collected from inferior vena cava, serum was stored in Eppendorf tubes at -20C°. Blood glucose was measured according[8], total cholesterol (TC)[9], Triglyceride (TG) [10], HDL cholesterol with total cholesterol[11]. VLDL according[12]. Sperm count according[13]. Individual sperm motility according[14]. The organs fixed in 10% formalin, stained with H&E and examined under light microscopy.

## Statistical Analysis

The data were expressed as mean ±Standard deviation (SD), ANOVA analysis in our study. Least significant difference (LSD) was used to test the differences among means, indicated a significant (P<0.05), using computerized SPSS v3.

## Results

### 1.Biochemical tests and Sperm analysis

Table(1) showed that was a significant increase (P≤0.05) in HB, PCV, RBCs and WBCs count of simvastatin group compared with control and other treated groups. While, it showed a significant decrease in PTL count of all treated groups compared with control group.

Table (2); the serum cholesterol, TG, and VLDL cholesterol level of sim, metf, and co-treated sim with metf groups were significantly lower than control group (P≤0.05). While, markedly increase level of HDL cholesterol was observed in sim rats compared with control and other treated rats. Also, serum level of LDL cholesterol remained elevated in the control and metf rats compared with sim and co-treated rats.

Effects of metformin and simvastatin on serum blood glucose and plasma total proteins in adults male rats was shown in table (3). Compared with met, and co-treated sim-metf grups the serum level of blood glucose were significantly higher in group sim (p≤0.05). On the other hand, the level of total proteins in co-treated group were significant higher than all groups are studies. However, simvastatin, metformin and co-treated rats showed a significant increase in abnormal sperm morphology compared with control.

**2.Histopathological study**

**1. The Testes**

Testes of control rat include normal seminiferous tubules. Testes of rat treated with simvastatin(20mg/kg B.W), shows degeneration with vacuolation of germinal epithelium and irregularity of basement membrane. Few numbers of spermatogonia as well as necrotic spermatocytes in some seminiferous tubules. Testes of rats treated with metformin (150 mg/kg b.w) shows vacuolation of germinal epithelium. There few numbers of spermatogonia. Testes of rats treated with simvastatin(20mg/kg b.w)and metformin(150mg/kg b.w) shows disarrangement, sever sloughing of epithelium and destruction the wall of some seminiferous tubule. There is a lot of number of spermatids in seminiferous tubules.

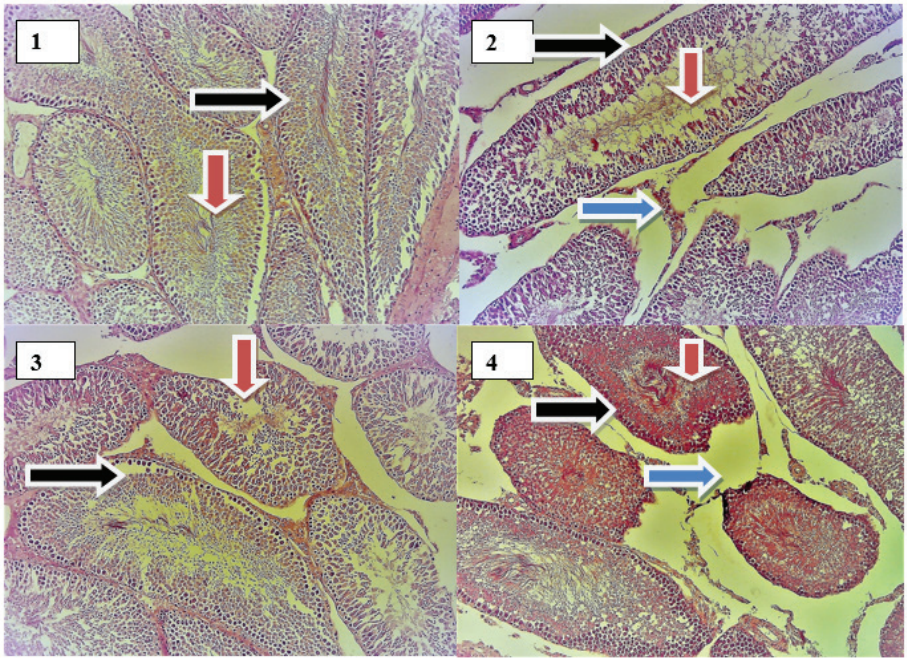

**Figure (1): tests of control, normal structure (black arrow) full with sperm(red arrow). (2): tests of rat treated 20mg/kg simvastatin, degeneration in addition to vacuolation (red arrow) (3): tests of rat treated 150mg/kg metformin, vacuolation &degeneration(red arrow).(4):tests of rat treated simvastatin and metformin, thickens within semineforus tubules and vacuolization(red arrow). H&E, 200x.**

### 2. The Liver

The liver tissue of control group has shown normal liver tissue. The cellular cords separated by sinusoids. The plate hepatic cells were separated by narrow, congested blood sinusiods with vacolation of hepatocytes(figure 2). Also there is vacuolization of hepatocytes, congested central vein, enlarged sinusoid(figure 2). Hepatic nuclei are enlarged pyknotic and light chromatinic stained, disappearance of the radiated hepatic architecture, massive vacuolation in hepatocyte, the central vein thick and narrow(figure 2).

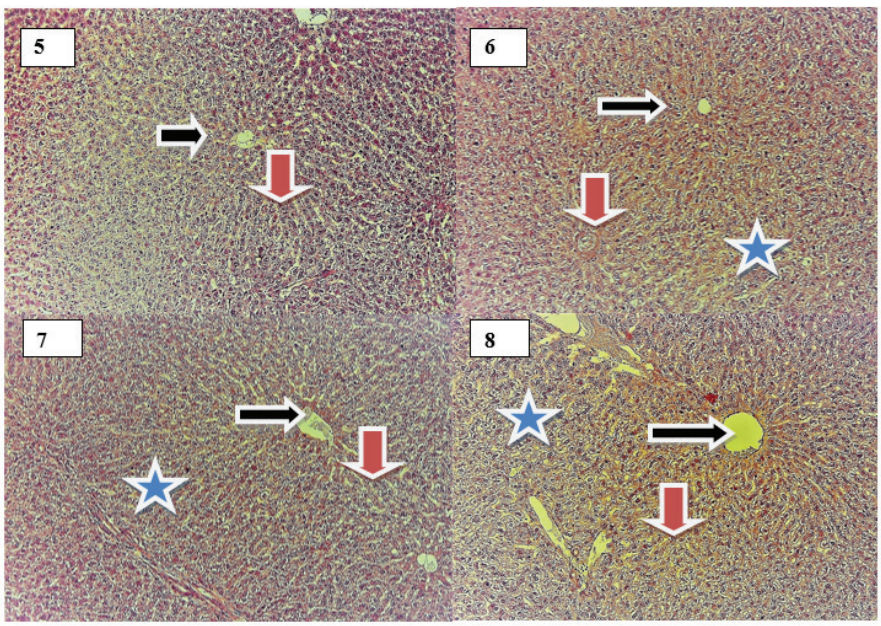

**Figure (2): liver control rat (black arrow) and hepatocytes (red arrow).(6): liver of male rat exposed 20mg/kg B.W.of simvastatin, vacuolization (blue star), congested of sinusoid (red arrow).(7): liver of male rat exposed 150mg/kg B.W.of**

## Discussion

The continues increasing of glycosylated hemoglobin as product of diabetic related with glucose over all in blood is give form to changes of Hb structure, this factors could have contribute to increase in all blood cells. Therefore, hyperglycemic increases the blood cells count[(15)]. Hence, the altered in blood picture (RBCs, WBCs, PCV, and PLT) may presented in table(1)[(16)]. Another interesting finding of our study is that the effect of simvastatin, metformin & combination on lipid profile in which there is a significant decrease in lipid profile of all treated groups in comparison to control group while there is a significant increase in HDL in simvastatin group when compared with untreated rats as shown in table (2). Our result is in line with[(17)] who mentioned that there is a decrease in all lipid profile in mice treated with atorvastatin.

Several studies showed that rats treated with metformin cause a decrease in lipid profile, while the addition of natural honey to metformin significantly decrease all type of cholesterol and has a better effect in comparison to metformin alone in diabetic rats[(18,19)]. Our results are also in agreement with Wang etal[(20)], who observed that the level of TC, TG significantly decrease & the HDL cholesterol increase in diabetics rat treated with simvastatin drug. Bellia etal, mentioned

that random clinical studies of patient treated with simvastatin drug at dose 20mg/day has no effect on glucose level control for 4weeks of treatment, also found that glycemic control and HbA1c may worsen with increase duration of treatment till 1year with no change in insulin sensitivity[21,22].

Result in table(3)revels the increment in glucose level in rats treated with statin drug significantly in comparison to those treated with metformin &the combination of these two drugs, this result may be related to the effect of statin drug on islet of Langerhans which may effect on their ability to secret insulin or may be due to decrease the sensitivity of insulin which lead to increase insulin resistance and increase glucose level. This result is in agreement with[23,20] they both reported that simvastatin associated with an increase in serum glucose level and impaired glucose homeostasis in patients and rats respectively.

The present study showed an effect of simvastatin, metformin and their combination on sperm count, motility and normal morphology presented as a decrease in sperm characteristics, on the other hands, these drugs also increase the abnormality of sperm morphology in comparison to control group , this result is in agreement with[24] who mentioned that a decrease in testes weight, low sperm count, motility and abnormal morphology of semen in rat administered high dose atorvastatin.

Adaramoye and Lawal,[25]; Banihani,[26] they mentioned that administering of metformin in rat may have a positive effect on sperm characteristics especially in diabetic rat and at dose 30mg/kg per day for 6weeks. While administering of metformin for 3 weeks at the same above dose in rat associated with a decrease in semen count and motility by 33%[27]. Our results corresponding with histopathological study of testes tissue associated with degeneration, vacuolation of epithelium, sloughing in germinal epithelium and spermatocytes necrosis in some of seminiferous tubules, this results is in line with(28,29) they reported that rat treated with rousovastatin and atorvastatin respectively cause changes in seminiferous tubules, death of some germinal epithelium and edema in interstitium.

Drugs exposed to metabolism by liver and kidney tissue, therefore histopathological study of these organs associated changes including dilation of liver sinusoid, vacuolation of hepatocytes and congestion of hepatic sinusoids. Kidney associated with excretion of drugs metabolites therefore in some field showed atrophy of some glomeruli, dilation of bowman`s capsules and degeneration of some glomerular cells. These changes occur as an adaptation of these organ to accommodate the continuous administration of these drug, therefore considered as reversible changes and the organs can back to normal state if the cause annotate[30].

# Parkinson's Disease Follow Up Self-Assessment Scale

**Kifah K. Al- Ubaidy[1], Aiyar Shakir[2], Basim Abdulelah Ali[2]**

*[1]Assistant Professor, Department of Internal Medicine, College of Medicine, Al-Qadisiyah University, Iraq.*

*[2]Researcher/Neurologist. Al Diwaniyah Neurology Center, Iraq.*

## Abstract

Parkinson's disease is a neurodegenerative progressive disorder end with independency for many years at late life, leading to great burden on patient and family life. The available treatment is symptomatic focused on improving life quality of the patient and it's in need for good communication with the physician.

So far there is no easy and practical way for follow up, thus we've designed the Parkinson's disease follow up self-assessment scale aiming to detect ON and OFF time, it's include PD manifestations, medications and medications adverse effects filled out by the patient family at home in order to mailing it to the physician, and intend to testing it by comparing the performance of patient family with expert staff in using the scale at hospital for 24 hours. Then enquiring about difficulty of using the same scale at home.

A 44 PD patient were completed the study. All items accuracy filling out was 93.4% in compare to expert staff. Its mean degree of difficulty was 4/10 and among patients families only 29.54% consider it difficult to use. The ON and OFF time was detected precisely in 92.2% by follow up physician. The proposed scale is precise in detection ON an OFF time and not difficult to use.

***Keywords:*** *health; patient; self-assessment scale; disease*

## Introduction

Per neurodegenerative disorder Parkinson's disease (PD) prevalence ranked next to Alzheimer's disease[1]. Worldwide about 10 million people are living with PD[2]. Although it's progressive, the parkinsonians life is slightly shorter than general population[3] and survive approximately 10.3 years from onset[4] but more than half of patients will lose the ability to live independently and become in need for secondary care after 5 years of onset[5].

Moreover after several years of L-dopa treatment the patients eventually present with more complications mainly motor fluctuations[6] and dyskinesia particularly young patients[8] leading to deterioration of patient life and rising caregiver burden[7] necessitating frequent medication adjustment. To delay motor fluctuations progression [9] each patient needs best regimen therapy, and in order to improve regimen efficacy an early detection of motor fluctuations is essential [10].

Consequently management of Parkinson's disease is complex with early involvement of neurological or elderly services. PD Patients significantly had more emergency unit visits and physician consultation mainly attributed to medications response[11].

Till now the main parameter to evaluate therapeutic efficacy is ON and OFF time[10]. Thus, obtaining precise timing of ON and OFF is necessary for providing optimal therapeutic regimen for each patient individually [12]. Currently, to assemble such data the available methods consists of either self-reporting diaries[13] or Inertial Sensor[14]. Both are either not always available or difficult to perform. While Unified Parkinson's disease Rating Scale [15] is suitable for staging and needs expert supervision.

**Corresponding author:**

alubaidykifah@gmail.com

Most of guideline encourage the participation of PD patient in judgements about their own care and nessisate the alerting of patient and family members about PD disorder and medications problems [9]. The Shared decision making practice is offering an opportunity of treatment preferences to the patient including therapeutic regimen[16]. PD had its impact on patient daily life activities (drinking, swallowing, dressing, walking etc.)[15]. And practically the patient and his family are more familiar with the patient daily difficulties, so they can provide precise information about the patient condition. Hence engagement of patient can be expanded to include gathering information about his condition which may make a change in regimen selection.

