is to increase the participation of health cadres to stimulate and detect child growth and development . hould have further research on training methods suitable for health cadres.

# The Effect of Re-unification Education on Empathy and Multicultural Competence of Nursing-College Students

**Myoungsuk Kim[1], Gie-Ok Noh[2], MJ Park[2]**

*[1]Assistant Professor, Department of Nursing, College of Nursing, Kangwon National University, 1 Gangwondaehakgil, Chuncheon-si, Gangwon-do, South Korea, [2] Assistant Professor, Department of Nursing, College of Nursing, Konyang University, 158 Kwanjeodongro, Seo-gu, Daejeon, South Korea*

## Abstract

**Background**: South Korean society is increasingly multicultural. As the percentage of North Korean defectors, married immigrants, and foreign workers increases, nurses will encounter more patients (and their family members) from diverse cultural backgrounds, which can pose a substantial burden. There is also a need for multicultural education among young people generally in South Korea. The purpose of this study was to identify the effects of an educational program about re-unification on nursing student's empathy and multicultural competence.

**Method**: A six-session re-unification educational program was developed based on a cultural-competency model. It was implemented outside the regular nursing curriculum among first-year and second-year nursing students from September to October 2019. Data were collected from 65 students: 32 in the experimental group and 33 in the control group.

**Finding**: Multicultural "capacity" increased in the experimental group relative to the control group ($t=2.60$, $p<0.001$). The results indicate that re-unification education can build and strengthen the multicultural competence of nursing-college students.

**Conclusion**: This result can be an important part of preparation for re-unification, because these students will be the main providers of nursing care for the multicultural population at that time.

***Keywords**: Re-unification educational program, nursing-college students, multicultural competence, empathy*

## Introduction

South Korean society is becoming more multicultural. Already, North Korean defectors, married immigrants, and foreign workers make up more than 4% of the population[1]. As that percentage increase, nurses will encounter more patients (and their family members) from diverse cultural backgrounds, which can be a substantial burden on those nurses[2]. Existing evidence indicates a need for multicultural education among young people in South Korea. Many South Korean college students were found to have a negative attitude toward the provision of preferential benefits to North Korean defectors[3]. In addition, South Korean nursing students were found to have a very low "supportive attitude" toward North Korean defectors[4], nursing students' multicultural awareness of North Korean defectors was different from their awareness of other cultures[5]. This indicates that nursing students would benefit from a more positive awareness of North Korean defectors. There is room for education-based improvement with regard to these students' empathy and multicultural competence. Multicultural competence comprises perception, knowledge, and skills. Cultural awareness in particular is a key element of multicultural competence, and a previous study[6] indicated that competence including cultural awareness is related to the ability to be empathic. This is consistent with a need to increase both multicultural competence and the ability to be empathic among college students. To be empathic here comprises

taking an inclusive attitude to effectively synchronize feelings, in the interests of altruistic behavior[7]. It also includes taking an affirmative role to acquire the knowledge needed to integrate well with people of other cultures and to avoid or to end prejudice[8]. Looking forward toward potential re-unification of north and south, we see a need for education that begins with an understanding of North Korean people and society, as well as an understanding of North Korean defectors from a multicultural perspective[9]. With consensus on re-unification recognized as the most important factor in re-unification education[10], positive perceptions of North Korean defectors can be promoted, together with understanding of North Korea, which may contribute to the success of eventual re-unification. Bringing latent attitudes and feelings to light can increase empathy and multicultural competence. However, it is still difficult to find a program combining re-unification education with strategies for enhancing multicultural competence. We evaluated a re-unification educational program for nursing-college students. The program was developed based on a model of cultural competence, and its effects on the students' empathy and multicultural competence were measured.

## Study Objectives

The goal of this study was to examine the effect of a re-unification educational program on empathy and multicultural competence of nursing-college students. There were two hypotheses. **Hypothesis 1:** Multicultural competence will increase in the experimental group, i.e. the group receiving the re-unification education, relative to the control group. **Hypothesis 2:** Empathy will increase in the experimental group relative to the control group.

## Methods

### Study design

This was an experimental study. The two outcome variables (empathy and multicultural competence) were measured both before and after the intervention (the re-unification educational program) in both groups.

### Participants

The participants were first-year and second-year students at a nursing college in D city. To minimize any influence of students' motivation to participate in the program, the control group comprised students who were interested in the program but could not participate because of other academic commitments. After the end of the study, the control group was provided with the contents of the program in lectures abbreviated to two hours. The sample size was computed using G*power 3.1.9[11]. In a previous study of the effect of an educational program on multicultural competence[12], the effect size was 0.97. For the independent-sample t-test with an alpha level of 0.05, an effect size of 0.50, and a power of 0.85, the minimum number of students required for each group was 30. At the start of the study, 35 students were in the experimental group and 37 were in the control group, but 3 in the experimental group participated in only part of the program and 4 students in the control group withdrew their consent. Thus, for the final analyses n=32 for the experimental group and n=33 for the control group.

### Measurements

Empathy and multicultural competence were measured using structured self-report questionnaires. The questionnaire used before the program had 3 items asking about general characteristics, 28 items to measure empathy, and 28 items to measure cultural exchange capacity. The follow-up questionnaire included the same 56 items measuring empathy and multicultural competence

### Multicultural Competence

Multicultural competence was measured using the Korean-language version of the Cross-Cultural Competence Inventory (CCCI)[13, 14]. It is a 28-item measure of commitment, self-efficacy, and cultural empathy, using a 5-point Likert-type scale. Six of the question-items are negatively worded, so they must be reverse-scored. Higher total scores indicate greater capacity for cultural exchange (maximum score: 5). Coefficient α (internal-consistency reliability) was 0.84 in the baseline survey.

### Empathy

Empathy was measured using the Interpersonal Reactivity Index (IRI)[15]. It has 7 question-items measuring perspective taking, fantasy, empathic

concern, and personal distress, using a 5-point Likert-type scale. Nine of the question-items are negatively worded, so they must be reverse-scored. Higher total scores indicate greater empathy. Coefficient α was 0.74 in the baseline survey.

**Intervention: The re-unification educational program**

The intervention was a re-unification educational program that was implemented as an extracurricular activity. The program was based on a model of cultural competence[16]. Cultural competence is a synthesis of acquired knowledge and skills in cultural awareness, cultural knowledge, and cultural sensitivity. During the first session of the program, after the participants completed the questionnaires on cultural exchange and empathy, the content focused on understanding the backgrounds of other cultures, with emphasis on the basic idea of a single Korean people. The next part of the program comprised sessions two through four, and it focused on health, inequality, and education for North Koreans and defectors. During the fifth session, cultural sensitivity was promoted by helping the students learn how the Korean language is used differently by people in the north and in the south, and the students practiced communication in role play. The sixth and final session focused on planning and preparation for re-unification based on empathy and multicultural competence. There was one 60-minute session per week.

**Data Collection**

Data were collected from September through October 2019. The recruitment announcement was posted for two weeks on a bulletin board designated by the school. To students who indicated their interest in participating, the researcher explained the purpose of the study, the guarantee of anonymity, and the rights of participants. Students who could participate in all six sessions of the program were assigned to the experimental group, and those who had commitments that would prevent them from participating in all six sessions were assigned to the control group. After informed consent was obtained in writing, students in both groups completed the baseline questionnaire. The baseline questionnaire included the scale for measuring empathy and the scale for measuring the capacity for cultural exchange. On the questionnaire the students used a nickname rather than their actual name, and the questionnaires were collected using an opaque box. After the six weekly sessions, all students completed a follow-up questionnaire that included the same two scales again. The nickname used before was used again, and again the questionnaires were collected using an opaque box. After the follow-up data were collected, students in the control group received the contents of the program in two hours of lectures.

## Statistical Analysis

The data were analyzed using IBM SPSS 22.0 software. Baseline homogeneity of empathy and multicultural competence between the groups was tested using the independent-samples t-test. The *a priori* hypotheses regarding the effects of the program on empathy and on multicultural competence were tested using the before-after change in scores (independent-samples t-test).

## Findings

**Homogeneity of demographic characteristics between groups**

The two groups did not differ significantly with regard to age, gender, or year in school (Table 1).

**Table 1: Tests of baseline homogeneity of demographic characteristics between groups (n=65)**

| Characteristic | Division | Experimental group (n=32) | Control group (n=33) | t or χ2 | P |
|---|---|---|---|---|---|
| | | n(%) or M±SD | n(%) or M±SD | | |
| Age | | 20.47±0.84 | 19.94±1.35 | 1.90 | 0.063 |
| Gender | Men<br>Women | 4 (12.5%)<br>28 (87.5%) | 7 (21.2%)<br>26 (78.8%) | 0.88 | 0.349 |
| Year in school | First year<br>Second year | 11 (34.4%)<br>21 (65.6%) | 17 (51.5%)<br>16 (48.5%) | 1.95 | 0.163 |

Inter-group homogeneity of empathy and of multicultural competence at baseline. At baseline, the two groups did not differ significantly with regard to empathy or multicultural competence (Table 2).

**Table 2: Test of baseline homogeneity of dependent variables between groups (n=65)**

| Variable | Experimental group (n=32) | Control group (n=33) | t | p |
|---|---|---|---|---|
| | M±SD | M±SD | | |
| Multicultural competence | 3.50±0.35 | 3.49±0.34 | 0.03 | 0.980 |
| Empathy | 3.46±0.32 | 3.33±0.27 | 1.78 | 0.079 |

**Effect of the re-unification educational program on empathy and on multicultural competence** Table 3 shows the results of tests of hypothesis regarding the effects of the re-unification educational program on multicultural competence and on the ability to be empathic. **Hypothesis 1:** Multicultural competence increased by 0.20±0.24 points in the experimental group, but it decreased by 0.03±0.26 points in the control group ($t=2.60$, $p<0.001$). Therefore, hypothesis 1 was supported. **Hypothesis 2:** Empathy increased by 0.05±0.20 points in the experimental group, and it increased by 0.13±0.22 points in the control group ($t=-1.43$, $p=0.157$). Therefore, the second hypothesis was not supported.

**Table 3: Empathy and multicultural competence before and after re-unification education (n=65)**

| variable | group | Baseline | After the intervention | Pre-post difference | t | p |
|---|---|---|---|---|---|---|
| | | M±SD | M±SD | M±SD | | |
| Multicultural competence | Experimental group (n=32)<br>Control group (n=33) | 3.50±0.35<br>3.49±0.34 | 3.70±0.34<br>3.47±0.38 | 0.20±0.24<br>-0.03±0.26 | 2.60 | < 0.001 |
| Empathy | Experimental group (n=32)<br>Control group (n=33) | 3.46±0.32<br>3.33±0.27 | 3.51±0.33<br>3.46±0.26 | 0.05±0.20<br>0.13±0.22 | -1.43 | 0.157 |

## Discussion

Empathy and cultural competence are essential for high-quality nursing[13]. Re-unification education for multicultural competence may improve students' understanding of North Korean defectors. We investigated the effects of such education on nursing-college students' empathy and multicultural competence. At baseline, the average score on the scale measuring multicultural competence was 3.50. A very similar result, 3.48, was found in a study of 663 college students[5]. A very similar score, 3.55, was found in fourth-year college students[5], and in that study multicultural competence was higher in female college students than in their male counterparts. On the empathy scale, the average score was 3.39, which was slightly lower than the average score of 3.47 found previously[17] in a study of 201 nursing students. Research on larger numbers of students is needed to determine whether that difference is reproducible and, if so, whether it is due to, for example, the students' year in school. The results of this study support the hypothesis that the re-

unification educational program increased multicultural competence. This is consistent with the increase in multicultural competence in a study of another program for nursing-college students[13]. In at least one previous study[13], the program tested was included in the curriculum and lasted for 14 weeks. While in this study the six sessions were implemented as an extracurricular program, still the same effect was found. Therefore, the goal of promoting multicultural competence can be achieved at least to some extent through a short-term program that students are not required to attend. The re-unification educational program apparently had no effect on the students' empathy. Others[18] have found that multicultural nursing education based on team learning did have a positive effect on empathy. Their program differed from the one in this study in that it included direct contact with people of other cultures. Thus, future programs probably should include experiences such as exchange activities with North Korean defector nursing students[19,20] or special lectures given by North Korean defectors themselves. The program tested in this study was developed on the basis of a conceptual model of cultural competence, and it combined multicultural education with content aimed at increasing students' understanding of re-unification [21]. Another important point is that students who were not motivated to participate were not included in either group. While that minimized any influence of students' motivation to participate (because all students in both groups were motivated to participate), it also means that no conclusions can be drawn regarding students who were not motivated to participate. Therefore, future work should include large randomized controlled studies to test the potential effects of students' motivation to increase their empathy and their multicultural competence.

## Conclusion & Recommendations

This re-unification educational program can increase the multicultural competence of nursing students. Future research should include randomized controlled trials of larger numbers of students. Also, to increase empathy, the program should include direct multicultural experiences.

**Ethical Clearance:** Not required

**Source of Funding:** This study was done with support from the designation and development project for leading universities in unification education at Kangwon National University, in 2019.

**Conflicts of Interest:** None

# Assessment of Health Status of Children with Cancer who Undergo Chemical Therapy

**Kareem Ghadhban Sajem**

*Middle Technical University / Medical Technical Institute /Al-Mansour*

## Abstract

Purpose sample of 65 parents to assess their children with cancer who undergo chemotherapy in Child Central Hospital / Al-Asscan / in Baghdad City to determine the psychological, physical, social and nutritional aspects from 25 /10/ 2016 to 24 /4 /2017. Information was collected through direct interview with parents and analyzed by application of descriptive statistical and Chi square.

Results of the study indicated that high percentages concerning to psychological aspect **(**Measures to treat anxiety); psychological aspect **(**prepare child to provide chemotherapy); social aspect **(** Provide Social support) and Nutritional aspect (Daily diet as recommended).There was no significant differences between health status according to their aspects.

Based on such results many studies may be recommended for standing on health status of children. Health education and awareness programs can be design on chemotherapy and needs of children's cancer to increase awareness of parents.

***Key words:*** *Health Status, Children with Cancer, Chemotherapy.*

## Introduction

*Cancer* defines as abnormal growth of cells that not control. The cells can spread by blood and lymph. There are many kinds of cancers [1]. Some of them have not stopping and spread into surround tissues .Cancer in children the same parts of body such as other populations. It can occur sudden, no early signs and symptoms, need to high rate of cure and dealing with carefully. Most common cancer in children is leukemia. Treatment of cancer that affect included surgery, radiation and chemotherapy therapy [2, 3].

Childhood cancer is mostly common and distributed under eighteen. Cancers are rare in children. Overall, incidence rates of them has different across the world [4]. Almost, children with cancer can survive and healthy lives. So, the children in low-income countries do not complete nursing care or treatment plans [5]. A report of IARC (2016) state that there are many of cancers in the world are diagnosed as a children cancer who under of nineteen of age annually [ 6].

Chemotherapy is effective drugs that used in treatment of cancer. The types of treatment of cancers in children depends on level of cancer stage, type and its spread of disease [7,8] patients with cancer and their parents have many of health problems when chemotherapy is receiving, it may be coordinated the treatment program through medical team.[9]. The responsibility of health team is to management of signs and symptoms, providing support when starting of diagnosis. Parents in hospital may receive counseling, education about management of side effect, providing treatment plans and support for psycho-social needs [10].

A program has improved medical care plans to children cancers. Such care can help children and their parents to identify clinical health, screening, investigations, problem's health and how to treat side effects [11] .World Health Organization acts as measures prevention of childhood cancer that promote national care plans and programs that can prevention, diagnosis and treatment measures [12] .

## Material and Method

A descriptive study which used an assessment approach was implemented o;n children in Al-Asscan Central Child/ in Baghdad City to assess of psychological, physical, social, and nutritional aspects of children with cancer who undergo chemotherapy and find out of relationships between demographic data with aspects of their health status from 25 /10/ 2016 to 24 /4 /2017.

Purposive selection of (65) parents and their children. Data was receiving through direct interview from the parents by using of a questionnaire tool that consist of six parts. Demographic data of the sample, aspects of psychological, Physical, social and nutritional. Validity of the questionnaire was determined through the 3 experts. Data was collected by personal interview and analyzed by application of frequencies, percentages and Chi square.

## Findings

**Table 1: Distribution of parents and their children according to demographic characteristics**

| **Variables** | **Frequency (F)**<br>**65** | **Percentage (%)**<br>**100** |
|---|---|---|
| Gender<br>parents / Mothers (most)<br>children / Giles (most) | <br>53<br>39 | <br>81.5<br>60 |
| Age<br>Parents / 30-40 years (most)<br>Children / More than 3 years (most) | <br>33<br>32 | <br>50.8<br>39,3 |
| Education Status<br>parents /Intermediate School ( most) | <br>25 | <br>38.5 |
| Employment Status<br>Un Employment (both parents) | <br>47 | <br>72.3 |
| Duration in Hospital<br>Less than 3 months (most) | <br>43 | <br>66,1 |
| Type of disease<br>Leukemia | <br>35 | <br>53,8 |

The finding indicated that majority of mothers (81.8 %), in years of 30-40 (50.8%) at Intermediate School 38.5%. High percentage of them was un Employment (72.3%). So, more than half of children was Giles (60%), more than 3 years (49.3%), almost of them 66.1% while hospitalized of 3 months (49.3%) with type of disease is Leukemia at (53.8%).

**Table 2: Assessment of psychological aspect of the sample**

P value at 0.05 Chi square 0.991

This table indicated that high percentages of social aspect was (provide Social support 73.8%).so high percentage of Nutritional aspect was (Daily diet as recommended 60%)

## Discussion

Results in Table 1 agreed with statement of child care plans that including treatment, and observe of child to return a normal life. As well as; signs and symptoms of an infection and measurers to prevent infections disease)[13]. Also, parents of children must be providing information and suggestions to help when children with cancer know what to expect [14]. Results supported too through the leukemia in childhood account for twenty-nine percent of all cancers who under 14 of old in 2018[15,16].

Results in Table 2 supported with that the stress and anxiety was depending on their situation of children.

Anxiety may be highest level when a child and their parents was waiting for results of diagnosis or waiting treatment to start)[17]. Feelings of these aspects are mostly common in such people to these life change experience [18].

Results in Table 3 supported by results that explain of prepare and monitoring health of children allows health professionals to assess the impact health intervention and prevention programs and identify needs of children [19]. Parents of children need to parental tasks because they plays vital role when providing medical care and prepare child to chemotherapy. These procedures due to major source of anxiety and stress for both children and parents [20].

Results out of Table 4 agreed with the statement of Parents and both nurses and health professionals in hospitals should pay special attention in case of social support in order to offer access to different kinds of support to children with cancer [21]. Such children who receiving high psycho-social support tends to feel less anxiety[22].

Results in Table 5 indicated that high percentages of Nutritional aspect of the sample (Daily diet as recommended according to order 60%). This result agreed with statement of many kids undergoing cancer treatment tends to eat less and lose body of weight because their appetites are affected [23]. Such issues supported with the term of healthcare that may be ask questions about health diet, weight history, counseling and diet changes are made to improve the condition of patient's nutrition [24].

## Conclusion

The study concluded that there is disparities in assessment of health status of children who are infected with cancer and who are undergo to chemotherapy, but in general it is good for the living conditions of the challenges and pressure. Which confirmed its recommendations that health programs can be design on chemotherapy of cancer, side effects and children needs related to bio-psycho-social aspects and nutritional need to promote their health services.

# Effects of Onion Extract on Hepar Histopatology in Alloxan-Induced Diabetic Rattus Novergicus

**Ni Komang Aprilina Widi Suputri[1], Ajik Azmijah[2], Retno Bijanti[3], Made Mahaguna Putra[4]**

*[1]Post-Graduated Student, [2]Lecturer Department of Pathology, [3]Lecturer Department of Basic Veterinary, Faculty of Veterinary Medicine, Airlangga University, [4] Lecturer Department of Nursing, School of Health Sciences Buleleng*

## Abstract

This study was aimed to know the effect of giving shallot extract (*Allium ascalonicum L*) to histopathological feature of rat (*Rattus norvegicus*) liver induced by alloxan. Alloxan was intraperitoneally injected 120 mg/kg BW (single dose). A total of twenty male Wistar rats of three months old were used in the study. The rats were divided into five groups. 1) negative control group (K-) treated by CMC Na 0.5 %, 2) positive control group (K+) treated by metformin 45 mg/kg BW as a standard drug, 3) extract of *Allium ascalonicum* 250 mg/kg BW (P1), 4) extract of *Allium ascalonicum* 500 mg/kg BW (P2), 5) extract of *Allium ascalonicum* 750 mg/kg BW (P3). Rats were treated for 14 days. The data of this study were analyzed by Kruskal Wallis Test, then it continued by Mann-Whitney Test. The result of this study is *Allium ascalonicum* can improve the histopathological feature of rats liver induced by alloxan.

***Keyword:*** *Allium ascalonicum, alloxan, liver, Rattus norvegicus.*

## Introduction

Diabetes mellitus (DM) is a degenerative disease that continues to grow in Indonesia. The increasing prevalence of this disease is caused by people's lifestyles and eating patterns. Diabetes mellitus (DM) occurs due to decreased function of the pancreas to produce insulin or insulin receptors do not occur due to complications, whereas diabetes does not turn into glycogen and cannot enter cells[(1)]. Clinical manifestations include disorders of lipid metabolism, carbohydrates, and proteins which will then stimulate the condition of hyperglycemia. Then the condition of hyperglycemia will develop into diabetes mellitus[(2)].

In the treatment of diabetes, oral antidiabetic drugs may be useful for sufferers who are allergic to insulin or who do not use insulin injections. While its use must be understood, so there is conformity with the indications without causing hypoglycemia conditions. Therefore, experts develop a traditional treatment system for diabetes mellitus that is relatively safe by using ingredients from herbal plants[(3)].

One of the plants that can be used as an alternative is onion (Allium ascalonicum L). Onion are very beneficial for health because they are rich in antioxidants to inhibit free radicals[(4)]. The dominant flavonoid content in the onion tubers, especially quercetin, is thought to have a hypoglycemic effect and is beneficial for people with diabetes mellitus[(5)].

This study uses alloxan to induce the condition of diabetes mellitus. Giving alloxan can increase blood glucose levels, causing disruption of insulin production due to damage to pancreatic β cells. Disruption of glucose entry into cells results in high blood glucose levels[(6)]. This hyperglycemia condition can cause oxidative stress from several organs, including the liver, heart, brain, and skeletal muscles[(7)]. Oxidative stress can cause lipid metabolic reactions, proteins including enzymes, which can cause oxidative damage if it continues it can cause liver cell damage and death. This study aims to determine

the effect of the onion extract (Allium ascalonicum L) on the histopathological picture of the liver of white rats (Rattus norvegicus) induced by alloxan.

## Material and Method

This research was conducted in February - March 2015 at four locations, namely the Experimental Animal Laboratory, Department of Basic Medicine, Faculty of Veterinary Medicine, making histopathological preparations of white rat liver (Rattus norvegicus) in the Diagnostic Center Building Dr.Soetomo General Hospital Surabaya, as well as observation and scoring of preparations histopathology in the Department of Veterinary Pathology, Faculty of Veterinary Medicine, Airlangga University.

This study used 20 white male Wistar rats divided into 5 treatment groups, each group containing 4 white rats. The treatments consisted of K-, K +, P1, P2, P3. On the first day, all white rats measured their blood glucose levels and then induced an alloxan dose of 18 mg / 150 grams BW intraperitoneally. Giving alloxan is done once on the first day of treatment. After four days of the alloxan induction process (to get a constant rise in blood glucose levels) then the blood glucose level was measured again. After an increase in blood glucose levels, in the K-group given 0.5% CMC Na, the K + group was given a dose of 45 mg/kg BW of metformin, while groups of P1, P2, P3 were given onion extract at a dose of 250 mg/kg BW, 500 mg/kg body weight, 750 mg/kg bodyweight for 14 days.

After the next stage of treatment is carried out euthanasia using chloroform, then performed surgery on white mice for liver organs. The liver is then fixed to a place containing a 10% BNF solution. Histopathological preparation using Haematoxylin Eosin (HE) staining. Examination of liver histopathology preparations using a 400 times magnification microscope on five different fields of view for each slide. Assessment criteria using the scoring method[8].

**Table 1 Scoring assessment of the degree of liver cell histopathology [8]**

| | Degeneration | Necrosis |
|---|---|---|
| None | 0 | 0 |
| Minimal (0-25%) | 1 | 1 |
| Mild (25-50%) | 2 | 2 |
| Moderate (50-75%) | 3 | 3 |
| Severe (75-100%) | 4 | 4 |

## Result

This study used 20 white rats which were divided into five treatment groups with four replications. Before being divided into treatment groups, all-white rats were induced by alloxan at a dose of 18 mg / 150 grams BW intraperitoneally. The results of the examination of blood glucose levels of alloxan-induced white mice 18 mg / 150 grams BB intraperitoneally showed an increase in blood glucose levels that exceeded the normal range. Examination of blood glucose levels of rats using the EasyTouch brand glucometer.

After the condition of hyperglycemia, the K-group was treated with 0.5% CMC Na 0.5 ml by giving once a day for 14 days orally. For the K + group treated with metformin at a dose of 45 mg/kg body weight by giving once a day for 14 days orally, while in the groups P1, P2 and P3 treated with shallots extract at a dose of 250 mg/kg body weight (P1), 500 mg/kg BW (P2), and 750 mg/kg BW (P3) by giving once a day for 14 days orally. Then data were analyzed with the SPSS using the Kruskal-Wallis test and if there were significant differences between treatment groups ($p < 0.05$), then continued with the Mann-Whitney test.

### 1. Liver cell degeneration

Microscopic observations of white rat liver cell degeneration showed no significant difference between treatment groups ($p > 0.05$). The statistical analysis of observations of liver cell degeneration can be seen in table 1.

**Table 2 Median values of liver cell degeneration**

| Treatment | Median |
|---|---|
| K- | 2.8000[a] |
| K+ | 2.0000[a] |
| P1 | 2.4000[a] |
| P2 | 2.3000[a] |
| P3 | 2.1000[a] |

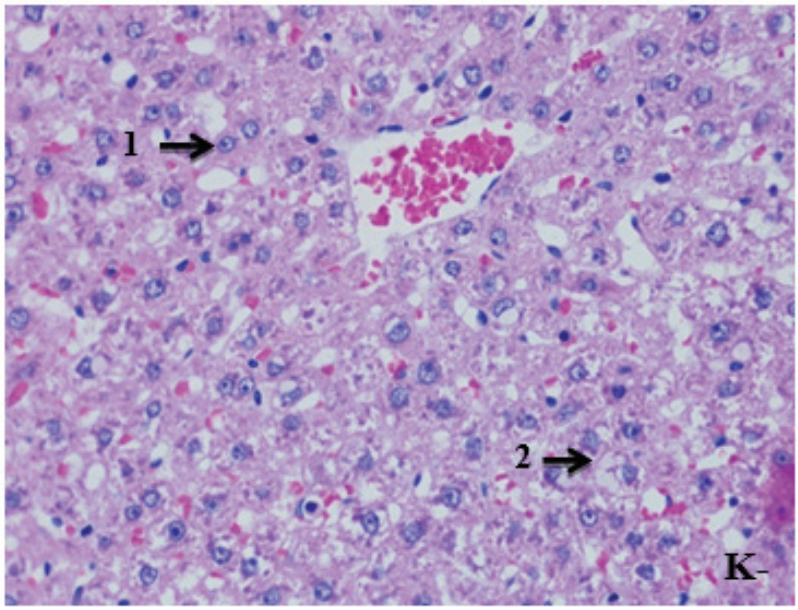

**Figure 1 Histopathology of liver cell degeneration in rat K-treated. (1) Normal liver cells. (2) The degenerated liver cells are seen to have swollen so that the cavity looks wider (HE staining; 400x magnification).**

In the K-group treated with alloxan and CMC Na 0.5%, the most severe degeneration occurred (2.8000), when compared to the K + group who were treated with alloxan and metformin 45 mg/kg BW degeneration occurred with a value (2.0000). Groups P1, P2 and P3 treated with alloxan and onion extract 250 mg / kg BW, 500 mg / kg BW and 750 mg / kg BW showed degeneration statistics with median values (2.4000), (2.3000) and (2.1000). The results show different figures for each treatment, but the Kruskal-Wallis statistical test did not show any significant difference ($p > 0.05$). Histopathological picture of liver cells in degenerated mice can be seen in the following figure.

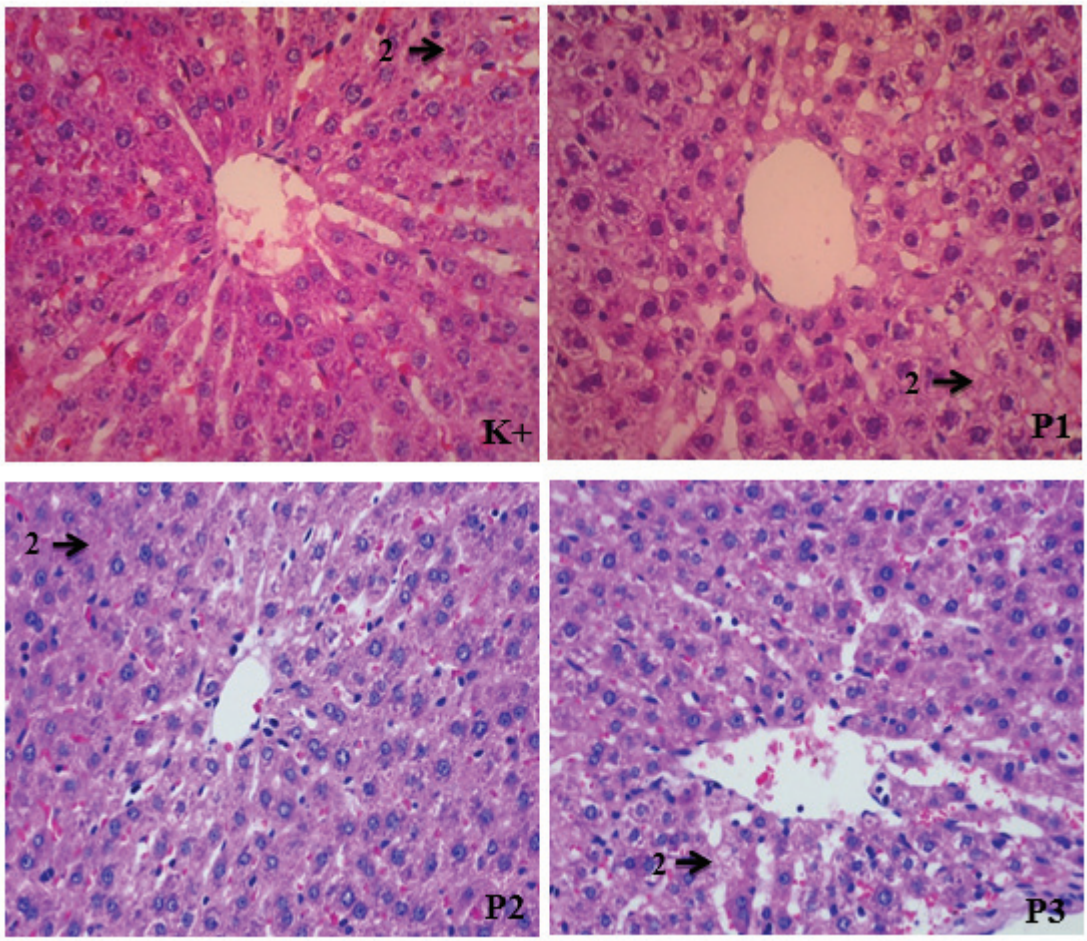

**Figure 2 Histopathology of rat liver cell degeneration treated with K +, P1, P2, P3. (2) The degenerated liver cells are seen to have swollen so that the cavity looks wider (HE staining; 400x magnification).**

### 2. Liver cell necrosis

Microscopic observations of white rat liver cell necrosis showed significant differences between treatment groups ($p < 0.05$). The statistical analysis of observations of liver cell necrosis can be seen in table 2.

**Table 2 Median values of liver cell necrosis**

| Perlakuan | Median |
|---|---|
| K- | 1.6000[a] |
| K+ | 1.4000[a] |
| P1 | 1.3000[a] |
| P2 | 1.0000[b] |
| P3 | 1.0000[b] |

Statistical analysis of the occurrence of liver cell necrosis in the K-, K +, and P1 groups were not significant differences in the three treatments. In the P2 and P3 groups, there were also no significant differences. However, the K-, K +, and P1 treatment groups showed significantly different results when compared to the P2 and P3 treatments seen from the superscript listed. Histopathological picture of liver cells of mice undergoing necrosis can be seen in the following figure.

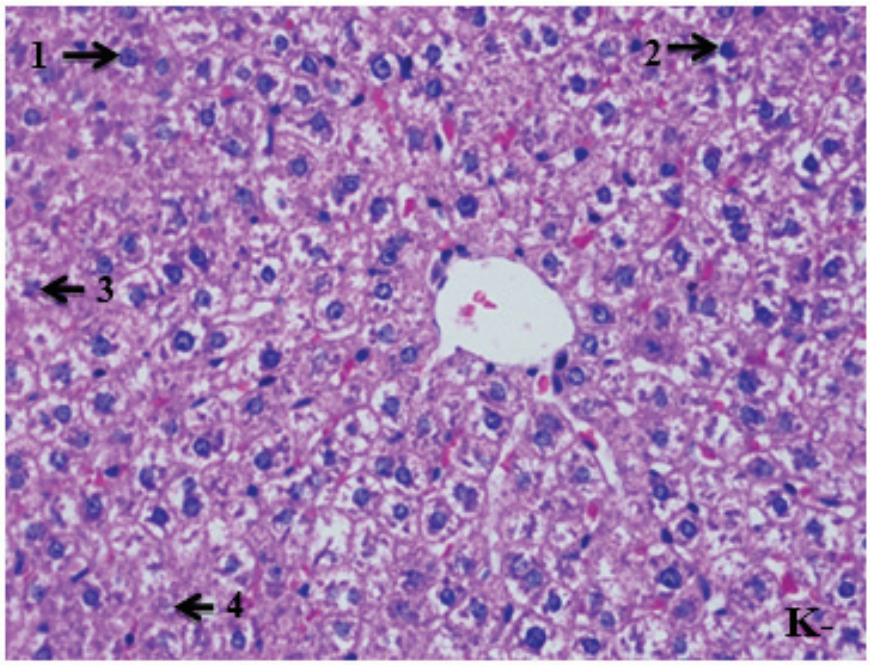

**Figure 3 Histopathology of liver cell necrosis in rat K-treated. (1) Normal liver cells. (2) Liver cells experience necrosis in the form of picnotics. (3) The nucleus of the liver cell experiences karyoreksis. (4) The nucleus of the liver undergoes cariolysis. (HE coloring) 400x magnification.**

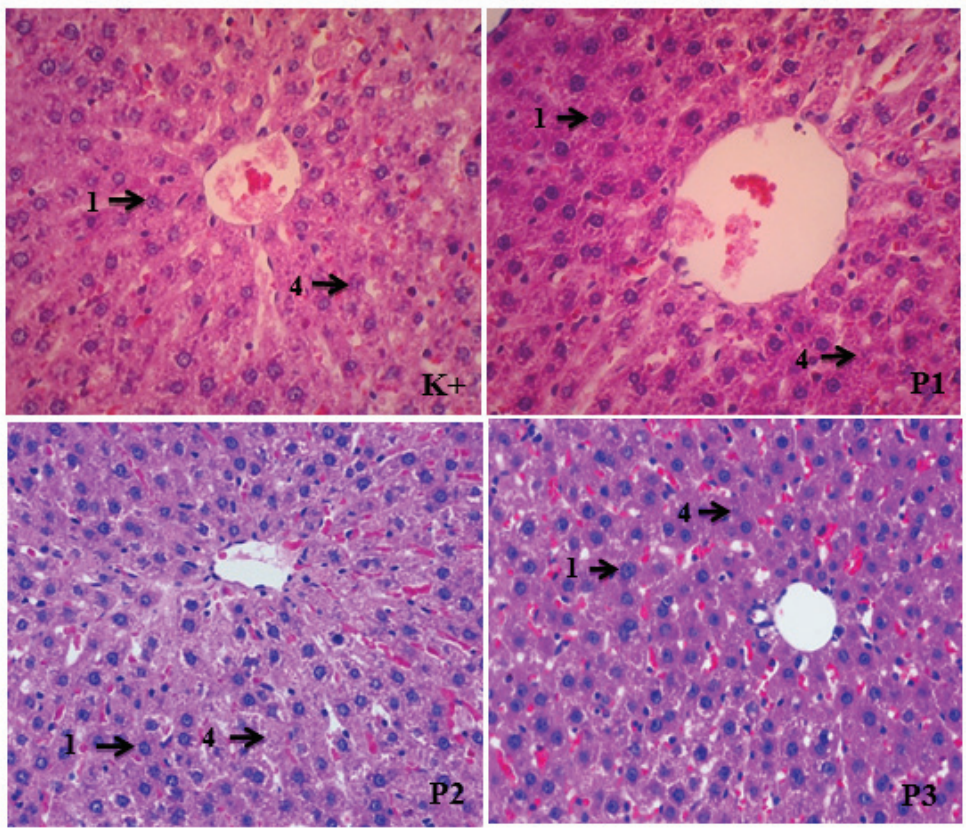

**Figure 4 Histopathology of rat liver cell necrosis with treatment K +, P1, P2, P3. (1) Normal liver cell nucleus. (4) The nucleus of the liver cell undergoes karyolysis. (HE coloring) 400x magnification.**

## Discussion

This research was conducted to see the effect of the onion extract (Allium ascalonicum L) on the histopathological picture of the liver of the white rat (Rattus norvegicus) induced by alloxan. Statistical results of the occurrence of liver cell degeneration showed no significant difference, while the occurrence of liver cell necrosis there were significant differences in each treatment. This is enough to prove that the onion extract plays a fairly good role in repairing liver cell damage due to alloxan induction.