At early stage of PD it's important to decide when to initiate and electing suitable medication and follow up is vital for validation of effectives of regimen. While in later stages a best regimen selection is individual and may requiring a secondary care and specialist services. So follow up of PD patients is in need for effective way of communication with the clinicians. Hence we aimed to design and testing a simple scale filled out at home by the PD patient himself or one of his family member to be useful for follow up even without patient attendance.

## Method

The proposed scale designed to follow PD manifestations and adverse effects of medications each hour in relation to time of medication intake, meal and sleep time. The evaluation of each item relying on patient difficulty in performing usual life activities. Basically the system of scaling estimate the level of difficulty in performing each activity considering a value of (+ = ON) when patient finish the task normally or Have difficulty but still helpful for others, (0) score when patient not in need for assistance or help to complete the task but he is not helpful, whereas (- = OFF) scoring when he is in need for assistance or help or completely dependent. (Table 1)

In consistent with the United Kingdom PD Society Brain Bank diagnostic criteria[17], a 48 PD patients were admitted for one day to Al- Diwaniyah teaching hospital neurology center with one of the patient family member. Both learned to fill out a proposed scale (Table 2). For each patient; two copy of same scale were filled one by patient or family member and the second by expert staff at same time.

At home, each PD patient or family member asked to use the same scale for a random days / month for 3 months and mailing a copy to the neurology center.

In addition, the PD patient and family member asked to evaluate the proposed scale by a questionnaire enquiring about the difficulty of using the scale ranging from 1 to 10 and whether its adding more information to the family about PD manifestations, medications and medications adverse effects as YES or NO for each.

Via another questioner the PD patients following physicians evaluating the precision of ON and OFF timing for each patient by YES or NO.

**Table 1: The basic system of scale.**

| Level of performance | | Manifestations | | | | | | Adverse effects | |
|---|---|---|---|---|---|---|---|---|---|
| | | Tremor | Dressing | Walking | Bed turning | swallowing | Swallowing | Dyskinesia | Hallucination |
| ON | Normal Or Have difficulty but still helpful | +2 | | +2 | | | | | |
| | | +1 | +1 | +1 | +1 | +1 | +1 | +1 | +1 |
| | Not needs for help or assistance | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| OFF | In need for assistance or help | -1 | -1 | -1 | -1 | -1 | -1 | -1 | -1 |
| | Completely dependent | -2 | -2 | -2 | -2 | -2 | -2 | -2 | |

**Table 2: Parkinson's disease follow up self-assessment scale.**

| **Write the score for each item below corresponding to time** | | | | | | | | | | | **Mark by X the items corresponding to time** | | | | | | | | | | |

## Results

A 44 (91.7%) PD patient were complete the study, 4 (8.3%) patients are not compliance, 25 (56.8%) were male whereas 19 (43.2%) were female, age range was (46 - 87) years average 71 years.

Each item of the proposed scale were filled accurately by the patient in compared to expert staff as following; time 44 (100 %), tremor 44 (100 %), dressing 42 (95.5%), walking (100%), bed turning 41 (93.2%), swallowing 44 (100%), speech 38 (86.4 %), dyskinesia 32 (72.7 %), hallucination 39 (88.6%), drugs 40 (90.9%) and impulsive disorders 44 (100%). All items accuracy filling out was 93.4%. (Table 3)

The difficulty in filling the scale 7-10, 4-6, 0-3 / 10 for the participants was 11 (25 %), 20 (45.4 %), 13 (29.54%) sequentially, mean degree was 4/10 (Table 4) (Figure 1). Families awareness about PD were become better by acquiring more knowledge were 34 (77.3%), 37 (84.1%), 41 (92.2%) family for PD manifestations, medications and medications adverse effects consecutively (Table 5).

The ON and OFF time sensitivity by the proposed scale was precise in 41 (92.2%) patients. (Figure 2)

**Table 3: The accuracy of items filling of proposed scale.**

| Item | Patients | Expert | % |
|---|---|---|---|
| Time | 44 | 44 | 100 % |
| Tremor | 44 | 44 | 100% |
| Dressing | 42 | 44 | 95.5% |
| Walking | 44 | 44 | 100% |
| Bed turning | 41 | 44 | 93.2% |
| Swallowing | 44 | 44 | 100% |
| Speech | 38 | 44 | 86.4 % |
| Dyskinesia | 32 | 44 | 72.7 % |
| Hallucination | 39 | 44 | 88.6% |
| Drugs | 40 | 44 | 90.9% |
| Impulsive disorders | 44 | 44 | 100% |
| Sum | 452 | 484 | 93.4% |

**Table 4: The level of difficulty of scale to the patient or family member.**

| Difficulty / 10 | 0-3 | 4-6 | 7-10 |
|---|---|---|---|
| Participant number | 16 | 20 | 8 |
| Percentage | 36.4% | 45.4 % | 18.2 % |

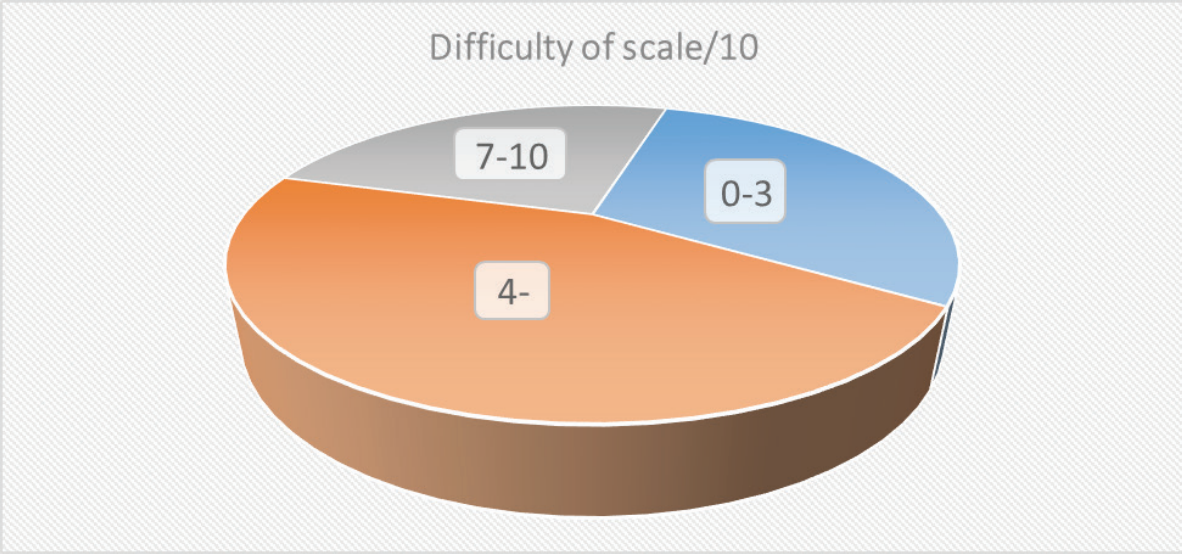

**Figure 1: The level of difficulty of scale to the patient or family member.**

**Table 5: Families acquired more knowledge about PD.**

| Item | Number | % |
|---|---|---|
| Manifestations | 34 | 77.3% |
| medications | 37 | 84.1% |
| adverse effects | 41 | 92.2% |
| Sum | 112 | 84.8% |

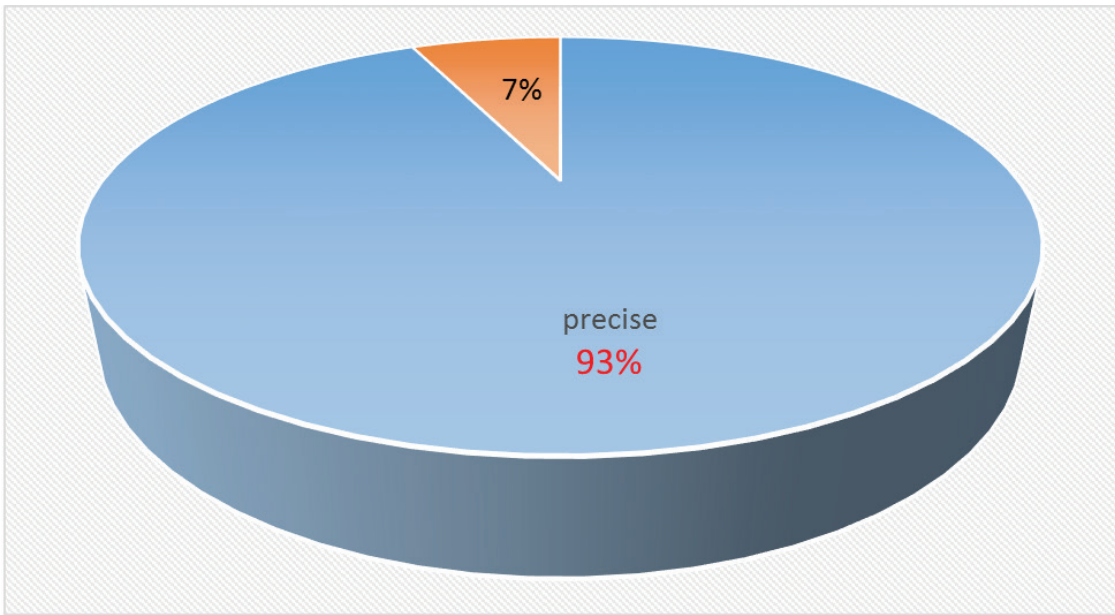

**Figure 2: The ON and OFF time sensitivity of scale.**

## Discussion

For all items the scale were filled out accurately in 93.4% by the patient or his family member in comparison to professionals so generally it's sensitive and reliable for detecting patient condition.

Although 4 (8.3%) participants were not completed the study, but 91.7% completed it with mean degree of difficulty was 4/10. Concluding it's practical and not difficult.

The proposed scale add extra information about PD and its medications to the patient families and make them more familiar in 84.1%, so it's serving the aim of patient education.

The identification of ON and OFF time was precise in 41 (92.2%) patients indicating a high sensitivity which is the main aim of the scale. **The scale designed to demonstrate patient condition each one hour which can be manipulated to 2,3,4 hours according to patients condition , a result of + (green zone) equivalent to ON while - (red zone) resemble OFF (table 1).**

At early stage its helping to decide when to initiate treatment and election of suitable medication since it demonstrate the main disabling feature either in the pole of tremor or rigidity and hypokinesia. While in later stages it helping in validation of effectives of regimen and assisting in selection of the best regimen individually or the need for secondary care and specialist services. **The scale weighing the medications adverse effects with the** ON time for adjusting proper dose and timing medications intake with meals and sleep.

## Conclusion

The proposed Parkinson's disease follow up self-assessment scale is useful for following PD patients since it's practical and sensitive as verified by all results. It can be used patient family, career, and nursing staff. It's not difficult, precise in detection ON an OFF time without patient attendance or hospitalization.

### Recommendations

We recommend to test the same scale in other neurological centers with different communities and arranging for an internet page or application for easy communication between patients and physicians.

## Abstract

Background: The world is facing an epidemic of dental caries, which affects all age groups, and the problem is clearer among specific risk groups such as mental patients. This problem has a great impact on humanity, on oral health, on quality of life and general health, economic, social and esthetic drawbacks. **Patients and methods:** A cross-sectional prospective study covered 124 mental patients visiting a private psychiatric clinic in Kerbala city. clinical diagnosis and medication history were registered. In addition, oral examination was conducted to determine DMFT index diagnose other dental manifestations (plaque and hairy tongue), and xerostomia was investigated through a specific questionnaire. **Results and discussion**: Dental caries and poor oral health of 124 patients with equal gender distribution and a mean age of 35.04±12.52 year. More than three quarters of the sample had dental caries of at least one tooth with significantly higher prevalence among females. DMFT value >2 was encountered in 54% of females compared to 42% of males. Teeth brushing was never or irregularly performed by two thirds of the patients and was a high significant predictor of total DMFT, Decay and Missing component. A great majority (85%) had xerostomia, 50% had plaque staining, 13% had bruxism, 9% had hairy tongue and 3% had denture some of these conditions were positively associated with DMFT or its components. **Conclusions:** Especial attention needs to be paid for the oral health of mental patients the xerostomia encountered as a side effect of most medicines in these patients could influence oral health in general and dental caries in particular.

***Keywords:*** *Dental caries, DMFT index, Mental patients, Kerbala*

## Introduction

The World Health Organization (WHO) put since 1948 three main pedicles for health, namely physical, mental and social. Mental disorders and dental caries are highly prevalent in all regions of the world and the former represent a major source of disability and social burden worldwide [(1)]. The WHO estimated that one quarter of the world population will be affected by mental or neurological disorders at some point in their lives and around 450 million people currently suffer from such conditions [(2)], and the burden has risen by 41% in the last two decades [(3)]. In the Eastern Mediterranean Region (EMR), mental disorders contributed to 5.6% of the total disease burden in 2013 [(4)]. It was found in a global epidemiological review that in spite of the measures to combat dental caries; its prevalence is increasing [(5)], and dental caries and periodontal disease are in fact the two most common oral diseases [(6)]. Additionally, a recent systematic review found a significant negative correlation between dental caries indices with the socioeconomic and educational level [(7)]. Although many psychological disorders are associated with comorbid physical illnesses such as cardiovascular diseases and cancer and death [(8)], less attention has been paid to the issue of oral health [(6, 9, 10)], and these physical impacts are further deteriorated by the chronic intake of large amount of alcohol, or illicit drug use, prevalent among mental patients [(11, 12)]. The reasons behind these higher rates of oral diseases among mental patients include: their lower motivation toward oral health maintenance, ignorance, lower immunity, drugs side effects, iatrogenic, and many other factors [(6, 13, 14)]. It has been found that psychiatric patients in general had a worse DMFT score, worse oral hygiene and increased frequency of periodontitis [(5, 15)]. A systematic review of literature between 1971 and 2009

estimated a substantial reduced optimal oral health (61%) among individuals with serious mental illnesses [16]. On the other hand, reduced saliva (quantity and quality) as medicines side effect [17]; deprives these patients from many protective functions: antimicrobial, buffering, and lubricating agent that promotes cleansing and removal of food debris within the mouth and maintaining oral mucosa and teeth mineralization [18]. A recent study among internally people in Baghdad, reported positive association between DMFT index and severity of depression, while a second study put forwards the hypothesis behind this association [19, 20]. The mentioned association was extensively investigated by a large sum of references, globally [15, 21]. Little previous published study investigated oral health of mental patients while many others surveyed mostly schoolchildren. The mean DMFT values for a random sample of 516 students (13-15 year) in Mosu1 was 5.17. Significant predictors were age and gender (more caries females) in many studies [22, 23]. poor among a rural population in a village in Mosul was also reported in Mosul in 2006 [24].