Giving alloxan can increase the blood glucose levels of white mice that cause disruption of insulin production due to damage to pancreatic β cells. This compound can enter rapidly into pancreatic β cells and is reduced to dialuric acid which will then be oxidized back into alloxan which results in a redox cycle with the end result of radical peroxide compounds. This radical peroxide compound will undergo a process of dismutase to hydrogen peroxide. Hydrogen peroxide together with Fe2 + will form a reactive hydroxyl ($OH^-$) radical compound so that it can cause damage to pancreatic β cells. Disruption of glucose entry into cells results in high blood glucose levels[6].

This hyperglycemia condition can cause oxidative stress from several organs, including the liver, heart, brain, and skeletal muscles[7]. Oxidative stress can cause lipid metabolic reactions, proteins including enzymes, which can cause oxidative damage, if this continues it can cause liver damage and death. The liver functions in the process of biotransformation and detoxification of endogenous and exogenous substances that enter the body, and functions to filter blood from various organs that contain food, medicine, toxins, and bacteria. The state of diabetes will affect the occurrence of cell morphological changes from the liver[9].

### 1. Liver cell degeneration

Degeneration is a state of decreased intracellular biochemical changes accompanied by morphological changes due to nonfatal lesions in cells or as a cell reaction to lesions that are still reversible storage process or accumulation of fluids or other substances in cell organelles[10].

Based on the results of statistical analysis with the Kruskal Wallis test, there were no significant differences between the treatment groups ($p > 0.05$). In the K- (2.8000) treatment showed the most severe degeneration when compared to the K + (2.0000) treatment, this clearly happened because in the K (-) treatment no therapy was given and only 0.5% CMC Na was given which did not provide a therapeutic effect. in the liver, whereas in the K + treatment therapy is given with the drug metformin dose 45 mg/kg BW. Metformin is an oral anti-hyperglycemia biguanide class. Metformin works to reduce blood glucose levels by inhibiting hepatic glucose production (by reducing glycogenolysis and gluconeogenesis) and reducing insulin resistance especially in the liver and skeletal muscles[11].

In groups P1, P2, and P3 treated with onion extract doses of 250 mg / kg BW, 500 mg / kg BW, 750 mg / kg BW showed statistical results of median values (2.4000), (2.3000) and (2.1000). These data indicate that there was a decrease in the mean value of liver cell degeneration when compared to the K-treatment group which was only given CMC Na 0.5%. This means that onion extract can be an alternative therapeutic reference to improve the histopathological picture of the alloxan-induced liver. Onion has high phenolic phytochemicals. Recent research has reported that phenolic phytochemicals from onion have a blood glucose-lowering effect and high antioxidant activity in the alloxan-induced diabetic rat[12].

Shallots are believed to contain chemical components that have anti-inflammatory, anti-cholesterol effects, anticancer, and antioxidants such as quersetin[4]. There are studies that report that shallots contain high levels of quercetin, saponins, isorhamnetin and glycosides[13]. Most plants that contain bioactive compounds such as glycosides, alkaloids, terpenoids, flavonoids, and ceratenoid have antidiabetic activity. [14].

### 2. Liver cell necrosis

Necrosis is the death of liver cells. Dead cell nuclei can appear smaller, chromatin and reticular fibers multiply. The nucleus appears more dense and dark (picnotic) which can be broken or broken into several segments (karyoreksis) and then the cell nucleus is not visible because it has undergone perfect lysis (karyolysis) [15]. The mechanism of the occurrence of necrosis occurs

when tissue experiences hypoxia or the entry of a foreign body that is considered poisonous, the mitochondria will be injured, resulting in ATP down and Na + and K + pomp disturbed. Na + enters the cell which causes the lysosome to burst, releasing the hydrolytic enzyme so that it dissolves the cell[16].

Based on the results of statistical analysis with the Kruskal Wallis test showed that there were significant differences in each treatment group ($p < 0.05$) and continued with the Mann-Whitney test. In the group K- (CMC Na 0.5%), K + (metformin 45 mg / kg BW), and P1 (onion extract 250 mg / kg BW) there were no significant differences in the three treatments. In the P2 and P3 groups, there were also no significant differences. However, the treatment groups K-, K +, and P1 showed significantly different results when compared with treatments P2 and P3. The effect of decreasing the occurrence of different liver cell necrosis in each treatment may be influenced by different amounts of concentration at each dose of therapy.

Hepatocyte damage begins with changes in membrane permeability followed by cell death (necrosis). Increased enzymes in the blood caused by severe liver damage and accompanied by necrosis, so that enzymes from the mitochondria also come out of the cell[17].

## Conclusion

Based on the results of this study it can be concluded that the administration of onion extract (Allium ascalonicum L) can improve the histopathological picture of the liver of white rats (Rattus norvegicus) induced by alloxan.

# Inclusive and Sustainable Healthcare Delivery-A Public Private Participatory Model

**Nimble O J[1], A.V.Chinnasamy[2]**

*[1]Assistant Professor, Centre for Management Studies, Presidency College, Kempapura, Hebbal, Bangalore,*
*[2]Assistant Professor in Economics, Government Arts College for Women, Nilakottai, Tamil Nadu*

## Abstract

Healthcare has become one of India's largest sectors with high income generation and employment opportunities. Indian Healthcare includes Public and private hospitals, clinics outsourcing, telemedicine, medical tourism, health insurance and other medical equipment. Public spending on public health and welfare in India are still not at the required level even after introduction of Ayushman Bharath. The gap between the actual spending by common man and the required amount is high in low-income which results in inter-state inequality in healthcare.

The aim of this paper is to analyze the public private participatory projects by Narayana Hrudayalaya and its CSR activities to reduce the problems faced by common Indian citizen in receiving good healthcare.

***Key Words:*** *Healthcare, public-private participation, out of pocket spending, underprivileged, Narayana Hrudayalaya, CSR activities.*

## Introduction

Good health is an important component of human development and improvement. Empowerment of people comes from the freedom from poverty, hunger, and malnutrition, and freedom to work and lead a healthy life.[1] Access to good healthcare is highly required for better development and empowering citizens. Government intervention in healthcare is highly recommended in world level to provide and regulate health services especially in developing countries as they have high income disparity between rich and poor and poverty.

Government spending for public health care in low and middle income countries is below than what is actually required. Low income generations and revenue collection and high demand for expenditure contribute to this gap in public health spending in these countries. Another problem is limited access to public health care facilities which forces common man to go to public health providers which increases out-of-pocket (OOP) spending, especially for the poor.[2]

Universal health care is providing access to key primitive, preventive, curative, and rehabilitative healthcare for all at an affordable cost. However, most low- and middle income countries find this a major challenge, as it requires substantial increases in public spending. Some middle income countries like Thailand, some Latin American countries China, Indonesia, and Vietnam, are focusing on improving access to healthcare.

In India there have been some recent initiatives to improve public spending on health care which resulted in some increase in access to good healthcare. The, National Rural Health Mission (NRHM), established in 2005, and the recent introduction of Rashtriya Swastya Bima Yojana (RSBY) and Ayushman Bharat Yojana launched in 2018 a national health insurance scheme for people below the poverty line are the two most important initiatives by the central government. Several state governments also have come up with their own insurance schemes. Despite such programs, the actual public spending on health is not at required level.

**The Critical Need for Health Care for Under Privileged**

Most rural and informal sector workers in the world do not have any form of health security. The labour sector of the Indian economy consists of roughly 487 million workers, the second largest after China. Of these over 94% works in unorganized enterprises ranging from pushcart vendors to home-based diamond and gem polishing operations.[3]

The poor are particularly vulnerable to the lack of health security. The poor spend a greater percentage of their income on health or related expenditures. In fact, healthcare costs are one of the primary reasons for rural indebtedness and poverty. Moreover, there is the issue of accessibility. Thus for many, simply accessing health care is by itself, an expensive proposition.

**PPP in Healthcare by Narayana Hrudayalaya**

'Low Cost Healthcare', an expression private hospital rarely speaks about these days. Nevertheless, there is one company, Narayana Hrudayalaya Limited, which has a mission to offer low cost health services to all the patients they can reach out to, in order improve the wellbeing of our nation. Corporate social responsibility is recent and an evolving concept for the business organizations in the country. NH CSR policy is a set of basic principles and guidelines to direct focus and influences the actions and decision-making towards providing necessary care and assistance to the needy through Public Private Participatory projects.

## Review of Literature

A literature review aims at reviewing current knowledge of theoretical and methodological contributions to a particular topic.

According to **Dr. A Venkat Raman and Dr James Warner** (2006) some issues at the policy level need in-depth analysis whether the government should directly propose and handle the PPP initiatives or whether it should create a specialized independent agency and provide incentives that encourage higher level of private sector involvement in provision of healthcare services.[4]

**Rustam Sengupta** (2013) in his book Sustainable and Inclusive Innovations in Health Care Delivery – A Business Model Perspective, found that the healthcare sector in India is undergoing a very good phase of progressive rapid growth. All healthcare providers are attracting investment in this sectors.[5]

Dr Jennifer Gill and Prof David Taylor (2013) of the UCL School of Pharmacy have suggested in their research Health and Health Care in India National opportunities, global impacts, that it is possible that the country's established expertise in areas like information technology and vaccine production will prove useful in recasting current models of self-care and professional care and opening the way to a unique and potentially world leading Indian health service model.[6]

Public Private Partnership (PPP) in Indian Health Care by **Dr. R Ramakrishnan** (2012) opined that PPP in healthcare is an instrument for improving health of the population. According to him medical sector is a national asset. Private and public sectors are very much accountable for overall health system of the country.[7]

**Govinda Rao and Mita Choudhury** (2012) said that it is the duty of central government to expand health infrastructure in both rural and urban areas of the country.

The above studies mainly focus on equitable distribution healthcare services, government intervention in providing healthcare finances, effectiveness of different public-private participatory projects and infrastructural developments in health sector.

**Research Design**

## Objectives of the Study

The main objectives of the study are:

1. To understand the role of government in healthcare financing.

2. To review the CSR activities of Narayana Hrudayalaya.

**3. To understand the public Private participatory projects of Narayana Hrudayalaya**

## Methodology

The paper is conceptual in nature and is adopted the descriptive research design. Primary data used in

the study is collected from patients using convenience sampling and secondary data obtained from reports of Narayana Hrudayalaya, official sites of Govt. of India and Govt of Karnataka, newspapers, books and journals

**Role of Government in financing healthcare**

Health care involves not only public spending by the government but also the activities of the private parties. Heath care commonly considered as a public good, but its demand and supply cannot be regulated solely by the invisible hands of the market.

Government should focus on

- Accessibility
- Fair distribution
- Availability to vulnerable groups and under privileged
- Expanding role of government in health care system

A public–private partnership (PPP) is a government service or private business venture which is funded and operated through a partnership of government and one or more private sector companies. These schemes are sometimes referred to as PPP, P3 or $P^3$. This is mainly done by the government sponsoring the private players to work in a particular field. The model has successfully worked in various other sectors like roads, airports, telecom, irrigation and etc.

CSR activities of Narayana Hrudayalaya

NH CSR policy directly focuses on providing necessary care and assistance to the needy. This policy is in accordance with the requirements set out in Section 135 of Companies Act 2013 read with Companies (Corporate Social Responsibility) Rules, 2014 notified by Central Government in this behalf.

NH aims to make a positive difference in the lives of the people by engaging in activities that eliminates or alleviates pain and suffering to the under privileged sections of the society.[8]

**NH CSR policy intends for:**

· Promoting healthcare facilities for the upliftment of people by providing affordable and accessible healthcare.

· Promoting educational facilities to help and assist talents of the children and amateurs.

· Strive for socio-economic development thereby reducing inequality between rich and poor.

NH CSR FOCUS AREAS

· Healthcare

· Enhancing livelihood

· Education

Narayana Hrudayalaya Public Private Participatory Projects

**Overview of projects/programs undertaken during Financial Year 2017-18**

· Rajiv Gandhi Arogya Yojana (RAY):

This program was initiated in November 2005 to develop a model of rural primary health care system in Amethi. The project currently includes 4 Primary Healthcare Clinics spread across four blocks of Amethi constituency and covers the basic healthcare needs of around 200 villages catering to a population of more than 60,000 people.

· **Railway Clinics:**

This program was initiated in July 2011 in the State of Karnataka in collaboration with Southern Railways. The objective is to provide timely care to the patients or accident victims in railway stations, and thereby curb the increasing number of deaths due to railway accidents.

· Mobile Mammography Screening:

The effort therefore, of the mammography screening program, has been to educate, screen, identify and refer patients for further treatment. In the past financial year, the program reached out to 7,000 women through 171 camps and 2,048 mammograms were conducted.

· Care Companion Program:

The Care Companion Program (CC Program) was first set up in 2013 in the NH Hospital in Mysore. This

program is designed to educate patient family members with low or no prior medical knowledge for attending to the needs of patients. Multi-lingual group teaching sessions use interactive videos for identifying warning signs of illness, checking temperature, pulse, blood pressure, timely medications etc.

· **E - Health Centre Program (eHCs):**

The program focuses on delivering quality and affordable primary health care to people living in resource-deprived locations of India using appropriate technologies. NH is the healthcare partner to implement, operate and manage eHealth Centres.

A Total of 9 eHealth Centres have been established in states of Karnataka, West Bengal, Rajasthan and Gujarat. A total footfall of 64,037 has been witnessed since inception.

· **Shorapur Maternal Obstetric Monitoring program**

Yadgir District has been identified by the Ministry of Health and Family Welfare as a High Priority District for the implementation of focused health care interventions under National Health Mission (NHM). Based on statistical data for maternal healthcare indices, it was decided to pilot maternal healthcare interventions in Shorapur Taluk of Yadgir District. NH team stationed in Shorapur co-ordinates free drives for Ultra sonography (USG), High Risk Pregnancy detection (HRP), as well as blood transfusion for anaemic pregnant women.

With implementation of this workflow innovation, there has been a 50% rise in detection of high risk pregnancy cases.

· **Udaan:**

According to the World Health Organization, India has seven doctors for every 10,000 people, half the global average. These shortages exist despite India having one of the largest medical education systems in the world. The unwillingness of doctors to work in rural areas is another challenge. Considering these twin challenges, the objective of Udaan is to nurture the potential of rural students from disadvantaged backgrounds and create a platform which they could leverage on towards realizing medical Education.

**New PPP Programs Initiated By Narayana Hrudayalaya**

· Community Radio program

Narayana Hrudayalaya Foundation was granted 90.4 spectrum wireless operating license in January 2017 for establishing a community radio station in Health city, Anekal. The community radio was named "Namma Nadi" with focus on health, education, environment, culture and civic issues within the primary and secondary zones of health city.

· **Non-Communicable Diseases (NCD) Program**

This new program was initiated in June 2017 with a focus to improve awareness and conduct screening for non-communicable diseases including breast and oral cancer. The program has been initiated at five locations – Mysore, Jamshedpur, Delhi, Howrah and Bangalore.

## Findings

· Inclusive and Sustainable healthcare system is a must for human resource development of any nation, which in turn increases the growth rate of the country.

· Proper institutional system within bureaucracy by the government and trained people is required for providing quality healthcare to common people.

· Proper PPP initiatives will work wonders in providing quality healthcare to masses.

· PPP is not a substitute for providing health services by the public sector through better governance.

· PPP initiate by Narayana Hrudayalaya through their CSR activities are mostly community model healthcare system which is a beacon of hope for providing healthcare services.

· NH model PPP are not only supporting the public healthcare system in Karnataka state, but also gives its support to other states like Rajasthan, West Bengal, UP etc.

· NH CSR activities focus not only on healthcare, but also supports livelihood enhancement and Education.

· NH PPP UDAN gives lifelong support for

talented poor students to achieve their dreams in higher education especially in the field of healthcare.

**Suggestions**

· The healthcare sector in India is undergoing a rapid change. Apart from the healthcare providers, other health industry contributors also should contribute to PPP projects.

· Government need to focus on providing health security provision to each and every individual with a highly innovative, affordable, and accessible health system.

· There is a need to reform or modify certain administrative systems and procedures.

· Policy makers should also try to establish global health care services market generating foreign exchange and driving its growth process.

· The main challenges on the field still are in terms of logistics, lack of awareness, government apathy and rudimentary delivery channels, measures must undertake by government to overcome these problems.

· Government has to focus on good health and wellbeing for all throughout their lives and should try to reduce the time lag in dispersing the fund to the people.

## Conclusion:

The Union Budget of 2018 introduced a healthcare project for common man; The National Health Protection Scheme (NHPS) is aimed at extending healthcare insurance to 100 million families and raising the insurance ceiling to 5 lakhs per family. The scheme would be a boost for Indian healthcare system.[9]

However, The World Health Organisation's ranking of health systems of countries; India is ranked at 112, way below countries like Bangladesh, Indonesia, Iran and Iraq. This low ranking shows India's low quality medical infrastructure and shortage of doctors. Private healthcare providers can fill the gap in the healthcare services by working with various developmental agencies and other institutions.[10] The transferability of schemes like this depend almost entirely public private participation and the existence of health care infrastructure of a reasonable kind. These projects will provide the country an inclusive and sustainable growth in health sector.

**Acknowledgment**: This research paper is made possible through the help and support from everyone, including: family, friends, and colleagues and in essence, all sentient beings. Especially, Dr.A.V.Chinnasamy, co-author and my research guide, Dr. R Venkatraman Dean Presidency Centre for Management Studies, NH management staff provided with their valuable support and advices.

**Conflict of Interest Statement**

The authors received moral support from Centre for Management Studies, Presidency College and Mother Teresa Women's University. The present paper has been reviewed and accepted as working paper by Presidency CMS. The authors also conduct research in the area of Health Economics and public spending.

**Source of Funding:** The research was a self-funded project.

**Ethical clearance Statement:** In undertaking this research various sources have been consulted in order to ensure that this study meets acceptable ethical guidelines. The paper is conceptual in nature and secondary data obtained from reports of Narayana Hrudayalaya, Bangalore and Asha Workers in Karnataka

# Factors Analysis Related to the Completeness of Providing Basic Immunization in Infant Aged 12 Months

**Hannik Rahmaningrum[1], Harmayetty[1], Deni Yasmara[1], Ilya Krisnana[1]**

*Faculty of Nursing, Universitas Airlangga, Surabaya, Indonesia, Jl. Mulyorejo, Mulyorejo, Surabaya, Kota SBY, Jawa Timur 60115, Universitas Airlangga Kampus C*

## Abstract

**Background:** The highest number of children with incomplete immunizations in Indonesia is five provinces in Java. During 2015, diphtheria cases in Blitar District, East Java reached 44 cases. However, in 2016, there was an increase with the discovery of 49 infants affected by diphtheria and spread in several districts and obtained the number of 12-month-old infants who did not get complete immunizations of 47 infants.

**Aim:** The purpose of this study analyzed the factors related to the completeness of basic immunization for 12-month-old infants.

**Method:** This study was a quantitative study with cross sectional approach. The study was conducted on mothers who have 12-month-old infants by filling out the questionnaires about the relationship of independent variables, namely knowledge and attitudes of the mother, family support and health workers support as well as the dependent variable, namely the completeness of basic immunization. Total respondents were 46 people. Data were analyzed using the Chi Square test to determine the relationship between independent and dependent variables and logistic regression statistical tests to find out the dominant variables related to the completeness of basic immunization.

**Results:** There was a relationship between maternal knowledge (p = 0,000), maternal attitudes (p = 0,000), family support (p = 0,000), and health workers support (p = 0,000) and the completion of basic immunization. The dominant factor related to the completeness of basic immunization was knowledge.

**Conclusion:** Knowledge, attitude, family support, and health workers support have a significant relationship with the completion of basic immunization.

***Keywords:*** *immunization, knowledge, attitude, family support, health workers support*

## Introduction

Basic immunization is the provision of early immunization for infants up to one year old to reach immune levels above the protection threshold. It means that if one day exposed to the disease, they would not be sick or only experience mild illness. The purpose of immunization in general reduces morbidity, mortality, and disability due to disease that can be prevented by immunization (PD3I). In addition, other goals are the achievement of Universal Child Immunization (UCI) targets as determined, the elimination of PD3I such as tetanus, polio, measles, etc. and the implementation of safe immunization and management of medical waste (safety injection practice and waste disposal management)[1,2].

World Health Organization (WHO) in 2011 mentioned 10 facts of serious diseases which become a global burden; one of them is a disease that can be prevented by immunization (PD3I). WHO noted that there are still 18.7 billion infants who do not get basic immunization. The highest number of children with

**Corresponding author :**
**Harmayett**
E-mail: harmayetty123@gmail.com

incomplete immunizations in Indonesia is five provinces on Java Island (55.3% of the national figure), namely East Java with 150,569 children, West Java with 180,788 children, Central Java with 199,030 children, Banten with 201,087 children and DKI Jakarta with 154,786 children[3–5].

One indicator of the immunization program success is the achievement of Universal Child Immunization (UCI). The achievement of UCI is a picture of immunization coverage in infants (0-11 months) nationally to the village level. WHO and UNICEF determined that immunization coverage indicator was 90% at the national level and 80% in all districts. In Indonesia, Basic Immunization is still 86.8% and Universal Child Immunization (UCI) is still 82.9%. Some disease outbreaks that occur in several provinces in Indonesia are caused by diseases that should be prevented by immunization. In recent years, there have been cases of "re-emerging disease" due to measles and diphtheria in several provinces in Indonesia[6].

The theory of Lawrence Green (1980) stated that a person's health is influenced by 2 main factors namely behavioral factors (behavior causes) and factors outside of behavior (non-behavior causes). A person's behavior factors are influenced by three factors, namely predisposing factors, enabling factors, and reinforcing factors. Predisposing factors consist of the level of knowledge, attitudes, education, perception, beliefs, socio-economic status, and age. The enabling factor consists of health service facilities that have the characteristics of availability, can be accessed, can be accepted, and can be reached. The last is the reinforcing factors consist of family support, health worker support, family support, health care support, and community figure support. The factors affecting health above need to be explored further, especially in relation to the completeness of basic immunization in infants aged 12 months[7,8].

## Method

This study was a quantitative research with analytical survey with cross sectional approach. The population in this study was mothers who had a 12-month-old infant in the working area of the Kademangan Health Center in Blitar, East Java, Indonesia. The sample was determined by calculating the formula, thus as many as 46 respondents were obtained. In this study, the sample was all mothers who have a 12-month-old infant with immunizations that was not on schedule.

Criteria for inclusion of respondents were: 1. Willing to be a research respondent, 2. Can read and write, and 3. Mothers who have babies aged 12 months. However, the respondents' exclusion criteria were: 1. Not willing to be a research respondent, 2. Cannot read and write, 3. Mothers who have infants over 12 months.

The study was conducted on mothers who have 12-month-old infants in the working area of the Kademangan Health Center in Blitar Regency with a questionnaire containing the relationship of mother's knowledge, mother's attitude, family support and support of health workers with the completion of basic immunization. Sampling was done by purposive sampling technique. The dependent variable in this study was the completeness of basic immunization for infants aged 12 months. The independent variables in this study were the factors that influence the completeness which consists of maternal knowledge, maternal attitude, family support, and health workers support. The results of the validity and reliability test on the results of the questionnaire revealed that all questions were valid and reliable. The next data was taken by visiting one by one respondent's house. The analysis in this study included unvaried analysis, bivariate analysis using the Chi Square test with a degree of significance $\alpha < 0.05$, and multivariate analysis.

## Result

### Respondent Characteristic

Table below showed the distribution respondent result based on age, last education, and job.

**Table 1 : Respondent Characteristic**

| **Respondent Characteristic** | **%** |
|---|---|
| Age | |
| 17-25 | 10,9 |
| 26-35 | 80,4 |
| 36-45 | 8,7 |

| Support | 25 | 54,3 | 3 | 6,6 | 28 | 60,9 | 0.000 |
| Do not Support | 4 | 8,7 | 14 | 30,4 | 18 | 39,1 | |
| Total | 29 | 63 | 17 | 37 | 46 | 100 | |

## Discussion

Based on data analysis using the Chi Square test, it was concluded that there was a relationship between maternal knowledge and the completeness of basic immunization in 12-month-old infants. The results of this study were consistent with research conducted by Odusanya (2008) which showed that maternal knowledge about immunization (p = 0.006) was significantly related to immunization coverage. Maternal knowledge referred to what is known by mothers about complete basic immunization which included the type of complete basic immunization, diseases that can be prevented by immunization, immunization schedule, the number of doses given, and the benefits of immunization. People who are highly knowledgeable tended to have a better mindset so they try to apply a healthy lifestyle behavior[1,9].

The results of this study differed from the results of the study of Astrianzah (2011) which examined that there was no relationship between the level of maternal knowledge and the status of complete basic immunization in infants (α = 1,000). In this study, knowledge was everything that was known or answered

by respondents about complete basic immunization in infants including the notion of immunization, benefits of immunization, type of immunization, and timing of immunization in infants. Knowledge was divided into three categories, namely good, sufficient, and less knowledge. Maternal knowledge about the completeness of basic immunization provision found that the majority of respondents' knowledge in the good category was 24 respondents, sufficient categories were 7 respondents, and less knowledge categories were 15 respondents. A person's knowledge was influenced by several factors, including age, education, occupation, interests, experience, culture, and information.

Based on data analysis using the Chi Square test, it was concluded that there was a relationship between maternal attitudes and the completeness of basic immunization for 12-month-old infants. The results of this study were consistent with Isnaini's research (2011) which stated that there was a significant relationship between maternal attitudes and compliance with basic immunization for infants. The formation of attitudes was based on the ability to think to understand and explore the completeness of basic immunization. Positive attitude of a mother, who has formed, can have a good impact on the basic immunization status of their children. On the other hand, if the maternal attitude was negative towards giving immunization, it can have a negative impact on the child's immunization status. The results of this study differed from studies conducted by Conscience (2013) that there was no relationship between maternal attitudes and the completeness of children's basic immunizations with a value of p = 0.671.25[10].

According to the data, the attitude of the respondents in the statement of immunization to infants did not have to be in accordance with the specified schedule, there were respondents who answered agree. For the statement of each complete basic immunization can be done at health service, health center, midwife practice, or doctor's practice. There were respondents who answered disagree. In addition, in the statement of the frequency of giving complete basic immunizations to 12-month-old infants was 12 times, many respondents answered less agree as many as 16 respondents. From the results of the study, it can be illustrated that there were still negative attitudes of mothers about the statements above. In this case, maternal knowledge was very important. If mother has less knowledge about basic immunization, then maternal attitude will be negative, hence, her child was not given complete immunization.

Based on data analysis using the Chi Square test, it was concluded that there was a relationship between family support and the completeness of basic immunization for infants aged 12 months. The results of this study were in accordance with the study of Giantiningsih et al (2013) that the Chi Square Test results obtained exact value with p value of 0.204 <0.05. This examined about the relationship between the role of the family and the completeness of basic immunization in infants aged 10-12 months. The results of this study differed from studies conducted by Gunawan (2009) which stated that there was no significant relationship between family support and the administration of Hepatitis B 0-7 immunization to infants. The best family support in this study lies in the domain of assessment which included families listening to the complaints of mothers when having difficulties in providing immunizations, families caring about maternal fears about the side effects of giving immunizations to their babies, and families always involving mothers in making decisions for provide complete immunization[11].

Based on data analysis using the Chi Square test, it can be concluded that there was a relationship between health worker support and completeness of basic immunization for 12-month-old infants. The results of this study were in accordance with the research of Jusuf (2015) using the Chi Square test p value = 0.031 <α = 0.05. 28 The results of this study differed from research conducted by Yahiji (2015) which revealed there was no relationship between the health profession support and complete basic immunization with p value of 0.580. Health behavior of a person or community was also determined by the presence or absence of health information. The results of this study were obtained by mothers who said they had received counseling about basic immunization from health workers as many as 33 respondents. This depicted that the majority of respondents had received information or information from health workers, so it can be concluded that the factors that encourage mothers to immunize their infants because of the support of health workers[12,13].

The dominant factor related to the completeness of basic immunization based on multivariate statistical

tests was knowledge. The results of this study were supported by Tampemawa's study (2015) which mentioned that the most dominant variable influencing the immunization status of children aged 12-24 months was maternal knowledge. In this study, mothers with good knowledge showed higher completeness of basic immunization rates than mothers with less knowledge. Based on the logistic regression statistical tests that have been carried out, there was a 39.9 times greater risk to immunize their infants in mothers who have good knowledge about immunization compared with less knowledge. This was in line with Notoatmodjo (2010) which stated that a person's actions on health problems will basically be influenced by one's knowledge of the problem[14,15].

## Concusion

There were relationship between maternal knowledge, maternal attitude, family support, and health workers support and completeness of providing basic immunization in infants aged 12 months. Health dominant factors that were related to completeness of providing basic immunization were maternal knowledge.

**Ethical Clearance**: Taken from the Faculty of Nursing, Universitas Airlangga, Surabaya committee, with the number "212-KEPK".

# The Effect of Soot Particulate towards Vascular Cell Adhesion Molecule-1 (VCAM-1) Expression in the Mechanism of Cardiovascular System Disruption

**Edmond Leonard[1], Muhammad Aminuddin[1]**

*[1]Department of Cardiology and Vascular Medicine, Faculty of Medicine Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya 60285, Indonesia*

## Abstract

**Background:** Air pollution is associated with cardiovascular morbidity and mortality; however, the underlying mechanisms are not yet clearly understood. Several previous studies have implicated potential mechanism action including oxidative stress, systemic inflammation, autonomic dysfunction, and endothelial dysfunction. Several epidemiological studies have examined the association between ICAM-1, VCAM-1 and particulate matter.

**Objective:** To describe the effect of soot particulate exposure in VCAM-1 expression in the mechanism of cardiovascular dysfunctions.

**Methods:** The experiment was conducted in laboratory female rats (Rattus novergicus) and consisted of 3 groups: Control group (n=10), without soot particulate exposure; Treatment 1 group (n=12), exposed by soot particulate with the concentration of 532 mg/m3 an hour each day for 30 days; Treatment 2 group (n=12), exposed by soot particulate with the concentration of 1064 mg/m3 an hour each day for 30 days. The expression of VCAM-1 on cardiac tissue was measured after the end of treatment by immunohistochemical examination. The differentiation of VCAM-1 expression among the groups was tested using the Kruskal-Wallis test and the Mann-Whitney test.

**Results:** The mean rank of VCAM-1 expression in the control group, treatment group 1 and treatment group 2 was significantly different (8.85, 17.63, 24.58, p=0.001). There was a significant difference in VCAM-1 expression by using the Mann-Whitney test among groups ($p < 0.05$).

**Conclusion:** The exposure to soot particles increased VCAM-1 expression significantly in laboratory animals. Our findings indicated the important role of the inflammatory activation pathway as a response to soot particulate exposure in the mechanism of cardiovascular disease.

***Keywords:*** *Soot particulate, vascular cell adhesion molecule-1 (VCAM-1)*

## Introduction

Cardiovascular disease is the leading cause of death and morbidity in the world [(1)]. Epidemiological studies showed an important association between cardiovascular morbidity and mortality after exposure to particles in air pollution, especially particulate matter (PM); however, the mechanism remains unclear. [(2, 3)]. In the last 15 years, air pollution that induces cardiovascular disease has been the focus of intensive research among cardiologists and environmental medicine experts [(4)]. The comparisons of six cities in the United States with different levels of pollution found an increased risk of cardiovascular cases from atmospheric pollution with fine particles [(3)]. PM exposure as a result of air pollution has been a risk

factor for cardiovascular disease including arrhythmias, myocardial ischemia, myocardial infarction, and heart failure. Nearly 1 million people at risk of death from cardiovascular disease are associated with PM worldwide every year. The risk of myocardial infarction is estimated to be 1.48 times greater for a small increase in PM (25 μg / m3). Compared to the risk of myocardial infarction which was reported, it was approximately 3 times higher in smokers than non-smokers. The increased risk of cardiovascular disease associated with PM is relatively smaller compared to traditional risk factors such as smoking, diet, obesity, diabetes, metabolic syndrome, etc. However, air pollution with the PM is encountered by a larger number of population and lasts a lifetime [(1)].

One of the suspected instrumental mechanisms is the occurrence of oxidative stress which will then increase the Reactive Oxygen Species (ROS) in the body that can cause cell damage through a chain reaction called lipid peroxidation. This oxidative stress further induces changes in the cardiovascular system [(4)]. Exposure to PM can result in lung inflammation, with the release of proinflammatory cytokines by alveolar macrophages that regulate local inflammatory responses. These cytokines also enter the circulation, resulting in systemic inflammation, in which the bone marrow is stimulated and releases leukocytes and platelets, as well as stimulate the liver to produce Creative protein (CRP) and fibrinogen [(3, 5, 6)]. The high levels of CRP will affect endothelial function by weakening the reactivity of nitric oxide (NO) and increasing the expression of intercellular molecule adhesion molecule-1 (ICAM-1), vascular cell adhesion molecule 1 (VCAM-1), and E-selectin. ICAM-1 and VCAM-1 can also be stimulated by interleukin1-β (IL-1β) and tissue necrotic factor-ά (TNF-ά). Increased levels of these cytokines and adhesion molecules in the blood are associated with the widespread of coronary and carotid artery disease. ICAM-1 and VCAM-1 are the members of the Immunoglobulin superfamily and have a role in binding monocytes, lymphocytes to the endothelium, allowing them to enter the intima tunica. This is very important in the process of atherosclerosis [(5, 7)]. The experiment on laboratory rabbits that were given PM exposure to its lung can increase the expression of adhesion molecules on the endothelium. This suggests that several stimulations that induce lung inflammation can also activate vascular endothelium. Active endothelial cells will decrease NO production and increase endothelin. Increased endothelin has been documented in patients with atherosclerosis and coronary disease. Endothelin is a vasoconstrictor and activates monocytes that affect the inflammatory response. This study suggests that pulmonary inflammation increases endothelial dysfunction markers in the circulation. It indicates a possible association between pulmonary inflammation and the occurrence of atherosclerosis [(5)].