## Patients and Method

The study was conducted in a private psychiatric clinic in Karbala/Iraq during the period from 1st April till 31st May 2019. All patient who accepted to undergo oral health examination. All the patients suffering from any systematic disease (hypertension and diabetes mellitus) or pregnancy excluded. Demographic and the xerostomia criteria test reported by Fox [25], were obtained before oral examination. In addition, the entire patient undergo to. The statistical analysis us included descriptive and analytic methods using SPSS-23 at a significance level of <0.05.

## Results

The mean age of the patients was 35.04±12.52 year, and the gender proportions were almost equal. Only one third of the patient reported brushing their teeth regularly, against one third who never brushed their teeth. The smoking prevalence among the sample was 14.5%, while only four patients (1.6%) reported alcohol consumption. For the number of used medications, four fifths of the patients were on one to three medications, whilst only one fifth reported no current medication (table 1).

**Table 1: The main demographic and other characteristics of the mental patients in Kerbala/Iraq in 2019 (n=124)**

| Variable | Group | Frequency | Percentage |
|---|---|---|---|
| Gender | Male | 61 | 49.2 |
| | Female | 63 | 50.8 |
| Age category | Below 20 year | 15 | 12.1 |
| | 20-29 year | 26 | 21.0 |
| | 30-39 year | 41 | 33.1 |
| | 40-49 year | 25 | 20.2 |
| | 50 year or more | 17 | 13.7 |
| Tooth brushing | Never | 41 | 33.1 |
| | Irregular | 44 | 35.5 |
| | Regular | 39 | 31.5 |
| Smoking | Smoker | 18 | 14.5 |
| | Non-smoker | 106 | 85.5 |
| Alcohol consumption | Yes | 4 | 1.6 |
| | No | 120 | 98.4 |

***Cont...*** **Table 1: The main demographic and other characteristics of the mental patients in Kerbala/Iraq in 2019 (n=124)**

| | | | |
|---|---|---|---|
| Occupation | Official employer | 21 | 16.9 |
| | Housewife | 51 | 41.1 |
| | Retired | 5 | 4.0 |
| | Private shop | 1 | .8 |
| | Student | 10 | 8.1 |
| | Unemployed | 9 | 7.3 |
| | Laborer | 27 | 21.8 |
| Number of medications taken | 0 | 26 | 21.0 |
| | 1 | 24 | 19.4 |
| | 2 | 38 | 30.6 |
| | 3 | 35 | 28.2 |
| | 4 | 1 | 0.8 |
| Total | | 124 | 100.0 |

Total DMF ranged between 0 and 28 and the mean was 4.76±6.10, with one third of the patients having DMF index >5, while one quarter had an index of zero.

Comparison between male and female patients showed that females had higher DMF index than males 5.06± 5.79 vs. 4.60± 6.64). However, this difference was not significant (p=.428). More than one half of the female patients (53.9%) had a DMFT value >2 compared to only 42.6% of the male patients and this difference was significant (p=.007).For teeth brushing; it was found to be highly significant predictor of oral health indices. The difference in the mean DMF index between those who brush their teeth was highly significantly lower than those who do not (p=.006) and in older patients (p=.049). Similar significant differences were observed among Missing teeth categories (p=.002), while no such difference was found among Decay or Filling categories (p=.763).

The means DMF index and its components (D, M and F) were: 4.94±6.3, 1.88±3.15, 2.29±4.84 and 0,77±1.59, respectively.

Significant Caries Index (SiC Index) is the mean DMFT of the one third of the study group with the highest caries score. The index is used as a complement to the mean DMFT value. In this sample of mental patients the oral health indices for the worst third of the sample showed that the mean DMFT was 12.08± 6.482 (table 2).

**Table 2: The minimum, maximum, mean and standard deviation of the main oral health indices of the mental patients in Kerbala/Iraq in 2019 (n=40)**

| Variable | Minimum | Maximum | Mean | Std. Deviation |
|---|---|---|---|---|
| D | 0 | 18 | 4.28 | 4.535 |
| M | 0 | 28 | 6.35 | 6.878 |
| F | 0 | 7 | 1.45 | 2.253 |
| DMFT | 0 | 28 | 12.08 | 6.482 |

Tooth filling was the least prevalent among the mental patients, while comparable proportions observed for decay and missing teeth. Caries free patients was 10.48% of the total sample.

Among the total patients; 105 patients (84.7%) had xerostomia according to the xerstomia test, one half of the sample (62 patients) had plaque staining, 16 patients (12.9%) complained of bruxism, 11 patients (8.9%) had hairy tongue and four patient (3.2%) had denture. Cross-tabulation was used through chi-square test in addition to t-test to compare means to predict the association of these factors with DMFT and its components. Plaque staining had highly significant association with decay (p<.001, table 3). Similarly, DMFT was significantly associated with plaque staining (p=.039), but not with missing teeth or filling (p=.632 and .100, respectively). While no other significant association was found except for missing teeth and denture (p=.007).

**Table 3: The distribution Decay categories among mental patients in Kerbala/Iraq in 2019 (n=124)**

| Plaque staining | D Category | | | | Total |
|---|---|---|---|---|---|
| | Null | 1-2 | 3-5 | >5 | |
| Negative | 35 (56.5%) | 22 (35.5%) | 5 (8.1%) | 0 (0%) | 62 (100.0%) |
| Positive | 19 (30.6%) | 22 (35.5%) | 8 (12.9%) | 0 (0%) | 62 (100.0%) |
| Total | 54 (43.5%) | 44 (35.5%) | 13 (10.5%) | 13 (10.5%) | 124 (100.0%) |

## Discussion

Dental caries and periodontitis are the most common oral disease globally, and represent the major causes of tooth loss [5-7, 26]. Many psychiatric disorders are associated with dental diseases such as dental erosion, caries, and periodontitis [27].

The reported caries predisposing factors included: age, gender, type and length of psychiatric disorder and treatment and smoking [28].

For this reason, taking a thorough medical history and performing oral examination can assist physicians in delivering best care to these patients. The results of the present study showed that mentally ill patients had poor oral health [27, 28].

A 40 years systematic review suggested suboptimal oral health in approximately two thirds of patients with severe mental illness [16]. While, a systematic review reported (DMF-T) in chronically hospitalized patients with mental disorders a mean score of 26.74 (out of a possible 32), one of the highest reported in the literature [29]. Patients with severe mental illnesses in Western countries were reported to have scores of more than 20 [30].

While a study among 133 outpatient psychiatric patients in India in 2014 reported a mean DMF score of 2.10, which was not significantly associated with age, while, periodontal condition worsened as age increased. The prevalence of caries was 54.89%, in addition to poor hygiene practices. One quarter of those below 50 year had healthy gingiva, in comparison to none of those above 50 year (p<.05) [31]. In addition, a cross-sectional study in a hospital in Lahore/Pakistan reported DMFT at 3.83± 0.469 [32]. It was found that people with severe mental illness have 2.7 times risk of losing all their teeth, compared with the general population [27]. In Iraq, a study among 213 people in village in Mosul reported a men DMFT of 2.42 among 10-19 year age group but increased significantly to 8.73 among those aged ≥40 year, while the proportion of individuals who have missing teeth increased from 14.29% to 73.33% in

these age groups. Only a minority (15.49%) were caries free [24]. While a study among adolescent sample of 981 students reported a mean DMFT of 3.26 and 4.43 for males and females, respectively; with significant difference according to age [23].

In Iraq, a recent study measured DMFS among 121 internally displaced people in Baghdad demonstrated that depression had a negative effect on caries prevalence and severity [19]. The effect of dry mouth is a major risk factor for oral health problems and is often associated with opportunistic gingivitis as a result of nutritional deficiencies secondary to psychosis or anorexia nervosa [30]. A case-control study reported a significantly higher DMFT and its components among hospitalized schizophrenia patients in Belgrade in in 2016 [11].

## Conclusions

Poor oral health among mental patients reflected from the results call for an urgent program to halt the downward progress of oral health in this risky group of patients. Health education concentrating on preventive measures such as tooth brushing and regular checking represents an important tool in this program.

# Treatment of Iraqi People with Hyperkinetic Movement Disorders by Tetrabenazine in Relation to Genetic Polymorphism of CYP450 2D6

**Zainab A. Abbood [1], Shatha H. Ali [2] Nawfal M. Sheaheed[3]**

*[1]Researcher/ Clinical Pharmacy Department, College of Pharmacy/ University of Baghdad, Iraq, [2]Prof. Dr. Clinical Laboratory Science Department, College of Pharmacy / University of Baghdad , Iraq, [3]Consultant Neurologist Dr. Baghdad Teaching Hospital, Medical City, Baghdad/ Iraq*

## Abstract

Genetic polymorphism is defined as the inheritance of a trait controlled by a single genetic locus with two alleles in which the least common allele has a frequency of about 1% or greater. The Cytochrome P450 (CYP2D6) enzyme metabolizes about 25% of clinically used drugs from many different drug classes including antidepressants, antipsychotics, antihypertensives, and analgesics. The CYP2D6 is a highly polymorphic gene locus with more than 75 allelic variants, thus subjects can be classified into poor metabolizers (PM), ), intermediate metabolizers (IMs), extensive metabolizers (EM), or ultra-rapid metabolizers (UM) of a given CYP2D6 substrate. By using pharmacogenomics, the pharmacotherapy can be optimized, thereby increasing the treatments overall efficacy and decreasing the incidence of adverse events.

The present study is aimed to predicted phenotypes of CYP2D6 as : poor metabolizers, intermediate metabolizers, extensive metabolizers, and ultra rapid metabolizers for tetrabenazine in patients with hyperkinetic movement disorders compared to healthy subjects in Iraq .

The study was carried on 75 subjects participated (30 male, 45 female) ; fifty of them were with hyperkinetic movement disorders( 25 dystonia , 25 chorea ) the reminder 25 were healthy . Genotyping of CYP2D6 gene was performed by polymerase chain reaction (PCR) conventional (allele specific method). Plasma concentration of Tetraberazine was measured by High-performance liquid chromatography (HPLC) . Data were collected through direct interview with the subjects besides the assessment of genetic polymorphism of CYP 450 2D6 enzyme for Iraqi people.

The results of this study show there were a significant CYP 450 2D6 enzyme polymorphism. the number (percentage) of subjects with CYP 450 2D6 gene polymorphisms was 17 (22.66%) of the total study population. The number (percentage) of subjects with CYP 450 2D6*2 was 58 (76.32%), whereas, subjects with CYP450 2D6 *10 was 17 (22.66%).However , no subjects were observed with CYP 450 2D6 *4 polymorphisms in this study. The tetrabenazine concentration with mean ± SD was 3.08± 0.231 and 2.506±0.235 ng/ml for chorea and dystonia patients respectively , while alpha and beta dihydrotetrabenazine range was 37.72± (2.18 ng/ml _38.13± 2.00 ng/ml ) and (21.376±0.583ng/ml_ 18.252±0.874ng/ml ) respectively .

***Keywords**: CYP 450 2D6 polymorphism, poor metabolizers (PM), intermediate metabolizers (IMs) , extensive metabolizers (EM), tetrabenazine.*

## Introduction

Genetic polymorphism is defined as the inheritance of a trait controlled by a single genetic locus with two alleles in which the least common allele has a frequency of about 1% or greater[1]. In other words, it is a alteration in DNA sequence among individuals, groups, or populations. Polymorphisms can be in the coding regions (where they may be synonymous or nonsynonymous) or, more commonly, in the non-coding regions, and often vary by ethnicity[2].

The Cytochrome P450 (CYP2D6) enzyme metabolizes about 25% of clinically used drugs from many diverse medication classes including antidepressants, antipsychotics, antihypertensives, and analgesics. The CYP2D6 is a extremely polymorphic gene locus with more than 75 allelic variants, and subjects can be categorized into poor metabolizers (PM), extensive metabolizers (EM), or ultra-rapid metabolizers(UM) of a given CYP2D6 substrate[3],[4]. EMs carry at least one CYP2D6 allele viewing normal enzyme function, IMs carry one CYP2D6 allele showing reduced function and another with no CYP2D6 function, and PMs carry two nonfunctional CYP2D6 alleles[5]. ultra-rapid metabolizers, however, carry several copies of functional CYP2D6 genes[6]. The CYP2D6*9, CYP2D6*10, CYP2D6*17, and CYP2D6*41 are the greatest vital intermediate metabolizer (IM) alleles[7], in which CYP2D6*10 (49.5%)[8], CYP2D6*1 (40.1%–43.5%)[9],[10], CYP2D6*2 (11.9%–26.2%)[11], and CYP2D6*4 (0.2%– 2.8%)[7],[9] are the most common CYP2D6 alleles in Asians. About 13%–50% of Asian people may be homozygous for the CYP2D6*10 allele[12]

A cytosine-to-thymine replacement (C>T) at nucleotide 100 in the CYP2D6*10 allele, resultant in a change of proline-to-serine at codon 34, is public between Asian people[13] and is related to reduced metabolism of numerous CYP2D6 substrates[12]. There is a greatly conserved proline-rich zone among microsomal P450s. The proline at codon 34 perhaps performances a center among the lipophilic membrane anchor and the active site (heme moiety) of the enzyme. Alteration of an amino acid in this area may well reduce the activity of the enzyme[14],[15]. The CYP2D6*4 (G1846A) allele results in a splicing defect with nonfunctioning enzyme activity due to change of guanine (G) by adenine (A) at position 1,846. This single base substitution in the intron 3/exon 4 boundary result in move of the consensus acceptor splice site, yielding a spliced messenger RNA with extra base, thus resultant in a early termination codon[16].

**Aim of the study:** The present study is aimed to predicted phenotypes of CYP2D6: poor metabolizers, intermediate metabolizers, extensive metabolizers, and ultra-rapid metabolizers in Iraqi people with Hyperkinetic Movement Disorders treated with tetrabenazin and relation between the genotypes and level of tetrabenazin.

## Subjects and Method

### Subjects

This is a prospective case control study ,that was carried on 75 subjects participated in this research (30 male, 45 female) , attending Baghdad medical city during the period from September 2018 to June 2019. Data were collected through direct interview with the subjects with mean age of 38.81±1.31years . Blood samples were collected at the beginning of the study to measure genetic polymorphism of CYP 450 2D6 enzyme for Iraqi people . The study was approved by the local committee of ethics .

DNA was extracted from whole blood samples using DNA Extraction kit, to be utilized for genotyping of CYP2D6 gene was performed by polymerase chain reaction (PCR) conventional (allele specific method) according to method described by Taimour Langaee, Issam Hamadeh, Arlene B. Chapman, et al[17]. Polymerase Chain Reaction (PCR) was applied using MultiGENE OPTIMAX ( Labnet international, Inc.,USA ).

The following primers were used for PCR amplification.

**1.CYP2D6 *2 (2850 C>T) rs16947**

Forward 5’ GGCCCCTGCACTGTTTCC 3’

Reverse 5’ AAGGGGAACCCTGAGAGC 3’

2. CYP2D6 *4 (1846 G>A) rs3892097

Forward 5’ TGCCGCCTTCGCCAACCACT 3’

Reverse 5’ GCAGAGACTCCTCGGTCTCTC 3’

3. CYP2D6 *10 (100 C>T rs1065852)

Forward 5’ TGTCCAGAGGAGCCCATTT 3’

Reverse 5’ GTCGAAGCAGTATGGTGTGTTCT 3’

The agarose gel electrophoresis used to check the integrity and presence of the extracted DNA, using Mupid-ONE - ADVANCE/Japan. Agarose solution (1.0 %) heated to boiling till all agarose particles melted, and then 1.0 µL of ethidium bromide dye (10 mg/mL) added to agarose solution, then agarose allowed to solidifying

at room temperature onto the gel chamber ,then DNA samples were mixed with three µL of DNA loading dye and loaded in agarose, gel wells .Gel electrophoresis finished at 70 volts for 30 minutes then DNA bands were visualized under UV ray.

Measure Plasma Level of Tetraberazine by HPLC

Plasma about (20 µ1) was injected in to the liquid chromatographic system involving of a Cl8 µ Bondapak column and fluorescence detector. The mobile phase was acetonitrile-1% acetate buffer, pH 4.5 (50: 50) at a flow-rate of l_ml/min. The fluorescence of the eluent was measured using an excitation wavelength of 265 nm and an emission filter (KV418)[18].

## Statistical Analysis

Data will analyze by using SAS (Statistical Analysis System) (version 25.0) program (SPSS Inc., Chicago, Illinois, USA) and Minitab version 17 software. In all comparisons, a p-value <0.05 was reflected statistically significant.

## Results and Discussion

1.Demographic data of the study population

Seventy five subjects included in this study. Demographic data of the subjects was shown in (Table-1).

**(Table -1): Demographic data of the subjects** .

| **Data** | **subjects** |
|---|---|
| Age (yrs.) | 38.81±1.31 |
| No. of subjects<br>With Chorea<br>With Dystonia<br>Healthy | 75<br>25<br>25<br>25 |
| Gender | 45 female<br>30 male |

*Significant difference

Cytochrome P450 (CYP) 2D6 is one of the most examined CYPs in relative to genetic polymorphism, however it is accounts for only a small fraction of all hepatic CYPs (around 2-4%). However, there is a great inter-individual variation in the enzyme action of CYP2D6. The enzyme is mainly non-inducible and metabolizes about 25% of present medications. Typical substrates for CYP2D6 are basically lipophilic bases and include certain antidepressants, antipsychotics, antiarrhythmics, antiemetics, beta-blockers and opioids[19].

The CYP2D6 activity varieties noticeably within a population and consist of ultrarapid metabolizers (UMs), extensive metabolizers (EMs), intermediate metabolizers (IMs) and poor metabolizers (PMs). There is a significant variability in the CYP2D6 allele spreading amongst diverse racial groups, resultant in variable fractions of PMs, IMs, EMs and UMs in a given population. The allele *10 provide a substrate-dependent reduced action. It is reported that alleles *3, *4, *5, *6 and *7 have no enzyme activity[20],[21].Furthermore, no patients were observed with CYP 450 2D6 *4 polymorphisms in this study.

There has been promoting from monitoring a drug level in plasma of tetrabenazine and it's metabolites for hyperkinetic movement disorders and a takings precaution in the polymorphism of CYP 450 2D6 enzyme. The plasma concentration of tetrabenazine after one and half hour for therapeutic efficacy suggested as less than 2.5 ng/ml and Alpha and Beta dihydrotetrabenazine 40.5 ng/ml and 25.7 ng/ml respectively [22].

In the presence of low CYP2D6 activity, dealkylated decreased, and excess intermediate metabolites are stayed in plasma. High alpha-DTBZ concentrations related to increased adverse effect like sedation, insomnia and depression. It proposed that activeof the drug and its metabolism. The range of plasma level of the tetrabenazine found in all patients subject was 3.08±0.231ng/ml with mean ± SD equal to 2.506±0.235ng/ml, were due to the 26% of patients having CYP2D6 polymorphism. This polymorphism significantly affects the plasma concentration of alpha-DTBZ due to change in enzyme activity. Plasma concentration of tetrabenazine was narrow in comparison to its metabolite, which it may be due to the timing of assessment or the small data about the short half-life of the drug about the long half-life of its metabolite. There was a significant increase in plasma concentration of alpha and beta-dihydrotetrabenazine in patients with CYP2D6 polymorphism in comparison to those with nonmutant gene-phenotype that is due to the low activity of the enzyme (31.91± 0.56 vs. 52.69± 3.7) (19.96± 0.34 vs. 25.01± 0.97) respectively for chorea patients, while (33.59± 0.58 vs. 52.5± 4.7) (18.25± 0.87 vs. 24.85± 1.1) for dystonia patients, which results in elevation in the plasma concentration of tetrabenazine (2.467±0.086ng/ml vs. 4.657± 0.37) for chorea and (1.932± 0.10 vs. 4.325±0.34) for dystonia .

## Conclusions

According to the data of the present study, we can conclude that:

There is a relatively high incidence (22.66%) of CYP 450 2D6 gene polymorphisms in Iraqi population and mainly CYP 450 2D6*10 which is intermediate metabolizers (IMs) .

Higher plasma concentration of tetrabenazine among patient with CYP 450 2D6*10 polymorphism in comparison to patient without CYP 450 2D6 polymorphism(2.467±0.086ng/ml vs. 4.657± 0.37) for chorea and (1.932± 0.10 vs. 4.325±0.34) for dystonia .

Depending on the results acquired in this study: Determination a genotype of the CYP 450 2D6 genes in Iraqi patients in relative to the safety and efficacy of drugs that metabolite and to determine the suitable dose for the patient depending on the genotype of the CYP 450 2D6 from one side and the concentration of the drug in the plasma from other side.

# New Record of the Genus *Hydrotaea* Robineau-Desvoidy, 1830 (Diptera, Muscidae) from Kerbala City, Iraq

**Haider Naeem Al-Ashbal[1] , Rafid Abbas Al-Essa[1] , Hanaa H. Al-Saffar[2]**

*[1]College of Education for Pure Sciences/ University of Kerbala, Kerbala, Iraq, [2]Iraq Natural History Research Center and Museum, University of Baghdad, Baghdad, Iraq*

## Abstract

The current study showed the genus *Hydrotaea* Robineau-Desvoidy, 1830 recorded for the first time to Iraqi entomofauna and with its two species *H.aenescens* (Wiedemann, 1830) and *H. albuquerquei* Lopes, 1985.The specimens collected from carcasses of dogs. The photos taken by the aid of dino light digital microscope. The identification of diagnostic characters by using many taxonomical keys.

***Key words:*** *Diptera, Forensic Entomology, Hydrotaea, Iraq, Muscidae, Ophyra.*

## Introduction

The genus *Hydrotaea* Robineau-Desvoidy, 1830, belongs to the family Muscidae and is widespread in Palearctic and temperate regions around the world [(1)]. This genus *Hydrotaea* includes more than 130 species [(2-3)].

The members of *Hydrotaea* species were diagnosed by body color metallic black, blue or green or not shining; the compound eyes of male are holoptic and bare; female ocellar triangle shining, short or long, sometimes reaching lunula; antenna dark sometimes with pale base, aristae very short pubescent; gena with or without reclinate strong differentiated seata, the palpi orange- dark black. Thorax with dorsocentral bristles (2+4), notopleuron with two setae equal in size and covered with setulae; anepimeron bare; sub Costa is raining with a fine curve from humeral Cross-vine to Costa, medial vein straight.

Some authors showed the junior synonyms of *Hydrotaea* is *Ophyra* Robineau-Desvoidy 1830, such as: [(2-5)] with diagnostic features as body usually metallic black. Fronto-orbital seta of female are weak and shorter than frontal setae. Ocellar triangle of female almost long and reaching the lunule, gena without setae [(6-8)].

These species of *Hydrotaea* are environmentally important because of their eating habits as predators as well as their presence near residential areas. which are natural sweepers for the disposal of waste and recycling in the environment, so some countries have been breeding and proliferation in nature, as they do not enter the housing does not cause any inconvenience to humans as well as their importance in research Criminal [(9,10)].

Several studies have been conducted on this genus, which contributed to determining the age of the body and time of death (PMI). That its occurrence on human bodies abundantly in the late stages of decomposition within the graves of the burial of the dead, which gave it special importance in future criminal studies [(6) (11-16)]. The larvae of *Hydrotaea* species are predators of the other dipteran larvae and therefore seen in the later stages of decomposition [(2, 10)].

This species of *Hydrotaea* generally associated with environments where temperatures are mild throughout the year as it significantly affects the distribution and growth of these insects, in particular on the immature stages [(17-19)].

## Materials and Method

In this study the specimens were collected from dog carcasses during the period from 1/3/2018 to 28/2/2019, which killed by two methods the first using a sharp knife and the second by a toxic substance (Strychnine sulfatetablet). Use three duplicates in each of the above-mentioned transactions. The flies collected by air net and fly roll trap during the bloating and decaying stages of

carcasses. The specimens were taken to the laboratory and killed by freezing (24h) and so as they mounted by insect pins, the locality and date of collection were recorded [20, 21].

For identification of genus and species were used taxonomical keys such as [6, 7] [16] [22-26] The habitat and morphological features taken photos by the aid of the digital microscope dino-light with scales of measurements.

## Results and Discussion

In the present study, the genus *Hydrptaea* Robineau-Desvoidy, 1830 and its species, *H.aenescens* and *H. albuquerquei*, recorded as new to Iraqi fauna.

***Hydrotaea* Robineau- Desvoidy, 1830**

Synonym: *Ophyra* Robineau- Desvoidy, 1830

*Ophira* Rondani, 1856

*Osphyra* Meade, 1830

*Alloeonota* Schnabl, 1911

**Diagnostic characteristics of the genus *Hydrotaea* Robineau-Desvoidy, 1830:**

These genes can be identify by the diagnosis characters. The body is shining blue-black species (Pl. 1 A, B); the compound eyes of male is holoptic, while in female is dichoptic (Pl.2 A, B); the gena with no distinct setae, frons with the shining ocellar triangle extended more than halfway from front ocellus to lunule (almost reaching to lunule) without dusting.

Key to the two species of *Hydrotaea* Robineau-Desvoidy, 1830

1- Maxillary palp orange-yellow in color (Pl. 4 A); ocellar triangle with a blunt end (pl.3 A), Hind trochanter, on ventral surface, with tuft of fine, hooked setae (pl.5) …….. *H. aenescens* (Wiedemann, 1830)

2- Maxillary palp black-dark brown (Pl.4B); ocellar triangle with a sharp end (pl. 3 B), Hind trochanter, on ventral surface, without tuft of fine setae..... *H. albuquerquei* Lopes, 1985

***Hydrotaea aenescens* (Wiedemann, 1830)**

**Common name:** America black dump fly

Synonym: *Anthomyia aenescens* Wiedemann, 1830

*Anthomyia aenescens* (Wiedemann, 1830)

*Crssopalpus aenescens* (Wiedemann, 1830)

*Ophyra trochanterata* Malloch, 1932

**Materials examined** (37 specimens), at blotting stage (3♂♂; 5♀♀) 20.III.2018; (2♂♂; 5♀♀) 2.XI.2018, at decaying stage (9♀♀; 6♂♂) 21.III. 2018; (2♂♂; 5♀♀) 3-20.XI. 2018.

**Distribution:** America [27]; Hungary [28]; Lebanon, Tunisia, Egypt, Morocco, Britian and Irlend [29]; Turkey [30]; Argentina [24] as *Ophyra aenescens*; Belgian cost [31]; Portugal [32]; Argentina [23]; Finland [33]; Weatren Palaearctic Region [10]; Bulgaria [8].