In one epidemiological study, Pope et al., (2004) reported that PM exposure [(2, 5)] was a risk factor of cardiovascular disease mortality through pulmonary and systemic inflammatory mechanisms, accelerated atherosclerosis and altered cardiac autonomic function [(8)]. The national study conducted in the United States (US) currently estimated each decrease is 10ug/m3 levels of PM is associated with an increase in life expectancy of 0.61 years [(9)]. Very few epidemiological studies examined the relationship between ICAM-1 and VCAM-1 with PM. This inflammation and endothelial dysfunction can be a process in which air pollution affects the cardiovascular system [(7)].

Based on the elaboration above, the researchers are encouraged to research the effect of soot particulate exposure on VCAM-1 expression in the cardiovascular system by using a laboratory experiment method and rats as the experimental animals.

## Method

### Subjects

The experimental unit of this study was the hearts of female white rats (Rattus novergicus) which fulfilled the research criteria of female rats (Rattus novergicus), aged 4 months (16 weeks), weight 100-200 grams, and healthy. The research was conducted at the Biochemical Laboratory of Faculty of Medicine Universitas Airlangga and Department of Veterinary Anatomy Faculty of Veterinary Medicine, Universitas Airlangga. It was conducted for 6 months with the stages including giving particulate exposure for 30 days, laboratory animal surgery after treatment, VCAM-1 expression examination with immunohistochemical methods.

This research was a laboratory experimental research conducted to examine the hypothesis through several stages of research. The study protocol was approved by

the Ethical Commission to conduct basic science/clinical research in Dr. Soetomo General Hospital Surabaya. The descriptive data analysis was presented in the mean ± SD or median form and the frequency was showed in percentage. To test the normality of data distribution, the present study applied the 'one-sample Kolmogorov-Smirnov test'. One Way ANOVA parametric statistical test was performed to examine the normal data distribution. If there was a significant difference, then it is followed by Post Hoc (Tukey HSD) statistical test. On the other hand, the abnormal data was examined by the non-parametric statistical Kruskal-Wallis test and followed by Mann-Whitney U statistical test. The results of data analysis were displayed in graphics. The data analysis was processed by using SPSS software version 20 (SPSS, Inc., Chicago, IL)

## Results

### Observational Data

The results of VCAM-1 expression measurements were obtained by applying immunoreactive score scale (IRS) according to Remmele and Stegner[32] This immunoreactive score index (IRS) or Remmele scale was the result of multiplication of the intensity of the color reaction and the percentage of cells with positive reactions (∑ = A x B) (score 0-12). It was obtained the difference of VCAM-1 expression among groups (control: mean rank 8.85; T1: mean rank 17.63; T2: mean rank 24.58) (table 1, 2, 3 and figure 1, 2).

### Data Analysis

There was a significant difference in VCAM-1 expression among groups (p=0.001) by using the non-parametric Kruskal-Wallis statistical test (table 4). Based on the result of the Mann-Whitney test, it was obtained a significant difference of VCAM-1 between the Control group and Treatment 1 group (p=0.015), between Control group and Treatment 2 (p=0.000), and between Treatment 1 and Treatment 2 group (p=0.048) (table 5).

**Table 1. The VCAM-1 expression using IRS index (score 0-12) according to Remmele and Stegner**

## Discussion

Particulate matter exposure contributes to an increased risk of cardiovascular disease by initiating and promoting the development of atherosclerosis which is the main cause of most cardiovascular diseases [3, 10]. Air pollution can induce peripheral artery, coronary atherosclerosis, and aortic atherosclerosis. PM exposure in a short period has been associated with increased mortality in acute cardiovascular disease [11]. In one epidemiological study, Pope et al., (2004) reported that PM exposure [2, 5] was a risk factor of cardiovascular disease mortality through pulmonary and systemic inflammatory mechanisms, accelerated atherosclerosis and altered cardiac autonomic function [8]. Once it was in PM circulation, it can interact with vascular endothelium or has a direct effect in atherosclerosis plaque which causes local oxidative stress and inflammatory effects in the lung. The endothelial dysfunction caused by PM has been examined in experimental animals in which there

was increased VCAM-1 expression [10, 12].

In 2011, Jette Gjerke Hemmingsen et al. reported that the ROS production increased in the human umbilical vein endothelial cell (HUVEC) that were exposed to PM. The smaller size of PM produces a higher ROS level. The expression of VCAM-1 increases in small size PM exposure as compared to HUVEC control ($p<0.01$) [13]. It indicates the association between PM with oxidative stress and inflammation. In 2011, Aling Dong, et al., compared the retinal vessels that had ischemia with a combination of ischemia and oxidative stress. VCAM-1 expression was higher in retinal vessels that had ischemia and oxidative stress and this increased the lacostasis and bone marrow-derived cells in the retina, which in both cases were blocked by intravenous injection of anti-VCAM-1 antibodies. Increased leukostasis will result in the neovascularization of the retina [14].

Vascular adhesion molecule -1 is a marker of the earliest lesions of atherosclerosis in experimental animals and is an adhesion molecule key that mediates the emergence of leukocytes in early lesions. Endothelial cells with VCAM-1 expression assist the monocyte cells to roll and cling tightly [15, 16]. The antibody that blocks VCAM-1 or β1 or β2 integrins significantly decreases monocyte adhesion and the ICAM-1 or VCAM-1 gene mutation decreases atherosclerosis in laboratory rats [16]. Zhang Jie, et al. revealed that mast cells, neutrophils, and macrophages released the proinflammatory cytokines such as TNFά, INFγ, and IL6 that induced adhesion molecule expression of endothelial cell and recruited leukocytes that were the pathogenesis of the vascular inflammatory disease [16]. Salvi et al. reported that up-regulation of bronchial adhesion molecules such as ICAM-1 and VCAM-1 occurred after exposed to PM [17].

A research conducted by Swapna Upadhyay, et al., in 2010 reported that particulate matter affected the vascular homeostasis in the lung and systemic. This has been identified based on the analysis of various biomarkers that are related to hypertension (ACE), endothelial activation (ET-1, VCAM-1), coagulation factor (TF, PAI-1) and angiogenesis (VEGF). The up-regulation of VCAM-1 in lung tissue can be due to endothelial cell activation by cytokines which were released from active macrophages or collected neutrophil cells. Various studies have proven that VCAM-1 promotes the progressiveness of atherosclerosis by the accumulation, adhesion, and migration of transcendental leukocytes [18]. Furthermore, active endothelial cells can enhance the expression of PAI-1, VEGF, and VCAM-1 which are responsible for the development of atherosclerotic lesions. In the heart, all the signs measured elevated at high levels on day 3 after the exposure [18, 19].

In this study, the results indicated a significant difference in VCAM-1 expression among groups ($p=0.001$). It was also obtained a significant difference in VCAM-1 expression between the Control group and Treatment 1 group ($p=0.015$), between Control group and Treatment 2 ($p=0.000$), and between Treatment 1 and Treatment 2 group ($p=0.048$). The results of this study are following the previous studies. These findings support the hypothesis that exposure to soot particulate can increase VCAM-1 expression in the mechanism of cardiovascular system disruption.

## Conclusion

The inhalation exposure of soot particulate matter with the duration of 1 hour daily for 30 days, a dose of 532 mg/m3 and 1064 mg/m3 significantly increased the VCAM-1 expression in the cardiomyocyte cells of the experimental rats. The results also showed that increased VCAM-1 expression was following increased doses of soot particulate matter exposure, which plays a role in the inflammatory response underlying the occurrence of atherosclerosis. The findings of our study are important in explaining how particulate matter, especially soot, can contribute to cardiovascular causes.

**Conflict of Interest:** There is no conflict of interest in this research**.**

**Source of Funding:** This is research use individual funding.

**Ethical Clearance:** This research has ethical clearance from the Faculty of Medicine, Universitas Airlangga.

# The Role of Universal Health Coverage in Supporting National Family Planning Program: A Comparative Study

**Erni Rosita Dewi[1], Muhammad Ardian Cahya Laksana[2], Nur Anisah Rahmawati[1], Alifia Candra Puriastuti[3], Budi Prasetyo[2]**

*[1] School of Midwifery, Faculty of Medicine, Universitas Airlangga, [2] Department of Obstetric Gynecology, Faculty of Medicine, Universitas Airlangga, [3] Department of Reproduction Health, Faculty of Medicine, Universitas Airlangga*

## Abstract

**Background:** The family planning program in some countries have not been successful yet because the population is growing rapidly. Currently, all the government is trying to provide family planning access in health facilities through the national health insurance program

**Aim:** To compare the role of universal health coverage in supporting national family planning programs

**Method:** This literature study had been made by data reviewing in four different countries which have large population: China, India, the USA and Indonesia. Using the indicator of involvement of UHC in family planning in several countries, there are advocacy and policy, health service, health financing and governance. It was compared the support of contraceptive policy and highlighted the program as a strategy for developing family planning in the national health insurance era

**Results:** Policies related to the use of national health insurance for supporting family planning in several different countries produced different results. In addition to the aspect of finance, the policy on the number of children, the private and public service systems, the priority of contraception choice and family involvement also played a role in the success of the program

**Conclusion:** The correct target program must be immediately determined by the government so it is important for policymakers to self-introspection related to family planning in this country by using the indicator of involvement of UHC.

***Keyword:*** *family planning, universal health coverage, family planning program*

## Introduction

Universal health coverage achievement is defined as providing all people with access to needed promotive, preventative, curative, and rehabilitative quality health services while ensuring that people do not suffer financial hardship in paying for these services. The health system will not be able to achieve UHC by itself. Levels and inequalities in education, income, wealth, and power relationships in society have a bearing on the health resources available, the risk factors to which individuals are exposed, and whether or not people use the services that are available[1,2].

In recent years, integration of family planning services into broader health financing schemes and more specifically, health insurance schemes have been a primary focus for international development. Inclusion of family planning into health insurance can provide a designated, more predictable revenue stream to finance facility-based services and can stimulate underlying demand for services. [1,3].

**Correspondence author:**

m.ardian@fk.unair.ac.id

The World Health Organization (WHO) has a definition of family planning allows individuals and couples to anticipate and attain their desired number of children and the spacing and timing of their births. Family planning prevents about one-third of pregnancy-related deaths, as well as 44% of neonatal deaths. This is because the timing and spacing of pregnancies at least 2 years between births is needed to prevent adverse pregnancy outcomes[4,5]. The coverage of essential health services with a single number, as well as estimates of gaps in service coverage and more detailed analyses of levels and trends in a subset of service coverage become interesting to discuss particularly in countries which have the biggest number of population in the world [2].

Based on the World Population Review, the top five countries that have the largest number of populations in the world are China (1.433.783.686), India (1.366.417.754), the United States (329.064.917), and Indonesia (270.625.568). The current values of the UHC index of coverage of essential health services show a unique finding, some countries have good achievements and the other not in this paper it will try to compare the role of universal health coverage in supporting national family planning programs in these countries.

## Method

The study used a literature review method through an electronic search of the published literature. The data collection was done with the time limited sampling that conducted from the 2014s until the recent literature. The literatures are available in soft copies; such as PDF journals and direct reading from online journal articles scientifically proven.

A sharp search strategy in digital literature, PubMed and another electronic journal website, was applied by some keywords which obtained "role", "universal health coverage", and "family planning" in five different countries. The highlighting of program as strategy on developing family planning in the era of national health insurance.

The defined inclusion criteria of the studies consists of: (1) the definition of universal health coverage or family planning (2) the study explained the role of universal health coverage to family planning program (3) the studies showed the finding of UHC and family planning in China, India, the United State, Indonesia and Pakistan. (4) the studies included in the review were restricted to English and Indonesia languages. The result of the studies was explained in the result section and the analysis qualitatively provided in the discussion section. Then the citation process was performed by references manager as Mendeley.

## Result and Discussion

### Characteristic of Country

The table below shows the finding of characteristic in each country based on some indicators.

**Table 1: Characteristic of Country**

| Country | Population | Fertility Rate | UHC service coverage index (SDG's 3.8.1) | Family planning demand satisifed with modern methods (%) |
|---|---|---|---|---|
| China | 1.433.783.686 | 1.7 | 76 | 95 |
| India | 1.366.417.754 | 2.2 | 56 | 72 |
| USA | 329.064.917 | 1.8 | ≥80 | 86 |
| Indonesia | 329.064.917 | 2.3 | 49 | 81 |

**Involvement of UHC in Family Planning : Advocacy and Policy**

Evolution of family planning policy in China: the Chinese leader between 1949 and 1976 believed in the principle: "More people, more power" and then they got the hardships of overpopulation but the leader still believed that a larger population was better. China's total fertility rate reached more than six births per woman in the early 1960s. A serious family planning campaign began in China in 1971, commencing with the propaganda theme: "One child isn't too few, two are just fine, and three are too many. In 1973, the State Council established the Leading Group for Family Planning, which was responsible for calling a national birth planning. This family planning campaign was successful; and China's overall fertility rate declined by half between 1971 and 1978. The one-child policy was implemented, in 1979, fertility rates continued to decline. China implemented a policy of 1 child for 30 years, a two-child policy implemented since January 2016 until nowadays.

India was the first country in the world to launch a National Program for Family Planning in 1952. Under the program, the public health sector provides a variety of family planning services at various levels of the health system. "Pariwar Vikas Mission" to improve access to contraception and family planning services in the high fertility district.

The health care system in the United States is quite unique when compared to other developed countries. The United States has no uniform health system, no universal health care coverage. Recently there is a law that requires coverage of health services for all people, which is called the Affordable Care Act (ACA). Since 2013, the entry into force has gradually included provisions for the full coverage of all-female contraceptive methods determined without cost sharing. The Community Health Services Act title X family program is a US government program dedicated to providing family planning services for those in need.

In 2005, the Indonesian government committed to providing health insurance for the poor with the launch of the public health insurance program. That program has now begun a new chapter in the evolution towards universal health coverage. National health insurance is being implemented in stages, with the aim of providing universal health coverage to the entire population by 2019. Indonesia applies a two child policy.

**Health Service**

China has rapidly achieved UHC with benefits that including prevention and comprehensive curative services. In China, improvements in the health system cause the contraceptive prevalence rate of married couples to last more than 85% from 1980 to 2010[7,13–15]. In other hand, the trend of long-term reversible contraceptive methods, IUDs and implants, increased significantly in the US from 2008 to 2014, from 6% to 14%. While women who have lower incomes choose to sterilize, but the figure is quite decreased from 2008 to 2014, which is 32% to 28%[20,21].

In India, Services under the National Family Welfare program currently the family planning methods in India can be broadly classified in two categories – spacing methods. The utilization of contraceptives and distribution of the same to the States/UTs under Free Supply Scheme and through Public-Private Partnership (PPP) under Social Marketing Scheme. Services are dominated by the private sector. The Indian health system has a broad but underutilized health infrastructure. Under the National Rural Health Mission (NRHM), in 2005, Government of India introduced a cadre of female community health workers, called the Accredited Social Health Activists (ASHAs) at village level[16–19].

The services were integrated at the village-level and through multiple sectors. In the 1970s and onwards, about 35,000 salaried family planning field workers worked at the village level to promote contraceptive use and motivate and recruit women into the family planning program.There are trained field workers for family planning. Doctors, nurses, and midwives placed at the local level are encouraged to open their own private practices in the areas where they work. The KB village is expected to become an icon of the population, family planning, and family development (KKBPK) program and reach 14,838 current[11,22].

**Health Financing**

China is reforming and restructuring its health insurance system to achieve the goal of universal

coverage. In 2013, 94.5% of this population owned at least one type of public insurance, and 12.2% bought private insurance. In general, rural populations in China tend to be uninsured and are less likely to buy private insurance. There is a very large socioeconomic gap in public and private insurance coverage[23–25].

India urgently needs UHC - around 600 million people fail to access the health services they need and 63 million Indians are living in poverty because of healthcare costs. The root cause of India's health woes is its chronically low levels of public spending on health. Most Indians are forced to buy services from private providers and in particular from expensive, profit-maximizing hospitals[26].

In America, 28.5 million people remain uninsured, representing nearly 9% of the total population. For comparison, two-thirds of the insured population are covered by private health insurance with the remainder covered under public insurance. Coverage of compulsory employer contraception insurance in the US has become a controversial component of the Canestaro Affordable Care Act (ACA), 2017. Based on a Medicaid statement (as of May 2014), there are more than 2.5 million women of reproductive age who are low income and without insurance, are at risk of unwanted pregnancy and may require family planning services (unmet need) [21,27,28].

Approximately 36.8 percent of Indonesia's population does not yet have any form of health coverage, including those working in the informal sector. There were strong support and financial commitments from international donors and the Government of Indonesia to the family planning program, and there was sufficient financing for the program[11,12,29].

**Governance**

Using Kingdon's theory moved China beyond the frequently used political economy method of analyzing how reforms are introduced when political compromises are made by various stakeholders[23]. In addition, India, The Family Planning division has augmented efforts for improving quality in sterilization service provision. In 2014, Family Planning division updated the manual on Standards and Quality Assurance in Sterilization Services. The Quality assurance committees have been established across all States and districts[16,26].

The U.S, The responsibility for these two functions is shared by private insurance companies as well as the government, both of which are known in policy terms as "payers." As such, the United States can be thought of as a "multi-payer" system. The final structure and outcome of the U.S. healthcare system are unknown, these disagreements between providers, patients, insurers, and political parties will be instrumental in shaping the healthcare provided to Americans[28].

Therefore, there was a very strong political commitment from the government at all levels in Indonesia. Using strong behavior-change communications campaigns and the provision of the clinic and integrated community- based services, BKKBN facilitated the decrease in the birth rate, a decrease in maternal mortality, and contributed to the health and increased economic participation of women[11,30,31].

## Conclusion

Judging from the policies and laws on the use of national health insurance in the use of contraception, each country has its own policies in the family planning program, including determining the number of children recommended, policies in case of violations and the process of equitable national. Each country faces different problems but from the indicators, it is emphasized that the target is directed at increasing the role of the community as well as efforts to improve the quality of providers and the application of national health insurance to support family planning programs.

# A Study to Assess the Level of Knowledge on Ill Effects of Mobile Usage among Adolescents in Selected College at Kancheepuram District, Tamilnadu, India

**Renuga S[1], Alfred Sam D[1], Dinesh.J, Keerthi.G[1], Parasuraman P[1], Vijay S[1], N.Thivya[2]**

*[1]B.Sc. (Nursing) IV year Students, [2]Assistant Professor, Chettinad College of Nursing, Chettinad Academy of Research and Education, Kelambakkam, Kanchipuram dist. Tamilnadu.*

## Abstract

Mobile phone is a device used to communicate verbally all over the world who are not near to us, it is common in adolescents. Mobile phone became more and more a tool in our daily life.Therefore a study was done to assess the knowledge on ill effects of mobile usage among students at selected college,Kanchipuram district, Tamilnadu, India. Was undertaken with the objectives: to assess the knowledge on ill effects of mobile usage among students and to associate the knowledge on ill effects of mobile usage with selected demographic variables. Non experimental - Descriptive research study was conducted. The study sample consisted of total 55 adolescents. Data was analyzed by inferential statistics and presented through tables and figures. Findings revealed that Variables like, number of mobile phone is found to be significant. The number of students having moderate knowledge were 28(51%), inadequate knowledge was 20(36%) and adequate knowledge was 7(13%). Mean value 4.8 and standard deviation (SD) 1.6 are as follows.

***Key words:*** *Knowledge, attitude, ill effects, prevention*

## Introduction

Mobile phone is a small, portable communication device that enables people to make phone calls whenever and wherever they are. Signal transmission is the very basic concept for mobile phone. The convenience of mobile phone is allowing people to communicate with one another without the limitation of regions and time. The mobile telecommunication has the source of Radio Frequency radiation that produces energy; heat up the tissues.[2] During use, mobile phones usually kept close to the ear, which is very near to the brain. It is suspected that continuous use of mobile phone for longer time may damage brain tissues. Mobile phones are more injurious to people's health as compared to smoking. Mobile phones usage and brain cancer are linked to each other.[4]

Various studies indicate that the emission from a cell phone can be extremely harmful, causing tumors, memory loss, and increased blood pressure and weakening the immune system. This is alarming information, and one has to take into account all these factors.

Therefore, the present study is designed to investigate the mobile phones and also to contribute to the increase in social awareness of health problems associated with the use of this device. Problems related to mobile phones are an area which is not explored much by nurse researchers. Hence the researcher felt the need to conduct study among fourth year nursing students about the mobile phones dependence and its harmful effects on health.[3]

## Materials & Method

The methodology of research indicates the general patterns of organizing the procedure for getting valid and reliable data for investigation. Quantitative, non-experimental - evaluative approach with descriptive

research design was used in this study**.** The study was conducted at selected colleges Kanchipuram district, Tamil Nadu, India. A Simple random sampling was used to select 55 samples..The study was conducted at selected colleges, Kanchipuram District, Tamilnadu.

**Description of The Tool:**

The tool was organized into 2 sections.

Section A -- Demographic variables:

It consists of demographic data of the students -- Age in years, Gender, Type of family, Monthly income,Number of mobile phone, Type of mobile phone in your home.

Section B -- : Assess the knowledge on ill effects of mobile usage among college students.

**Study Findings**

- Regarding demographic variables

Majority of the adolescents 38(69%) with in the age group of 14-16Years.

Majority of the adolescents 29(53%) were male.

Majority of the adolescents 26(47%) were extended family.

Majority of the adolescents 24(44%) were having monthly income of 5000 and below.

Majority of the adolescents 26(47%) were using 1 number of mobile phone at home.

Majority of the adolescents 35(63%) were using basic mobile phone at home.

Hence it is stated that there is significant association between the level of knowledge with selected demographic variables of adolescents like number of mobile phones at home on ill effects of mobile usage. With regard to the hypothesis $H_2$ is accepted.

- Regarding Knowledge level

13% had adequate knowledge, 46 % had moderate knowledge, 33 % had inadequate knowledge. Overall mean and SD of mothers with related to knowledge aspects, From the above discussion, it is seen from the results that the highest mean score noticed is 4.8.

- Regarding Association: The findings shows that there was significant association between demographic variables (number of mobile phone at home) and there was no significant association between demographic variables ( age in years, gender, type of family, monthly income, type of mobile phone in your home on ill effects of mobile usage among adolescents).

## Conclusion

The current study provides an update and more inclusive data on Ill effects of mobile usage students in Tamilnadu. A significant variation between male and female students in their ill effects of mobile usage observed. Interventions should consider the gender differences to prevent a Ill effects of mobile usage for college students in Tamilnadu.

# Learning of Patient Identification in Patient Safety Programs Through Clinical Preceptor Models

**Roymond H. Simamora**

*Faculty Of Nursing, Universitas Sumatera Utara, Jalan Prof. T. Ma. As. No 3. Medan Indonesia*

## Abstract

Clinical Preceptorship Learning Model is a learning model that is implemented in hospitals with guidance supported by guidance, assistance for nursing students, who are currently educating in hospitals. A clinical Preceptorship implementation model that will determine learning competence and also patient safety planning. This research is a type of quantitative research with research. Data collection is done by collecting and distributing questionnaires. Respond to 114 nursing students with total sampling techniques. Data processed by the Spearman test. The results showed that the application of the clinical Preceptorship model was expressed well (89.5%), and the application of patient safety learning was stated to be good (91.2%). The p value of 0.024 shows the relationship between the clinical Preceptorship implementation model and the implementation of the patient safety program and the OR value: 0.298. shows the strength of weak relationships and the direction of positive interactions. Continuing Education Development for Preceptorship Clinics is needed, through Training and also Certification so that the application of this Learning Model can support the goals of nursing education, and the goals of nursing care services available in hospitals

***Keywords****: Identification of patient, Patient Safety, Model, Learning, Nurse, Preceptorship, Student*

## Background

Several studies in the world regarding patient safety studies that cause one patient[1]. Problems that occur in Indonesia. Indonesia reports quite high patient safety issues. Report from the Hospital Safety Committee[2]. The results of a survey of 30 hospitals in Indonesia that show a supportive attitude towards patient safety that supports commitments that are still low[3]. Students are involved in the service process to support patient safety reporting. Data from the Joint Commission International (JCI) shows that there are 13% of surgical errors and 68% of blood transfusion errors[4]. Patient Safety Incident Data published by HPSC (Hospital Patient Safety Committee) in Indonesia contains 114 patient safety reports in 2009, 103 reports in 2010, and 34 reports in 2011 in the first quarter[5]. Patient safety incidents in hospitals will adversely affect hospitals, staff, and patients as service recipients. The impact is a decrease in the level of public trust in Flynn's health services[3].

Nursing students are people who must be the foundation in starting or triggering nursing attitudes. As prospective nurses who will participate directly with patients who participate in providing nursing care, students undergoing an educational process in nursing must complete training in the care of patients who require future care assistance. In the process of education, nurses successfully encourage and assist students in developing nursing skills[6]. Nursing students who practice in hospitals can also make mistakes. Students as individual factors oppose the quality of care and patient safety[7]. Students need to implement and implement a patient safety program so as to prevent injury to patients. Implementation of a good patient safety system by students, then mistakes can be avoided. The integration of the patient safety learning process in the implementation of nursing care for patients needs to be improved with the help of clinics[8]. Suryani's regarding the implementation of patient safety by University X students still occur errors including errors in the flow of assistance one injection drug[3]. The patient recovered in shock, but was immediately approved and resolved immediately so that the patient could be helped. The mistakes made by students at that time were not accompanied by the perception clinic,

because the perception clinic was preoccupied with managerial and management activities for patients who were concurrently held, so guidance for students became less than optimal. Statistical test results obtained from a significant relationship between the perception clinic and patients in Y Hospital[3].

Recommendations from the results of the study include the role of clinical perception and implementation of patient safety by students[9]. The six goals of patient care based on JCI researchers only discuss 5 of the 6 patient safety goals because in their fields professional students are limited in terms of competence and opportunities in doing things to ensure a place, truly procedures, and truly surgical patients. Nursing students who practice in hospitals can also make mistakes. Individual factors derived from students are related to the quality of care and patient safety[7]. Implementation of a good patient safety system by students, then mistakes can be avoided. Students need to integrate patient safety into the learning process carried out on patients with guidance from the perception clinic[8]. Perception clinics are very successful in the process of clinical learning and competency success[8]. Perception clinics guide students, treat patients, and often play many roles including facilitators, trainers, mentors, role models, and evaluators.

## Method

Cross sectional design in this study. This study used a sample of 114 nurses from the Universitas Sumatera utara Faculty of Nursing at Universitas Sumatera utara Medan Hospital. The instrument used consisted of three types, namely questionnaire A about demographic data consisting of age, gender, while the second instrument was questionnaire B about the role of clinical perception consisting of 9 items, including as a facilitator, trainer, educator, role model, evaluator. Meanwhile, the initial instrument, namely questionnaire C about the implementation of patient safety programs by students, consisted of 10 items. Item included; Improve patients properly, improve effective communication, increase the safety of drug use that requires high vigilance, reduce the risk of safety by health workers, reduce the risk of falls. The results of the trial instrument in questionnaire B with Cronbach's Alpha 0,607, while in questionnaire C with Cronbach's Alpha 0.746. Data analysis was performed using the Spearman statistical test. This research has passed an ethics test from the nursing ethics committee of the USU Faculty.

## Result

Univariate Analysis Characteristics of respondents (students) Characteristics of respondents (students) based on the results of research conducted by adult students, women. Of the 114 respondents, based on gender, the largest results obtained were 72 students with a percentage (63.2%) and the average age of students was 22 years with 66 students with a percentage of 57.9%. For the implementation of the clinical Perceptor model in the clinical Perceptor role meeting needs to be categorized well by as many as 102 students with a percentage (89.5%). Implementation of the Patient Safety Program by Students shows that the implementation of patient safety programs by students approves the blessings of 104 students with a percentage (91.2%). Statistical test results showed that there was a significant relationship between the clinical Perceptor implementation model and the implementation of patient safety by nursing students, as evidenced by a significant p value of 0.024 ($p < 0.05$) which showed there was a relationship between the clinical Perceptor implementation model and the implementation of patient safety programs. Spearman rating value of 0.298 indicates the strength of weak relationship and positive direction, meaning the better implementation of the clinical Perceptor model, the better the implementation of the professional student patient safety program in taking patient safety measures.

## Discussion

Statistical test results using the Spearman rank test found the implementation of the clinical Perceptor model both with the implementation of a good patient safety program of 48 students. Statistical results show that the results obtained significance of 0.024 (p value <0.05). From the results of the analysis also obtained the value of OR = 2.098, meaning that with the implementation of the clinical Perceptor model that is less, then students risk 2.098 times greater to carry out patient safety with less than the role of a good supervisor. The results, research entitled Patient Safety in Nursing Education said that the study was conducted by 24 respondents with only 12 qualified nurses found that there was no attitude of the supervisor's role in handling patient safety

risk. At the RSUPN. Dr. Cipto Mangukusumo Jakarta stated that there was a significant relationship between the role of the chief information room and the success of the nosocomial infection control efforts[10]. Clinical counselors involve patients in the learning process to students but must maintain and protect patients[11]. That the role as a professional nurse is the role as a provider of nursing care to patients, ranging from the ability to conduct assessments to conduct evaluations to patients and the ability to provide feedback with patients[16]. A role is a set of behaviors that are expected to arise from someone related to the task in society. Clinical counselors are selected medical teams, experts in clinical practice who request assistance and direct the learning process according to learning objectives[12].The results of research with observations in the preliminary studio show the role of clinical advisors who are difficult to accompany associate students when taking action, students not only have clinical competence but also assist when taking action, increasing the supervisor's intensive is also a supporting factor. The role of the clinical supervisor as a role model or provide examples for students to explain and demonstrate techniques related to the implementation of patient safety programs. Role role model is the expected role of clinical counselors that contain relationships and positive attitudes[13]. If the role of clinical advisors is less than the guidance process and goals will be less than optimal regarding patient safety programs that implement six patient safety goals[2]. Students during practice at the hospital can take care or direct action to patients[14]. The role of the clinical supervisor will determine specific learning competencies related to patient safety. That clinical counselors who have good knowledge and skills will be able to help students to gain knowledge and skills[17]. Clinical counselors have a large participation in the clinical learning process for students to achieve learning goals[15]. The results of the statistical analysis in this study are about the role of the clinical supervisor who has a relationship with the patient administration program related to students, with a positive thing, this is related to the increase in the level of the role of the clinical supervisor so that the higher level of implementation of the patient safety program as well. The results showed positive and the results between the two significant variables with a p value: 0.024 it can be concluded that the research hypothesis was accepted, so it was assumed to use a clinical perception model the better the better the implementation of research by students.

## Conclusion

This study produced conclusions involving a model ofclinical Perceptor implementation with the implementation of patient safety programs by nursing students. Clinical trials with the implementation of patient safety programs by nursing students, to assess, study, improve and encourage for clinic perception and also improve student academic can improve quality and improve student discipline in terms of patient safety. Suggestions The results of this study can also be used as an evaluation material for the management of Universitas Sumatera Utara hospital training to assess the implementation model of clinical perception and pay attention to aspects needed by nursing students while implementing nursing practice for nursing profession education Patient safety by nursing students to improve nursing quality.

# Effectiveness of Structured Teaching Programme on Pulmonary Rehabilitation among Patients with Chronic Obstructive Pulmonary Disease

**S.Eswari[1], Pushpakala K.J[2]**

*[1]M.Sc (Nursing) Student, [2]Associate Professor., Department of Medical Surgical Nursing, Chettinad Hospital and Research Institution, Chettinad Academy of Research and Education, Kelambakkam, Kanchipuram District, Tamil Nadu*

## Abstract

A quasi experimental research design was adopted for the study. The study was conducted in tertiary hospitals of kanchipuram district. The sample of the study well COPD (who are fulfilled the inclusion criteria between the age group of 25yrs -55yrs) the purposive sampling technique 56 samples are experimental group and 56 are considered control group. the data collection instrument was the structured interview to assess the knowledge on pulmonary rehabilitation the results revealed that in the post test of the experimental group, the overall mean 39.46 with SD: 0.738 in control group the overall mean 17.52 with SD 3.722 the impaired T-test value was t=37.808 experimental group the T=3.810 control group its depicts the + there is significant difference between the experimental and control group so that the computer based education is effective the past test of dyspnea scale in experimental group over all mean 0.58 with SD: 0.499 in control group over all mean 1.63 with SD:1.396. the impaired T test value was t=14.402 experimental group. The T=1.264 control group based education programme effective. The past test of cat scale in experimental group mean 9.21 SD=2.213, control group cat scale mean 25.88 SD=5.596 increased control group effective.

## Introduction

When a child is born, it cries to take its first breath which continues till death. The respiratory process is thus vital for human survival. The lung takes the important role in maintaining respiration from the birth. As the child grows the lung capacity and function also improves, but due to many factors the vital part corrupted. Respiratory problems are widespread in current scenario due to pollution,Climaticchanges,allergy etc[1].

The human respiratory system not only provides oxygen to each cell of the body but also removes body wastes, filters out infectious agents, and provides air needed for speech. Although the lungs are able to withstand abuse in the form of smoke and other pollutants, a number of disorders impair its function[2]. Some of these maladies are temporary and relatively harmless while others may be life-threatening. Any chronic breathing problem or other cough should be checked [3]. Respiration in simple terms is the act of breathing, a vital function of the body which helps to supply oxygenated blood to the various organs, and aids in elimination of carbon dioxide from the body [4].

Chronic obstructive pulmonary disease is a type of obstructive lung disease where the airways become damaged causing them to narrow.[5] The world department reported that chronic obstructive pulmonary disease is an umbrella term for diseases that impair lungs and leave people feeling breathlessness. Currently 64 million people are affected with COPD worldwide, in India

**Corresponding Author:**

Chettinad Hospital and Research Institution, Chettinad Academy of Research and Education, Kelambakkam, Kanchipuram District, Tamil Nadu.

almost 24 million adults who are over the age of 40. Chronic obstructive pulmonary disease is predominantly a disease of men and only 40% of cases in India occur among women. Much more than a smoker's cough, it will become the 3rd leading cause of death by 2030.[6]

Pulmonary rehabilitation plays a key role in the management of chronic obstructive pulmonary disease. Health-related quality of life outcomes related to pulmonary rehabilitation explores five themes: optimizing pulmonary rehabilitation components to improve health-related quality of life , characterization of a responder phenotype, suitability of pulmonary rehabilitation following acute exacerbations, exploration of psychological and behavioral mechanisms explaining pulmonary rehabilitation benefits, and long-term maintenance of health-related quality of life benefits after pulmonary rehabilitation.[7] pulmonary rehabilitation is a multidimensional continuum of services, directed to persons with pulmonary disease and their families usually by an interdisciplinary team of specialists, with the goal of achieving and maintaining the individual's maximum level of independence and functioning in the community. Pulmonary rehabilitation improve the sense of control of a patient over their disease, as well as their emotions.[8]

A qualitative study was conducted on "self-management behaviors for patients with chronic obstructive pulmonary disease, among 18 patients in College of Nursing, Taiwan. The study concluded that the participants are experts on their lives and, as such, they adopt appropriate disease control behaviors, based on their experience, knowledge, as well as integrate the illness and its symptoms into their lives.[9]A study conducted on "effects of home-based pulmonary rehabilitation in patients with COPD" in Canada. A sample of 252 cases were selected and questionnaire dyspnea sub scale analysis was done. The study reveals that after 4 weeks of education programme, patient took part in home based rehabilitation or out patient, hospital- based rehabilitation for 8-weeks. The study results revealed that both interventions produced similar improvements in the chronic respiratory questionnaire dyspnea subscale; improvement in dyspnea of 0.62 (95% CI, 0.43 to 0.80) units in the home intervention (n=107) and 0.46 (CI, 0.28 to 0.64) units in the outpatient intervention (n= 109). The study concluded that home rehabilitation is a useful, equivalent alternative to outpatient rehabilitation in patients with COPD.[10]

## Methodology

### Research Approach

A quantitative evaluative research approach was considered appropriate for the present study was conducted effectiveness of structured teaching programme on pulmonary rehabilitation among patients with chronic obstructive pulmonary disease in selected tertiary hospital, kanchipuram district,Tamilnadu,India.