***Hydrotaea albuquerquei* Lopes, 1985**

**Common name:** black dump fly

Synonym: *Hydrotaea oides* Skidmore, 1985

*Ophyra albuquerquei* Lopes, 1985

**Materials examined** (30 specimens), at blotting stage (2♂♂; 5♀♀) 20.III.2018; (1♂♂; 4♀♀) 2.XI.2018, at decaying stage (8♂♂; 4♀♀) 21.III. 2018; (2♂♂; 4♀♀) 3-20.XI. 2018.

**Distribution:** Brasil [17] [34]; Neotropical Region [35]; South America [6]; in southern Brazil [36]; Peru [37].

# Effect of Aerobic Training on Selected Cardiopulmonary Parameters in Myocardial Infarction Patients with Stroke

**Zeezy Soliman Eraky, Nesreen Ghareb El-Nahas, Naguib Mohamed Salem[3], Samir Abdelfattah El-gazar[4], Ahmed Ali[5]**

*[1]Assistant Lecturer, Faculty of Physical Therapy, Modern University for Technology and Information, [2]Professor of Physical Therapy for Cardiovascular, Respiratory Disorder and Geriatrics, Faculty of Physical Therapy, Cairo university, [3]Dean of Faculty of Physical Therapy, Modern University for Technology and Information, [4]Dean of Faculty of Physical Therapy, Heliopolis University, [5]Lecturer in Department of Neurology Faculty of Medicine, Beni Suef university*

## Abstract

**Background:** Patients in cardiac rehabilitation are typically advised to complete a period of maintenance phase. **The purpose** of this study was to determine if there was any difference in effect of aerobic training on selected cardiopulmonary parameters in myocardial infarction patients with stroke. **Methodology:** Forty patients of both sexes with age 40-50 years with chronic myocardial infarction patients with stroke after 6 months participated in the study. Patient's were assigned for 4 weeks into two groups: group (A) received aerobic training and traditional physical therapy program and group (B) which received traditional physical therapy program. Patients were assessed pre and post treatment using through Stress exercise test unit (Modified Bruce protocol) and modified ashwarth scale. **Results:** This study revealed that there is significantly improved in resting heart rate (10.10%), maximum heart rate (4.67%), METs (64.95%), maximum systolic blood pressure (4.45%), maximum diastolic blood pressure (9.45%) and VO2 max (35.36%) variables in group (A) treated by aerobic training than those of traditional physical therapy program only. **Conclusion:** Aerobic training was a valuable method for management myocardial infarction patients with stroke.

***Key Words:*** *Myocardial Infarction, Stroke, Aerobic Training, Cardiopulmonary Parameter)*

## Introduction

Myocardial Infarction is defined by **Borja Ibanez et al,**[(1)] as myocardial cell necrosis due to significant and sustained ischaemia. It is an acute manifestation of atherosclerosis-related coronary heart disease. Myocardial Infarction results from either coronary heart disease, which implies obstruction to blood flow due to plaques in the coronary arteries or, much less frequently, to other obstructing mechanisms.

Individuals after stroke generally have low endurance for exercise as a secondary consequence of immobility. The VO2max values are 25–45% lower than in age-matched, healthy patients. This early and persistent decline in aerobic capacity can delay or inhibit participation in a therapeutic exercise program, complicate the rehabilitation process and long-term post-stroke course of care, and limit the ability of the individual to perform functional activities independently. [(2)].

A cardiopulmonary exercise test compares the coronary circulation during physical exertion, showing any abnormal blood flow to the myocardium (heart muscle tissue). The results can be interpreted as a reflection on the general physical condition of the tested patient. This test is used to diagnose coronary artery disease and used as prediction after a myocardial infarction [(3)].

Aerobic exercise (also known as cardio) is physical exercise of low to high intensity that depends primarily on the aerobic energy-generating process. Aerobic literally means "relating to, involving, or requiring free oxygen", and refers to the use of oxygen to adequately meet energy demands during exercise via aerobic metabolism. Generally, light-to-moderate intensity activities that are sufficiently supported by aerobic metabolism can be performed for extended periods of

time [4].

## Material and Method

Patient Selection

Forty patients of both sexes (31 men and 9 women) with age 40-50 years was participated in the study, the study was delimited to chronic myocardial infarction patients with stroke after 6 months. They were selected from Physical Therapy Center, Modern University for Technology and Information.

**Inclusion Criteria**

Patients who demonstrate a mild spasticity according to Modified Ashwarth scale and Patients able to walk independently.

**Exclusion Criteria**

Patients having contraindication for stress test, Musculoskeletal or neurological disease that may affect walking, patients who didn't follow instructions (Aphasia, blindness and deafness) and Patients who had marked sensory loss.

Group (A): consist of twenty stroke patients (16 men and 4 women) received aerobic exercise (treadmill training) and traditional physical therapy program.

Group (B): consist of twenty stroke patients (15 men and 5 women) received traditional physical therapy program.

Instrumentation:

Instrumentation:

Assessment equipment

**Stress exercise test unit.**

QUARK_CPET, COSMED with 12 channels ECG to measure resting heart rate, maximum heart rate, METs, maximum systolic and diastolic blood pressure and VO2 max.

## Methodology

Steps of evaluation carried at baseline of the study for both groups and re-assumed after 4 weeks of training.

**I) Evaluation procedure**

Stress test

Patient instructed not to eat at least 2 to 3 hours before the test. Patient was asked about the drug being taken, and potential electrolyte level abnormalities. A 12-lead ECG was applied in standing position. Careful explanations of the test; the testing procedure. The optimal exercise protocol **(**Modified Bruce protocol) last 10 minutes and will be adjusted to the patients. Begin exercise test, monitoring the 12 lead ECG, vital signs, oxygen saturation, and symptoms throughout the test. At regular intervals, asking patients how about Chest or arm discomfort, Short of breath, Dizzy, Lightheaded or Any other unusual symptoms. When the test starts there is half minute before the treadmill start then the phase of warming up for 2 minutes with speed 1.4 mph and 0 in inclination then exercise phase for 8 minutes with speed 2 mph and 0 inclination and final cooling down for 2 minutes with speed 1.4 mph and 0 inclination. After the test end wait until symptoms and/or ECG and vital signs returns to baseline.

**Modified Ashwarth scale (MAS):**

The MAS was done in supine position. Because spasticity is "velocity dependent", the MAS were done moving the limb at the "speed of gravity." The test was done for the maximum of three times for each joint. If it is done more than three times the short-term effect of a stretch impacts the score;

II) Treatment Procedure:

**A) Group A:**

Patients received 4 weeks of aerobic training and traditional physical therapy, three times per week for 45 minutes per session.

Patients obtained aerobic training (treadmill training) through speed range from 0.6 to 1.3KM/H, 0°incline and no resistance.

Traditional exercise program for both groups:

Relaxation technique for spastic muscles, Facilitatory technique for antispastic muscles, stretching exercise to prevent shortening, Proprioceptive Neuromuscular Facilitation (PNF) and Trunk control training.

B) Group B:

Patients received the same traditional physical therapy training for 4 weeks as in group A.

## Results

**Data collection**

Normality test of data using Shapiro-Wilk test was used, that reflect the data was normally distributed after removal outliers that detected by box and whiskers plots. Additionally, testing for the homogeneity of variance revealed that there was no significant difference (P>0.05). All these findings allowed the researchers to conducted parametric and non-parametric analysis. Therefore, in the current study the data is parametric and normally distributed.

**1. Demographic data**

The mean values of age in group A and group B were 45.11 ±3.03 and 45.10 ±3.77year, respectively. The mean values of weight in group A and group B were 82.20 ±6.90 and 81.33 ±7.005kg, respectively. The mean values of height in group A and group B were 169.64 ±3.58 and 169.43 ±4.48cm, respectively. The mean values of BMI in group A and group B were 28.56 ±2.97 and 28.33 ±1.94kg/m$^2$, respectively. The statistical analysis by independent t-test revealed that no significant differences (P>0.05) in values of general demographic data (age, weight, height, and BMI) between both groups.

**2. Rest HR (BPM)** Table (1)

Within each group, the statistical analysis by paired t-test revealed there were significantly decreased of rest HR (BPM) at post treatment compared to pre-treatment within group A (P=0.0001; P<0.05) and group B (P=0.0001; P<0.05). Between both groups, the statistical analysis by independent t-test revealed that there were no significant difference in pre-rest HR (P=0.479; P>0.05) while, a significant difference in post-rest HR (P=0.0001; P<0.05) between both groups.

**Table (1): Comparison between mean values of pre- and post-rest HR (BPM) within each group and between both groups.**

| Items | Rest HR (BPM) | |

## Discussion

The main aim of this study was to determine if there was any difference in effect of aerobic training on selected cardiopulmonary parameters in myocardial infarction patients with stroke.

Patients in cardiac rehabilitation are typically advised to complete a period of supervised aerobic training, in the current study there was significant difference in systolic and diastolic blood pressure in addition to heart rate with privilege to group A whom received aerobic exercise training.

This was explained by **Kjeldsen et al [5],** who proved that SBP and DBP rise during exercise provides information about the hemodynamic response to increasing physical stress. Dynamic exercise produces

a large increase in SBP and DBP. The highest cardiovascular disease mortality rate was observed in men with both elevated resting and exercise blood pressure. They reported that SBP and DBP at moderate and peak workloads was directly associated with the risk of cardiovascular events in hypertensive men with an increased risk of any stroke.

Both SBP and DBP changed to levels that were statistically significant when comparing both groups after the program, although changes in both groups separately were not significant. Percent of change in SBP was (4.2 % ↓ and 2.1% ↑) and DBP was (2.6% ↓ and 2.3% ↑) for study and control groups respectively. Improvement of study group and deterioration of control group showed the positive effect of Cardiac Rehabilitation program [(6)].

In the current study there was significant improvement in METs with aerobic training which was approved by **Swain and Franklin [(7)]**, they demonstrated on their study improvements were 1.41 METs (39% improvement), 1.01 METs (15% improvement), and 0.80 MET (8.6% improvement) for the low, moderate, and high cardiorespiratory fitness patients (at baseline), respectively. The greatest improvements occurred in those patients who were most likely to benefit most from an aerobic training intervention, that is, those in the lowest cardiorespiratory fitness, high-risk cohort.

The present study showed significant improvement $VO_2$ max outcome after aerobic training, the result goes with a study in individuals starting exercise within 6 days to 6 months after stroke onset, revealed a large effect size. This finding supports the evidence that individuals in the sub-acute stage after stroke have high potential to increase $VO_2$peak following a cardiovascular training intervention. This is in addition to a spontaneous recovery of peak aerobic capacity of 16.9% that occurs during the first 6 months after stroke. But given the fact that $VO_2$peak is reduced within 0–30 days after stroke, and 10 ml/kg/min is required for light activities of daily living (ADL), this small improvement of peak aerobic capacity could lead to a large functional carryover [(8)].

## Conclusion

The results of this study revealed better improvement of aerobic exercise more than those of traditional physical therapy program alone. Aerobic exercise could be considered a valuable method for improvement of cardiopulmonary parameters on myocardial infarction patients with stroke.

# Effects of Perceived Health Condition, Gerotranscendence, and Wisdom on Successful Aging of Elders

**Hee Kyung Kim**

*Professor, Department of Nursing, Kongju National University, Republic of Korea*

## Abstract

**Background/Objectives**: The purpose of this study was to analyse the effect that perceived health condition, gerotranscendence, and wisdom have on successful aging in elders. **Methods/Statistical analysis**: This study is a descriptive survey design using a convenience sampling. The subjects of this study were 94 elders between 65 years old or above. The data were analyzed using descriptive statistics, t-test, ANOVA, Pearson's correlation coefficient and multiple regression using the SPSS Win 23.0 program. **Findings**: Successful aging of subjects had positive correlation with perceived health condition, gerotranscendence and wisdom. As a result of conducting the stepwise regression analysis, the explanatory power of above 2 variables was appeared to be 57.8% including wisdom (β=.713, p<.001) and monthly household income (β =.153, p=.032).

**Improvements/Applications**: As a plan to achieve the successful aging of the elders through the results of this study, the government and local governments need to develop a nursing arbitration program for elders to have wise lives in their daily lives and to make efforts to institutionalize the customized job creation considering the ages and conditions of the elders so that they can raise monthly household incomes.

***Keywords**: Elderly, Successful aging, Perceived health condition, Gerotranscendence, Wisdom*

## Introduction

According to the extension of the old age along with the growing number of elders, The problems of elders appear in various forms, such as physical change, economic instability, loss of social role, and psychological maladjustment, raising interests in solving these problems. Many elders evaluate that they lived a life without regret when looking back on their own in their old age and hope that they look forward to providing hope and consideration even in the present lives. The life of these elders can be called successful aging. Considering the meaning from various scholars, successful aging means living a psychologically comfortable and happy life by being in good physical health, maintaining a high level of cognitive abilities, being economically stable, exchanging positive interactions with family and people around, and actively engaging in social activities[1]. Therefore, health care professionals, including nurses, should provide physical, mental, and social care to ensure successful aging for the rest of elders' lives.

For this nursing intervention, it is necessary to preferentially clarify the variables related to successful aging. Based on an analysis of previous studies, the variables of the perceived health condition, gerotranscendence, and wisdom can be considered as mainly related to the physical, psychological, social, and cognitive factors of the elders. First of all, the physical health of the elders aged 65 or older generally has one or more physical illnesses, but the subjective way they judge by themselves is more relevant to the daily lives of elders at the level of physical function than the medical objective way, and it is more appropriate to measure successful aging measuring the health conditions that the elders themselves perceive subjectively[2], so this study includes the health conditions that the elders perceive subjectively. On the psychological side, there is also a phenomenon in which the elders try to overcome their physical and mental abilities and

**Corresponding Author :**
**Hee Kyung Kim,**
Professor, Dept. of Nursing, Kongju National University, E-Mail: hkkim@kongju.ac.kr

realities that degenerate in the latter half of their old ages and develop into a new dimension beyond time and space. Elders who have reached this gerotranscendence recognize that aging is part of the process of normal human growth and development and naturally accepts changes in physical, psychological, and social aging[3]. According to Yang[4]'s study with the subjects of 185 elders, the most influencing variable for successful aging was self-transcendence, and the higher the degree of self-transcendence, the higher the degree of successful aging, so it can be said that gerotranscendence is related to successful aging.

In addition, as wisdom is a mature mental activity that solves the various problems of life through the balanced integration of cognitive, emotional, mental, moral, and relational factors[5], wisdom means cognitively experienced eye, high insight, excellent judgment, and harmonizes with the balanced integration of the personal inner self. Therefore, the wisdom of the elders can be inferred that it plays an important role in a successful life. The previous study of elders in North Jeolla Province also showed that the wisdom of life has a mediated effect on successful aging[6].

Therefore, in this study, I would like to syntagmatically utilize the variables of perceived health conditions, gerotranscendence, and wisdom for elders living in the community to identify the relationship with successful aging, and grasp the effect of these variables on successful aging to use it as basic data for nursing intervention for the successful aging of the elders.

## Method

### 1. Subjects

The subjects of the study are elders aged 65 or older who visit five health clinics located in D city, who have understood the purpose of the study and voluntarily expressed their willingness to participate with the written consent. People who are not diagnosed with dementia or who are with mild dementia, who can communicate and do not have a mental illness. To verify the fitness of the sample size, the G*Power 3.0 program was used and a significance level of .05, effect size of .15, verification power of .80 and 5 predictive factors were applied to the regression analysis to acquire the final number of 92 subjects. A total of 94 copies were used in the final analysis.

### 2. Instruments

#### 2.1. Perceived health condition

The tool developed by Speak, Cowart & Peller[7] and used by Kim[8] was used. With a total of three questions, the higher the score on a five-point scale from 1 "very bad" to 5 "very good," the higher the perception of health conditions. Cronbach's α=.85 at the time of the development and .78 in this study.

#### 2.2. Gerotranscendence

Nine questions concerning Transcendence, a sub-area, of the Successful Aging Inventory-Korean, which was designed by Troutman et al. and whose reliability and validity was verified by Kim[9]'s translation, were used. It is a four-point Likert scale from 1 "Strongly Disagree" to 4 "Strongly Agree" and the higher the respondents' scores, the higher the degree of gerotranscendence they feel. Cronbach's α=.71 in Kim[9]'s study and 70 in this study.

#### 2.3. Wisdom

Korean Wisdom Scale (KMWS) developed by Kim[10] was used. A total of 43 questions consist of four sub-areas. The higher the score, the higher the degree of wisdom, with the five-point scale from 1 "Strongly Disagree" to 5 "Strongly Agree". Cronbach's α=.93 of reliability at the time of the development and .97 in this study.

#### 2.4. Successful aging

The successful aging tool of Korean elders developed by Kim[11] was used. This tool consists of 31 questions. The higher the score, the higher the degree of successful aging, on a scale from 1 "Strongly Disagree" to 5 "Strongly Agree". Cronbach's α=.92 in Kim[11]'s study and .95 in this study.

### 3. Data collection

The data collection period was from April 20 to May 20, 2020. The researcher explained the purpose and method of the research to the heads of five health clinics located in D city and obtained permission for the same data collections after two meetings with the heads

of health clinics with the researcher. The heads of health clinics were required to read and respond directly to elders who visited the health clinics. It took about 20 minutes to complete the questionnaire.

### 4. Ethical consideration

The researcher explained in advance that the subject would not have to respond if they were reluctant to reveal personal information. The researcher explained that subjects can stop or withdraw the answering at any time if they do not want to participate in the study. It was approved by the K University's Institutional Review Board for the data collection of this study(KNU-IRB-2020-12). During the study period the guidelines on ethical studies were observed.

### 5. Data analysis

Using the SPSS/WIN 23.0 program, the subjects' general characteristics and variables were analyzed for frequency, percentage, mean, and standard deviation. The difference in successful aging according to general characteristics was analyzed using t-test, ANOVA and Scheffé test. 각 The correlation between each variable was Pearson's correlation coeffects, and the influence factors of successful aging were analyzed using stepwise multiple regression.

## Result And Discussion

### 1. General characteristics of subjects

The average age of subjects was 74.81 years old. The elderly aged 70-79 accounted for 42(44.7%) of the population. 51(54.3%) of the subjects said that they do not have religion, and as for the state of marriage, marriage is 63(67.0%), and majority. 71(75.5%) were living with more than one family. Most of the subjects (70, 74.5%) thought that monthly allowance was more than normal degree, and 67(72.3%) earned less than 1.5 million won per month. 56(59.6%) of the subjects graduated from elementary school and 51(54.3%) of the subjects had more than two diseases. 57(60.6%) answered that they were exercising. As for friendship with friends, most of 86 (91.5%) answered that they are connected[Table 1].

**Table 1. General Characteristics and Difference of Successful aging according to Characteristics (N=94)**

| Characteristics | Categories | n(%) | Successful aging | |
|---|---|---|---|---|
| | | | M±SD | t/F (P) |
| Age (years) | 65-69 | 25(26.6) | 3.76±0.64 | 1.90 (.155) |
| | 70-79 | 42(44.7) | 3.62±0.53 | |
| | 80+ | 27(28.7) | 3.43±0.66 | |
| Religion | Yes | 43(45.7) | 3.75±0.56 | 2.23 (.028) |
| | No | 51(54.3) | 3.47±0.62 | |
| Marital Status | Living together | 63(67.0) | 3.66±0.56 | 1.01 (.316) |
| | Separation by death, divorce, etc | 31(33.0) | 3.52±0.68 | |
| Family living together | No | 23(24.5) | 3.48±0.67 | -1.09 (.277) |
| | More than one person | 71(75.5) | 3.64±0.58 | |

***Cont...*** **Table 1. General Characteristics and Difference of Successful aging according to Characteristics (N=94)**

| | | | | |
|---|---|---|---|---|
| Ideas of the monthly pocket money | Not enough | 24(25.5) | 3.40±0.62 | -1.91 (.059) |
| | Above normal | 70(74.5) | 3.67±0.59 | |
| Monthly Household Income | Less than 1.51 million won | 67(72.3) | 3.49±0.61 | -3.03 (.005) |
| | More than 1.51 million won | 27(28.7) | 3.90±0.51 | |
| Academic Background | Graduated from elementary school or below | 56(59.6) | 3.50±0.64 | -2.10 (.039) |
| | Middle school dropout or higher | 38(40.4) | 3.76±0.52 | |
| The number of diseases | Less than one | 43(45.7) | 3.67±0.61 | 0.83 (,409) |
| | Two or more | 51(54.3) | 3.55±0.61 | |
| Exercise | Do | 37(39.4) | 3.48±0.69 | -1.32 (.102) |
| | Don't do | 57(60.6) | 3.65±0.53 | |
| Having a friend ship | Have | 8(8.51) | 3.32±0.61 | -1.36 (.176) |
| | Don't have | 86(91.5) | 3.63±0.61 | |

**2. Descriptive statistics of the variables**

The mean of subjects' perceived health condition was 2.96±0.75, 2.60±0.57 for gerotranscendence, 3.29± 0.57 for wisdom, and 3.60±0.61 for successful aging[Table 2].

**Table 2. Descriptive Statistics of the Variables**

| **Variables** | **M±SD** | **Min** | **Max** |
|---|---|---|---|
| Perceived health condition | 2.96±0.75 | 1.00 | 5.00 |
| Gerotranscendence | 2.60±0.57 | 1.44 | 6.11 |
| Wisdom | 3.29±0.57 | 1.93 | 4.53 |
| Successful aging | 3.60±0.61 | 1.94 | 4.81 |

**3. Difference of successful aging according to general characteristics**

The difference of successful aging according to general characteristics showed significant difference according to religion (t=2.23, p=.028), monthly household income (t=-3.03, p=.008) and education (t=-2.10, p=.039). In other words, elders with religion, elders with income of more than 1.51 million won, and elders

with the academic background of more than middle school dropouts had a higher level of successful aging awareness[Table 1].

**4. Correlations among the variables**

Successful aging of subjects had positive correlation with perceived health condition (r=.30, p=.003), gerotranscendence (r=.35, p=.001) and wisdom (r =.744, p<.001)[Table 3].

**Table 3. Correlations among the Variables**

| Variables | Perceived health condition r (p) | Gerotrans cendence r (p) | Wisdom r (p) |
|---|---|---|---|
| Successful aging | .30 (.003) | .35 (.001) | .74 (<.001) |

**5. Factors affecting successful aging of subjects**

Successful aging was set as a dependent variable for a multiple regression analysis. The self-correlation coefficient of Durbin-Watson was 2.021, and VIF value was 1.046 which is smaller than 10, indicating that there were no issues of multi-linearity.

The analysis showed that wisdom (β=.718, p<.001), and monthly household income (β=.153, p =.032) (more than 1.51 million won) had a significant effect on successful aging in elders. The regression analysis was statistically significant (F=61.61, p<.001), with the combined explanatory power of wisdom, and monthly income being 57.8%. Among them, the most influential variable was wisdom[Table 4].

**Table 4. Factors affecting successful aging of subjects**

| **Variables** | **B** | **SE** | **β** | **t** | **p** |
|---|---|---|---|---|---|
| Constant | 1.044 | .245 | | 4.256 | <.001 |
| Wisdom | .760 | .075 | .718 | 10.183 | <.001 |
| Monthly household income(more than 1.51 million won) | .206 | .094 | .153 | 2.183 | .032 |
| R2=.578, Adj R2 =.569, F=61.61, p<.001 | | | | | |

Reference category: monthly household income=Less than 1.51 million won

## Discussion

This study sought to provide basic data on nursing intervention development for the successful aging of the elders by identifying the effects of perceived health conditions, gerotranscendence, and wisdom on the successful aging of the elders.

The perceived health conditions of the elders, gerotranscendence, and wisdom had a positive correlation with successful aging, and the factors affecting the successful aging of the elders were wisdom and household monthly income. It showed that these variables explain 57.8 percent of successful aging.

According to a study[12] of 172 elderly people in rural areas, it showed a positive correlation between perceived health conditions and successful aging, and the factors affecting successful aging are similar to this study. The perceived health condition of elders is the overall health condition, including objective health condition and subjective health care needs, which is the recognition of daily activities and health conditions in their lives. Therefore, recognizing that their health is better than the number of diseases can be an important clue for the health of the elders. Therefore, nurses who are primary health workers should create a health-related local environment and provide professional care for the elders' regular health behaviors. In addition, a study of 185 elderly women[4] found that self-transcendence had a net correlation with successful aging and was the most influential variable in successful aging. And a study of 174 elderly women[13] showed a strong net correlation between self-transcendence and successful aging. In addition, 152 Korean elderly men[14] found that wisdom has a mediating effect in the relationship between self-esteem and successful aging, and also in the study of 513 elderly Koreans living in the community[15], there is a net correlation between wisdom and successful aging and the wisdom was found to be an influencing factor for successful aging, which was consistent with the result of this study. If both men and women have gerotranscendence in their old age, I believe that they will be able to achieve successful aging by showing a positive attitude toward life because they can maintain the meaning and purpose of life, be interested in

contributing to the next generation, and control and manage themselves[16] out of everyday life. Moreover, elders who have reached the gerotranscendence tend to accept physical, psychological, and social aging naturally, thinking that aging is part of the process of human growth and development[3]. Also, a wise person tends to accept the positive and negative aspects of reality and be satisfied with his or her own life, so he or she can lead a successful life in old age. Yang[4]'s study is similar to this study because the amount of monthly spending money for the elders was a factor affecting successful aging. As the economic condition is a major variable in managing the lives of the elders, the support is needed to ensure that the elders do not suffer from economic problems. I hope that there will be more opportunities for elders to get financial helps through works, considering their own levels of health. Economic welfares such as job creation through the invigoration of exchanges with social enterprises and local businesses are required.

## Conclusion

According to the above results, As wisdom enables integrated and overall access to life's challenges and problems, they can achieve successful aging if they support their wise lives. And the economic aspect has also proved to be a major factor of successful aging. Therefore, nurses need to interact with agencies concerned to provide policy-level and institutional support by developing and applying nursing intervention considering these factors.

This study is meaningful in that it is an integrated approach that considered physical, mental, and cognitive variables for the successful aging of the elders.

# Association of Terminal Complement Complex (TCC), Prostaglandin (PGj2) among Patient with First Episode Psychosis (Case-Control Study)

**Rana Fadhil Obaid[1], Rasha Fadhel Obaid[2], Sumeiya Mahdi al Har[3]**

*[1]Lecturer in Department of Medical Microbiology, College of Medicine, University of Kufa, Najaf, Iraq, [2] Lecturer in Department of Anesthesia Techniques, Al-Mustaqbal University College, Babylon, Iraq, [3]Assistant lecturer in Department of Medical Microbiology, Jabir ibn Hayyan Medical University, Najaf, Iraq,*

## Abstract

The purpose of the study investigate the association between some inflammatory biomarkers with first episode psychosis (FEP) and to find out the correlation with different socio demographic profile. A case-control study was involve patients with first episode psychosis and healthy control. peripheral Blood samples collected from 44 cases they were attending AL-Hakeem General hospital, Psychiatric Department, Najaf, Iraq, in the period between January, 2019 to may, 2019. The cases included females and males, and the age was 18-70 years. Control: 44 healthy controls who had no history or clinical evidence of first episode psychosis or any other disease. The result revealed that increase in the level of serum Complement Complex C5b-9 and decrease Prostaglandin J-2 among FEP patients (1021.7±58.5 and 3.82±0.36) respectively in comparison to control were mean (585.87±47.059 and 9.94±0.67). The results of this research concluded that, the inflammatory response is an immune system that allow the individual to cope with various menacing advise, but in long-lasting conditions and pathological, the continuous of this stimulate could develop into harmful. The regulation of the all development involves endogenous counter-balancing mechanisms that control special effects of deleterious pro inflammatory mediators. information showing a misbalance in some pro inflammatory/anti inflammatory in blood of person with FEP.