### Research Design

A quasi experimental study, Pretest and Post test design.

### Research Setting

The present study was conducted at pulmonary and Medical outpatient departments, Wards, Chettinad hospital and research institute, Kanchipuram district, Tamilnadu.

### Population

The population of the present study comprises of patients with COPD who were attending the Pulmonary and Medicine Outpatient department and admitted in wards in a selected tertiary hospital, Kanchipuram District, Tamilnadu.

### Sample Size

The total sample used for the study was 112 patients with Chronic Obstructive Pulmonary disease. The assigned samples in experimental group 56 and control group 56.

### Sampling Technique

Purposive sampling technique was used for the study.

Sampling Criteria

Inclusion Criteria

- Patients with chronic obstructive pulmonary disease who are willing to participate in the study and present at the time of data collection.

- Patients with chronic obstructive pulmonary disease who can understand Tamil or English.
- Both male and female patients.

**Exclusion Criteria**

- Patients with Chronic obstructive pulmonary disease who are seriously ill.

**Description of the Tool**

**Section A**

The structured questionnaire consists of closed ended questions to elicit the information on demographic data. It consists of demographic variables like a age, gender, education, marital status, occupation, history of smoking, co morbid conditions and BMI.

**Section B**

Knowledge questionnaire regarding pulmonary rehabilitation.

**Section C**

Modified Medical Research Council Dyspnea Scale comprises of 5 statements regarding Breathlessness. Grade>2 or equal is consider as High risk.

**Section D**

COPD assessment test is a standardized scale which includes 8 subjective statements regarding symptoms of COPD. If score >30 is consider as very high risk. Score<10 is consider as low risk.

**Section E**

Structured teaching programme on Pulmonary rehabilitation refers to educating the chronic obstructive pulmonary disease patients on breathing retraining and bronchial hygiene technique, respiratory muscle training, nutritional counseling, guidelines for cessation of smoking, alcohol and beverages, stress relaxation techniques for 30 Minutes.

## Method of Data Collection

112 patients with COPD was selected using simple random sampling technique. Among Patients with COPD in Pulmonary unit considered as Experimental group and Medical unit patients considered as control group to prevent sample contamination. The objective of the study was explained and Informed consent was obtained from both the groups. Demographic data was collected by using structured questionnaire, Breathlessness and COPD patient quality of life was assessed by using standardize scale such as CAT assessment and mMRCdysnea scale. The experimental group was divided and was given Structured teaching programme on Pulmonary rehabilitation for 30 minutes on Day1 and Day 8. The Post test was assessed on day 15 in both experimental and control group. The nurse investigator thanked the participants for their cooperation throughout the data collection period.

## Statistical Analysis

A statistical software programme (SPSS) was used for data analysis. Descriptive statistics was used to analyze Frequency, Percentage, and Mean in all the aspects such as demographic variables, level of knowledge among experimental & control group. Chi-square used to identify the association between the selected demographic and the level of knowledge.

## Results and Discussion

The majority (54%) patients were in the age group of 36-45yrs in experimental group. In control group majority (57%) of patients were in the age of 46-55 years. The mean age and Standard deviation as 43.51(6.65) in experimental group and 46.14(5.95) in control group. The majority 96 % of the patients were married in experimental group and 98% of the patients were married in control group.57% of the patients were in the primary school in experimental group and In control group majority 53% of the patients were primary school. Majority 53% of the patients were private employee in experimental group, In control group majority 54% of the patients were private employee.43% of the patients were getting below Rs. 8000 in experimental group and control group majority 61% of the patients were getting Rs.8001-12000.63% of the patients were not having habit of smoking and 27% of them having history of smoking in experimental group. In control group 80% of the patients were not having habit of smoking and 20% had habit of smoking. The majority i.e.57% of the patients having obstructive sleep apnoea, 23% of them were having hypertension and 20% of them were having

diabetes in the experimental group. In control group majority 54% of the patients were having obstructive sleep apnoea, 34% of them were having hypertension and 12% of them were having diabetes. The majority 57% of the patients was having COPD for the past 4-5 years and In control group majority 71% of them were having 4-5 years. The majority 88% of the patients were normal weight, In control group majority 86% of the patients were normal weight, The mean BMI and Standard deviation as 25.08 + 2.77 in experimental group and 23.39 + 3.24 in control group.

The study findings showed that majority of the patients pre and post test level of knowledge in the experimental and control group. The pre test mean value of knowledge as 16.79 and standard deviation 4.499 post test level of mean 39.46 and standard deviation 0.738 the value of t is -37.80 which has statistically significant at $p<0.001$ in experimental group. control group the pre test mean as 15.07 and standard deviation 3.562 and the post test mean as 17.52 and standard deviation 3.722 the value of t is -3.810 which has statistically significant at $p<0.001$ in control group. In experimental group, CAT score depicts the pre test mean value as 24.38 and standard deviation 3.333 and post test level of mean 9.21 and standard deviation 2.213 the value of t is- 31.454, where as in control group the pre test mean as 24.05 and standard deviation 3.544 and post test level of mean 25.88 and standard deviation 5.596 the value of t is -2.743 which has not statistically significant at $p>0.001$. In experimental group, Dyspnea grade depicts the pre test mean value as 1.98 and standard deviation 0 .522 and post test level of mean 0.57 and standard deviation 0.499 the value of t is- 14.402, where as in control group the pre test mean as 1.88 and standard deviation 0.605post test level of mean 1.63 and standard deviation1.396 the value of t is-1.264 which has not statistically significant at $p>0.001$. A study aimed to determine the effects of a comprehensive eight-week pulmonary rehabilitation program on the physiologic response to and performance of ADLs in patients with COPD. Methods Before and after pulmonary rehabilitation, 31 patients with COPD (71% men; mean age: 64.2±8.4 years; mean $FEV_1$: 54.6±19.9% predicted) performed physical function tests, the Canadian Occupational Performance Measure (COPM) and an ADL-test.After rehabilitation, patients with COPD used a significantly lower proportion of their peak aerobic capacity and ventilation to perform ADLs, accompanied by lower Borg scores for dyspnea and fatigue.The study concluded that the comprehensive pulmonary rehabilitation program can improve the physiologic response to and actual performance of ADLs in patients with COPD[11].

A study conducted on "education in pulmonary rehabilitation: the patient's perspective" in Ireland. A sample of 32 patients with COPD were selected and educated about pulmonary rehabilitation. The study reveals that patients had deficit knowledge, understanding and management of their disease. So the researcher educated about management of breathlessness, management of exacerbations, medications, and psychological support, welfare and benefits systems. The study concluded that subject's gained knowledge regarding pulmonary rehabilitation after pulmonary rehabilitation education programme.[7]Both the study results reveals that there was a significant difference between the pretest and Post test level of knowledge and CAT score and dyspnea Grade in the experimental group which indicates that pulmonary rehabilitation can be implemented in management of patients with COPD.

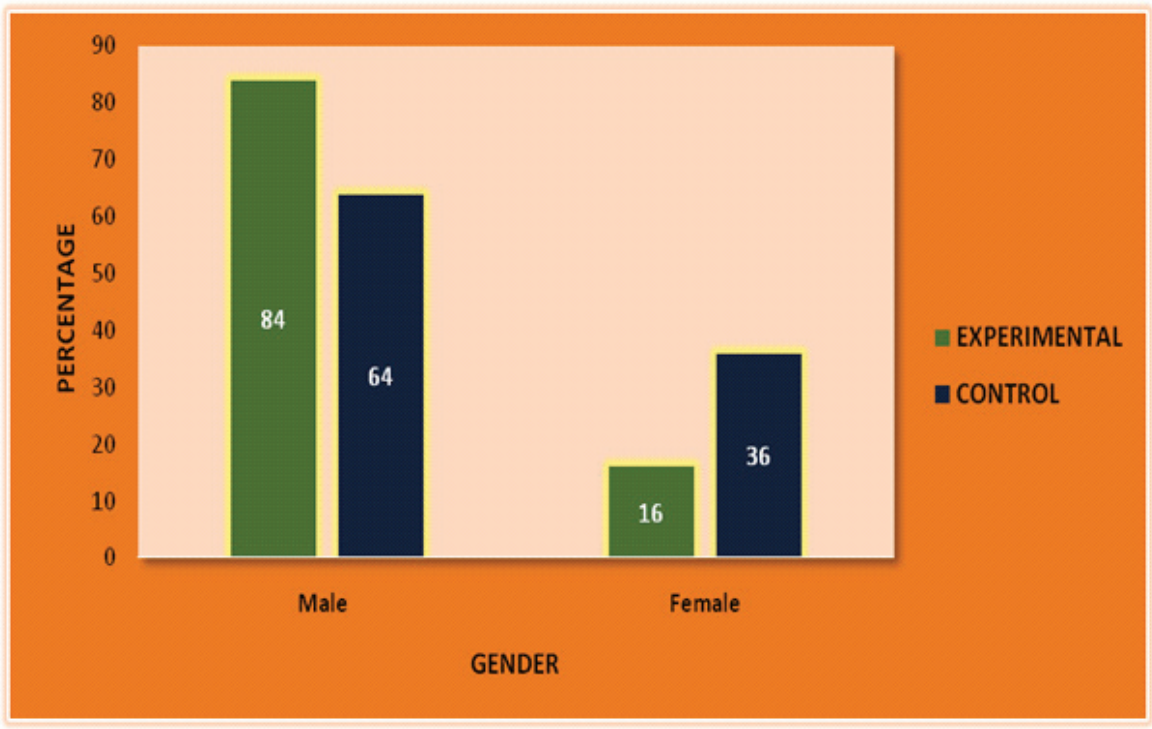

**Fig: Percentage distribution of samples with reference to gender**

| GROUP | PARAMETERS | PRETEST | | POST TEST | |
|---|---|---|---|---|---|
| | | Mean | SD | Mean | SD |
| **Experimental** | Knowledge level | 16.79 | 4.499 | 39.46 | .738 |
| Control | | 15.07 | 3.562 | 17.52 | 3.722 |
| Experimental | CAT score | 24.38 | 3.333 | 9.21 | 2.213 |
| Control | | 24.05 | 3.544 | 25.88 | 5.596 |
| Experimental | Dyspnea scale | 1.98 | .522 | .58 | .499 |
| Control | | 1.88 | .605 | 1.63 | 1.396 |

**Mean and Standard Deviation regarding pre and post-test level of knowledge on Pulmonary Rehabilitation, CAT score and dyspnoea Grade among patients with chronic obstructive pulmonary disease in experimental and control group.**

## Conclusion

Based on the findings of the study the conclusion was drawn. Pulmonary rehabilitation was found to be effective in improving the level of knowledge and reducing CAT scale score and dyspnea grade among patients with chronic obstructive pulmonary disease. The findings of the study revealed that there were significant increase in the level of knowledge and reducing CAT scale score and dyspnoea grade among patients chronic obstructive pulmonary disease in experimental group after pulmonary rehabilitation and minimal changes in level of knowledge, cat scale and dyspnoea scale in the control group who was on usual routine care. On the basis of this the research hypothesis was accepted.

# Nicotine Adds Risk Factors to the Cardiovascular System and Increases Mortality and Sudden Cardiac Arrest

**Salah Abd- Al kader Omran**

*M.Phil.med.cardiologst*, *College of Medicine, Al- Muthanna University - Iraq*

**Abstract**

The Work began on 7th of January 2019 and for 9 months in General Academic Hospital and Specialized Center for Diabetes and Chronic Diseases on smokers patients in Iraq collecting patient history and duration of smoking (modern, chronic smoking) and on non-smokers and patients. After the collection of analyzes more patients than the **First Group**: of young patients older than> 25 years suffer from tension headache, polycythemia (Increased hemoglobin blood ), Psychology, variant angina, Hypertension, respiratory disease, high triglyceride (TG), shortness of breath so the effect of smoking, pollution and nicotine on patients with chronic youth were evident smoking results : 30% of them have arrhythmias 15% increased Lipid ( LDL,HDL, TG, Cholesterol), 10% psychology, 10% polycythemia (Increased hemoglobin blood ), 10% Coronary disease, 20% Respiratory diseases, 5% High blood pressure, 5% depression. The **Second Group**: are older than> 40 years of chronic smoking and are suffering from atherosclerosis and high blood pressure, Ischemic heart disease, Respiratory diseases in addition to malignant tumors of the lung, heart rhythm disorders, polycythemia, Pulmonary heart disease, The appearance of cancerous tumors inside the mouth and lip, ( MI) myocardial infarction , ACD ( Acute coronary syndrome), So the results were: 20% Arrhythmias, 10% coronary artery disease, 3% polycythemia (Increased hemoglobin blood), 25% chest and respiratory diseases, 9% drug-resistant diabetes, 3% lung and oral cancers, 2% ASD, MI, 18% Increased lipid, 5% depression, In addition to emergencies sudden cardiac death that require the patient to enter Intensive Care Unit and the work of cardiac catheterization to ensure patient safety. Compared to people 65 patient who do not smoke cigarettes there is no aggravation of risk factors and a threat to people's lives directly. Patients are under control of their risk factor Leading to death.

***Keyword:*** *Cigarettes, nicotine, factor risk, Coronary heart disease, atherosclerosis, Electrocardiographic ( ECG), adult population smoke cigarettes. The environment, tobacco.*

## Introduction

**C**igarette smoke contains more than 9,000 chemicals, and greater than 69 known carcinogens, the type of nicotine found in tobacco plants, comes from the nightshade family[1], In this applied scientific work at Academic Teaching Hospital in Samawah, Iraq because of its importance and human value to drive the specter of death and the threat of human life from the harm of smoking and toxic substances carried by cigarettes and tobacco **,** cigars, pipes or water pipes (Hookahs) And chewing tobacco in the mouth , In addition to containing toxic substances Nicotine, Carbon monoxide, Tar, Carbon[2]. Represents an essential risk factor plus chronic conditions, such as cardiovascular disease (CVD), cancer, chronic obstructive lung disease, asthma and diabetes[3]. Smoking cessation is one of the few interventions that can safely and cost- To minimize mortality and morbidity, We focused on research cardiovascular disease ,Cigarette Smoking markedly increases the risk of acute coronary, including myocardial infarction, stroke and sudden death[4]. Smoking accelerates atherogenesis producing premature atherosclerosis in epicedial coronary arteries, the aorta, carotid, and cerebral arteries, as well as peripheral circulation. Other cardiovascular effects of smoking include aggravation of stable angina pectoris, intermittent claudication, vasospastic angina, and restenosis after thrombolysis or angioplasty of coronary or peripheral arteries[5]. Cigarette smoking also promotes progression/aggravation of heart failure, chronic kidney disease and cardiovascular morbidity and mortality in people with chronic kidney disease and increases

the risk of developing atrial fibrillation. So Smokers experience acute myocardial infarction on average at a younger age than nonsmokers, and myocardial infarction is associated with more thrombus and less severe underlying atherosclerosis. Paradoxically, smokers who quit smoking after myocardial infarction have a much better prognosis than non-smokers because they have less severe underlying atherosclerosis and multiple reversible pathophysiological adverse effects caused by smoking[6,7,8]. The aim of the study is to reduce sudden heart disease (SCD) for different ages and to eliminate human life-threatening risk factors and to protect society morbidity and premature death to determine the effect of smoking and smoking cessation among people, coronary artery disease and early atherosclerosis, we assessed the future relationship between the amount Cigarette smoking (status, amount of cigarettes smoked daily, duration of smoking and early heart disease).

## Materials and Method

Work began on 7 January 2019 for 9 months at the General Academic Hospital and the Specialized Center for Diabetes and Chronic Diseases on smokers who collect patient history and duration of smoking (modern and chronic smoking) and on non-smokers and patients attending 915 patients were randomly assigned to both men and women to review clinics Hospitalization, Internal Medicine, Cardiology, Diabetes and Chronic Diseases. Who do not smoke cigarettes only risk factors and diseases around them, examine patients and perform laboratory tests for patients to control heart disease and chronic diseases : HbA1c, RFT, profile fat, CPK-MB, CBP, AST, ALT , Electrolyte blood, Vit -D, ECG, Holter ECG, Treadmill ECG, cardiac enzyme examination, lung function test, taste of stress, pulse, pressure, HR , Sonar (ultrasound) and echocardiography, chesr-x-ray, after collecting analyzes more than patients from the **first Group** young patients over > 25 years of age Suffer from tension headaches, polycythemia, psychology, variant angina vasospastic , high blood pressure, respiratory disease, high triglycerides (TG), dyspnea smoking, pollution and nicotine in patients with chronic youth the results of smoking were clear: 30% of them had arrhythmias, 15% fat gain, 10% psychology, polycythemia By 10%, 10% from coronary artery disease, 20% from respiratory disease, 5% high blood pressure, 5% depression. **Group II:** greater than > 40 years of chronic smoking and suffering from atherosclerosis, hypertension, ischemic heart disease, respiratory diseases, as well as malignant lung tumors, heart rhythm disorders, polycythemia, pulmonary heart disease, the appearance of cancerous tumors inside the mouth and lips, coronary artery disease, so the results were: 20% arrhythmia, 10% coronary artery disease, 5% polycythemia, 25% of chest and organ diseases Respiratory, 9% of drug-resistant diabetes, 3% of lung and mouth cancer, 2% ASD, MI , 21 % increase in fat, 5% of depression, In addition to sudden emergencies cardiac death that requires the patient to enter the intensive cure unit treatment and perform cardiac catheterization To ensure patient safety. Compared to 65 people who do not smoke cigarettes, there is no exacerbation of risk factors and a direct threat to people's lives. They are safer in life for patients under control of the risk factor that leads to death

**pharmacology the nicotine:** Nicotine is a tertiary amine composed of a pyridine and a pyrrolidine ring. Nicotine can reach the brain in as little as **10** seconds after being inhaled. In the body, the half life or nicotine is around **2** hours**..** Once within the blood stream, nicotine travels to the brain where it binds to and activates receptors called cholinergic receptors. These receptors are abundant in the brain as well as in other areas of the body such as the muscles, heart, adrenal glands and other vital organs. Normally, these receptors are activated by the neurotransmitter acetylcholine which is produced at nerve endings in the brain and in the nerves of the peripheral nervous system. Acetylcholine stimulation of the receptors is involved in maintaining healthy respiration, heart function and muscle movement as well as cognitive functions such as memory. Since nicotine has a similar structure to acetylcholine, it can activate the cholinergic receptors.

**Common Side Effects:** Toxic effects of nicotine, Effect on coronary arteries, (ECG (electrocardiogram )

Deaths increase from sudden cardiac arrest (cardiac arrest). In fact, an electrical defect is attributed to heart diseases or heart diseases, or the exacerbation of the risk factors resulting from chronic diseases. Most cases, especially young people, accelerate the heart rate for many reasons, which shows (ECG) aerial fibrillation (AF), SVT supraventricular tachycardia, wolff-parkinson, VT

ventricular tachycardia) In addition to cardiac disturbances, either at the age of 40 years, heart disorders, ventricular hypertrophy of high blood pressure, Ischemia heart disease coronary plaque..) Early and periodic examination is to reduce and treat heart disease and eliminate risk factors that may lead to death.

## Results

In the research we provided clear evidence of smoked exposure to cardiovascular disease. The risk of cardiovascular disease increased dramatically with age , We calculated the long-term risks of death from smoking for individuals of different ages and smoking status in terms of excess deaths that smoking contributed to, in addition to the primary deaths resulting from the same diseases caused by factors other than smoking using standard life schedule procedures. Because mortality data for specific categories of smoking were only available from future studies, we expanded their range to death levels. We have assumed, for lung cancer and heart disease among the most interested in expelling the specter of death, that death rates among non-smokers have not changed, and for other diseases related to smoking, the risk of death for smokers compared to non-smokers is clear. The possibilities resulting from alternative assumptions were also investigated and presented. Up to a third of heavy smokers who are 35 years old before the age of 80 will die from diseases caused by smoking. So according to the results first group young patients over > 25 years 30% of them had arrhythmias (arrhythmias, Palpitations, sinus arrhythmias, bradycardia, tachycardia, ventricular tachycardia, ectopic), 15% fat gain (LDL, HDL, TG, cholesterol), 10% psychology, polycythemia By 10% (increased hemoglobin blood), 10% from coronary artery disease, 20% from respiratory disease (chest, Lung, stomach and colon)), 5% high blood pressure, 5% depression , Group II: greater than > 40 years of chronic smoking 20% arrhythmia, 10% coronary artery disease, 5% polycythemia (increased hemoglobin in the blood), 25% of chest and organ diseases Respiratory, 9% of drug-resistant diabetes, 3% of lung and mouth cancer, 2% ASD, MI, 21 % increase in fat (LDL, HDL, TG, cholesterol), 5% of depression.

## Discussion

The risk of sudden cardiac death in smokers increases compared to non-smokers compared to the risks of myocardial infarction[9,10]. This may result from the combined effects of ischemia and the effects of nicotine irregularity[11]. The release of nicotine catecholamine can contribute to ventricular tachycardia and lethal fibrillation, therefore, I am using it in research to assess the important effects that the starting age of the individual cigarette smoking cycle can have and the health effects: (a) nicotine dependence, (b) number Cigarettes that are smoked daily (smoking intensity), (C) (likelihood of quitting smoking) or conversely, the likelihood of keeping a smoker), and (4) health outcomes. These four factors are closely related[12,13]. The dependence of nicotine is closely related to the smoking intensity, and both procedures in turn are linked to the possibility of remaining a long-term smoker. Factors: smoking intensity (number of cigarettes per day) and duration of smoking yen (number of years of smoking), as well as the effects of a lifetime cumulative exposure to cigarette smoking[14,15]. Much of the harmful health effects of cigarette smoking depends on a dose, we provide an automatic explanation of how a very early age from the beginning can strongly participate in the health effects of smoking that you mediate by increasing your exposure to cigarette smoke[16]. Cigarette smoke, and therefore, due to the relationships between dose and response, is expected to increase the risk of smoking diseases and deaths caused by smoking[17,18,19]. Another negative consequence of starting smoking at a young age is that tissues and organs of organs that are still in ripening and maturity may be particularly exposed to toxic substances in smoke[20,21], so that a certain dose of exposure to cigarette smoke is more harmful when exposed occurs during childhood and adolescence[22,23]. Puberty.

## Conclusion

Smoking cigarettes greatly contributed to the population burden of many of the leading causes of chronic disease deaths that usually occur in late and late adulthood, such as cancer, cardiovascular disease and chronic obstructive pulmonary disease , SCD indicates sudden cardiac death; and CHD, coronary heart disease (angina, myocardial infarction [MI], or coronary revascularization); Therefore, quitting smoking has an economic benefit, reducing medical effort, reducing deaths and spreading healthy culture among people.

# The Effect of Abuse of Some Anabolic Steroids on Hormonal and Testicular Function in Male Rats

**Salah M.M. Al Chalabi[1] Rashaa F. Abdul-Lattif[2] and Haylim N. Abud[3]**

*[1]Assistant Prof., Biotechnology Research Center, Al-Nahrain University. Iraq, [2] Lecturer, University of Baghdad, College of Education Ibn Al-Haitham, Baghdad, Iraq, [3] Assistant Prof., Al Karkh University of Science, Department of Microbiology, Baghdad, Iraq*

## Abstract

Anabolic androgenic steroids are complex molecules contain innate male hormone, the prolonged uses of these molecule cause destructive effects on health, thus, the investigation goals of this study to clarify the effect of high doses of anabolic steroids on follicle stimulating hormone (FSH), luteinizing hormone (LH),), testosterone hormone, prolactin and estrogen hormones levels, sperm parameters (sperm count, motility, abnormality and viability), also to clarify the effect on body **,**Epididymis and test weight. This study was carried out by treating rats with a high doses of anabolic steroids (testosterone and nandrolone) hormones. After 35 days of treatment ,the result indicated that ,there was a significant decrease in FSH,LH and testosterone hormones level while prolactin and estrogen will be increased, Although there was a significant decrease in sperm count ,motility and viability while abnormality will be increased ,body and test weight show statistically decrease.

***Key words:*** *Anabolic androgenic steroids, testosterone, prolactin*

## Introduction

Anabolic androgenic steroids (AAS), are a complex group of molecules that include both steroidal androgens such as testosterone and its related-precursors (dehydroepiandrosterone, androstenediol and androstenedione) as well as many different synthetic compounds, physiologically produced by adrenal cortex and Leydig cells in men and by corpus luteum, preovulatory follicles and adrenal cortex in women, testosterone is the major anabolic hormone in the human body [1–3], and original AAS. It functions by penetrating the cellular membrane of target cells and binding to an intracytosolic molecule [4]. The testosterone effects can be divided into two types: anabolic and androgenic. The anabolic effects include increased bone metabolism, muscular growth, collagen synthesis and nitrogen fixation. The androgenic effects include effects that correlated with male puberty such as effect on the hair growth, reproductive tract function, and sebaceous gland activity [5].

Beside the use of AAS in disease conditions, they are most frequently used in higher doses and for long durations among athletes [6,7], to improve body image (through an increase in muscle and/or decrease in fat mass) and also exercise performance [8]. The prolonged administration and/or using high doses of AAS were shown to compromise the function and structure of different organs such as, testis, kidney, heart and liver[9,10]. Exogenous testosterone provides in various preparations and each form carries various risks. Many men who take AASs are infertile because chronic AAS use suppresses spermatogenesis, this may relate to deficient of estrogen effect on the brain. Testosterone is aromatized to estradiol, and estradiol effects on the brain are very important for normal sexual function. Many AAS compounds are not aromatizable. In addition to oligomenorrhea and anovulatory infertility, women often develop clitoromegaly with chronic high-dosage of anabolic steroid use [11,12]. Testosterone is associated with hepatotoxic effects, the derivatives of alkylated testosterone are hepatoxic especially when taken orally [13]. Regarding the effects of endogenous sex hormones

on the urinary markers of nephrotoxicity, an experimental study in rats investigate that, there was a significant association between testosterone and urinary excretion of leucine aminopeptidase, γ-glutamyl transpeptidase, alkaline phosphatase and β2-microglobulin, as biomarkers of kidney's proximal tubule [14]. The current study was designed to evaluate the effect of high doses of testosterone and nandrolone hormones on males sex hormones and sperm parameters in male rats as well as evaluate the effect on body, testes and epididymis weight after 35 days of treatment.

## Materials and Method

**1. Blood collection**

After 35 days of treatment by AAS, animals were anesthetized by intramuscular injection of ketamine 90 mg/Kg BW and xylazine 40 mg/kg BW. Blood samples were obtained via cardiac puncture technique from each anesthetized animals using disposable insulin needles. Sample were centrifuge at 2500 round per minute (rpm) for 15 minutes and then sera sample were stored in freeze at -18 c° till there use..

**2. Hormonal estimation**

Serum testosterone hormone concentration was determined by using Elisa kit(catlogMBS282195 from MyBiosource/USA) ,

Serum follicle stimulating hormone and Serum luteinizing hormone concentration were measured by using Elisa kits provide by( Human-Germany)

**3. preparation of Epididymal tail suspension**

The tail of epididymis of both sides were taken and embedded in one drop of phosphate buffer solution at 37 c° in a watch glass, and then the tail was cut into at least 200 section by micro-surgical scissors to perform the following microscopically examination on sperm characters[15].

4. Sperm function test

4.1.Sperm count

Sperm count was done according to[15], by using hemocytometer (neubauer type). The hemocytometer slide were filled with 5 microliter of sperm suspension and covered by cover slide, the sperm were counted in twenty-five small squares of the chamber. Estimation of sperm was made according to the following formula

Sperm con.= No. of sperm * 10

**4.2Sperm motility**

Sperm motility was assessed by methods described by [16]. Sperm motility percentage was assessed according to the method reported in this measurement is motility grade where the motility of sperm are divided into four different grade

**Grade A**: Sperm with progressive motility. These are the strongest and swim fast in a straight line.

**Grade B**: (non liner motility). These also move forward but tend to travel in a curved or crooked motion.

**Grade c**: These have non-progressive motility because they do not move forward despite the fact that they move their tails

**Grade D**: These are immotile and fail to move at all

**4.3 Abnormal sperm morphology**

To evaluate the abnormal sperm morphology, a drop of sperm suspension prepared was placed over the edge of slide and then a drop of easion-nigrosin stain was added and mixed, then two smear of each sample were prepared on microscopic slide. The smear of sperms were examined for abnormal morphology, 200 sperm were counted in each smears. The final percentage was calculated by estimating the average of two smears. Abnormal sperm morphology was calculated according to the following equation

Percentage of abnormal sperm= No. of morphologically abnormal sperm/Total sperm no. * 100

The morphologically abnormal sperms were estimated depending on sperm abnormality which had tapered head, tailless, coiled tail, bifurcated tail and broken tail[17]

**4.4 Sperm viability**

The assessment of alive and dead sperms was carried out by putting one drop of sperm suspension on a slide and a drop of easion-nigrosin stain was added and mixed.

Viable sperms repel the vital stain (easion-nigrosin), while dead sperm had lost the structural integrity of their plasma membrane and there for absorbed the dye ,for each sample two smears were made and 200 sperms were examined in each smear .Sperm viability was calculated as in the following equation

Percentage of dead sperms= No. of dead sperms/ total sperm No.* 100

**5. Testicular weight to body weight ratio**

After the end of treatment period (35 days), rats were weighed, anesthetized by intramuscular injection of ketamine 90 mg/kg BW and xylazine 40 mg/kg BW), and tests were excised and weighted by sensitive balanced after being cleaned from accessory connective and adipose tissue testicular weight to body weight as in the following equation

Relative weight = testicular weight (gm)/body weight (gm) *100

## Statistical Analysis

All data of the experiment were analyzed with one-way (ANOVA) by SPSS for windows (version 15) followed by LSD test. $P<0.05$ was assumed as statistically significant.

## Results

The results indicated that, the FSH, LH and testosterone hormones level showed statistically decrease while prolactin and estrogen hormones showed statistically increase after treatment by high doses of anabolic steroids compared with control, as shown in Table 1

**Table(1) the effect of some steroid hormone of body building on some sex hormones in male rats**

## Discussion

The objective of this paper is to evaluate the effect of high doses of AAS on FSH, LH, testosterone ,prolactin and estrogen hormones, as well as estimate the effect on some sperm parameters and body, test and epididymis weight in male rats after 35 days of treatment. The present finding showed a significant reduction in FSH, LH and testosterone hormones levels while prolactin and estrogen showed significantly increase compared with the control groups .This may be due to the temporary impairment of AAS in the pituitary function reflected in decreased LH and FSH hormones levels and hence ereduced testosterone levels [18]. The use of exogenous hormone is thought to inhibit the production of gonadotropin-releasing hormone, which reduces the release of luteinizing hormones and subsequently reduces the production of testosterone [19]. It was again supported by an animal model study conducted in India, which showed adverse effects on testes caused by intraperitoneal injection of AAS, also these results investigated detrimental changes in the seminiferous epithelium of the testes and reduction in tubular diameter, resulting in lower pituitary gonadotropin (LH and FSH) and serum testosterone levels [20]. Furthermore, these effects result from that, high doses of AAS derivatives induces negative feedback on the hypothalamic-pituitary axis and reducing the secretion of LH and FSH. Spermatogenesis is dependent on the action of intra-testicular testosterone concentration and FSH on Sertoli cells. Within the seminiferous tubules, only Sertoli cells possess receptors for FSH and testosterone. Numerous signaling pathways are activated when FSH binds to FSH receptors on these cells, and acts synergistically with testosterone to increase the efficiency of spermatogenesis and fertility [21]. Infertility after AAS abuse commonly presents as azoospermia and oligozoospermia with abnormalities in sperm morphology and motility[22]. The hyperprolactinemia could also be the results of elevation in the prolactin levels through increased sensitivity to prolactin-releasing factor and prolactin inhibitory factor and from altered regulation of serotonergic and oradregneric neurons which in turn modulate dopamine release. Adding to that, seizures induce discharges in the neuron cell which stimulate the hypothalamus and increased prolactin secretion by the pituitary gland [23]. According to the present study there was a significant decrease in sperm count, motility and viability, the best explanation of this result may be related to apoptosis proses. Apoptosis has been reported to play an important role in the regulation of germ cell populations in the adult testis. The main basic cells which interrupted spermatogenesis are the Leydig, Sertoli cells and the germ cells. Each of these cell types in animals can be selectively affected by high doses of AAS leading to apoptosis [24]. Recently, the correlation between apoptosis and high AAS doses has been assessed in animal studies. AAS led to a deficient in the Sertoli cells activities, which lead to incomplete meiosis, failure of spermatogenesis, and stop of transition of spermatocytes to spermatids [25]. Shokri et al. report a significant increase in the rate of apoptosis of spermatogenic cells after nandorlone administration. Moreover, AAS

adversely affected sperm parameters by reducing sperm concentration and motility, increasing abnormal sperm morphology , sperm DNA damage and causing damage in the testicular structure of male rats, the mechanism of AAS toxicity in the male reproductive system arises from the alterations in hormonal status and promotion of oxidative stress [26].

Our finding clarified that, the body, test and epididymis weight decreased after 35 days of treatment by AAS, these results may be related to that, an excessive concentration of testosterone can inhibit growth and weight gain due to decreased appetite, electrolyte imbalance and increased lipid oxidation [27]. A study reported by [28] indicated that androgens inhibit the ability of some fat cells to store lipids by blocking a signal transduction pathway that normally supports adipocyte function. This might reduce the body weight gain. Also, AAS can decrease fat by increasing basal metabolic rate. The present work illustrated the extensive effects of AAS on male reproductive system of the rats**.** For this reason, drug-prevention counseling to athletes and teenagers is focused on the use of anabolic steroids.

# Study of a Hormonal Assay in PCOS Patients with Type 2 DM and their Correlation with Inhibin B

**Huda Hameed Hassan[1], Suaad Muhssen Ghazi[2] Aufaira Shaker Nasif[3]**

*[1]Lecturer/ MSc Clinical Biochemistry/ College of Science/ Unversity of Baghdad/Iraq, [2] Lecturer/ Ph.D. Physiology/ Mustansiriyah University/ College of Medicine / Physiology Department/Iraq, [3]Lecturer/ MSc Medical Laboratory Science Technology/ National Diabetic Center/ Mustansiriyah University/Iraq*

## Abstract

**Background:** inhibin B considered a sensitive marker for follicles numbers of the ovary. Inhibin B levels increased with overnighted, lipedema and PCOS women. PCOS affects women in menstrual age. Obesity and insulin resistance have an association with PCOS. This syndrome increases LH, FSH, Prolactin. and testosterone hormonal levels.

**Aim:** examine the role of inhibin B in polycystic ovary syndrome (PCOS) with type 2DM patients, and to investigate the correlation between these quantities with serum inhibin B for women on the 12$^{th}$ day of their ovulation developments and correlation of inhibin with other biochemical parameters in those patients.

**Patient and Method:** sixty women included in this study divided into two groups of 30 subjects. The first group is for women who had PCOS with type 2DM, and the second for control subjects. PCOS with type 2DM patients diagnosed according to Rotterdam ESHRE/ASRAM. The biomedical test is done for FBS, Cholesterol, TG, LDL, HDL, HbA1c for all subjects included in this study.

**Results:** BMI, weight, prolactin and testosterone, FBS, cholesterol, TG, LDL, HDL, HbA1c had significantly higher levels in PCOS women with type 2DM. while inhibin B level showed to be significantly lower in PCOS with type 2DM. when this study attempted to find the correlation between the inhibin B with the biochemical tests, only the TG and HbA1c show a significant correlation in PCOS with type 2DM women.

**Discussion**: The high levels of biochemical parameters for diabetic female patients' groups with PCOS are due to the association of PCOS with insulin resistance and obesity. So, the low inhibin B levels in PCOS with type 2DM and its correlation with HbA1c and TG in the PCOS group could be an indication for using inhibin B as a type 2 DM marker. This study supported by Katrine et al 2017 when found out that when they diagnosed type 2DM at a younger age the levels of event rate (HbA1c and FBS) was higher in PCOS compared with controls

**Conclusion:** There is a significant correlation in inhibin-B levels with HbA1c and TG levels in PCOS women with type 2 DM.

***Keyword:*** *polycystic ovary syndrome (PCOS), Inhibin B, Triglycerides, LH, BMI, FSH*

## Introduction

Some women in reproductive age had one of the common endocrinal disorders characterized by the state of anovulation called polycystic ovarian syndrome (PCOS) which may persist for any length of time. androgen excess, infertility, menstrual irregularity, and insulin resistance may appear as an endocrinological feature for PCOS patients. PCOS is associated with insulin resistance and obesity [(1)]. It was found that ovarian inhibin exerts negative feedback on pituitary

**Corresponding author:**
**Suaad Muhssen Ghazi**
E-mail: suad94@ymail.com

gonadotrophin production, preferentially affecting follicle-stimulating hormone (FSH) secretion, inhibin has been shown to impact basal secretion of both FSH and LH, as well as gonadotrophin-releasing hormone (GnRH)-stimulated FSH with the isolation of inhibin.

PCOS found to be related to lipid abnormalities, dyslipidemia, cholesterol, low density of lipoprotein and triglycerides. All these increases the risk of type 2 diabetes in PCOS women [(2)].

Inhibin's are disulfide-linked heterodimers composed of an α-subunit and either a $\beta_A$-subunit (inhibin A) or a $\beta_B$-subunit (inhibin B) which belong to the transforming growth factor β (TGF-β) super family [(3, 4)]. Inhibin negatively regulates the secretion of FSH (follicle-stimulating hormone), even if there is no direct evidence of this phenomenon as well as locally enhancing the follicle development leading to reverse the growth of small antral follicle [(5)].

The investigations over decades show that in both male and female, inhibin B plays a physiological role in reproductive endocrinology applications. In a female, inhibin B considered as an earlier marker and more sensitive for ovarian follicle number as it is directly secreted by the granulosa cells of the small, developing follicles of the ovary when a low level clinically suggests a premature ovarian failure [(6)]. The inhibin B levels increase when women affected with weight gain, anorexia nervosa and with an increase in adipose tissue and leptin levels [(7)].

Throughout the menstrual cycle different secretory patterns displayed in Inhibin A and B. Levels of inhibin B serum and follicular fluid reach to maximum in the early to mid follicular phases, most likely under the stimulation of FSH. The information about factors regulating the shift production of inhibin in when the follicle becomes dominant [(8)]. Inhibin B levels are found to be inversely correlated with Body Mass Index (BMI) in PCOS [(9,10)].

In this case-control study, we aimed to examine the role of inhibin B in polycystic ovary syndrome (PCOS) with type 2DM patients and to investigate the correlation between these quantities with serum inhibin B for women in 12$^{th}$ day of their ovulation developments and correlation of inhibin with other biochemical parameters in those patients.

## Patient and Method

This study approved by the scientific committee of the physiology department for al-Mustansiriyah college of medicine. The data of patients collected from Al-Yarmouk Teaching Hospital. Sixty females included in this study: 30 females are diagnosed as normal or control and 30 females with PCOS and with type 2DM. All patients examined with Ultrasonography on the 12$^{th}$ day of the menstrual cycle and diagnosed by a gynecologist according to Rotterdam ESHRE/ASRAM. To determine if female have PCOS, the doctor checked that whether they have at least 2 of these 3 symptoms:

1. Irregular periods or no periods, caused from lack of ovulation (amenorrhea or oligomenorrhea

2. Clinical Hyperandrogenism (acne, hirsutism)

3. Multiple small cysts on the ovaries found in ultrasound diagnosis.

The weight, height and Body Mass Index measured by electronic height and balance apparatus. The Biochemical tests include serum for Hormones of LH, FSH, Prolactin, and Testosterone. Biochemical tests for type 2DM are done which is: Fast Blood Sugar (FBS) , Cholesterol, Triglyceride (TG), HDL, LDL, HbA1c were measured by using KENZA 240 TX system (Bio IABO Diagnostics 2016) which is random access analyzers with microprocessor or control for measurement of lipid profile, HbA1c & glucose level. We use minividus for hormonal assay. All mentioned test is done for both control and diabetic PCOS groups.

## Statistical Analysis

Analysis of data was carried out using the available statistical package of SPSS-25 (Statistical Packages for Social Sciences- version 25). Data were presented in simple measures of mean, standard deviation and range (minimum-maximum values). The significance of the difference of means (quantitative data) was tested using Students-test for the difference between two independent means. The significance of correlations was tested using the Pearson correlation test. Statistical significance was considered whenever the P-value was equal to or less than 0.05 [(12-14)].

## Results

A. Comparison between control & PCOS with type 2DM groups:

Table (1) shows no significant difference between the two groups in age and height, while there is a significant difference between these two groups in weight, BMI and *p*-value (0.0001) for both of them. where the PCOS women with type 2DM tend to be obese more than the control group.

**Table (1) characteristic of control and PCOS with type 2DM groups**

| | **PCOS** | **Controls** | **P value** |
|---|---|---|---|
| Age (years) | 28.9±5.6 (20-40) | 29.1±6.4 (20-41) | 0.822 |
| Weight (kg) | 74.16 ± 10.29 | 59.66±70.01 | 0.0001* |
| Height (cm) | 160.26 ± 7.99 | 159.1±5.32 | 0.5155 |
| BMI (Kg/m²) | 28.9±3.5 (22.46-35.96) | 23.5±2.1 (19.72-28.84) | 0.0001* |
| *Significant difference between proportions using Pearson Chi-square test at 0.05 level | | | |

Table (2): shows that inhibin B levels had a significant difference in control (102.7±83.7) and PCOS group (58.6.6±356.4) with p-value 0.001. It appears that levels of inhibin B in PCOS women is less than control. While the level prolactin and testosterone are higher in PCOS women with PCOS with type 2 DM rather than control.

**Table (2): hormonal assay for control and PCOS with type 2DM.**

| | PCOS | Controls | P value |
|---|---|---|---|
| Inhibin B | ⁅58.6 ±35.6 (4 -100)⁆ | ⁅102.7±83.7 (15-400)⁆ | ⁅0.0001*⁆ |
| LH (µIU/ml) | 5.6±2.6 (1.2-10.1) | 5.0±1.3 (3.0-7.1) | 0.212 |
| FSH (µIU/ml) | 3.1±2.9 (0.1-12) | 3.7±0.9 (2.1-5.6) | 0.284 |
| Prolactin (ng/ml) | 31.3±14.6 (10-74) | 18.6±6.0 (8-31) | 0.0001* |
| Testosterone (ng/ml) | 0.7±0.3 (0.2-1.1) | 0.4±0.3 (0.05-0.9) | 0.0001* |

*Significant difference between two independent means using Students-test at 0.05 level

The tests of biochemical parameters for type 2 diabetes are listed in the table (3) it appears that all parameters are had a higher significant level in PCOS groups with significant value (p-value 0.0001).

**Table (3): biochemical test for control and PCOS with type 2DM**

| | **PCOS** | **Controls** | **P value** |
|---|---|---|---|
| FBS (mg/dL) | 128.4±35.1 (75-201) | 85.2±7.1 (72-100) | 0.0001* |
| HbA1c (mg/dl) | 7.97±1.29 (5.2-10.6) | 4.24±0.31 (3.7-5.0) | 0.0001* |
| Cholesterol (mg/dl) | 230.57±51.10 (170-344) | 155.37±19.72 (105-190) | 0.0001* |
| Triglycerides (mg/dl) | 226.57±58.05 (165-368) | 129.70±16.95 (100-155) | 0.0001* |
| HDL (mg/dl) | 55.87±7.85 (34-69) | 41.53±3.78 (32-50) | 0.0001* |
| LDL (mg/dl) | 170.03±35.77 (107-235) | 86.30±10.28 (65-101) | 0.0001* |
| -Data were presented as Mean±SD (Range) | | | |
| *Significant difference between two independent means using Students-test at 0.05 level | | | |

B. Correlation between inhibin B with parameters in PCOS type 2DM

The results of the correlation of hormone parameters with inhibin B for PCOS and Control groups listed in table 4. It appears that there is no correlation of mentioned hormones with inhibin B for both control and PCOS groups.

**Table (4): correlation between hormones parameters with inhibin-B for PCOS and Control groups.**

| | PCOS | | Control | |
|---|---|---|---|---|
| **Parameters** | **Correlation Coefficient** | **P-value** | **Correlation Coefficient** | **P-value** |
| LH | -0.0206 | 0 .9164 | 0.1877 | 0.3205 |
| FSH | 0.1031 | 0 .5877 | 0.0714 | 0.7077 |
| Prolactin | 0.1210 | 0.5241 | -0.1949 | 0.3043 |
| Testosterone | -0.0746 | 0.6975 | 0.0254 | 0.8940 |

* Pearson Correlation Coefficient Calculator at 0.05 level.

## Discussion

Researches proved that one of the most common endocrinal metabolic disorder is PCOS which affect female fertility [15,16]. Being overweight is associated with PCOS and appear also in diabetic patients [17, 18]. Patient with high weight and PCOS is correlated with type 2DM [19].

Weight, BMI, Prolactin, testosterone, FBS, HbA1c, Cholesterol, Triglycerides, HDL, LDL significantly higher level in PCOS women considered as predictors for PCOS T2DM development. These results supported with Bhanu Kalra et al 2010 [5] when they found that in PCOS HbA1c, fasting plasma glucose, 2-hour plasma glucose, triglycerides, age, and BMI upon baseline were predictors of development of T2D. When models were corrected for age and BMI, fasting plasma glucose, 2-hour plasma glucose, and triglycerides were the best predictors of development of T2D. Hussain et al 2013 [20] compared hormonal levels in PCOS with control for cortisol, and testosterone is significantly high in the PCOS group.

The PCOS women with type 2DM with included in this study have higher BMI, prolactin, and lipids upon PCOS diagnosis. The significant of biochemical tests of type 2DM is agreed with Abbasi A et al 2012 [21] and Selvin E et al 2010 [22] where FBS is applied in many prediction models for risk of Type 2 DM developing in non-PCOS populations as control with PCOS patients HbA1c is a measure of average glucose levels and an indicator for increased risk of T2D in PCOS. It considered a better predictor of cardiovascular disease and overall mortality than fasting or 2-hour glucose.

The FSH levels result show no correlation with inhibin B in PCOS. The negative correlation of FSH with inhibin B for PCOS group of patients gives an indication that this hormone cannot be used to diagnose PCOS with type 2DM. These results are in agreement with Torgac et al [23] when they found out that the basal inhibin A or B levels give a significant positive correlation with the PCOS group and a negative correlation with FSH levels. As the previous studies showed that during the follicular phase, inhibin B is more important than inhibin A [24].

Prolactin and testosterone levels are higher in PCOS patients with type 2DM which demonstrated as a frequent condition in most PCOS patients increase of basal Prolactin levels or of an increased reserve of Prolactin in the pituitary gland. Prolactin heterogeneity behavior in secretion is a characteristic of PCOS [24]. The result agreed with Richard et al 2013 who showed that PCOS patients had hyperprolactinemia other than control [25]. The results of negative correlation for Testosterone and Prolactin with inhibin B agreed with Corrine K. et al. 2002 which reveals the fact that they had no direct effect on inhibin B levels but suggesting a stimulatory effect of insulin on Prolactin and testosterone [26].

We find in this study a significant correlation between inhibin B with HbA1c and TG lipids in PCOS women with type 2DM. There was no similar study (as we know) support this finding, but Corrine k. 2002 found that there are significant relationships between inhibin B and BMI including LH, insulin & SHBG. Katrine et al 2017 found out that when they diagnosed type 2DM at a younger age the levels of event rate (HbA1c and triglyceride) were higher in PCOS compared with controls [27].

# Estimation the Scavenging Activities of Ascorbic Acid, Uric Acid, Gallic Acid and GSH to DPPH Radical

**Ali M.A. Al-Kufaishi**

*Al-Furat Al-Awsat Technical University College of Health and Medical Techniques, Department of Medical Laboratory Techniques, Kufa, Iraq*

## Abstract

The "α,α-diphenyl-β-picrylhydrazyl radical **(**DPPH)" method from the estimation methods to determine the antioxidants activity in vitro, through the lowering the absorbance of DPPH with color changing from violet into yellow with increasing the strength of antioxidants activity. So, the results of this study show the uric acid is the strongest scavenging, then ascorbic acid when compared with other compounds used. But the reduced glutathione is the weakest although has acidic hydrogen.

***Keywords:*** *DPPH, scavenging activity, antioxidants, Ascorbic Acid, Uric Acid, Gallic Acid.*

## Introduction

The efficiency of antioxidants (scavenging activity) depends on the ability of free radicals scavengers (FRS) to given hydrogen to the free radicals [1]. The increase in rate and energy promotion for hydrogen ion transition from FRS to free radicals depend on the lowering in energy level for hydrogen bond with FRS. Efficient FRS results free radicals after donating hydrogen but not react rapidly with oxygen to produce superoxide. The efficiency of FRS as well depends on other factors as volatility, pH sensitivity and polarity [2].

In the present study, the antioxidants involve such as vitamin C, uric acid, gallic acid, and reduced glutathione.

Ascorbic acid (AA):

One from most powerful FRS [3,4]. It is found in several plants cells types. AA present in the reduced form under physiological conditions (90% of the ascorbate pool) in plants leaves and chloroplasts [5], were the concentration of AA (20 mM) in the cytosol, and (20-200 mM) in the chloroplast stroma [6]. The ability of AA to give the electron by many enzymatic and nonenzymatic reactions, therefore act as main detoxification antioxidants against ROS in the aqueous phase. So, the AA can directly be scavenging for singlet oxygen, superoxide radical, hydroxyl radical and reduced hydrogen peroxide to water by ascorbate peroxidase reaction [7].

AA capable to reduce tocopheroxyl radical into tocopherol that responsible about cell membrane protection. AA performs a number of non-antioxidant roles in the cells. It has been involved in the regulation of cell cycle progression from G1 to S phase, cell division, and cell elongation [8,9].

Glutathione (GSH):

"Tripeptide glutathione (□-glutamylcysteinylglycine)" is a plentiful compound in the tissues of plants. It is found in all compartments of the cell such as cytosol, mitochondria, and endoplasmic reticulum [10], were GSH has many roles in organisms such as storage for the sulphur, serve as precursors for phytochelatins, act as a detoxifier for xenobiotics via GSH-conjugation [11,12], and maintenance about redox form of the cellular membrane through (GSH-GSSG) system. Also, GSH has the ability to regulate gene expression. And regulation of cell cycle by GSH/GSSG system through -SH group [13,14].

GSH act as antioxidants through the nucleophilic center of –SH residue that responsible for higher reductive potential. So, its scavenger for singlet oxygen, superoxide radical and hydroxyl radical by non-enzymatic reactions, and with hydrogen peroxide and reducing to water by an enzymatic reaction [15]. GSH

has the ability to regenerate others antioxidants such ascorbic acid through the ascorbate-glutathione cycle [16,17].

Uric Acid (UA):

The final product of purine degradation in human and "Great Apes". It is a powerful scavenger for free radical such as singlet oxygen, hydroxyl radicals (.OH), and peroxyl radicals (RO. 2) [18,19]. In blood, stream urate considers from the major antioxidants against oxidative damage, so it is protected RBCs membrane from lipids peroxidation by scavenging oxygen radicals in aqueous media [20]. Uric acid some of the deleterious reactions, such as peroxide production by macrophages or autoxidation of haemoglobin [21].

In contrast, elevated the UA causes a lot of number from the epidemiology of hypertension [22], cardiovascular disease [23], visceral obesity [24], dyslipidemia [25], insulin resistance [26], kidney disease [19].

Gallic Acid (GA):

"GA is a 3,4,5-trihydroxybenzoic acid and its derivatives are widely spread in the plant kingdom and is a large family from secondary polyphenolic metabolites" in plants so it is from natural antioxidants [27]. GA present either methylated gallic acid form such as syringic acid, or in the orgalloyl conjugated form with catechin derivatives as "flanvan-3-ols, or in polygalloyl esters" form with glycerol, quinic acid or glucose [28].

The last two groups from "polyphenols are known as vegetable tannins, which their names derived from its ability to transform animal skins into leather" through the with collagen [29]. GA from the components of tea and some types of GA used as food additives to prevent peroxidation. Also, it is used in many phytomedicines due to its biological and pharmacological activities through the ability to free radicals scavenger [30], inducing apoptosis for the cancer cells [31,32], and inhibiting squalene epoxidase interfering the signal pathways involving calcium [33,34].

**α,α-diphenyl-β-picrylhydrazyl radical (DPPH):**

DPPH is described as relatively stable free radical due to delocalization phenomenon for the unshared electron overall whole molecule, so this radical do not suffer from dimerization as other radicals. The delocalization gives this radical the deep violet color when dissolved in absolute ethanol and absorbed at 517 nm. DPPH used to estimation the antioxidants activity for any sample or free radicals scavenging material [35].

## Material and Methods

**Prepared Serial Solutions:**

**Prepared Ascorbic acid solutions:**

This is done by dissolving ascorbic acid in distilled water (D.W.) as the following concentrations: 2.5, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70 mg/dl.

**Prepared GSH solutions:**

This is done by dissolving GSH in distilled water (D.W.) as the following concentrations: 2.5, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70 mg/dl.

**Prepared UA solutions:**

This is done by dissolving UA in distilled water (D.W.) (pH 8.5) as the following concentrations: 2.5, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70 mg/dl.

**Prepared GA solutions:**

This is done by dissolving GA in absolute ethanol as the following concentrations: 2.5, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70 mg/dl.

**DPPH procedure:**

**DPPH preparation:**

Prepared 0.1 mM from DPPH, by dissolving appropriate weight in absolute ethanol.

**Principle of method:**

The principle of this method depends on the reduce the absorbance values of DPPH after addition the sample due to conversion the violet colour into yellow colour depending on the antioxidants activity of the sample. The colour intensity measured at 517 nm (36) (figure 1).

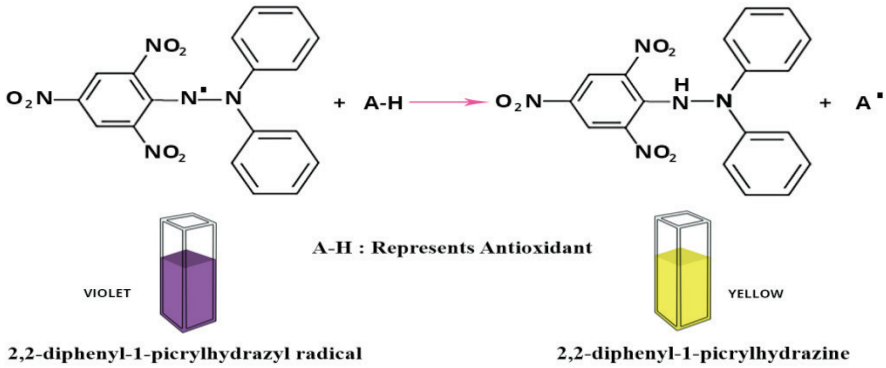

**Fig. 1: Reduction effect of AH to DPPH.**

**Procedure:** The procedure of addition as following:

| Reagent | Sample/µl | Blank/µl |
|---|---|---|
| DPPH | 1000 | 1000 |
| Sample | 100 | ------- |
| D.W. | ------- | 100 |

Incubate for 20 min at 25ºC. In the dark condition, then read the absorbance at 517 nm.

**Results and Discussion:**

The following results (Table 1) and (Figure 2) the inhibition values of DPPH by the antioxidants compounds. In other words, the absorption values for DPPH after scavenging by ascorbic acids, GSH, UA, and GA.

**Table 1: Absorption values for DPPH after scavenging by UA, GA, GSH, and ascorbic acid.**

| Concentration (mg/dl) of U.A, Gallic acid, GSH, Ascorbic acid | UA | Gallic acid | GSH | Ascorbic acid |
|---|---|---|---|---|
| 2.5 | 0.302 | 0.323 | 0.352 | 0.314 |
| 5 | 0.289 | 0.321 | 0.352 | 0.292 |
| 10 | 0.280 | 0.320 | 0.351 | 0.288 |
| 15 | 0.275 | 0.315 | 0.344 | 0.286 |
| 20 | 0.269 | 0.311 | 0.344 | 0.280 |
| 25 | 0.259 | 0.310 | 0.344 | 0.279 |
| 30 | 0.251 | 0.303 | 0.343 | 0.274 |
| 35 | 0.247 | 0.291 | 0.343 | 0.268 |
| 40 | 0.243 | 0.290 | 0.343 | 0.261 |
| 45 | 0.238 | 0.289 | 0.332 | 0.254 |
| 50 | 0.211 | 0.262 | 0.332 | 0.238 |
| 55 | 0.193 | 0.249 | 0.332 | 0.226 |
| 60 | 0.169 | 0.232 | 0.332 | 0.212 |
| 65 | 0.145 | 0.221 | 0.332 | 0.195 |
| 70 | 0.123 | 0.214 | 0.332 | 0.185 |

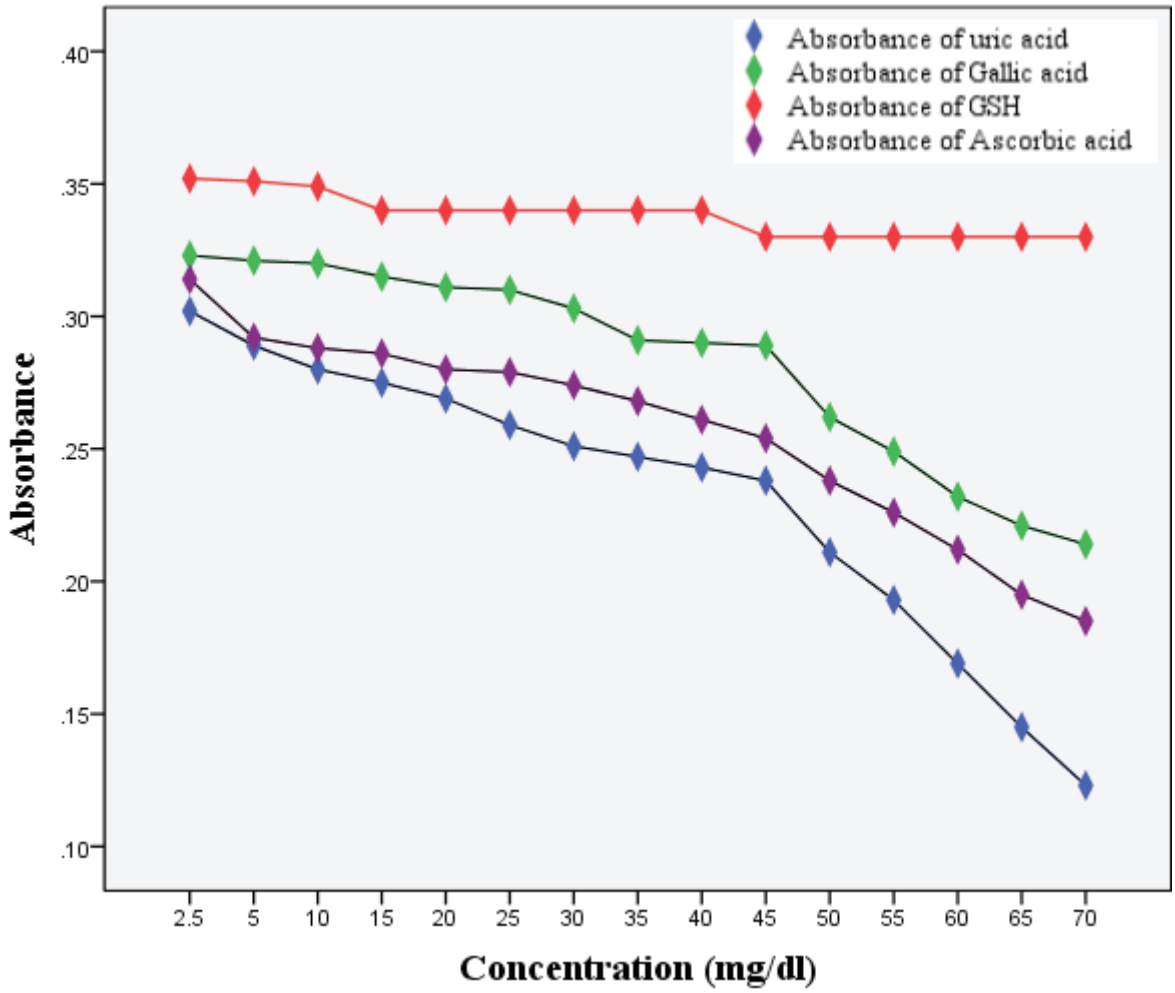

**Fig. 2: Decline in absorption values for DPPH after scavenging by UA, GA, GSH, and ascorbic acid.**

The scavenging effect for UA toward DPPH is more than other antioxidants were used in this study when compared in the same concentrations, may be due to the heterocyclic ring effect that responsible about delocalization and lowering energy of hydrogen bond with the compound (figure 3).

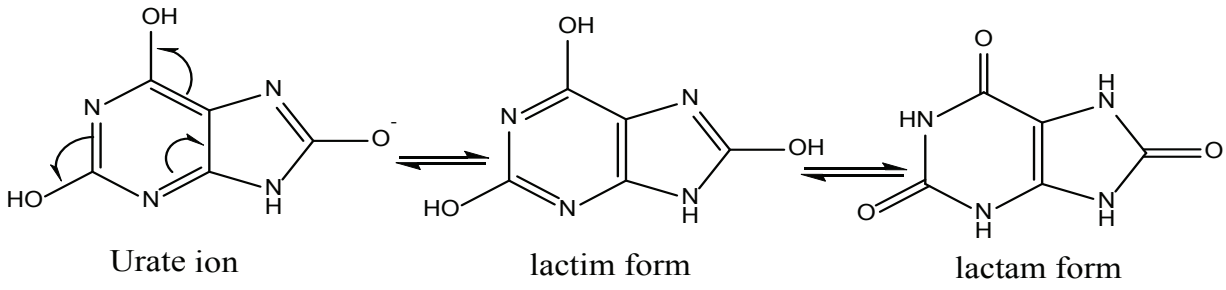

**Fig. 3: Urate tautomerism**

From the results show a slight decrease in the line chart (figure 2) for the GSH value, this means it is the weakest scavenging compared with other compounds used in this study may be due to the energy bond of hydrogen in the thiol group is relatively strongest than other compounds, therefore no change in the color of DPPH. However, the scavenging effect increased with an increase in concentrations of these antioxidants compounds.

## Conclusion

In conclusion, the strongest scavenging in vitro the compounds that have the ability to reduce the DPPH and change its the color from violet into yellow, therefore the scavenging strength follow the sequence UA, AA, and GA, where the GSH is very weakest scavenging to DPPH at the same concentrations.

# Histological Investigations for Cordia Myxa During the Treatment of Gastritis in Local Rabbits

**Hussein Bashar Mahmood[1], Ghassan A Dawood[2], Ali Fayadh Bargooth[3]**

*[1]Department of Anatomy and Histology\College of Veterinary Medicine\University of Kerbala/Iraq, [2]Department of Anatomy and Histology\College of Veterinary Medicine\University of Kerbala/Iraq, [3]Department of biology\ College of education for pure Sciences\Wasit University/Iraq*

## Abstract

**Background**: The goal of this study was to evaluate the effect of medical fruits, through $H^+$ proton pump inhibitors and observation to main of histological changes accompanying for treatment. **Methods**, Adult domestic healthy rabbits, all experimental animals were adapted in animal house. Animals were taken for this study distributed into three group, control (5 ml/kg b.w) gastritis (10% glacial acetic acid 1ml//kg b.w) and treatment group (5 ml/kg b.w) oral administration during 21 day for 3 time daily.

**Results**: the main histological observations for effects of (Juicer fruit Bumper) during induce inflammation by 10% acetic acid, after 4hr showing the inflammation region in internal surface in fundic region but most of internal surface it's normally. Histologically, the stomach of gastritis group was observed the erosion in epithelia surface and congestion of blood vessels, gastric pits disappear but most of changes which accrue in lamina propria generally. The rabbits of treated group was observed reductions in inflammatory area, with some extent of mucosal regeneration (re-epithelization) and the parietal cells appeared a granular cytoplasm and proliferation of connective tissue cells (granulation tissue).

**Conclusions**: these findings suggest that (Cordia myxa) considered perfect anti-inflammatory and H+ proton inhibited pump.

***Keywords**: Histological, Cordia myxa, anti-inflammation, rabbits*

## Introduction

Centrally the Myxa Cordia L. known as "Bumber" is commonly used for its role in chest and urinary tract infections )1( . This is also used for its effects as anthelmintic, antigastritic, diuretic, antidiarrheal, antiworm or even as a tonic to the liver. In conventional medicine certain Cordia species compounds were used in osteoarticular diseases. Analgesic, antiarthritis , anti-inflammatory and of C. Dear myxa, C. C'est francisci, C. Martiniquez, C. Serratifolia, with C. The ulmifolia was found in rats (2). Petroleum ether extract, especially of C. francisci, C. myxa and C. serratifolia leaves has been reported to carry significant analgesic, anti-inflammatory and anti-arthritic activities (3).

Most of the population of the world depends on traditional medicine and conventional medicine's major role including the use of plant extract and its active ingredients. (4,5) Medicinal plants in Iran were commonly used in folk medicine for the treatment of diseases. Herbal medicines have drawn scientists and physicians ' attention nowadays due to the excessive use of medications and synthetic drugs contributing to health hazards (6). The high resistance to injury depends on a variety of physiological responses from the mucosal lining to potentially harmful luminous agents as well as on the ability to quickly restore mucosal damage when it occurs (7). However, when the injurious factors overwhelm these protective mechanisms, a gastric mucosal lesion may develop. Through a variety of local

**Corresponding Author:**
**Hussein Bashar Mahmood**
Email: hussein.81@yahoo.com

and systemic mechanisms, these drugs can not only exert gastric injury effects, but also delay the healing of ulcer lesions [8]. The use of proton pump inhibitors represents another important issue about the integrity of gastric mucosa. Such medications have been shown not only to avoid upper gastrointestinal injury caused by NSAID, but also to facilitate the recovery process once the damage has occurred, even in the presence of a continuous treatment of NSAID [9].

The aim of this study explained the effects of Cordia myxa fruit on experimentally induced gastritis in rabbits and showing main of histological changes in stomach.

Materials and methods:-

Eighteen healthy rabbits for both sex were chosen and divided in to three groups (control group G1, inflammatory group G2, treatment group G3). Weight of animals (850-1100) g, breed locally, were used in this study. Control group (5ml/kg b.w), Gastritis group were given 10% glacial acetic acid directly in stomach by small stomach tube, after 20 minute water administrated for acidity decrease (1ml/kg b.w) and treated group administrated by bumper fruit (5 ml/kg b.w) oral administration during 21 day for 3 time daily [10]. The tissue specimens were sectioned from the fundic region. The size of the specimens were taken about 1 cm and then kept in 10% formalin for 48 hours. The samples were proceeding with routine histological technique [11].

## Results & Discussions

The present study showing the stomach of rabbits consist of three regions, cardiac, fundic and pyloric region, each area had characteristics different from other. Generally, the stomach consists of four basic layer; mucosa (epithelia, lamina propria and muscularis mucosa), submucosa contains loose connective tissue, elastic fibers and blood vessels, tunica muscularis consisting of smooth muscles fibers and tunica serosa. These results akin with [12] who describe that the histological structure of stomach in lab animals consist of four basic layers in all regions of stomach.

### Control group

The current study showing, the epithelial of fundic region consists of simple columnar epithelia without goblet cells, gastric pits were oval shape and normal state occupied by gastric glands, thickness of gastric pits was (90) µm. the distribution of simple tubular gastric glands were regular, the parietal cells oval or pyramidal in shape fill with granules with rounded nucleus located in central of cells. These consequences agree with [13] who noticed that the fundic region of stomach in domestic animals lined by simple columnar epithelia and glandular region consist of parietal and chief cells spread as a cord like. (Fig,1,2)

### Gastritis group

In current study, the characteristic histological examination of acetic acid induced gastric inflammation, showing damaged mucosal epithelium, distortion of glands. This study was observed the erosion in epithelia surface and congestion of blood vessels, gastric pits disappear but most of changes which accrue in lamina propria generally. This finding comparable with [3] who stated that the acetic acid causes the local inflammation during gastrointestinal tract.

also showing the present large numbers of parietal cells characteristic by polyhedral or oval in shape, have strong affinity had highly granules in cytoplasm, dark nucleus and aggregation in many group and form the circles, reach in epithelial surface with present of severe inflammatory infiltrate, proliferation of fibroblasts. These results showed congestion area located under tunica mucosa. The parietal cells that located in epithelial surface illustrated as circles and increase in number but chief cells less than its. These consequences similar with [14] who describe that the parietal cells become fill with granules during too much of acidity (Fig,3,4).

### Treatment group

In this study, the Gastro -mucosal changes at four weeks revealed complete healing in treated with (Juicer fruit Bumper) this finding showed regeneration to epithelial surface and consist of gastric pits a normally and increase in length about (170) µm, reduce in congestion areas. The stomach in treated group lined by a simple columnar epithelium with a lightly stained cytoplasm. The general histological appearance of parietal cell which serialized arrangement, decrease in number if its compared with inflammatory group, have pink lightly cytoplasm, decrease in cytoplasm granules. The present study showing the submucosa become

dense and contains a large amount of collagen fiber which filled the space. In current study First registered, the Cordia myxa fruit act to inhibitors proton pump by reducing quantity of acid in stomach during in active of parietal cells), this result comfortable with [15] who stated the parietal cells after treated with Rabeprazole appearance under regenerate epithelia and have purple cytoplasm due to decrease secretion of hydrochloric acid ( Fig, 5,6).