***Keywords****: first episode psychosis, serum Complement Complex C5b-9, Prostaglandin J 2. Psychosis.*

## Introduction

The word first episode psychosis (FEP) is applied to describe conditions that impact the mind, in which people have problems distinguishing between what is true and what is not. When this occurs, it is called a psychotic episode. The pathogenesis and etiology of FEP is understood, although the facts suggests a contribution from both genetic factors and environmental.[1]

The complement system is a essential part of the innate immune defense, but it is also implicated in the induction of the adaptive immune response and in the removal of dead cells and immune complexes. Also, it helps the ability of phagocytic cells and antibodies to clear pathogens or antigens from an organism. Alters in the level of complement system can be discovered in FEP in compare with healthy. The measurement in serum concentration from both of a selected panel of complement and activation compound with the aim of gaining insight into identifying candidate biomarkers and underlying pathology.[2]

The Prostaglandin 15d-PGJ2 is the newly discovered type of prostaglandin. dehydration product of PGD2, unlike other prostaglandins in numerous respects. 15d-PGJ2 production by no specific prostaglandin synthase (PGS) and no specials 15d-PGJ2 receptor has been well-known to date. In place of, 15d-PGJ2 worked by PGD2 receptors. These characters are accountable for numerous of anti inflammatory functions.[3]

In the deficiency of a biological marker, the diagnosis relies upon clinical assessment. Besides participate to difficulties in early diagnosis, therapeutic choice, disease stratification, (treatment is largely experimental

and prediction of outcome).[4]

The purpose of the study was to examine the role for using complement-related proteins (Terminal complement complex C5B-9) and Prostaglandin J2(PGJ2) as serum biomarkers for FEP. However, the biomarkers could help to explain the pathogenesis of the disease and the present of biomarkers for FEP which would be supportive for diagnosis and might help to know the molecular basis for these conditions, in the outlook studies, to be directly concerned in causing the disease symptoms, they would be very important targets for prevention efforts and rational treatment.[5]

**Methods: Study Design :** Case-control study:

**Patients:** The study population involve patients with first episode psychosis. peripheral Blood samples collected from 44 cases at AL-Hakeem General hospital, Psychiatric Department, in Najaf, Iraq in the period between January, 2019 to May 2019, and the age was 18-70 years.

**Control:** 44 healthy controls who had no history or clinical evidence of first episode psychosis or any other disease.

**Inclusion criteria**: First episode psychotic patients drug naïve.

**Exclusion criteria**: All patients with any acute or chronic diseases and patients with autoimmune disease were excluded from this study in addition excluding pregnant women.

**Informed consent**: Informed consent was obtained from all individual participants included in the study.

**Collection of Sample**

Samples of blood were taken from the individuals enrolled in this study after obtaining the oral consent of them. 5 ml of blood was obtained from cases and controls but, before drawing the blood , had to be cleaned the skin and blood sample were distributed to 2ml of blood to EDTA tube that for (ESR and WBC) and 3ml of blood to plain tube for immunological tests the centrifuge samples at 2 - 8°C 2000-3000 Round Per/Minutes for 15 minutes within 30 minutes.

**Study Parameters**: All suspected patients first episode psychosis and control group subjected to the following immunological tests; Complement complex TCC by ELISA, Prostaglandin J2 by ELISA and Serological Tests Erythrocyte Sedimentation Rate (ESR)**,** White Blood Cell Count.

**Statistical Analysis**: The data of present study were articulated as Mean ± Standard Error, the statistical analysis Descriptive statistics, Correlation coefficients, P-value were using Graphpad prism to calculated. The comparison between two groups were analyzed by t-test and the comparison among subdivided. when P-value < 0.05 was statistically a significant relations between 2 categorical variables was explored by cross- tabulation. The statistical significance of such associations was assessed by Chi-square ($\chi 2$) test. An estimate was considered statistically significant if its P value was less than an $\alpha$ level of significance of 0.05.

## Findings

Forty four patients with FEP and forty four healthy control enrolled in the present study, Table (1) shows the mean of ESR to patient (13.7) control (9.6) and WBC count to patient (10209), control (7847).

**Table (1): Mean of Erythrocyte sedimentation rate and white blood cell count in the studied group**

| Hematological tests | Cases | Controls N=44 | Normal range |
|---|---|---|---|
| | Mean± SE | | |
| ESR | 13.7 | 9.6 | (5-20) |
| WBC | 10209 | 7847 | (4000-7000) |

The result of table (2) revealed that increase in the level of serum Complement Complex C5b-9 and decrease PGJ-2 among FEP patients (1021.7±58.5 and 3.82±0.36) respectively in comparison to control were mean (585.87±47.059 and 9.94±0.67) respectively. Moreover there was a significant differences (P<0.05) among cases & control in regard to concentration of C5b-9, and in serum PGJ-2 levels in patients with FEP in comparison with healthy group.

**Table(2) Distribution of C5b-9 and PGJ2 in the Studied Groups.**

| Biomarkers | FEP N=44 | Controls N=44 | P value |
|---|---|---|---|
| | Mean± SE | | |
| C5b9 | 1021.7±58.5 | 585.87±47.059 | 0.00106 |
| PGJ2 | 3.82±0.36 | 9.94±0.67 | 0.000119 |

**Comparison serum biomarkers levels according to gender in patients .**

Table (3) indicated there is no significant differences (p>0.05) in biomarkers concentration (C5b-9 and PGJ2) among patients with FEP according to gender where the concentration of biomarkers PGJ2 and C5b-9 among male were ( 3.97and 1046.7) respectively in comparison to female were ( Assistant Lecturer, Faculty of Physical Therapy, Modern University for Technology and Information and 1008.3 ) respectively.

**Table (3) Comparison serum biomarkers concentration according to gender in patients.**

| Markers | Mean± S.E. | | p-value |
|---|---|---|---|
| | Male | Female | |
| PGJ2 | 3.97±0.36 | 3.737±0.33 | 0.35 |
| C5B-9 | 1046.7±82.8 | 1008.3±45.45 | 0.25 |

**Comparison serum biomarkers concentration according to Age in patients.**

The results of biomarkers levels (C5b-9 and PGJ2) in FEP patients reflect no significant differences (p>0.05) according to age groups, as shown in table (4). The table also shows a marked decrease in the level or concentration of PGJ2 in comparison to level of the C5b-9.

**Table (4) The mean of serum biomarkers concentration in FEP patients according to age.**

| Markers | Mean± S.E. | | p-value |
|---|---|---|---|
| | (15-29) N=18 | (30-55) N= 26 | |
| PGJ2 | 3.1±0.42 | 4.3±0.24 | 0.31 |
| C5b-9 | 1028.4±71.7 | 1016.3±47.1 | 0.12 |

Estimate the concentration of the biomarkers (C5b-9 and PGJ2) among FEP patients in regards to occupation show statically insignificant ($p > 0.05$), the mean value of C5b-9 and PGJ2 among employed were (3.76 and 1,101.57) in comparison among unemployed (4.15 and 929.3) respectively. Table (5).

**Table (5) Comparison serum biomarkers levels according to occupation in patients.**

| Markers | Mean± S.E. | | p-value |
|---|---|---|---|
| | Employed N=28 | Unemployed N= 16 | |
| PGJ2 | 3.76±0.29 | 4.15±0.51 | 0.31 |
| C5b-9 | 1,101.57±61.83 | 929.3±19.9 | 0.14 |

**Comparison serum biomarkers concentration according to residence in patients**

Distribution of concentration of the biomarkers (C5b-9 and PGJ2) among FEP patients in regards to residence reflect no significant differences ($p > 0.05$) among the mean of the biomarkers in urban and rural as shown in table (6).

**Table (6) Comparison serum biomarkers levels according to residence in patients.**

| Markers | Mean± S.E. | | |
|---|---|---|---|
| | Urban | Rural | p-value |
| PGJ2 | 3.95±030 | 3.68±0.4 | 0.22 |
| C5b-9 | 994.8±54.9 | 1,106.3±165.9 | 0.55 |

The correlation to determine the association between PGJ2 and C5b-9, with first episode psychosis diseases, the figure (1) reflect that, there is a inverse (negative) correlation ($r = -0.249$) between C5b-9 and PGJ2 among FEP patients.

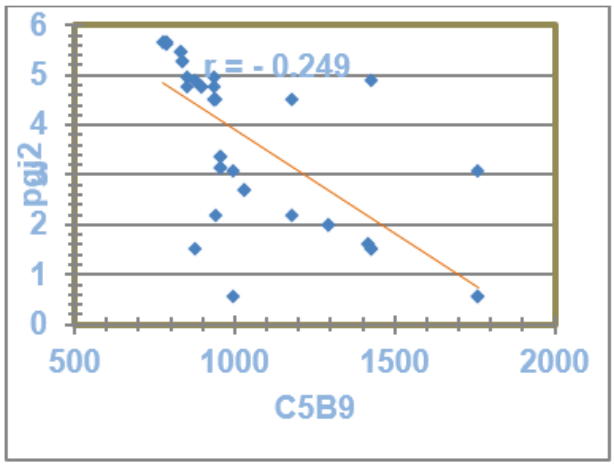

**Fig 1 the graphical presentation of the inverse correlation between C5b-9and PGJ2 in patients with FEP r = - 0.249.**

## Discussion

Distribution of Complement Complex C5b-9 and PGJ-2, in the Studied Groups.

In this study the concentration of the terminal complement complex (C5b-9) was investigated in serum of 44 patients with FEP and 44 healthy controls by using ELISA kit and the results showed that the p-value =0.001. The result of the following studies are similar to and support the result of our study [6,7,8] they said the association between (C5b-9) and disease p value = 0.003.

In this current study the concentration of the PGJ-2 was investigated in serum of 44 patients with FEP and 44 healthy controls by using ELISA kit and the results showed that the decrease in concentration PGJ-2 in patients with FEP compared with the control p-value =0.001. The results of current study are in agreement with results reported by.[9,10]. There is decrease in the concentration of pgj2 biomarker in patients due to the presence of inflammation consumes the natural concentration of marker, but in control ratios were normal.

**Comparison serum biomarkers levels according to gender in patient and control**

The results in this study indicated there is no significant differences ($p > 0.05$) in comparison serum biomarkers concentration (C5b9 p-value = 0.35 ,PGJ-2 p-value = 0.25 ) among patients with FEP according to gender**.** This result agreement with results reported by [11] but find in some study the significant result.[12]

The probable explanations of these findings is that female and male FEP are depending on specific clinical observations, the environmental influences such as smoking, which are more often present in men.

**Comparison serum biomarkers levels according to age in patients and controls.**

The results in this study indicated there is no significant differences ($p > 0.05$) in comparison serum biomarkers concentration (C5b9 p-value = 0.12 ,PGJ-2 p-value = 0.31) in patients with FEP according to age. The result of this study agreement with the study by [13] they reported no significant differences ($p > 0.05$).

In another studies by.[14] Significant differences($p < 0.05$). The effects and pressures of social and psychological impact on all ages, adding to the circumstances of war and death and orphanhood and unemployment and others.

**Comparison serum biomarkers concentration according to occupation in patients.**

The results of this study indicated there is significant differences ($p < 0.05$) in comparison serum biomarkers concentration in patients with FEP according to occupation group**.**

The result of this study supported by previous studies like, [15] while other studies reported statistically no signifcant differences like.[16,17]. The result of the current study reported there is significant differences because the exposure to work problems and may be associated with other socio demographic characters.

**Comparison serum biomarkers concentration according to residence in patient**

The results of this study indicated there is no signifcant differences ($p > 0.05$) in comparison serum biomarkers concentration (C5b-9p-value=0.55,) in patients with FEP according to residence**,** in the previous studies showing similar result. [18,19] while in another studies find signifcant result.[20,21] There is no difference in results because rural life at present is very similar to the advanced life in the city and so they are subject to the same influences.

**Results of the correlation coefficient among biomarkers in patients with FEP**

The result of figure (1) inverse (negative) correlation between C5b-9 andPGJ2 among FEP patients. in the previous studies showing same result. [22,23] The inflammatory response is an immune system that allow the individual to cope with various menacing advise, but in long-lasting conditions and pathological, the preservation of this stimulate could develop into harmful. The regulation of the all development involves endogenous counter-balancing mechanisms that control special effects of deleterious pro inflammatory mediators. Information showing a misbalance in some pro inflammatory/anti inflammatory in blood of person with FES.[24]

## Conclusion

- The inflammation association with symptoms of First Episode Psychosis.
- All age groups are at risk of having an equal incidence of First Episode Psychosis.
- Males and females have the same chance of becoming First Episode Psychosis.
- Biomarkers PGJ2 and C5b9 can be used as diagnostic criteria.

**Conflict of Interest**: there is no conflict of interest.

**Ethical approval:** This study protocol was accepted by the ethical committee, College of Medicine University of Kufa.

# Perception of Medical Health College Students Toward Mental Health

**Wiwik Widiyawati[1], Ah Yusuf[2], Indra Fajar Ibnu[3]**

*[1]Doctoral Degree Student of Faculty of Public Health Unair Surabaya, Lecturer of Faculty of Public Health, Universitas Muhammadiyah, Gresik, Indonesia, [2]Faculty of Ners, Universitas Airlangga (60115), Surabaya, Indonesia, [3]Faculty of Public Health, Universitas Hasanuddin, Makassar, Indonesia*

## Abstract

**Background:** Mental health is a major that often gets bad perception. Bad perceptions of mental health often occur in special populations (students). It is necessary to measure student perceptions to describe their perceptions regarding mental health

**Objective :** To describe student perceptions (aspects of cognition, aspects of affection and aspects of conation) about mental health.