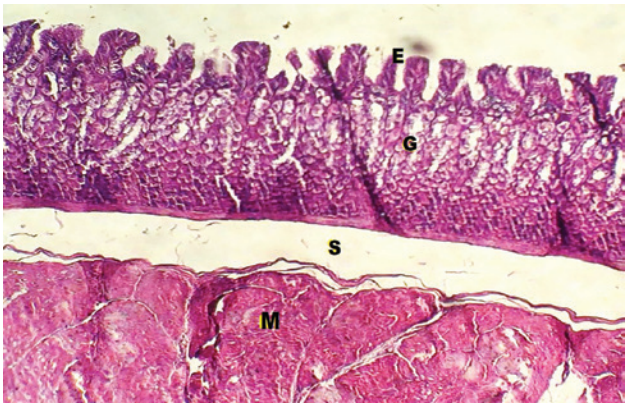

**Figure: 1. Stomach of control group shows the normal E-Epithelia, G-Glandular region, S-Submucosa and M-Muscularis. H&E stain.40X.**

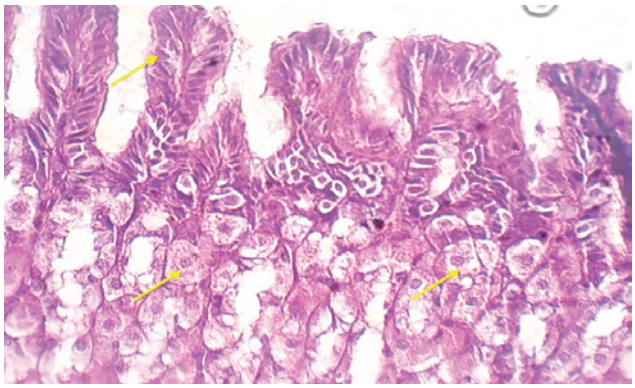

**Figure: 2. Stomach of control group shows the simple columnar epithelia (black arrow) and normal state of parietal cells oval in shape (yellow arrows). H&E stain.400X.**

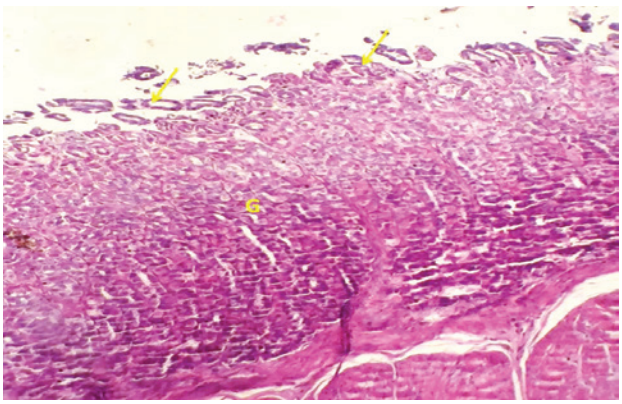

**Figure: 3. Stomach of gastritis group shows the damage of epithelia (yellow arrows) and the distribution of glandular cells randomly, G- Glandular region. H&E stain. 40X**

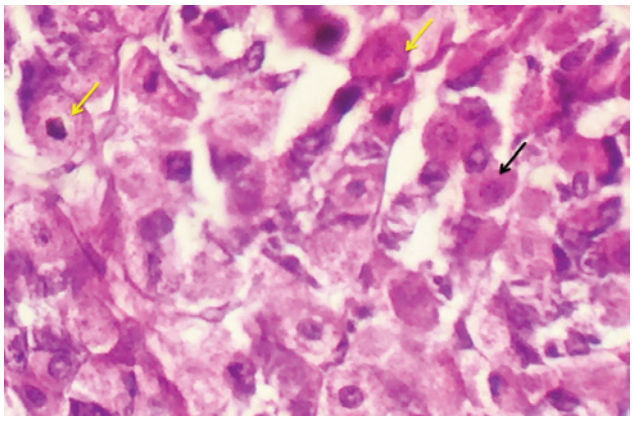

**Figure: 4. Stomach of gastritis group finding the dark and highly granular of parietal cells (yellow arrows) and pyramidal chief cell (black arrow). H&E stain. 400**

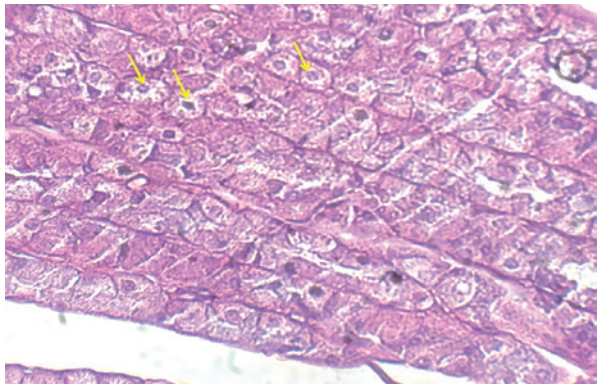

**Figure: 5. Stomach of treatment group finding the regenerated of high epithelial layer (yellow arrows) and glandular cells spread as a cord like (black arrows). H&E stain. 40X.**

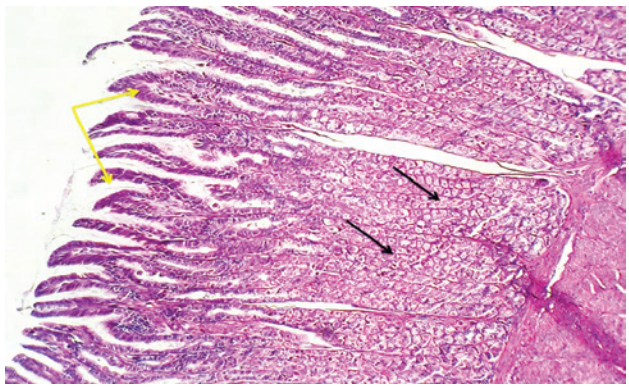

**Figure: 6. Stomach of treatment group shows the parietal cells appeared light and purple cytoplasm (yellow arrows). H&E stain. 400X.**

# Frequency of Aspirin Misuse Among Hypertensive Patients in Babylon Province

**Zahraa Fattah Ghani[1], Oday Jasim Alsalihi [2], Mustafa Shakir Mahmood[3]**

*[1]Marjan Medical City/Iraq, [2]College of medicine - University of Babylon/Iraq, [3]Ministry of health/Iraq*

## Abstract

**Background**: Hypertension endangering a risk of cardiovascular events and BP reduction will reduce such complications. the role of aspirin in hypertension is debated, however it is advised in primary prevention in case of patient with high risk factors assessed by one of the cardiovascular risk calculator, a state in which the benefit of aspirin outweigh the risk of complications.

**Objectives:** Estimate the prevalence of aspirin misuse in hypertensive patients ,which population at risk and estimate the possible source of this misuse habit.

**Patients and Methods:** A cross sectional study that has been conducted in babil city major hospitals for the period from the 20th of January to 2nnd of May. our study sample included 353 patients all cases were between 35 to 75 years old who attend to internal medicine outpatient clinic , emergency departments and inpatients of the above hospitals . All patient had hypertension being treated with antihypertensive agents and they did not experience any vascular events like CVA, IHD and PVD**.**

**Results:** 30.59% of patient do not use aspirin and 64.31 % of patients use aspirin prescribed by doctors. Most of aspirin use was according to doctor advice( 92.7%). 5.1 a use aspirin by advice from others. Aspirin use was more with increased age group (p value 0.003) and in females( p value is 0.04). No significant differences between educational level, economic status, residency and occupation with the use of aspirin. Regarding aspirin intake by their doctors and score <10 %: women were more than men ,age 40 – 60 years. Mostly were urban, higher education of 50% had positive history of CVD. Patient who need aspirin but they didn't use aspirin, were 66 patients mostly male live in urban area higher education , smoker , most of them had no family history of cardiovascular diseases.

**Conclusion:** Aspirin use requires coordinated interaction between patient and physician with encouraging the importance patient education about aspirin use, side effects and CVD risk and proper evaluation of patients risk factors and stratification using simplified charts accessible in health centers.

***Key words:*** *Aspirin, primary prevention, hypertension.*

## Introduction

The CVD risk associated with hypertension depend on multiple factors including age, gender, in addition to BW ,physical activity, cigarrete smoking, family history of hypertension , high cholesterol level, DM and preexisting vascular disease(1). Assessment of the risk of future CVD is an important step in patients requiring primary protection from any vascular events(2) . However, to determine the role of aspirin's in prevention of CVD, both primarily and secondarily the benefits should be balanced against the complications(3).The net benefit of aspirin in patients with known risk factors is clearly evident(4) . For primary protection ,guidelines vary about whether, and to which groups, aspirin is to be given(5) in that context, physicians should evaluate the risks and benefits of aspirin therapy for those patients free of risk factors (6)

Primary cardiovascular (CV) prevention defined as the use of pharmacological and/or nonpharmacological measures as prophylaxis of atherosclerosis to prevents

MCEs in in the absence of any history or clinical signs of underlying disease. The main outcomes to be measured are MI, stroke, and death from CVD. In addition to other outcomes including hospital admission , intervention of coronary disease, incident angina, all-cause mortality are sometimes added as ancillary end points these are applied to apparently healthy persons[7].

For the calculation of an individual probability to develop CVD all factors that contribute to the risk must be taken into account, including previous CVD events[8]. Many risk calculators are currently available that help in the detection of population at risk of developing CHDs[9].

**Patients and method**

A cross sectional descriptive study was conducted in Babylon city hospitals including al hila teaching hospital, marjan medical city and imam al sadiq teaching hospital. For the period from the 20th of January to 2nnd of May. This study has been done on patients diagnosed by their doctor having high blood pressure and take medication for it.

The data was collected using a preformed questionnaire by which the patient was interviewed after giving appropriate verbal consent .Each patient was interviewed for about 15 minutes

The questionnaire include the following Parts : Patient sosciodemographic characters (age, gender, residency, educational level, economic status, occupation and marital status,the parameters related to 10 years cardiovascular risk score, the protocol of study was approved by ethical committee of Babylon university, college of medicine. Appropriate verbal consent was taken from the patients before the interview. Confidentiality of patients data was approved by replacing names by numbers. To accomplish the study official agreement was taken from Babylon health directorate.

## Results

Table (1) shows the sociodemogrphic distribution of the study sample and the association with the habit of taking aspirin. The association between the age group and the use of aspirin was significant in which p value was 0.003. In which aspirin use was more with increased age group, also the association between gender and use of aspirin was significant when aspirin use was more in females p value is 0.04.

**Table (1): the association between sociodeogrphic characteristics of the patients and aspirin taking.**

## Discussion

Hypertension causes cardiovascular and renal. Thus decreasing blood pressure reducing morbidity and mortality. The effect of aspirin on control of BP is still a matter of debate[10]. Regarding the use of aspirin in healthy or apparently healthy people as primary prevention , there are no direct proofs of its efficacy, but in low-risk populations it may be of no benefit or may be risky[7]. In 2016, the (USPSTF) recommendations about aspirin use in primary CVD prevention in has been updated . (11).They adopted a calculator derived (ACC/AHA) for assessment of 10-year risk for first hard atherosclerotic CVD event (non-fatal MI,CHD, death, and fatal or nonfatal stroke)[12].

The study dealt with patients sociodemograhpic characteristics and its association with the habit of aspirin use. The age and the use of aspirin was significantly associated, in which aspirin use was more with increasing age , in those whose ages more than 60 years (120 patients) 97 of them taking aspirin p value 0.003. In a study conducted in Canada that prospectively enrolled 3015 patients without any previous CVS diseases for aspirin use as primary protection , when compared with their counterparts, the study found that ,

peoples receiving aspirin were older their ages in years was 61.6±8.4 vs. 55.5±8.1 with (P<0.0001)[13]

A significant association was also found between gender and use of aspirin in which aspirin use was more in females patients with p value is 0.04. A similar results was found by a study of mendy et al in USA on the aspirin use in primary protection in patients without prior CVS diseases, they found that aspirin use was more in female(45.9% ) than in male(39.1% )[14] .This may because of female in our communities look for and afraid more about their health status. The study found that there was no significant differences between educational level, economic status, residency and occupation with the use of aspirin. P value > 0.05.

The study evaluate the relationship of the effect of the score value of the patients and the indication of aspirin use according to score. From the total number of the patients taking aspirin ,19.2 % of them regarded as a misuse of aspirin , which include 17.6 % whose score is below 10 and their age is more than 40 years, and 1.6 % include patients with age below 40 years that is age not assessed by the score. 80.8 % of patients taking aspirin according to score. These findings were approximately similar to a study done by Vanwormer and his associates was done to find the relationship between; specific sociodemographic variables, and aspirin use among a representative sample of Wisconsin adults without CVD, and found that the percentage of regular aspirin intake in those without indication to take it was 18% (102 patients from the **563** patients) [15].

This study evaluated the distribution of patient who take aspirin prescribed by their doctors and their risk score was less than 10 %. Women were more than men and age between 40 – 60 years most of them were urban with medium to higher education half, of them had positive family history of cardiovascular diseases. In a study done by Vanwormer and his associates, they concluded that Aspirin intake was less by patients at high CVD risk which may have a cardiac protection effect from regular use of aspirin and excessive use in patients at low CVD risk. (15). These findings may be due to our patients themselves not complying with their following physician instruction or visiting not a specialist medical physicians with limited knowledge about the risk assessment. So to make any decision for aspirin prescription should fellow an individual clinical judgment that balance the benefits of cardio protection and bleeding risk. Patients with a higher CVD risk, have a greater benefit from aspirin. This final judgment to start aspirin therapy continuously should be made by health care personnel's , especially Primary Care Physicians (PCPs) in resource-poor areas, and they must have a knowledge about their role in assessing the benefit and risk of bleeding. [16]

The study show the distribution of patient who take aspirin. which included 5 patients their risk score was less than 10 %, and 4 patient had not included in the score whose age below 40 years. Male were predominant live in urban area, all of them were highly educated employed, also most of them had history their family of CVD, this is may be due to educated people be more aware about cardiovascular diseases. In the study of roth et al, performed in an urban county African –Americans and Hispanic adults where the quality of health care delivery should be high , they found that aspirin intake was insufficient with high risk patients for CVD and routinely used by many patients at low CVD risk [17].

This study shows the distribution of patient who need aspirin but they didn't use aspirin , they were 66 patients mostly male live in urban area.

Higher education , smoker , most of them had no family history of cardiovascular diseases. In a study done by Im et al which was conducted for assessment of the 10-year (CVD) risk and to set for the application of the current requirement on aspirin use for primary protection in Korean participants, and according to 2016 recommendation of (USPSTF), aspirin in their study was indicated in 266 participants (23.6%), but only 44 participants of them (3.9%) were on regular intake of aspirin . Among these who participates in their study, aspirin was prescribed in proper way in 36% of the participants, suggesting that only 6% of the participants were taking aspirin appropriately and 3.3% of them were taking aspirin inappropriately [18]

## Abstract

In the present study, the DPPH scavenging activity from the primary methods to estimation the antioxidants activity in the body by an inverse relation between them. So, the levels of DPPH scavenging activity is reduced in the patient with HPV16 genotype chronic cervicitis (G3= 43.01±2.74 in the serum, G3= 9.73±1.53 in the mucus) and without (G2= 47.22±4.50 in the serum, G2= 15.51±1.41 in the mucus)compared with healthy women (G1= 64.79±4.87 in the serum, G1= 21.24±3.62 in the mucus), this is a return to lowering antioxidants in the patients compared with healthy women. The deterioration in the antioxidants levels can cause cancer in the future or delay the response of the medication to inflammation.

***Keywords:*** *DPPH, Antioxidants activity, Chronic cervicitis, HPV, cervical cancer.*

## Introduction

Chronic Cervicitis from the widespread diseases in gynecology, caused by delayed treatment or diagnosis [(1,2)]. From the clinical symptoms for this disease include abnormal vaginal discharge, lower genital pain and constant lochia. chronic cervicitis occurs due to infected cervical by a pathogen [(3,4)]. Human papillomavirus (HPV) is a common pathogen that causes chronic cervicitis. The high-risk HPV (HR-HPV) is more than 180 genotypes that cause squamous epithelial hyperplasia because of the DNA of HR-HPV have the ability to synthesis oncoproteins that cause inhibition to tumor suppressor proteins such as "p53 and retinoblastoma protein (pRb)". So, the infected by HR-HPV can lead to "cervical intraepithelial neoplasia" or cervical precancerous lesions [(5,6)].

The chronic infection accompanied by increased free radicals and pro-oxidants, that have harmful effect to biological systems such as lipids, proteins and DNA, that cause ageing, cardiovascular disturbances, diabetes, and cancer [(7)]. While the antioxidants are the compounds, act as free radicals scavenging either by prevention or conversion mechanisms [(8)]. These antioxidants produced internally in living organs or intake by foods [(9)].

α,α-diphenyl-β-picrylhydrazyl (DPPH) is described as a stable free radical due to delocalisation electron overall whole molecule (Figure 1). therefore keep this molecule from dimerization. The DPPH from the mainly methods to evaluation of antioxidants activity for the biological systems [(10)].

## Material and Methods

### Study design:

The study design is a comparative study for healthy, chronic cervicitis patients with positive HPV 16 genotyping, and patients without HPV.

### Sample collection:

HPV 16/18 genotyping detection by real-time PCR by taken specimens as tissues by cervical scraping and as Pap smear with mucus by the physician in the hospital Imam Sadiq and maternity hospital and children in Babil province, where keeping in (2 ml) from phosphate buffer solution (PBS), in addition to serum for the same persons. The specimens collected depend on the criteria of chronic cervicitis such as age, number of pregnancy or abortion, infection delay, smoking, vaginal bleeding, lower abdominal pain and vaginal pH.

**Sample size calculation:**

The sample size calculated by applying the following equation [11]:

$$n = Z^2 P (1 - P)/d^2$$

Where Z refer to Z-score (equal 1.65), d is the absolute marginal error equal 10%, P is the population (number of women that have cervicitis and undergo to cervical screen equal 8%), therefore the number of samples equal to twenty for each group, but have been taken more than 20 for the chronic cervicitis without HPV 16/18 and healthy control (Table 1). The samples were collected for a period of six months.

**Table 1: Groups classification.**

| Groups | Description | No. of the patients |
|---|---|---|
| G1 | Women with chronic HPV16/18 cervicitis | 20 |
| G2 | Women with chronic cervicitis | 40 |
| G3 | Healthy women | 40 |

**Viral DNA extraction:**

Depended on viral gene-spin DNA extraction kit, can be extracted DNA and prepared to real-time PCR.

**Real-time PCR procedure:**

Have been used Bosphore HPV genotyping kit for real-time PCR to detect HPV 16/18 genotypes [12,13].

**DPPH procedure:**

Principle:

**DPPH has violet colour due to this delocalisation when dissolved in ethanol and absorbed at 517 nm. This radical can accept a hydrogen atom from antioxidants to reduce the colour intensity from violet to yellow colour depending on the antioxidants**

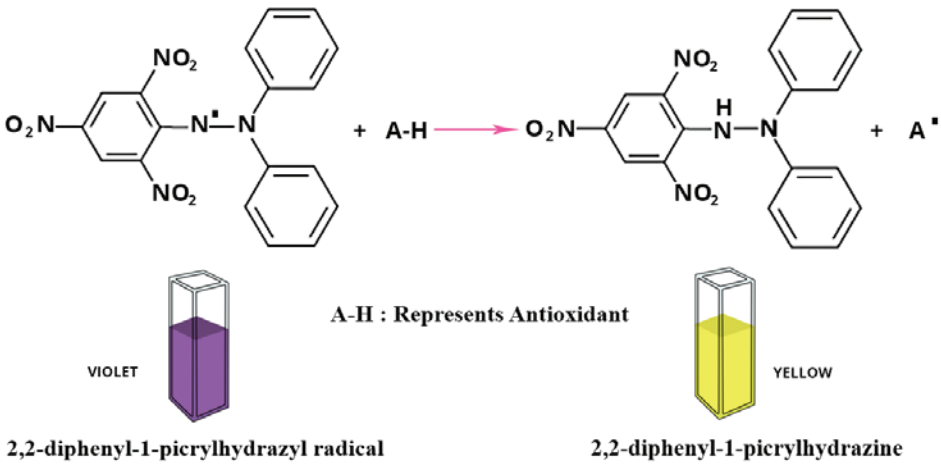

**Fig. 1: DPPH reaction with A-H.**

**Procedure:**

With minor modify prepared the reagent 1 (R1), DPPH (0.1 mM) in absolute ethanol, and control from ascorbic acid (20 mg/dl), then the following steps [14]:

| Reagent | Sample/µl | control/µl | Blank/µl |
|---|---|---|---|
| R1 | 1000 | 1000 | 1000 |
| Serum | 100 | ------- | ------- |
| Control | ------- | 100 | ------- |
| D.W. | ------- | ------- | 100 |

wait for 20 min at 25ºC. within dark condition, read absorbance at 517 nm. The results can be calculated by the following relation:

$$\textit{Free radical scavenging activity}\ \% = \frac{\textit{Absorbance of control}}{\textit{Absorbance of Sample}} \times 100$$

## Statistical Analysis

The data were entered into SPSS program version 23 to get on the variables as mean, standard deviation (SD), standard error (S.E), confidence interval and "one-way ANOVA. A p value of ≤ 0.05 was considered to be significant".

## Results and Discussion

The results for the sixty women that undergo to cervical screen represented only twenty from the patients that suffer from the symptoms that related with chronic cervicitis have HPV positive of 16 genotype only according to real-time PCR results as showing from the amplification plot (Figure 2). Where another forty also have chronic cervicitis but due to other causes than HPV 16/18 genotyping.

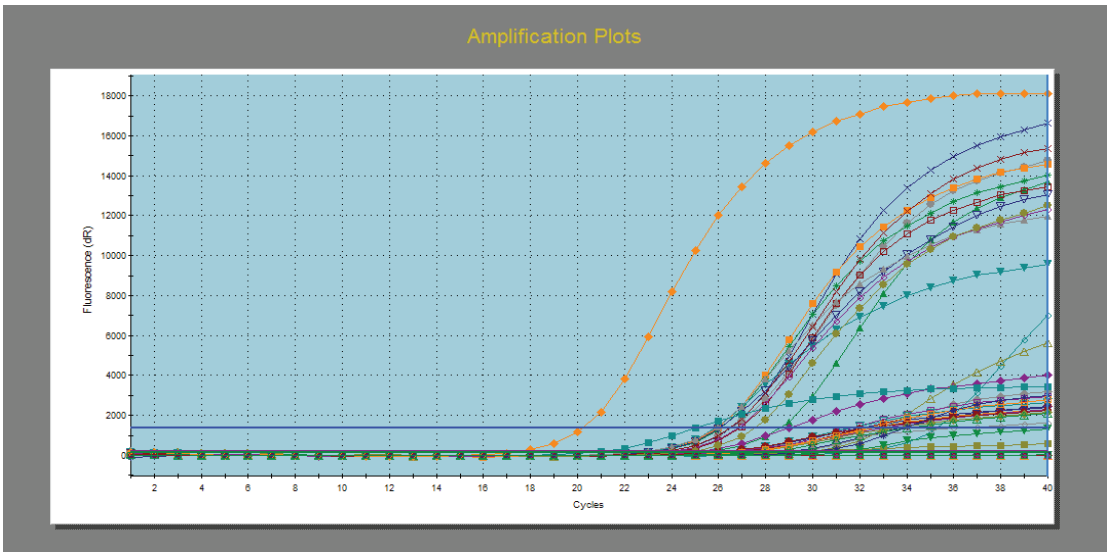

**Fig. 2: Amplification plots of real-time PCR.**

The DPPH results represented in (Table 2), were the results in G3 show the significant decrease in DPPH

scavenging compared with G1, and G2 compared with G1, also in G3 compared with G2.

**Table 2: DPPH scavenging activity.**

| Groups | | DPPH scavenging % (Mean ± SD) | S.E | Confidence Interval 95% | | P-Value |
|---|---|---|---|---|---|---|
| | | | | Lower | Upper | |
| G1 | Serum | 64.79±4.87 | 0.77 | 15.6187 | 19.5068 | .000 |
| | | | | 19.3968 | 24.1588 | .000 |
| G2 | | 47.22±4.50 | 0.71 | -19.5068 | -15.6187 | .000 |
| | | | | 1.8341 | 6.5960 | .001 |
| G3 | | 43.01±2.74 | 0.61 | -24.1588 | -19.3968 | .000 |
| | | | | -6.5960 | -1.8341 | .001 |
| G1 | Mucus | 21.24±3.62 | 0.57 | 4.5929 | 6.8647 | .000 |
| | | | | 10.1120 | 12.8945 | .000 |
| G2 | | 15.51±1.41 | 0.22 | -6.8647 | -4.5929 | .000 |
| | | | | 4.3833 | 7.1657 | .000 |
| G3 | | 9.73±1.53 | 0.34 | -12.8945 | -10.1120 | .000 |
| | | | | -7.1657 | -4.3833 | .000 |

The investigations of this results may be due to the chronic infection in cervix cause increased the number of leukocytes in the location (mucus) of inflammation and this lead to elevated levels of reactive oxygen species (ROS) such as superoxide and hydrogen peroxide to destroy the microorganisms that cause this inflammation such as HPV, bacteria or fungi. Also depletion of antioxidants in the immunity defense process.

Moreover, there are found significant lowering in G3 compared to G2, because of the viral cause desquamation for the epithelial tissues in chronic cervical infection and maybe cause epithelial cells necrosis, then increase electron leakage from the mitochondria and depleted the antioxidants. Therefore, the lowering antioxidants in the body (serum) or cells lead to reduce the ability to scavenging DPPH compared with healthy persons.

## Conclusion

In brief, DPPH scavenging activity from the primary methods to estimation the antioxidants status of the body. In the patients show the lowering in the antioxidants due to inflammation compared with healthy women. The deterioration in the antioxidants levels can cause cancer in the future or delay the response of the medication to inflammation.

# Estimation of Some Genetic and Physiological Variables of Iraqi Desert Snake *Cerastes gasperettii*

**Samir M. Khalaf[1], Haitham L. Abdulhadi[1], Banan R. Dabdoub[2], Luay H. Ali[1]**

*[1]Biology department Education college for pure sciences University of Anbar-Iraq, [2]Biology department Education college for pure sciences /Mosul University -Iraq*

## Abstract

This study nominate the first blood indicate ranges for desert snake (***Cerastes gasperettii***) , Twenty-eight samples of the species under study were collected during field trips in the study area (Anbar desert located at western sector of Iraq about 400 kilometers west of Baghdad City).The examined hematologic values of the (***Cerastes gasperettii***) snake showed the highest erythrocyte ,WBC , hemoglobin ,MCH , MCHC and hematocrit value in male when a compared with females, The MCV value was found to be the highest in females and the lowest in male, karyological study revealed that the chromosome number is 2n (diploid) and the fundamental number (ZW) is 34 in male and female. DNA fragment was observed by agarose gel electrophoresis for CTNNB1 and WAC specific primers, the derived fragments ranged from approximately 600 bp, Additionally, in the CTNNB1 specific primer amplification of DNA fragments was found in male and female and ranged from approximately 900-bp DNA band.

## Introduction

Western Iraq desert is home to a unique fauna and flora that has been shaped by the combination of several factors including the harsh climatic conditions of the Sahara (Arabian deserts), the episodic appearance of humid cycles, and by the complex geological evolution of the area. [(1)]. Taxonomy today often relies on molecular data for further support and information, such data are usually preferred over morphology for the reconstruction of evolutionary relationships among organisms. The increasing use and availability of molecular data has led to the development of new methods to study systematics, and has proven to be an invaluable tool for evaluating the evolutionary relationships between both closely and distantly related species [(2)]. Recent studies of Middle Eastern snakes have used molecular data to elucidate the inter- and intra-specific relationships among taxa, revealing high levels of genetic differentiation and cryptic diversity that do not accord with the current taxonomy, such studies have also provided insights into the historical biogeography of the taxa and the processes that triggered their diversification. However, the biodiversity of snakes in the Middle East remains unclear, as systematic and biogeographic data for several genera are still lacking. One such example is that of the colubrid genus *Cerastes sp*.[(3)]. ***Cerastes sp.*** is a venomous viper species occasionally found near human habitations, the information regarding their natural history is scarce are poorly known, it is very similar in appearance to *C. cerastes*, but the geographic ranges of these two species do not overlap, they are mostly daytime but can also be active during the nighttime Morphologically are characterized by Harsh, pressed body and short tail, the head triangular clear from neck, the Females are usually larger than males and average total length (body + tail) is 40–70 cm, with a maximum total length of 100 cm. that are mostly nocturnal but can also be found active during the day, prefer dry areas with little vegetation and are found in desert areas In Iraq desert, Jordan, and Egypt (i.e., the Sinai Peninsula), they are also known from arid and stony steppes, sparsely vegetated rocky slopes and wadis [(4).] The genus is currently comprised of three known species:

**Corresponding author:**
**Samir M. Khalaf**
Samir_mishrif@yahoo.com

***Cerastes cerastes***: it is found in arid North Africa (Morocco, Mauritania and Mali, eastward through Algeria, Tunisia, Niger, Libya and Chad to Egypt, Sudan, Ethiopia and Somalia) through Sinai to the northern Negev of Israel. In the Arabian Peninsula, it occurs in Yemen, Kuwait, extreme southwestern Saudi Arabia and parts of the country in Qatar where it is sympatric with *C. gasperettii.* A report of this species being found in Lebanon is unlikely [5]**.**

***Cerastes gasperettii***: In the Arabian Peninsula it has been found in Kuwait, Bahrain, Saudi Arabia, Oman, Qatar, United Arab Emirates, and Yemen. It is found in the Arava valley, located on the border between southern Israel and Jordan, eastwards through Jordan and Iraq to Khuzestan Province in southwestern Iran. [6].

***Cerastes vipera***: It is found in arid North Africa Mauritania, Morocco , Algeria , Mali , Tunisia , Libya , Niger, Chad and Egypt. Sinai Peninsula: Egypt and Israel. [7]. The current status of the recognized species within *Cerastes sp*., their relationships and distribution, remain relatively unclear, as no study has sampled all known species from the entire distribution range of the genus. In this work, we explore the phylogenetic relationships within *Cerastes sp*. by means of a broad sampling coupled with a morphological revision. Using an integrative taxonomic approach, we seek to produce the most complete phylogeny of *Cerastes sp.* to date, in order to clarify its systematics, describe a new species from Iraq, and elucidate its biogeographically and evolutionary history [8].

## Materials and Method

Twenty-eight samples of the species under study were collected during field trips in the study area (Anbar desert located at western sector of Iraq about 400 kilometers west of Baghdad City). Blood samples were collected from (males and females) the ventral tail vein using a 25-gauge needle attached to 1ml disposable syringe containing (EDTA)The red blood cell counts (RBC) and white blood cell counts (WBC) were carried out using a Neubauer hemocytometer, where standard Hayem's solution for red blood cells and Turk's solution for white blood cells were used as a diluting solution.Hematocrit (HCT) was deter-mined using the microhematocrit method [9,10]. The tubes were then spun in a microhemat-ocrit centrifuge for 5 min at 12,000 rpm and the hematocrit (HCT) was calculated with the total blood level divided by the blood cell level. Hemoglobin concentration (Hb) was measured by the Sahli method with a Sahli hemoglobinometer (Tanyer, 1985). The mean corpuscular volume (MCV), mean corpuscular hemoglobin (MCH), and mean corpuscular hemoglobin concentration (MCHC) were calculated mathematically, taking the above results into consideration [9]. Chromosome preparations were applied for cytogenetic studies by lymphocyte culture of whole blood samples. The culture cells were treated with a colchicine-hypotonic-fixation-air-drying technique followed by conventional staining, twenty cells of each individual chromosome checks, length measurements, karyotyping were accomplished by using a light microscope [10,11]. Genomic DNA extraction was performed with DNeasy tissue Kit (QIAGEN). Extracted DNA Blood samples were stored in -30ºC to be used as a template for the polymerase chain reaction, DNA were amplified using specific primers WAC and CTNNB1[12, 13]. The descriptive statistics of the data obtained from our study were performed using SPSS (10.0 for Windows Student Version). Hematological variables were summarized as mean, standard deviation (SD), standard error of the mean (SE), and range. Results were considered significant at $P \leq 0.05$.

## Results

The examined hematologic values of the (***Cerastes gasperettii***) snake showed the highest erythrocyte and WBC count in male whereas the lowest erythrocyte count was found in females , The hemoglobin and hematocrit value was detected to be the highest in male too , The MCV value was found to be the highest in females and the lowest in male , and the MCH and MCHC value was found to be the highest in male and the lowest in females, The hematologic values of (***Cerastes gasperettii***) snake are given in detail in Table 2.

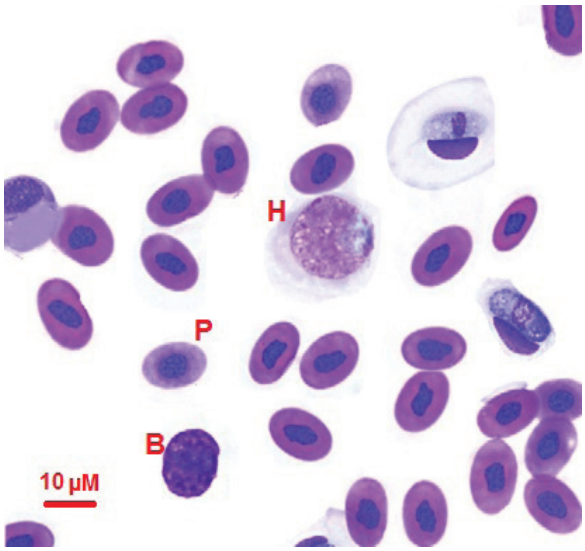

**Figure. 1. Peripheral blood from (*Cerastes gasperettii*) with erythrocytes and B, basophil; H, heterophil; P, polychromatophils Wright-Giemsa, x100 objective**

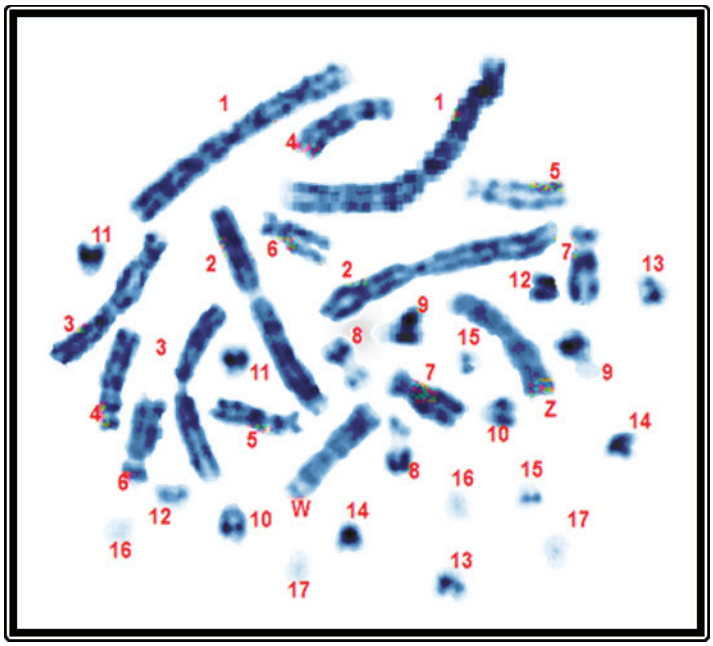
Karyological study of the (***Cerastes gasperettii***) snake using lymphocyte revealed that the chromosome number is 2n (diploid) and the fundamental number (ZW) is 34 in male and female. The diploid chromosome complements (Fig.1) consisted of pairs of metacentric or submetacentric macrochromosomes, gradually decreasing in size and pairs of microchromosomes.



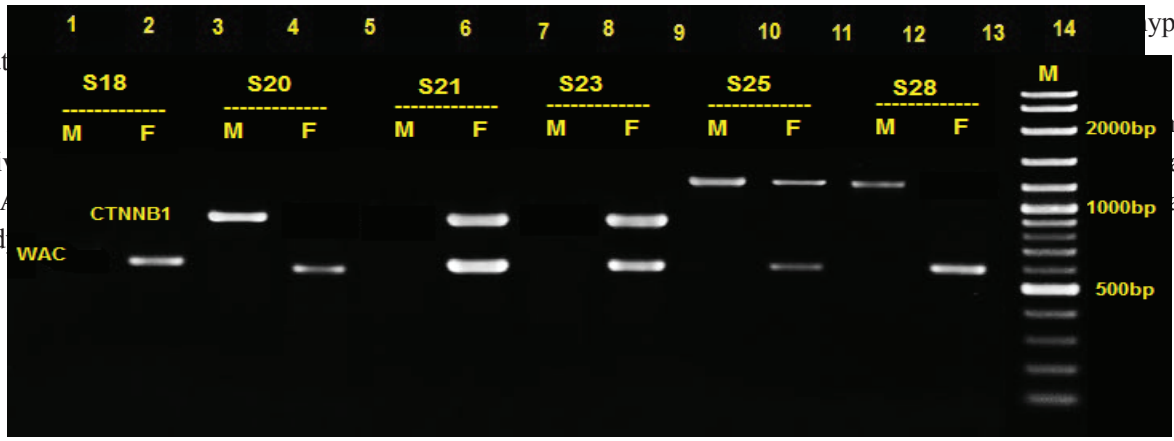


**Figure.4. Agarose gel electrophoresis of PCR products in males and females of six (*Cerastes gasperettii*) snake using CTNNB1 and WAC M, male F, female**

## Discussion

The recent study has Recorded the first set of haematological parameters for any Iraqi snake species and provides normal reference intervals may be applied when examining other snakes, particularly species in the same family as those lived in the same desert. The coccygeal vein blood sampling of snakes is the easiest and safest method for clinicians blood collection from venomous snakes[14]. We adjust our method of collection Because lymph can contaminate samples collected in the syringe via aspiration, One of the most uncertainty aspects of diagnostic hematology of snake is the adjust the cell counts, Because RBCs are nucleated manual methods must be used to quantify leukocytes[15].

This study reported significantly Other snakes may have higher PCVs as in other environments such as percutaneous oxygen uptake, increased oxygen storage capacity in the lungs and lowered metabolic rates may provide increased oxygen availability therefore reduce the need for higher PCV for oxygen carrying capacity. [16,17]. male had higher RBC counts, MCV , MCH , and MCHC values than females, Because of the inverse relationship between erythrocyte number and size, species with higher MCV, such as turtles and snakes, have lower RBC counts than lizards, which have a lower MCV and higher RBC count, The average erythrocyte lifespan ranges from 600 to 800 days in reptiles[17]. This extremely slow turnover of erythrocytes (relative to human erythrocytes, which have a 120-day lifespan)

is thought to be associated with the slow metabolic rate of reptiles[15]. The conventional G-banding techniques revealed good number of G-bands on one set of haploid, which includes autosomes, Z and W chromosomes, Our present study showed that eight chromosome pairs show the same patterns (pairs 10, 11, 12,13, 14 ,15 ,16 and 17) and ten pairs share similarities (pairs 1, 2, 3, 4, 5, 6, 7,8, 9 and ZW chromosomes).This indicates that maybe there is evolutionary relationship between the desert Snake and the other snakes[18]. For further studies, more information about genetic differences is needed which may be accomplished by using molecular biology or molecular genetics. We try to developed novel PCR-based molecular sexing methods with two primer sets to identify sex chromosome systems by molecular method utilizing sex-specific sequences, thus, more advantageous than cytogenetic analyses to identify individual (*Cerastes gasperettii*) snake sex , based on the nucleotide sequence differences of two gametologous genes CTNNB1 and WAC the males with the homogametic sex chromosome (ZZ) were characterized by a single DNA fragment band from the two Z homologs, and the females with the heterogametic sex chromosome (ZW) were identified by two bands differing in fragment sizes from the one Z and one W homologs. The two primer sets CTNNB and WAC were available for molecular sexing in (*Cerastes gasperettii*) snakes, respectively. These two markers exhibited co-dominant DNA pattern type. This suggests that the Z and W forms of the CTNNB or WAC genes were differentiated by the cessation of recombination in the (*Cerastes gasperettii*) lineages [19,20].

# Evaluation of Soluble PD-1 and PD-L1 in Iraqi Type 2 Diabetes Mellitus (T2DM) Patients with Chronic Toxoplasmosis

**Farah E. Mohammed [1], Ali N. Yaseen[1], Muhammed A. H. Aldabagh[2]**

*[1]Assist. Prof. , Department of Sciences, College of Basic Education, Mustansiriyah University, Baghdad-Iraq,*
*[2]Assist. Prof., Medical Research Unit, College of Medicine, University of Al-Nahrain. Baghdad-Iraq*

## Abstract

*Toxoplasma gondii* is an important opportunistic parasite in immunocompromised people. Globally, diabetes mellitus is one of the most challenging public health burdens of the 21st century. Both toxoplasmosis and diabetes are very common in Iraq and other countries. The main objective of the present study was to investigate the sero- prevalence of the anti-*Toxoplasma gondii* IgG antibodies in Iraqi T2DM patients and to clarify the role of soluble programmed death-1 (sPD-1) and ( sPD-L1) in Iraqi T2DM patients with chronic toxoplasmosis. Enzyme Linked Immunosorbent Assay (ELISA) was used to detect anti- *T. gondii* IgG antibodies in the sera of 180 patients with type 2 diabetes mellitus (T2DM) and 163 apparently healthy controls. The results showed that 117(34%) samples of sera patients have been founded T2DM with toxoplasmosis, 63(18%) samples have T2DM, 55(16%) cases have control toxoplasmosis (those patients were had toxoplasmosis but showing no symptoms) and 108 (32%) cases samples were considered as a control group without any infections. Sera (sPD-1 and sPDL-1) levels were determined by ELISA using a quantitative sandwich enzyme immunoassay technique. The results showed that levels of sPD-1 and sPDL-1 levels were significantly higher in patients group than healthy subjects (P<0.01).

***Keywords:*** *Toxoplasma gondii, chronic toxoplasmosis, T2DM, sPD-1 and sPDL-1*

## Introduction

*Toxoplasma gondii* (*T. gondii*) is an intracellular obligate parasite that belongs to phylum Apicomplexa which causes Toxoplasmosis [(1)]. Cats and other Felidae family members implicate as a definitive host of the parasite. Humans and other livestock are considered as intermediate host of *T. gondii* [(2)].

Toxoplasmosis is usually asymptomatic in infected humans. However, some infected group such as immunocompromised patients, suffer from fatal and life-threatening outcome including encephalitis, pneumonia, retino-choroiditis, epilepsy and other neurological complication [(3)].

**Corresponding author:**
**Assist.Prof.Dr. Ali N. Yaseen**
e-mail: ms.bio2012@yahoo.com

Toxoplasmosis is implicated in numerous autoimmune diseases for example rheumatoid arthritis, polymyositis, thyroid autoimmunity and anti-phospholipid syndrome [(4)]. However, *T. gondii* infection in individuals with type 2 diabetes mellitus (T2DM) has received little recognition.

The T2DM is the most common type which accounts for about 90% of all diagnosed diabetes cases [(5)]. The disease reduces cellular and humeral immune status through their deplorable long hyperglycemic course and possibly stimulates latent opportunistic pathogens [(6)]. The prevalence of diabetes is reaching epidemic levels and it is estimated that 642 million people will be living with diabetes by 2040, up from 415 million in 2015. Toxoplasmosis is a disease caused by the protozoan parasite *Toxoplasma gondii*. Up to one third of the world's human population is estimated to be carrying *Toxoplasma* infection and the life cycle of this parasite plays a huge role in its easy transmission [(5)].

Both toxoplasmosis and T2DM are very common in Iraq and other countries [7].

Programmed death-1 (PD-1) is a novel member of the CD28 superfamily. It's a negative co-stimulatory factor that mediates negative co-stimulatory signal [8]. PD-1 can effectively inhibit functioning and proliferation of the T cells, and reduce IL-2, IL-10 and IFN-γ secretion [9] playing an important role in immune regulation [10].

In recent years, more and more studies indicate that the pathogenesis of T2DM involves immune dysfunction, and T2DM can be considered somewhat a chronic inflammatory disease [11]. Impaired immunity in patients with diabetes may increase the risk of infection; however, the exact effect of diabetes on patients with toxoplasmosis remains to be studied. The main objective of the present study was to investigate the sero- prevalence of the anti-*Toxoplasma gondii* IgG antibodies in Iraqi T2DM patients and to clarify the role of soluble programmed death-1 (sPD-1) and ( sPD-L1) in Iraqi T2DM patients with chronic toxoplasmosis.

## Materials and Method

### Subjects and Samples

This study was included 180 samples of patients with Type 2 diabetes mellitus (T2DM ) attending to Department of diabetes in Al-Iamamain Al-Kadhumain Teaching Hospital in Baghdad ,Iraq. During the period from December 2018 to April 2019. Out of this sample, a group of 163 healthy subjects were considered as control group. The age of all patients and healthy subjects were ranged from 39 – 79. Five ml of venous blood were collected from each subjects (patients and control) and placed in gel tube, the serum was separated and divided in ependorff tubes then stored at -20C° until it is used.

### Serological tests

**1- ELISA *T. gondi* – IgG :** The sera of all samples (Patients and control) were tested with the presence of specific IgG antibodies of *Toxoplasma gondii*, via ELISA kits which had supported by (Bioactiva Company, Germany) and applied the test according to the manufacturer's instructions.

**2-Serum Level of PD-1:** Serum levels of **PD-1** was measured by using specific enzyme-linked immunosorbent assay) ELISA) kit (R&D Company, USA), according to the manufactures protocol.

**3-Serum Level of PD-L1:** Serum levels of **PD-L1** was measured by using specific enzyme-linked immunosorbent assay) ELISA) kit (Sunlong Biotech Company, China), according to the manufactures protocol.

### Statistical Analysis

The Statistical analyses were done by Statistical Package for the Social Sciences for Science (SPSS) version 2010. The statistical tests was included Descriptive statistical tables, Mean, Standard Error, Standard Deviation, 95% Confidence Interval of the Mean under $P > 0.05$ and $P < 0.01$ to considered statistically significant.

## Results

In the summarize examine results, the study samples showed that 117(34%) samples of sera patients have been founded T2DM with toxoplasmosis , 63(18%) samples have T2DM, 55(16%) cases have control toxoplasmosis (those patients were had toxoplasmosis but showing no symptoms) and 108 (32%) cases samples were considered as a control group without any infections (Table1).

The cut– off value of positive IgG (10 IU/ml) in all studied groups. The results recorded in the table 1 were shown higher results of levels of IgG in T2DM with toxoplasmosis group as 22.65± 8.55 IU/ml, followed by positive control group 19.59±7.52 IU/ml, and T2DM group with value 5.98±2.09 IU/ml, while negative control group presented low results of this antibody 3.48±2.40 IU/ml.

**Table 1: Levels of IgG antibodies (IU/ml) for all study groups.**

| Groups | No. of Samples | % | Mean ± SD. | 95% Confidence Interval for Mean | |
|---|---|---|---|---|---|
| | | | | Lower Bound | Upper Bound |
| Type 2 diabetes mellitus (T2DM) with Toxoplasmosis | 117/180 | 65 | 22.9 ± 6.42 | 21.71 | 24.06 |
| T2DM | 63/180 | 35 | 1.51 ± 5.5 | 5.17 | 5.93 |
| Positive control | 55/163 | 16 | 8.73 14.3 ± | 11.90 | 16.62 |
| Negative control | 108/163 | 32 | 3.0 ±1.98 | 2.64 | 3.39 |

Table (2) shows the comparisons in the means of the IgG among all studied groups, highly significant differences ($P < 0.01$) were registered when comparing the values of IgG for the patient's in T2DM with toxoplasmosis and T2DM only, positive control and negative control .

**Table 2: Multiple comparisons of the IgG concentrations ( IU/ml) according to**

| Parameter | Group(1) | Group(j) | P-value | Sig. |
|---|---|---|---|---|
| IgG | Type 2 diabetes mellitus (T2DM) with Toxoplasmosis | T2DM | 0.000 | HS |
| | | Positive control | 0.000 | HS |
| | | Negative control | 0.000 | HS |
| | T2DM | Positive control | 0.000 | HS |
| | | Negative control | 0.000 | HS |
| | Positive control | Negative control | 0.000 | HS |

HS: Highly Significant at P< 0.01

Games-Howell (G.H.) test for potential couples between studied groups

Table (3) referred to the differences of the means for sPD-1 among all studied groups, the results didn't record significant difference when comparing the level of sPD-1 in T2DM patients with toxoplasmosis and the groups of T2DM, positive control respectively, while high significant differences at probability of $P<0.01$ were recorded when comparing the negative group.

**Table 3: Multiple comparisons of the sPD-1 concentrations (pg/ml) according to**

| Parameter | Group(1) | Group(j) | P-value | Sig. |
|---|---|---|---|---|
| sPD-1 | Type 2 diabetes mellitus (T2DM) with Toxoplasmosis | T2DM | 0.817 | NS |
| | | Positive control | 0.088 | NS |
| | | Negative control | 0.000 | HS |
| | T2DM | Positive control | 0.241 | NS |
| | | Negative control | 0.000 | HS |

## Discussion

The main goal of the current study was to investigate the sero prevalence of the anti-*Toxoplasma gondii* IgG antibodies in Iraqi T2DM patients and to clarify the role of soluble programmed death-1 (sPD-1) and (sPD-L1) in Iraqi T2DM patients with chronic toxoplasmosis. The results of the present study revealed that 65% of the diabetic subjects were found seropositive for the anti-*T. gondii* IgG antibodies while 35% of the non-diabetic individuals were found seropositive with the same antibody.

Consequently, the risk factor for *T. gondii* infection in diabetic patients was about two folds higher than in healthy controls. Therefore, patients infected with *T. gondii* may be more at risk to develop diabetic than uninfected individuals.[10]. Recently, Sharad and Al-Hamairy[12] conducted a sero epidemiological study in order to detect the sero prevalence of *T. gondii* in diabetic individual in Babylon Province, Iraq and their results showed that the sero positivity rates were 51.4% for the *T. gondii* IgG by ELISA test. Siyadatpanah et al. [13] investigated the anti-*T. gondii* IgG antibodies in diabetic and non-diabetic individuals in west Mazandaran province, Iran, using ELISA method and their results showed that 52.6% of the diabetic individuals were seropositive for anti- *T. gondii* IgG while 50.6% of the non-diabetic individuals were seropositive for the same antibody. Recently, Modrek et al. [14] conducted a study to estimate the serum levels of *T. gondii* IgG antibodies in 205 diabetic patients in Iran and their results showed that the overall sero positivity rate was 70.7%. Molan and Ismael [7] detected a study to determine the serum levels of *T. gondii* IgG antibodies in 300 T2DM patients in Diyala Province, Iraq and their results showed that the overall sero positivity rate was 66%.

Although toxoplasmosis and diabetes may pave the way to each other, the occurrence of necrotic lesions in the pancreas of the experimental animals infected with *T. gondii* may indicate that toxoplasmosis paves the way to diabetes as the involvement of the pancreas can lead to the inhibition of insulin secretion and consequently the establishment of diabetes. Previous studies have confirmed the occurrence of necrotic lesions and inflammation in various organs (pancreas, stomach, lymph nodes and intestine) of the experimental animals infected with *T. gondii* and the tachyzoites have been detected in these lesions [13,14].

Oz [15] reported that *T. gondii* infects nucleated cells including pancreatic and may destroy the β cells and secretion of insulin and increase the risk of acute and chronic pancreatitis as well as diabetes. In addition, the tissue necrosis in pancreas during acute toxoplasmosis has also been reported [14]. The bradyzoites of *T. gondii* have been detected inside tissue cysts in the pancreatic tissues, acinar cells and bile duct epithelial cells [16].

Moreover, Prandota et al. [17] reported that *T. gondii* plays an important role in the pathogenesis of both types of diabetes. Consequently, during the process of organ transplantation, the recipients of pancreas and kidney containing the tissue cysts that contain the bradyzoites, are at a great risk for toxoplasmosis due to immunosuppressive chemotherapy and/or reactivation of bradyzoites [18].In contrast, T2DM has been considered as chronic inflammatory disease that induces various changes to immune cell function[19].

Programmed death-1 (PD-1) is a novel member of the CD28 superfamily. It's a negative co-stimulatory factor that mediates negative co-stimulatory signal [8]. PD-1 can effectively inhibit functioning and proliferation of the T cells, and reduce IL-2, IL-10 and IFN-γ secretion [9] playing an important role in immune regulation [10].

In this regard, there are no available literatures about the role of sPD-1 and sPDl-1 in toxoplasmosis. However, some studies have evaluated the serum level of sPD-1 during other infectious disease. These studies observed significantly higher levels of sPD-1 among patients with chronic HCV [20], *Echinococcus granulosus* [21], pulmonary tuberculosis and those whom having active pulmonary TB with co-incidental *Strongyloides stercoralis* [22] infection than control subjects free from these diseases.

Thus, increase in sPD-1 level inhibits the PD-1/ PD-L1 signaling pathway in T cells through negative feedback. Consequently, it reduces the inhibition of T cell activation and increases the activity of the immune system for managing CL. This supports the findings of Wang *et al*. [23] who suggested that sPD-1 blocks the membrane PD-1 binding site on activated T-cells, thereby attenuating the PD-1 signaling pathway and increasing the immune response.

# Clinical Variants of Rosacea in Iraqi Patients

**Ahmed Abdulhussein Kawen[1], Hussein Abbas Al-Sultany[2]**

*[1]Lecturer / MBChB, FIBMS/ Venereology and Dermatology / University of Thi-Qar/College of Medicine/Iraq,*
*[2]Ass. Prof. MBChB, FIBMS/ Venereology and Dermatology -Babylon University/College of Medicine/Iraq*

## Abstract

**Introduction:** rosacea can diagnosis by presence permanent erythema of the arched sides of the face, cheeks and nose then it affect the chin as well as brow. **Method:** A cross sectional study design was implemented, 50 child of Rosacea, were collected from outpatients of dermatology and venereology in Merjan teaching hospital and Alhussein teaching hospital in Thi Qar, from Jan. 2018 to Jan. 2019. All patients were identified basing on the distinctive clinical features by dermatologist, and for suspicious cases biopsy was taken to confirm the diagnosis. **Results:** no significant association between age groups and gender of kids. Significant association between gender and types, 61.1% of females and 54% of males with with Erythemato telengectetic while 30% of females and 14% of males with mixed type. No significant association between gender and types of skin P-value more than 0.05. No significant association between gender and drugs used. P-value more than 0.05. **Conclusion:** There is significant association between female gender and Erythematotelengectetic and mix type of rosacea, while significant association between male gender and Papulopastular type of rosacea.

***Key words:*** *Clinical variants, rosacea, Iraqi patients*

## Introduction

Rosacea can diagnosis by presence permanent erythema of the arched sides of the face, cheeks and nose then it affect the chin as well as brow. In addition, it separate from skin of periocular. It affected females with age 30 – 50 years old. In addition, more serous type of phymatous variations occur in males. Usual features include papules, pustules, flesh skin and telangiectasia. These tend to cluster in patterns, allowing for the identification of several subsets of patients; their recognition is important because the therapeutic implications differ [(1)]. The term □*rosacea*□ encompasses a constellation of clinical findings, with the key components being persistent facial erythema and inflammatory papulopustules. In 2002, rosacea was classified into four clinical subtypes1: (1) erythematotelangiectatic; (2) papulopustular; (3) phymatous; and (4) ocular . From a clinical perspective it is useful to classify rosacea into the following four subtypes [(1)]. However, this classification is intended as a guide given that there is some overlap amongst the subtypes and a patient can have more than one subtype. *Erythematotelangiectatic rosacea* (subtype 1; ETTR): Individuals have Persistent centrofacial erythema, Flushing, Telangiectasias, Skin sensitivity• *Papulopustular rosacea* (subtype 2; PPR): Patients have Persistent centrofacial erythema, Papules, Pustules/papulopustules, Overlap with other subtypesmay occur. Phymatous: In this form of rosacea patients have Thickened, nodular skin, Prominent pores, Can affect nose, (rhinophyma), chin (gnathophyma), forehead (metophyma), ears (otophyma), eyelids (blepharophyma), May be associated with other features of rosacea or occur in isolation. Ocular: This entity may or may not be accompanied by cutaneous changes of rosacea. Patients have Dry, gritty sensation, Blepharitis, Conjunctivitis, Chalazia and hordeola, Keratitis, episcleritis, scleritis, iritis (rare) [(2)].

## Methods

A cross sectional study design was implemented, 50 child of Rosacea, were collected from outpatients of dermatology and venereology in Merjan teaching hospital and Alhussein teaching hospital in Thi Qar, from Jan. 2018 to Jan. 2019. All patients were identified basing on the distinctive clinical features by dermatologist, and for suspicious cases biopsy was taken to confirm the diagnosis.

The demographic statistics such as age, gender and the duration of the disease was taken using a checklist, while information about the lesions such as type of lesion, site of involvement and numbers of lesions, itching and other associated symptoms were evaluated at the base time after taking the patients' verbal agreement. The statistical investigations using SPSS version were done. The results attained are deliberated significant at $p < 0.5$. Data used to evaluate the correlation between age, clinical type of LP and the gender of the patients.

## Results

50 child with UTI include in study, according to table 1 there is no significant association between age groups and gender of kids.

***Table 1: association between age groups and gender.***

## Discussion

Rosacea less affected color peoples than white peoples, trouble of discriminating erythema plus telangiectasia in color skin peoples lead to misdiagnosed and low reported of rosacea. Colored skin peoples less likely to have rosacea after sun exposure, prevalence of rosacea was high 40 million peoples affected with it and rate reach to more than 10% [3, 4]. Rosacea as a illness of people fair-skinned with Celtic plus North European legacy (Fitzpatrick skin I plus II), so high no. of rosacea occur in countries with significant amounts of peoples with skin of colored with rate more than 10%. While countries with proportion of white color skin peoples to darks skin if little so the no. of people with rosacea decrease. Peoples with dark skin may lead to miss diagnosis with rosacea and lead to delay in treatment and increase morbidity and mortality and developed phymatous rosacea [5]. The prevalence of rosacea in patients with skin of color is not well studied but appears to be less common than in those with skin phototypes I and II9. Epidemiologic studies from countries where darkly pigmented individuals predominate population-

wise suggest that the prevalence is far lower than in countries where the population is predominantly fair-skinned . Based upon a higher prevalence in those with skin phototypes I and II, *ultraviolet light* has been proposed as an additional contributing factor to the pathogenesis of rosacea. UVR also induces production of reactive oxygen species, which upregulate matrix metalloproteinases that lead to vascular and dermal matrix damage [2].

Rosacea affects all races, but is most common in fair-skinned individuals. Although the prevalence of rosacea is unknown, the vast majority of cases occur in fair-skinned populations and it is common. However, persons of African and Asian descent may also develop rosacea [6]. Rosacea occur facially and on eyes, the prevalence estimated 2.3% in Germany, 0.09% in Island, 10% in Sweden and 22% in Estonia. The ages of peoples that affected was 30 – 50 years old. Occasional cases of PPR and some cases of OR have been reported in children. The disorder appears to be less prevalent in the elderly. The age of onset of rosacea may be earlier in females than males [7]. Sex Some population studies report a slight predominance of males affected by rosacea [8], while others (mainly hospital-based studies) suggest females are more frequently affected [9]. The different figures may reflect the varying age of onset of the condition and the age profile of the particular population studied, or possibly the increased likelihood of female patients presenting to their dermatologist for treatment. Male patients are said to develop more severe rosacea than women and are much more likely to develop rhinophyma than females. Ethnicity Rosacea is a disorder that predominantly affects fair, pale-skinned, sun-sensitive individuals: those of Celtic origin seem to be most susceptible (sometimes referred to as the 'curse of the Celts' for this reason). This is reflected in the much higher frequency with which rosacea is diagnosed in dermatology clinics in northern Europe as opposed to those in southern African countries with darker skin-type populations [10]. Rosacea also appears to be less common in individuals with an Asian skin type than with white skin [11]. 348 of peoples works in Estonia 20% of them with rosacea and 55% of them with Fitzpatrick I and II type of skin, other study showed 38% of patients with type III skin and 7% type IV [12]. Also when rosacea diagnosis in color skin more in females than males with previously steroid used. Low flushing see in skin type VI occur due to circulatory supply to skin and microvascular functions. The circulation inside skin activate hyperemia then after obstruction and heating examine, so also these studies revealed difference between skin of white peoples and dark peoples and decrease in vascularity of skin of this peoples [5]. Salem et al. also revealed high frequency of rosacea in colored peoples in KSA [13], also the age of patients with rosacea was south Africa 47 years old [14], 49 years old in Tunisia [14] and 24 – 84 years old in China [16]. In China 68 women with mean of age 32.5 years old, 70.5% of patients have ETR, 29.4% of patients have PPR [17], in Japan 13 men with mean age 46.9 years old, Erythema besides papules in 69.2% of them [18], while in Korea 18 cases; with median of age 49 years old; women represented 72.2%, type IV of skin 61%; while ETR in 88.9% of cases and PPR in 11.1% of cases [19].

Another study in Korea revealed that 168 patients with mean age 47.8 years old, 70% of them were females, 57% type III of skin, 33% type IV, 7 % type V. 96 % ETR while PPR 50 %, 14 % ocular and finally 5% PHY [20].

90 patients in Italy with mean age 51 years old, 57% of them females, 27 with papulopustular lesions, 6 only with rhinophyma, 7 patients with ocular difficulties [21]. While 135 patients in Germany with mean age was 52 years old, 87% women, skin type classified as the following: 31% type III, 8% type IV, 64% ETR and PPR is most usual in in IV type of skin [22]. 50 patients in Saudi Arabia with mean age was 42 years old, skin type classified as the following: 40% type IV, 18% type V, 42% type VI, PPR represented 100% of cases [23]. In Egypt 15 women with mean age 44 years old and skin, type III 100% of cases [13].

## Conclusions

There is significant association between female gender and Erythematotelengectetic and mix type of rosacea, while significant association between male gender and Papulopastular type of rosacea.

# Assessment of MR-ProADM and N-Terminal B-Type Natriuretic Peptide of Serum Levels in Patients with Heart Failure.

**Ahmad abd alraheem Ibrahem Dahy[1]; Walaa Al-Jedda[2] , Abbas Al-Sharifi[3]**

*[1]College of Medicine/ Mustansiriyah University /Iraq, [2]Dept. of Biochemistry/College of Medicine/ Mustansiriyah University /Iraq, [3]Dept. of Medicine/ College of Medicine/ Mustansiriyah University /Iraq*

## Abstract

**Background**: Heart failure timely and effective diagnosis and treatment directly affects the prognosis of patients, so early diagnosis of heart failure treatment is very important. The current diagnosis of heart failure has yet to be further improved. To investigate the relationship between plasma levels of MR-ProADM and NT-proBNP in cardiac structure and function in patients with heart failure (HF) and the early detection of failure. **Methods**: Patients were recruited from the coronary care unit (CCU) of Al-Yarmouk Teaching Hospital and were admitted and verified as cases of HF by specialist cardiologists. Between the 1st of November 2017 and the 1st of April 2018; 48 patients (29 males and 19 females), were diagnosed to have HF and were included in the study. The total number of HF patients admitted to the CCU of the hospital during the study period was 100 patients but 52 patients were ruled out according to the exclusion criteria of the study such as Acute Myocardial Infarction, active myocarditis, Drug abuse or an alcohol drinker, renal failure .Apparently healthy subjects were recruited from the staff of Al-Mustanseryeah Medicine College. They comprised (40) subjects (30 males and 10 females). Each subject who was recruited in the control group has underwent a full history and physical examination with a recording of : age, gender, smoking, chronic diseases and medications.

Any subject in control group in this study must be fasting for 8-14 hours at the time of drawing of blood specimen. Consent was taken from all subjects in the control group after being told about the aim of the study. The plasma MR-ProADM and NT-proBNP levels were compared between the two groups to observe the value of plasma MR-ProADM combined with NT-proBNP in the diagnosis of heart failure. **Results:** the levels of plasma MR-ProADM and NT-proBNP were significantly higher in patients with heart failure Compared with the healthy control group. The levels of plasma MR-ProADM and NT-proBNP increased significantly ($P < 0.01$). The area under the ROC curve for the combined detection of plasma MR-ProADM and NT-proBNP was greater than the area under the three alone tests. **Conclusion**: The combined detection of MR-ProADM and NT-proBNP has high sensitivity and specificity in the diagnosis of heart failure and can be used as a new detection mode.

***Keywords*** *: MR-ProADM = mid-regional prohormone adrenomedullin, N-Terminal B-Type Natriuretic Peptide, Heart Failure .*

## Introduction

Heart failure is a clinical syndrome that results when the heart is unable to provide sufficient blood flow to meet metabolic requirements or accommodate systemic venous return its timely and effective diagnosis and treatment directly affects the prognosis of patients [(1)], so early diagnosis of heart failure treatment is very important. This study was to investigate the relationship between plasma levels of MR-ProADM and NT-proBNP in cardiac structure and function in patients with heart failure (HF) early detection of failure . The clinical data

**Corresponding author:**
**Ahmad abd alraheem Ibrahem Dahy**
ali_abd54144@yahoo.com

of 48 patients with heart failure and normal healthy people 40 subjects. The purpose of this study was to analyze the clinical significance of combined detection of plasma MR-ProADM and N-terminal B-type natriuretic peptide in the diagnosis of heart failure value. The study found that inflammation can aggravate myocardial injury, thereby worsening cardiac function, plays a very important role in ventricular remodeling [(2)]. Most of the inflammatory cytokines have a negative inotropic effect, thereby reducing myocardial contractility and cardiac output, worsening cardiac function [)3( )4(].

MR-ProADM is secreted in various tissues, including the heart, lungs, central nervous system, kidneys and gastrointestinal organs; it is also expressed in endothelial cells, vascular smooth muscle cells, fibroblasts and adipocytes. MR-ProADM has a hypotensive effect: it stimulates diuresis and natriuresis and also causes vasodilation, lowering blood pressure. In HF, as a consequence of pressure/volume overload and ventricular wall stretching, the MR-ProADM gene is upregulated in cardiac myocytes. The resulting high MR-ProADM levels appear to have a protective effect in the myocardium, as they lead to a decrease in preload and afterload. Some studies suggest that MR-ProADM additionally inhibits cell growth and hypertrophy; it has also been associated with reductions in remodeling and fibrosis[)5(].

One of the first responses to cardiac dysfunction is the activation of the sympathetic nervous system. Mid-regional proadrenomedullin (MR-proADM) is a precursor to a potent vasodilator with inotropic properties, adrenomedullin, originally isolated from pheochromocytoma cells. MR-proADM is elevated in patients with acute and chronic HF and is a strong predictor of clinical outcomes such as mortality and HF hospitalization, even when added to BNP or NT-proBNP.

## Materials and Method

### Research Objects and Groups

The study was carried out at the department of Chemistry and Biochemistry -College of Medicine- Al Mustansiry University. Patients were recruited from the coronary care unit (CCU) of Al-Yarmouk Teaching Hospital and were admitted and verified as cases of HF by specialist cardiologists. Between the 1st of November 2017 and the 1st of April 2018; (29 males and 19 females), aged ≥ 30 years, and we selected 48 patients were diagnosed to have HF. Diagnostic criteria for HF had based on the manifestation of three or four findings including: **EF in Echocardiogram** ,**Clinical presentation, ECG changes**, **and troponin positivity. The diagnosis is sometimes aided by the results of cardiac enzymes levels.** Blood was collected on admission to the CCU for the qualitative troponin-I testing. It is a device rapid test using cassette method as well as measuring complementary cardiac enzymes (GPT). Also the qualitative troponin-I testing by cassette method was repeated for double checking in the blood sample taken on the next morning for analysis of baseline laboratory tests and the study parameters. ECG changes were detected by electrocardiography done by expert nursing staff using under supervisor and specialist cardiologist electrocardiogram–recording apparatus (BIOMED Company, USA).

Any subject enrolled in control group must be fasting for more than 8 hours at the time of drawing of blood specimen.

Patients were interviewed using a questionnaire that included:

- Time of admission to CCU after chest pain.
- Past medical history , history of DM, current alcohol consumption.

Patients with Heart failure but have the following conditions were excluded in this study :

1. Acute Myocardial Infarction
2. Active myocarditis.
3. Strok , skeletal muscle injury, or trauma.
4. Age is <30 years.
5. Had abdominal enlargement for any reason other than central obesity.
6. Valvular heart disease

Apparently healthy subjects were recruited from the staff of Al-Mustansiryah Medicine College. They comprised (40) subjects (30 males and 10 females).

Each subject who was recruited in the control group has underwent a full history and physical examination with a recording of : age, gender, smoking state , chronic diseases and medications. They have no symptoms or history of coronary heart disease. They were age and sex-matched to study patients (41.55±7) and also comply to the criteria of exclusion in patients group. In addition, they underwent electrocardiographic screening to check for any ECG changes which might exist in spite of no clinical features of HF so as to be excluded from the study.

## Method

Blood collection was performed at 8.00 – 9.00 a.m. in the fasting state,

Collected blood was transferred into the tube while ensuring flowing down the wall of the tube, then serum was obtained and divided into aliquots in eppendorf tubes and stored at -20˚C until analysis.

Determination of serum NT-proBNP level by AFIAS ,is a fluorescence Immunoassay (FIA) for the quantitative determination of NT-proBNP in human serum, Boditech .While Determination of human MR-proADM concentration by enzyme linked immune sorbent assay kit (MyBioSource /USA) Application of it is measured according to kit instructions for testing .

## Statistical Methods

SPSS 22.0 software was used for statistical analysis. The t test was used to measure the data between the two groups. Chi-square test was used to count data. Logistic regression was used to analyze the risk factors for screening heart failure. The test level was 0.05. When $P < 0.05$, has statistical significane. The working curve (ROC curve) of subjects tested separately and jointly with MR-proADM and NT-proBNP was established to calculate their specificity and sensitivity.

## Results

**comparison between Heart Failure Group and Control Group in Plasma Levels of MR-proADM and NT-proBNP.**

Heart failure group increased significantly compared with the control group, the difference was statistically significant ($P < 0.01$, Table 1). Plasma levels of MR-proADM and NT-proBNP in HF group were significantly higher than those in control group ($P < 0.01$, Table 1) .

**Table 1: Heart failure group and control group heart function and plasma levels of MR-proADM and NT-proBNP.**

## Discussion

In clinical work, the diagnosis and differential diagnosis of heart failure is still a major problem, easily lead to missed diagnosis. Rapid progress of heart failure, once the condition deteriorated, often endanger the lives of patients. heart failure with poor prognosis )3(.

In recent years, NT-ProBNP has become hot spots in the early diagnosis of heart failure )6-10(. This study aimed to explore the value of MR-Pro ADM and N-terminal B-type natriuretic peptide in the diagnosis of heart failure.

This study aimed to explore the value of MR-Pro ADM and N-terminal B-type natriuretic peptide in the diagnosis of the heart failure. A large number of studies have shown that BNP can better reflect the function of the heart [1], making it widely used in the diagnosis of heart failure. BNP is a chemical that is pulled in the ventricular wall and released into the blood by cardiomyocytes [9] [10]. BNP is also present in normal tissues and is present in very low plasma concentrations. Cardiomyocytes release BNP while also releasing equimolar NT-ProBNP into the bloodstream. Compared with BNP, NT-ProBNP has higher stability in blood plasma, longer half-life and is less affected by other substances. As the heart expands, the hemodynamics and neuroendocrine activities in the heart cavity change. The higher the pressure in the ventricle, the stronger the ventricular wall is pulled and the higher the level of NT-ProBNP secreted by cardiomyocytes [11]. In the present study, the level of NT-proBNP was significantly higher than that of the control group, confirming that NT-proBNP has a very important clinical value in the diagnosis of heart failure. Nomura et al. [12] showed that serum NT-proBNP were elevated in heart failure and that agree with this study.

## Conclusion

In this study, our results showed that plasma levels of MR-Pro ADM and NT-proBNP in patients with heart failure were significantly higher than those in healthy controls, both of which could be used as indicators of heart failure. There was no significant difference in the levels of MR-Pro ADM and NT-proBNP between the

heart failure group.

ROC curve results show that the detection of MR-Pro ADM and NT-proBNP alone in the diagnosis of acute heart failure has a good sensitivity and specificity.

## Abstract

Cyclophosphamide, a medication that is used for the treatment of different types of cancer; however its' use associated with numerous adverse effects. Vitamin B2 and vitamin B12 suggested having nephroprotective effect. This work is designed to investigate the nephroprotective effect of both vitamins against cyclophosphamide induced nephrotoxicity. One hundred adult rats of both sexes were used in this study. The animals were randomly enrolled into ten groups of 10 rats each. On day eight, animals were sacrificed and blood collected for the measurement of serum superoxide dismutase 1, glutathione peroxidase; and kidney extracted for histological examination. Vitamin B2 and vitamin B12 significantly ($P$<0.05) increase superoxide dismutase 1, glutathione peroxidase; and the combination of vitamins produce significant ($P$<0.05) increase in superoxide dismutase 1 and glutathione peroxidase compared to the corresponding levels in other groups; and improve histopathological changes compared to cyclophosphamide-treated rats. In conclusion both vitamins may have nephroprotective effects against cyclophosphamide-induced nephrotoxicity.

***Key words:*** *Cyclophosphamide, Vitamin B2, Vitamin B12, Nephrotoxicity, Rats.*

## Introduction

Cyclophosphamide (CPA), an alkylating agent that widely used either alone or in combination with other agents for the treatment of different types of cancers and also as immunosuppressant [(1)], however its' use associated with varying adverse effects including nephrotoxicity [(2)]. Authors reported that the nephrotoxicity induced by CPA is due to active metabolites [(3)]. Furthermore, the nephrotoxicity caused by CPA can lead to variable reduction in glomerular filtration rate (GFR) along with tubular dysfunction [(4)]. Histologically in CPA-treated rat, kidneys showed glomerular nephritis, interstitial oedema and cortical tubular vacuolization in addition to that lysosomal enzymes activities were decreased and protein contents were increased with renal damage was consequently produced [(5)].

Vitamin B2 (Riboflavin) is a water soluble vitamin [(6)] which present in a wide sources of foods [(7)]. Such vitamin is important precursor for two active cofactors which are flavin adenine dinucleotide (FAD) and flavin mononucleotide (FMN) which participate in a wide range of redox reactions which in turn protect the body against variety of oxidative stress conditions [(8)]. Vitamin B12 is a generic name for a specific group of cobalt-containing corrinoids [(9)]. Cobalamin acts as cofactor for enzymatic conversion of homocysteine to methionine and also for conversion of methylmalonic acid (produced when proteins in the body are broken down) to succinyl-CoA [(10)].

Aim of this study to investigate the effects of vitamin B2 and vitamin B12 on cyclophosphamide induced nephrotoxicity.

## Materials and Method

**Experimental study:**

One hundred healthy adult albino rats of both sexes, weighing 180-220gm were used in this study; they were obtained from and maintained in the Animal House of the College of Pharmacy, Baghdad University under conditions of controlled temperature. The animals were fed commercial pellets and tap water *ad libitum* throughout the experiment period.

**Drugs**

Cyclophosphamide vial (500 mg) was purchased from Baxter, USA. Vitamin B2 capsule (400 mg) was purchased from Amazing nutrition, USA. Vitamin B12 tablet (1 mg) was purchased from TQ pharma, Japan.

**Experimental protocol**

The experimental rats were randomly divided into ten groups (10 rats/group) as follows:

**Group I:** Rats IP injected 1ml/kg/day normal saline for 7days; as control group. **Group II:** Rats IP injected with single dose of cyclophosphamide (CPA) (150 mg/kg). **Group III:** Rats orally-administered 10 mg/kg/day vitamin B2 for 7 days. **Group IV:** Rats orally-administered 40 mg/kg/day vitamin B2 for 7 days. **Group V:** Rats orally-administered 0.1 mg/kg/day vitamin B12 for 7 days. **Group VI:** Rats orally-administered 10 mg/kg/day vitamin B2 for 7 days and a single IP injection of 150 mg/kg of CPA at day 7. **Group VII**: Rats orally-administered 40 mg/kg/day vitamin B2 for 7 days and a single IP injection of 150 mg/kg of CPA at day 7. **Group VIII:** Rats orally-administered 0.1mg/kg/day vitamin B12 for 7 days and a single IP injection of 150 mg/kg of CPA at day 7. **Group IX**: Rats orally-administered a combination of 10 mg/kg/day vitamin B2 and 0.1 mg/kg/day vitamin B12 for 7 days and a single IP injection of 150 mg/kg of CPA at day 7. **Group X:** Rats orally-administered a combination of 40 mg/kg/day vitamin B2 and 0.1 mg/kg/day vitamin B12 for 7 days and a single IP injection of 150 mg/kg of CPA at day 7.

24 hour after the end of the treatment duration (i.e. at day 8), rats were euthanized by diethyl ether. 8 ±1 ml of blood was obtained by intracardiac puncture and was collected in gel and clot activator tubes to obtain serum for the determination of SOD1, and GP levels.

**Histological examination**

Kidney of each rat was prepared for histological examination according to the method of Junqueira [11].

Statistical Analysis

Data were expressed as the mean values, mean±standard error of the mean (SEM). Unpaired Student t-test was used for testing the significant difference between two groups. The statistical significance of the differences among various groups was determined by one-way analysis of variance (ANOVA). Differences were considered statistically significant for *P*-value less than 0.05.

## Results

**Effects on serum superoxide dismutase1 (SOD1)**

There were non-significant differences *(P*<0.05) in serum SOD1 level in groups of rats orally-administered vitamin B2 for one week (**Groups III,** and **IV**) respectively and vitamin B12 alone for one week (**Group V**) compared to that level in control (**Group I**) rats. Mean±SEM of serum SOD1 levels were respectively, 2.93±0.004, 2.94± 0.005, 2.95±0.009, and 2.92 ± 0.005. Furthermore, rats IP injected with CPA at day 7 (**Group II**) caused significant reduction (*P*<0.05) in serum SOD1 level compared to that level in rats of **Group I**. Mean±SEM of serum SOD1 levels were respectively, 0.95±0.011 and 2.92±0.016. Table 1

Moreover, there were significant elevation (*P*<0.05) in serum SOD1 level in **Groups VI, VII, VIII, IX,** and **X** of rats each compared to **Group II** rats. Mean±SEM of serum SOD1 levels were respectively, 1.15±0.003, 1.36±0.03, 1.58±0.003, 1.78±0.007, 2.04±0.034, and 0.95±0.011. Furthermore, table 1 showed that there were significant elevation (*P*<0.05) in serum SOD1 level in **Groups IX**, and **X** compared to the corresponding serum level in rats of **Groups VI, VII and VIII**. Mean±SEM of serum SOD1 levels were respectively, 1.78±0.007, 2.04±0.034, 1.15±0.003, 1.36±0.03 and 1.58±0.003.

**Effects on serum glutathione peroxidase (GP) levels**

Table 1 showed that there were non-significant differences *(P*<0.05) in serum GP level in groups of rats orally-administered vitamin B2 for one week (**Groups III,** and **IV**), and vitamin B12 for one week (**Group V**) each compared to the corresponding serum level in control (**Group I**) rats. Mean±SEM of serum GP levels were respectively, 331±0.611, 332±0.689, 332±0.465 and 330±0.527. Furthermore, rats IP injected with CPA at day 7 (**Group II**) caused significant reduction (*P*<0.05) in GP serum level compared to the corresponding serum enzyme level in control (**Group I**) rats. Mean±SEM of serum levels of GP were respectively, 169±0.603 and330±0.527. Moreover, there were significant elevation (*P*<0.05) in serum GP levels in **Groups VI, VII**, **VIII**, **IX**, and **X** rats compared to the corresponding serum levels in **Group II** rats. Mean±SEM of serum levels of GP were respectively, 216±0.588, 239±0.997, 243±0.683, 269±0.662, 297±0.741, and 169±0.603. Furthermore, table 1 showed that there were significant elevation (*P*<0.05) in serum GP level in Groups **IX**, and **X** of rats compared to the corresponding serum level in rats of **Groups VI, VII and VIII**. Mean±SEM of serum GP levels were respectively, 269±0.662, 297±0.741, 216±0.588, 239±0.997 and 243±0.683.

**Table 1. Effects of various treatments on serum superoxide dismutase 1 and glutathione peroxidase levels in rats**

| Group/Treatment | Superoxide dismutase1(SOD1) ng/ml | Glutathione peroxidase (GP) pg/ml |
|---|---|---|
| Group I | 2.92± 0.005a | 330±0.527a |
| Group II | 0.95± 0.011g | 169±0.603g |
| Group III | 2.93 ± 0.004a | 331±0.611a |
| Group IV | 2.94 ± 0.016a | 332±0.689a |
| Group V | 2.95 ± 0.003a | 332±0.465a |
| Group VI | 1.15 ± 0.011f | 216±0.588f |
| Group VII | 1.36 ± 0.030e | 239±0.997e |
| Group VIII | 1.58 ± 0.011d | 243±0.683d |
| Group IX | 1.78 ± 0.007c | 269±0.662c |
| Group X | 2.04 ± 0.034b | 297±0.741b |

Each value represents mean ± standard error of means (SEM).

Values expressed in small letters (a, b, c, d, e, f, and g) are significantly different (*P*<0.05). Number of animals in each group=10.

**Histological examination of rats' kidney tissue**

Rats IP injected with 1ml normal saline (**Group I**, control), orally-administered vitamin B2 (**Group III** and **Group IV**, respectively), and orally-administered vitamin B12 (**Group V**) each for 7 days showed normal kidney section, that characterized by thin glomerular basement membrane, cellularity and patent capsular space surrounding proximal and distal convoluted tubules. Figures (1-A, 1-B, 1-C and 1-D) respectively.

The kidney section from **Group II** rats IP injected with CPA showed dilatation of bowman space and renal tubules with fibroid tissue and massive apoptosis. Figure (1-E).

The kidney section from **Group VI** rats' orally-administered vitamin B2 for 7 days prior to IP injection of CPA at day 7 showed those histological changes; where, normal glomeruli with dilatation of bowman capsule space, degeneration of renal tubules and numerous apoptosis. Figure (1-F).

The kidney section from **Group VII** rats' orally-administered vitamin B2 for 7 days prior to IP injection of CPA at day 7 showed that atrophy of glomeruli with degeneration of renal tubules and vacoulation with numerous apoptosis compared to G**roup VI** rats. Figure (1-G).

The kidney section from **Group VIII** rats' orally-administered vitamin B12 for 7 days prior to IP injection of CPA at day 7 showed an atrophy of glomeruli, degeneration of renal tubules and numerous apoptosis. Figure (1-H).

While, kidney sections from **Group IX and Group X** rats orally-administered combination of each of vitamin B12 dose with vitamin B2 respectively for 7 days prior to IP injection of CPA; there were atrophy of glomeruli with dilatation of bowman capsule in addition to mild degeneration of renal tubules, and limited number of apoptotic cells. Figures (1-I and 1-J) respectively.

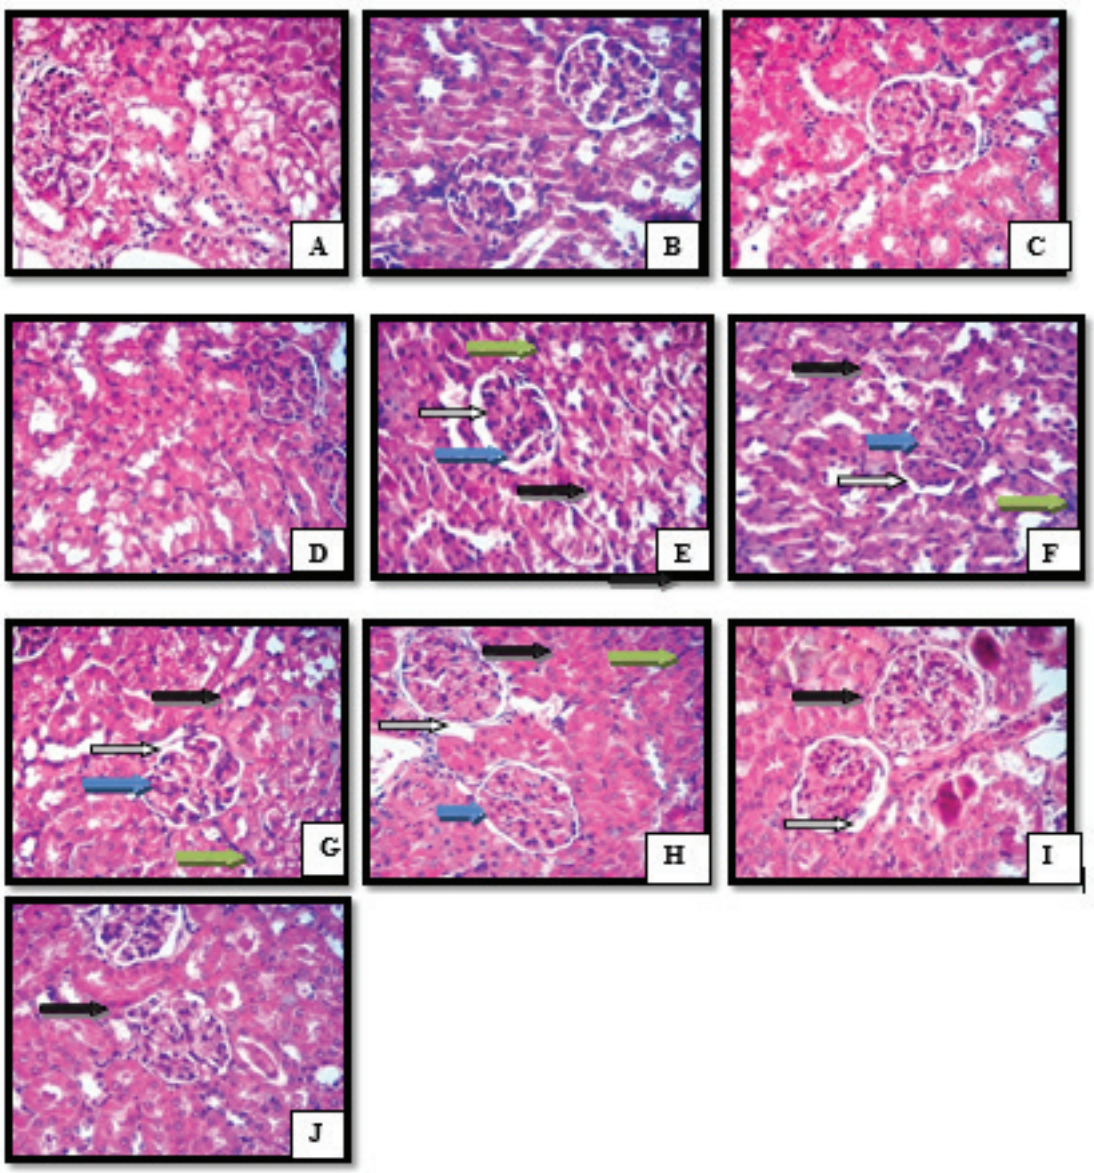

**Figure 1. Histopathological sections of kidney in various experimental rats' groups; (Hematoxylin and eosin; X40). Atrophy of glomeruli (blue arrow), dilatation of bowman capsule (white arrow), apoptotic cells (black arrow), fibroid tissue (green arrow).**

## Discussion

In this study rats IP injected with CPA at day 7 (**Group II**) caused significant reduction in both serum SOD1 and GP levels ($P$<0.05) compared to that levels in control (**Group I)** rats; these reductions may be due to the oxidative stress (OS) formation, which may responsible for CPA-induced nephrotoxicity; results of this study are coinciding with the work of Singh *et al* (2011) where, the OS was reported to be a possible pathological mechanism of nephrotoxicity-induced by CPA that can reduce both SOD1 and GP levels in serum [12].

Also, results of this study showed that orally-administered vitamin B2 in dose-dependent manner prior to CPA (**Group VI and Group VII**) significantly ($P$<0.05) elevate serum SOD1 and GP levels compared to such levels in CPA-treated rats (**Group II**); furthermore, the combination of different doses of vitamin B2 with fixed dose of vitamin B12 prior to CPA (**Group IX and Group X**) caused significant ($P$<0.05) elevations in serum SOD1 and GP enzymes levels compared to those levels in CPA-treated rats (**Group II**); moreover, there were significant ($P$<0.05) elevations in serum levels of

SOD1 and GP enzymes in rats of **Group IX and Group X** compared to corresponding enzymes levels in rats of G**roup VI, Group VII and Group VIII**; these effects could be explained that the antioxidant function of riboflavin could be attributed to the glutathione redox cycle, the reduction-oxidation reactions of riboflavin itself, and the riboflavin effects on antioxidant enzymes activities [13, 14]. Reduced glutathione (GSH), the active form of this antioxidant during its antioxidant activity, can be oxidized (GSSG), that mean inactive, thus, requiring a reduction through glutathione reductase (GR) to regain its antioxidant activity [15]. This enzyme requires the flavin adenine dinucleotide (FAD) coenzyme form of vitamin B2 for this reduction reaction; thus, emphasizing the important role of vitamin B2 in the formation of reduced, active (GSH); in fact, Dey S and Bishayi B (2016) reported that GSH levels were reduced following a decrease in riboflavin intake [16].

Also in this study, orally-administered vitamin B12 prior to CPA (**Group VIII**) produced significant ($P$<0.05) elevations in serum SOD1 and GP levels compared to those levels in **Groups II**, **VI and VII** of rats; these effects could be explained that vitamin B12 may act as antioxidant; where, its antioxidant function could be attributed to the following mechanisms: the enzymatically-processed vitamin B12 acts as a direct superoxide scavenger [17]; furthermore, vitamin B12 may indirectly stimulate ROS scavenging by preservation of glutathione, which likely involves an intricate network of reactions that has not been fully elucidated [17]; moreover, vitamin B12 might protect against (low-grade) inflammation-induced OS by modulating the expression of cytokines and growth factors [18, 19].

In this study, histopathological examination of kidney section of rats IP injected with CPA at day 7 **(Group II)** confirmed the nephrotoxicity; where kidney section of such rats showed renal cell disorganization and vacuolated glomeruli and renal tubules in addition to degeneration of renal tubules with fibroid tissues and massive apoptosis were observed; moreover, marked renal cells degeneration with frequent nuclear pyknosis, irregular darky-stained cells with pyknotic nuclei that are surrounded with halos arrows were prominent in figure (1-E). These findings are coinciding with the work of Hamdi A *et al* (2016) [20].

Concerning histological examination of kidney section of rats of **Groups VI, VII**, **IX** and **X**; there were improvement of the histopathological kidney lesions in all treated groups mentioned above [figures (1-F, 1-G, 1-I and 1-J)] compared to **Group II** (CPA-treated) rats [figure (1-E)]. Results of this study are in agreement with the study of Hajihashemi S *et al* (2017); where, a protective effect of vitamin B2 against nephrotoxicity was observed by histopathological examination [21]. Concerning histological examination in rats' kidney section performed in the present study, the effect of vitamin B12 orally-administered prior to CPA (**Group VIII**), showed that there were improvements of the histopathological kidney lesions in rats of (**Group VIII**) [figure (1-H)]compared to sections of rats' kidney of (**Group II**) (CPA-treated) figure (1-E). In this study, results are also in agreement with those performed others; where, a protective effect of vitamin B12 against nephrotoxicity was observed by histopathological examination [21]. In conclusion both vitamins may have nephroprotective effects against cyclophosphamide-induced nephrotoxicity.

# Investigating the Effect of *Lymnaea auricularia* (snail) Powder on Different Species of Pathogenic Bacteria

**Sally Hani Abdul-Khaliq[1], Nebrass Faleh Chachain[2], Raghad Abdulatif Abdurazaq[3]**

*[1]Researcher/Department of Biology, College of Science, Mustansiriyah University, Baghdad, Iraq, [2]Researcher Ph.D. Dr. Department of Biology, College of Science, Mustansiriyah University, Baghdad, Iraq, [3]Researcher/ Department of Biology, College of Science, Mustansiriyah University, Baghdad, Iraq*

## Abstract

The aim of this study was to investigate the antibacterial activity of ***Lymnaea*** *auricularia* (snail) tissue powder and shell powder against different human pathogenic bacteria (*Escherichia Coli, Pseudomonas aeruginoa* and *Klebsiella pneumonia*). Four concentration was tested (75,100.125,150) mg\ml of the powder with well diffusion assay. The highest activity of shell powder was in *E. Coli* at 75mg\ml concentration(19mm) inhibition zone, while the highest activity of tissue powder was in *P. aeruginoa* at 150mg\ml concentration with inhibition zone (28 mm). The powder extracts ' antimicrobial activity reveals that they may have biologically active metabolites.

***Keywords*****:** *Lymnaea auricularia. Antibacterial Activity. Human Pathogens.*

## Introduction

Mollusca phylum is considered for example the following generality widespread brute phylum including 100,000-200,000 types through over 52,000 types be situated specified and recognize [1,2]. Mollusca integrate a diverse extent of faunae and it is divided into Scaphopoda, Snail, Cephalopoda, Bivalvia, Polyplacophora, Caudofoveata, Solenogastres, and Monoplacophora [1,3]. Gastropod (snails) is the most diverse group of Mollusca, evaluated approximately 80,000 to 100,000 evaluated sorts [4,5]. Snails have colonized very different ecosystems from an ecological point of view, representing unified marine, aquatic and terrestrial taxonomic orders [6,7]. The snail includes Algae eater, deposit feeders, detritophages, herbivores, predators, filter- eater, ecto- and endoparasites [8]. those are smooth body beasts that are shielded via a solitary helical also limy shell that differs in volume, constitute and color. Snail be situated of economic importance for example a protein origin, ornament, coloring also remedy, Moreover, as a part of the natural diet for fish and birds, these species are important in the marine food chain [9,10].

## Material and Methods

Snail Collection

Snails were purchased from Al-ghazel market in the middle of Baghdad governorate. The samples were taken to the laboratory, water cleaned to remove sand and other dust particles [11].

### Identification of snails

Specimens were confirmed and identified by Dr.Muhannad Ramzi , the snail was identified according to the whorls number and the opening position[12].

### Preparation of snail powder

With the aid of a small hammer, the shells of the snail are broken and the meat was collected in clean containers or sterile beakers**,** then the meat was kept for 72 hours in the incubator at 55 ° C. The dried samples of snails were powdered into fine powder using mortar [11]. The shell was washed, cleaned, dried in an incubator at 55°C and crushed before it was blended into fine powder

using commercial milling machine [13].

**Culture media preparation**

The media was prepared according to manufacturing companies ' instructions, then disinfected via pressure chamber at 121 °C for 15 minutes under pressure 15bar/ Inch2, then poured in to sterilized petridishes after cooling to 45°C, incubated at 37°C for 24 periods for sterility then stocked by 4°C till utilize.

**The tested microorganisms**

The tested bacteria used in this study were pathogenic bacteria which were obtained from culture collection of higher studies Labrotory / department of biology /college of science / mustansiyrih university, which included three species of bacteria: (*Kleibslla pneumonia, Pseudomonas auergunosa, Escherichia coli*).

**preparation of the concentrations of snail powders against tested bacteria**

The snail powder was prepared as mentioned and four concentration prepared by adding distil water to powder. These concentrations prepared as following: 75mg/ml was prepared by adding 375mg of the powder to 5ml distil water. 100mg/ml was prepared by adding 500mg of the powder to 5ml distil water.

125mg/ml was prepared by adding 625mg of the powder to 5ml distil water. 150 mg/ml was prepared by adding 750mg of the powder to 5ml distil water [14].

**Antimicrobial activity of the prepared snail powder against tested bacteria**

Muller-Hinton a gelatinous substance dishes be situated utilized of vulnerability experiment through a gelatinous substance fully distribution procedure. Antibacterial activity was carried out by using standard well diffusion method [15,16]. This method is based on the observation the effect on the growth of microorganisms in plate. Bacteria used in this test are: (*K. pneumonia. auergunosa , E. coli*). Bacterial suspension was prepared by picking 4-5 colonies of each original bacterial isolate and suspended in a test tube containing 5 ml of normal saline, then adjusting turbidity to approximately 1.5x108 CFU\ml (MacFarland tube). A portion of the bacterial suspension was carefully and evenly transformed on the Mueller-Hinton a gelatinous substance medium by a sterile cotton swab. Wells was made in a gelatinous substance medium with the use of a cork borer. and then it was left for 10 min. After 10 min, about 100 µl of varying concentrations of each powder (75mg/ml, 100 mg/ml, 125 mg/ml, and 150 mg/ml) be additional in the hole and the dishes be situated nurtured aimed at 24 periods by 37 ° C. A scale was used to measure the diameters of the inhibition region [14].

**Result**

**Identification of the snail**

The snail has been described as *Lymnaea auricularia* based on its characteristics of morphology and physiology, which was confirmed by Assistant Prof. Dr Muhannad Ramzi, the length of the *L. auricularia* ranged from 1-4 cm and the weight of the whole body ranged from 2-6 g.

**Figure(1): *Lymnaea auricularia* snail**

**The effect of *Psudodontopsis euphraticus* snail shell powder and tissue powder on pathogenic bacteria**

*L. auricularia* powder was tested for antibacterial activities against three pathogenic bacteria (*Escherichia coli*, *Pseudomonas aeruginosa, klebsiella pneumonia*). Four concentration of the snail shell powder and snail tissue powder (75,100,125,150) mg/ml with well diffusion assay was used. The results were summarized in Table (1) and table (2)

**Table (1): Effect of different concentration of snail shell powder**

| **Pathogenic Bactria** | **Concentration &inhibition zone** | | | |
|---|---|---|---|---|
| | **75** | **100** | **125** | **150** |
| Klebsiella pneumonia | 12 | 14 | 15 | 12 |
| Psendomonas Aeruginoa | 11.4 | 14 | 16 | 16.5 |
| Eschericchia coli | 19 | 14.8 | 16.7 | 18 |

At 75mg\ml concentration *E. Coli* also showed the largest inhibition zone (19 mm), *K. pneumonia* (12 mm) and *P. aeruginoa* (11.4 mm). In concentration of 100mg\ml *E. Coli* showed the largest inhibition zone (14.8 mm) while both of *K. pneumonia* and *P. aeruginoa* were (14 mm). At 125 mg/ml concentration appeared high inhibition effect in *E. Coli* which was (16.7 mm) then *P. aeruginoa (*16 mm) and *K. pneumonia* (15 mm). The highest activity of powder at 150 mg\ml concentration was appeared in *E. coli* with inhibition zone (18 mm) followed by *P. aeruginoa with* inhibition zone (16.5 mm) *K. pneumonia* (12 mm).as shown in table (1) and figure (2).

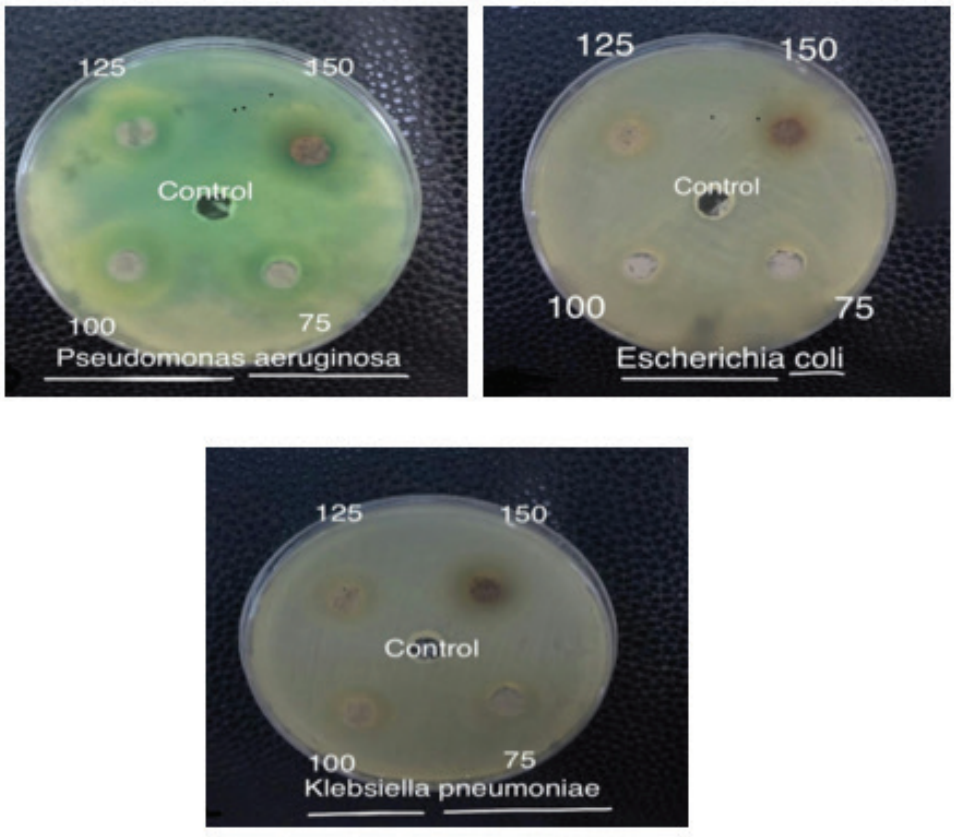

**Figure (2): Antibacterial activity of *Lymnaea auricularia* snail shell powder against bacterial isolates**

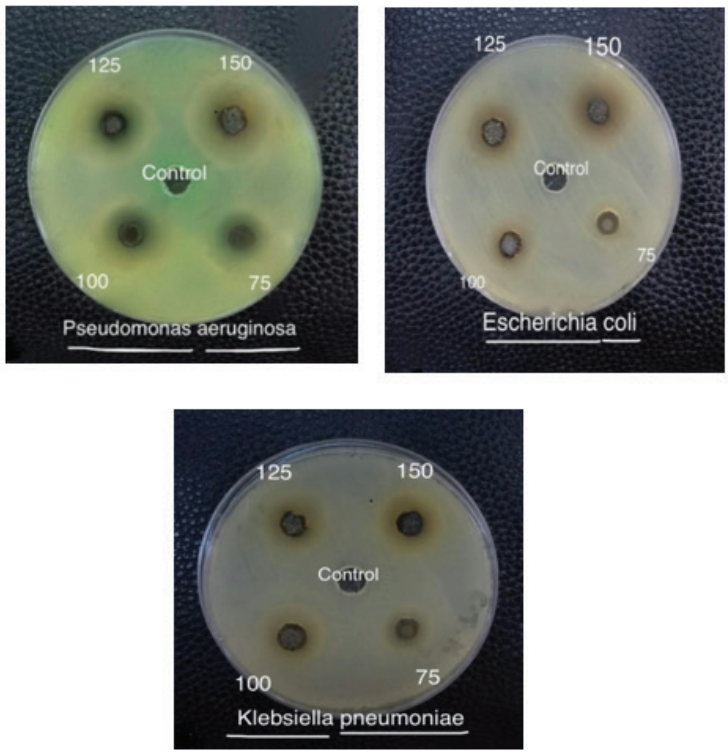
**Table (2): Effect of different concentration of snail tissue powder on bacteria**

| **Pathogenic Bactria** | **Concentration &inhibition zone** | | | |
|---|---|---|---|---|
| | **75** | **100** | **125** | **150** |
| Klebsiella pneumonia | 12 | 15 | 16 | 16.2 |
| Psendomonas aeruginoa | 15 | 22 | 25 | 28 |
| Eschericchia coli | 12 | 12.5 | 16 | 20 |

At 75mg\ml *P. aeruginoa* (15 mm), both of *E. Coli* and *K. pneumonia* were (12 mm). At 100mg\ml concentration *P. aeruginoa* (22 mm), *K. pneumonia* (15 mm) and *E. Coli* (12.5 mm). The concentration of 125mg\ml showed activity in *P. aeruginoa* (25 mm), both of *K. pneumonia* and *E. Coli* were (16 mm).The highest activity appeared in *P. aeruginoa* (28 mm) at 150mg\ml concentration followed by *E. Coli* (20 mm) then *K.pneumonia* (16.2 mm) as shown in table (2) and figure (3).



**Figure(3): Antibacterial activity *Lymnaea auricularia* snail tissue powder against bacterial isolates**

## Discussion

Molluscs are commonly used for various studies in international research institutions, but those possess be situated identified as per possibility origin about antiseptic and antimycotic metabolites only recently. It has identified and characterized some of the molecules involve in the antimicrobial activities [17].

Every year, extra than 100 novel antimicrobial composites own stayed isolated as of aquatic, animal lacking a backbone like snail and bivalves, which exhibit a wide range of antimicrobial properties [18,19]. extra than 1,000 novel composites own be situated identified as of

aquatic animal lacking a backbone for instance peptides, terpenes, polypropionates, nitrogen component, polypeptides, macrolides, prostaglandins also greasy acidulous output, sterols and other components [19].

In this study the highest activity of snail shell powder appeared in *E. coli* (19mm), and the highest activity of snail tissue powder exhibited in *P. aeruginoa* (28mm). This powder may have the potential to destroy the bacterial cell by inhibiting gene expression or have the ability to destroy cell membrane by pore formation ,altering the level of intracellular ions or changing the trans membrane potential.

Agreed with Lekshmi *et al.* [14] who investigated the antibacterial activity of *Pomacea insularium* snail tissue powder against (*Klebsiella sp, E. coli, Pseudomonas sp, Proteus sp, Salmonella sp, Aeromonas sp, Streptococcus sp, Staphylococcus sp, Bacillus sp* and *Enterobacter sp)*. the maximum activity was found against *Proteus sp.* (30.16±0.76 mm), greed by Elezabeth *et al.* [20] Record peak antibacterial activity against *klebsiella sp* and *Enterobacter sp* (20 mm).

The aim of the research by Darwin *et al.* [21] be situated to explore the germicide vigor of *Purfura bufo* aquatic gastropod similar with this study. Estimated antimicrobial activity in *Purfura bufo* body tissue extracts against *Pseudomonas aeruginosa, Bacillus subtilis, Escherichia coli, Klebsiella pneumoniae,* the extreme suppression region stayed detected in *K. pneumonia* (26 mm). The *Purpura bufo* species displayed possible antimicrobial activity against pathogenic microorganisms.

Gayathri *et al.* [22] concluded that *Pila viren* freshwater snails contain different bioactive compounds (proteins, peptides and sterols) and may be recommended as pharmaceutical-relevant freshwater snail.

Disagreed with Anand & Edward [23] examined five *Cypraea* species (*Cypraea errones, C. arabica, C. onyx, C.tigris* and *C.vitellus*) which stayed tested for those antiseptic and antimycotic effectiveness, the water solvent showed no activity against *Klebsiella pneumoniae, Pseudomonas aeruginosa* and *Escherichia coli.*

# Effects of Simvastatin and/or Metformin Administration on Lipid Profile and Reproductive Function in Adults Male Rats

**Muhsin S.G. Al_Mozie'l [1], Abbas A. Khudhair[2], Noora S. Ghalib[3]**

*[1]Lecturer/ Department of Pharmacology and Toxicology, College of Pharmacy. University of Basrah, Iraq, [2]Assistant Lecturer, [3] Assistant Lecturer/ Department of Clinical Laboratory Science, College of Pharmacy. University of Basrah, Iraq.*

## Abstract

**Background** : HMG-CoA reductase inhibitors, are large used lipid lowering medical that are effective in the functions of male reproductive. In addition, Metformin is affected on level of cholesterol that results in production of sperm. This study was designed to evaluate whether influence of simvastatin, metformin alone and combination in male rats. **Methods**: In this experiment 24 adult male rats were randomly divided into four groups(n=6) as following: control group (G1). 2nd group(G2)20 mg/kg simvastatin. 3rd group(G3)150mg/kg of metformin. 4th group(G4)150mg/kg metformin + 20m/kg simvastatin. The administration rout by oral gavage for 40 days. **Results**: There is a significant increase ($P \leq 0.05$) in blood parameters, HDL cholesterol, blood glucose, total protein and sperm abnormality in treated groups. Histopathological study of testes reveals degeneration, vacuolation of germinal epithelium, destruction the wall of some seminiferous tubules. Liver tissue shows dilated, congested sinusoid, vacuolation of hepatocytes and central vein congestion, on the other hands, kidney reveals a vacuolation of some epithelial lining of glomeruli and renal tubules, atrophy of some glomeruli and dilation of bowman`s capsules. **Conclusion**: Simvastatin have a better effect on lipid profile. On the other hands, have more effects on testicular function.

***Key Words:*** *Metformin, Simvastatin, HMG-CoA reductase.*

## Introduction

Statin affect cholesterol synthesis and thus may be contribute in inhibits steroidogenesis[(1)]. Due to their cholesterol-decreasing properties, this class of inhibitors might be expected to have adverse effects on reproduction by reducing the supply of circulating cholesterol which is required for steroidogenesis [(2)]. Nevertheless, HMG-CoA reductase inhibitors are considered teratogenic due to studies conducted with lovastatin [(3)], and sporadic testicular effects have been observed in dogs [(4,5)]. Metformin controlling blood glucose level. Metformin works by helping to restore the body's response to insulin. It decreases the amount of blood sugar that the liver produces and that the intestines or stomach absorb [(6)]. Metformin have a positive impact on sperm quality, this due to it is ability to reduce oxidative stress and lipid peroxidation, enhance 5'-AMP activated protein kinase activity, and restore the normal levels of pituitary-gonadal hormones [(7)].

## Materials and Methods

This study was conducted in College of Pharmacy and it's approved by the ethical committee in the College. In this study,24 adults male rats (335 -365 g) were used. Rats housed in plastic cages (2 rats /cage) under standard laboratory conditions (12/12 light/dark cycle, 22 ± 2 ˚C), they are allowed for pellet and tap water.

### Experimental design

Animals are divided randomly into 4 equal groups (n=6). The control group dosed with D.W. for 40days, simvastatin group 20mg/kg simvastatin, metformin group 150mg/kg metformin, simvastatin (20mg/kg) and simvastatin + metformin group dosed 20mg/kg simvastatin and 150 mg /kg metformin. Blood was