**Method:** This study uses quantitative method with descriptive approach. The sample of this study are 100 college students of Public health major in UIN Alauddin, Makassar,

**Result:** In general, cognitive aspect of respondents is positive, as well as psychomotoric and affection aspect.

**Conclusion** : Students' perceptions related to mental health after measurement tend to be good for all three aspects (cognition, affection and conation) without one statement having the largest negative percentage.

***Keywords:*** *mental health, medical students, cognition, affection, conation*

## Introduction

Mental health problems are one of the public health problems that must get more attention. The number of patients with mental health problems keeps increasing which is estimated at 450 million people worldwide (World Health Organization, 2013). In Indonesia, mental health problems also become a serious case, because there is a significant increase in number of mental health problem patients from 2 cases per mile in 2013 to 7 cases per mile in 2018. Mental health sufferers often get poor treatment. People who suffer from mental disorders often get negative and bad views and are often seen as frightening [1].

Negative perceptions of mental health not only arise in common people who have minimal knowledge related to mental health, but also arise in certain group, such as medical employees and students who incidentally have better knowledge about medic. Sometimes, students of public health also have negative and mistaken perceptions of mental health. Happell *et al* on their study state that there are still many first-year students who still have unfavorable perceptions of mental health and result in their lack of attention to mental health that they may experience bias in college [2].

Medical students must have a positive perception of mental health because this will affect the future of mental health services. Students who are currently conducting lectures will become health professionals in the future who are professional and have high integrity.

When students, especially in the field of health, have improved their perceptions and have positive perceptions related to mental health, it is hoped that when they have completed their education they can become good health workers, especially in patients experiencing mental health problems [3].

Medical students must have a good perception of mental health. Moreover, students also must be able to prevent the emergence of mental health problems in the community. However, if it does not have a good perception it can affect the intervention process that occurs. To avoid this, it is necessary to conduct research related to public health students' perceptions to determine student perceptions related to mental health. Based on this, the purpose of this study is to identify perceptions about mental health in public health students.

## Method of the Study

This study uses quantitative design with the descriptive technique for approaching the issue. This study was conducted in June - July 2018 at the Faculty of Medicine and Health Sciences, Alauddin State Islamic University, Makassar. Populations of this study are all students of the public health study program at Alauddin State Islamic University Makassar. This study uses Proportional Random Sampling Technique. Sample are selected using inclusion criteria, namely (1) Health faculty students of 2017; (2) was in the location when the research took place; (3) willing to be a research respondent. Selected sample respondents are 100 people, consisting of 25 people from classes A and C, 24 people from class B, and 26 people from class D [4].

Data collection was carried out directly by conducting interviews with respondents using instruments that had been prepared. Data collection was carried out for 2 months, starting from June 1, 2018 until July 30, 2018. Variable characteristics of respondents are collected included age, gender, type of residence of the respondent. Socio demographic variables are collected using a questionnaire independently, created by the researcher. Nurse perception variables based on aspects of cognition are measured using a questionnaire prepared by researchers. The questionnaire to measure this consists of 10 question items [5].

This questionnaire is rated on a Likert scale, which are Strongly Agree, Agree, Disagree and Strongly Disagree. The data of reliability test results of the questionnaire of cognitive are analyzed using Cronbach Alpha. The reliability result shows the number of 0.810, means that the questionnaire is reliable enough to be used for research instrument. Nurse perception variables based on affection aspects were measured using a questionnaire prepared by researchers. The questionnaire to measure this consisted of 14 question items [6]. The reliability test results of the questionnaire using Cronbach Alpha showed the number 0.81, so it can be said that the questionnaire is reliable for use as a research instrument [7].

Data analysis was carried out univariably, with the aim of describing the characteristics of the variables. Analysis of variables with a numerical data scale is then displayed in the form of mean and standard deviation. The data then are poured in the form of a description, while for each question item is displayed in the form of a percentage [8].

## Result

**Table 1. Distribution of Perception in students from cognitive aspect**

| Question | SS | | S | | TS | | STSS | |
|---|---|---|---|---|---|---|---|---|
| | N | % | n | % | n | % | n | % |
| I understand people who have mentality healthy ones are able to work well | 46 | 46 | 39 | 39 | 12 | 12 | 3 | 3 |
| Often think things that are unrealistic and daydreaming can interfere with one's mental health | 15 | 15 | 55 | 55 | 25 | 25 | 5 | 5 |

***Cont...*** **Table 1. Distribution of Perception in students from cognitive aspect**

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| I understand that people who have a healthy mentality will not cheat to win a race | 29 | 29 | 53 | 53 | 14 | 14 | 4 | 4 |
| I understand people who often get angry don't interfere with their mental health | 6 | 6 | 21 | 21 | 55 | 55 | 18 | 18 |
| Peace of mind can arise due to positive feelings | 52 | 52 | 44 | 44 | 4 | 4 | 0 | 0 |
| I understand that mentally healthy people can control their attitudes even when they are stressed | 26 | 26 | 63 | 63 | 8 | 8 | 3 | 3 |
| People who are confident can interfere with mental health | 0 | 0 | 12 | 12 | 58 | 58 | 30 | 30 |
| People who have erratic positions can influence their self-concept | 15 | 15 | 70 | 70 | 9 | 9 | 6 | 6 |
| I understand that people with mental disorders are people who refuse or run away from the reality of their lives | 13 | 13 | 53 | 53 | 32 | 32 | 2 | 2 |
| Rejecting the reality of life at hand does not interfere with his mental health | 5 | 5 | 17 | 17 | 66 | 66 | 12 | 12 |

Table 1 shows the distribution of students' perceptions based on aspects of cognition. Most respondents have the opinion that strongly agrees (46%) that mentally healthy people can work well. Most of the respondents also agreed (55%) about the opinion that the high imagination can cause mental health problems. Most respondents agreed (53%) with the statement that mentally healthy people can control themselves from cheating. Most respondents disagreed (55%) about the statement that being angry often did not interfere with mental health. Most respondents expressed strongly agree (52%) to the statement that positive feelings are caused by peace of mind. Most respondents felt agree (63%) of mind control statements can be done well by mentally healthy people. As many as 58% of respondents disagree with the statement that feeling too high in self-confidence can interfere with one's mental health. As many as 70% of respondents agree with the statement that people who do not have a good stance can influence their self-concept. Most respondents agreed (53%) with the statement that people tend to experience mental disorders when melting themselves from the reality of life. Most respondents disagreed (66%) with statements about the rejection of the fact of life does not interfere with mental health.

**Table 2. Distribution of Perception in students from affective aspect**

| Question | SS | | S | | TS | | STSS | |
|---|---|---|---|---|---|---|---|---|
| | N | % | n | % | n | % | n | % |
| I feel satisfied while doing everything I do efficiently | 58 | 58 | 38 | 38 | 2 | 2 | 2 | 2 |
| I feel under pressure when I have a lot of work piled up | 16 | 16 | 51 | 51 | 24 | 24 | 9 | 9 |
| I feel not disappointed when the activities that I do do not go according to the plan that has been arranged | 8 | 8 | 24 | 24 | 54 | 54 | 14 | 14 |
| I do not feel satisfied at all when being able to do more than one job at the same time | 6 | 6 | 14 | 14 | 63 | 63 | 17 | 17 |
| I feel jealous when my friends are very close to each other | 2 | 2 | 14 | 14 | 51 | 51 | 33 | 33 |

***Cont...*** **Table 2. Distribution of Perception in students from affective aspect**

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| I feel satisfied when I can control my emotionweel, so I don't get angry when there is a quarrel | 51 | 51 | 46 | 46 | 3 | 3 | 0 | 0 |
| I feel happy when I am able to solve every problem calmly (without haste) | 67 | 67 | 29 | 29 | 4 | 4 | 0 | 0 |
| I feel sorry for people who hate each other | 31 | 31 | 55 | 55 | 11 | 11 | 3 | 3 |
| Feeling inferior will not affect self-concept (the views and attitudes of individuals towards themselves) | 7 | 7 | 33 | 33 | 46 | 46 | 14 | 14 |
| I feel confident when dressing comfortably and decently without following trends | 52 | 52 | 45 | 45 | 3 | 3 | 0 | 0 |
| I feel happy when I am able to do everything properly | 59 | 59 | 39 | 39 | 2 | 2 | 0 | 0 |
| I feel worried when I am unable to adapt to the campus environment as a new student | 26 | 26 | 57 | 57 | 14 | 14 | 3 | 3 |
| I feel worried for people who can't accept the reality of their lives | 24 | 24 | 69 | 69 | 6 | 6 | 1 | 1 |
| I don't feel any satisfaction when I am able to solve personal problems without involving others | 4 | 4 | 20 | 20 | 68 | 68 | 8 | 8 |

Table 2 shows the distribution of students' perceptions based on aspects of affection. Most respondents have an opinion that strongly agrees (58%) that respondents are satisfied with work efficiency. Most respondents agreed (51%) about opinions which stated that respondents felt depressed over the pile of work. Most respondents stated disagree (54%) with the statement that the respondent felt disappointed when the activity did not run smoothly. Most respondents disagreed (63%) about the statement that respondents felt dissatisfied when able to do 2 work together. Most respondents said that they did not agree (51%) to the statement that the respondents felt jealous of the closeness of their friends. Most respondents felt strongly agree (51%) to the statement that the respondent was satisfied when successfully controlling emotions.

Total 67% of respondents strongly agree when able to solve problems calmly. There are as 55% of respondents agreed with the statement that respondents felt sorry for people who hate each other. Most respondents felt disagree (46%) to the statement that he felt inferior would affect the self-concept. Most of the respondents strongly agreed to agree (52%) with the statement that respondents felt confident when dressing modestly even though they did not follow trends. respondents agreed (59%) with a statement he felt happy when able to do things according to his nature. As many as 57% of respondents agreed with the statement that the respondents felt worried not being able to adapt in the campus environment. Most of the respondents felt agree (69%) to the statement themselves feel worried about people who can not accept the reality of his life. Most of the respondents disagreed (68%) towards the statement saying that the respondent felt dissatisfied when able to solve personal problems.

## Discussion

The aspect of cognition becomes one of the aspects of perception consisting of knowledge. Knowledge possessed by someone is influenced by individual experience. The higher the knowledge ssomeone possessed, the more likely it will be to have a positive perception. But not always someone who has high knowledge also has a positive perception but can also have a negative perception. From the result above, it can be seen that the majority of respondents already have a good perception of mental health. Respondents can choose answers to statements in accordance with the nature of the question, answer agree or strongly agree to positive questions and vice versa [9].

People whose mental state is not good can influence their self-perception, so that it will affect their mindset, such as difficult to concentrate, apathetic, and difficult to carry out the planned activities. The positive thinking can have a good impact on the mental of students, so that they can adapt well to the environment as medical student. Campus life is a transition between adolescents towards maturity, so that students need see a realistic view of the world and see their limitations as an advantage [10].

Kulshrestha in his tsudy states that where students 'perceptions of mental health are strongly influenced by students' knowledge, regarding mental health. The higher the knowledge they have the more positive their perception will be. Students are expected to have good knowledge gained during the study process and have enough experience, so that they can become competent medical team when entering workforce [11].

Next is the aspect of affection. Affection aspects are composed of emotions and feelings that arise in certain phenomena and objects. The results above shows that respondents have positive affection. This is proofed by the condition of respondents who can recognize themselves, have a good self-concept. Ramchandra in his study states that emotions and feelings are one of the important things that influence the formation of students' perceptions of people with mental health. When a student has good well being and does not have a guilty state on him, he will have good mental health and be able to deal with problems that arise in his life [12].

## Conclusion

Based on the result above, it can be concluded that the perceptions students have of mental health tend to be positive. There is not a single question that has a negative response to the most choices, which means negative responses are only given by a small portion of students. This is expected to become insight for enlightment to make improvements to some students who still have negative or unfavorable perception of mental health.

**Ethical Clearance**: The research process involves participants in the survey using a questionnaire that was accordant with the ethical research principle based on the regulation of research ethic committee. The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, nonmaleficence, and justice.

**Conflict of Interest:** The author reports no conflict of interest of this work.

**Source of Funding:** This study is done with individual funding.

# The Correlation between the Characteristic of Reflux Based on 24 Hours-Multichannel Intraluminal Impedance-Ph Monitoring with the Quality of Life of Refractory Laryngopharyngeal Reflux Patients

**Muhammad Amsyar Akil[1], Risma Sari Ayu Hasroni[1], Abdul Kadir[1], Fardah Akil[1]**

*[1]Associate Professor of Department of Otrhynoolaryngology-Head and Neck Surgery, Hasanuddin University School of Medicine, Makassar, Indonesia*

## Abstract

The evaluation of the quality of life of LPR patients is crucial to assess the success of medical therapy and help with diagnosis. Assessment of life quality of patients with refsractory LPR by using the selected LPR-HRQL questionnaire because it is more practical to use, easy to set scoring and analyze data. **Objective**: This study aims at investigating the reflux characteristic and the correlation with refractory Laryngopharyngeal Reflux (LPR) patients quality of life. **Method**: The examination is performed on ten refractory LPR patients using 24hour - MultichanneI Intraluminal Impedance pH monitoring, then grouped according to the characteristics of the reflux acid, non-acidic, and mixed. Furthermore, the assessment of life quality by using LPR-HRQL questionnaire. Data analysis using Chi-Square and Spearman's Rho methods. **Results**: The sampleLPR refractory is generally female (66.7%), while males (33.3%). Mixed reflux type as much as 44.4%, then 33.3% acid reflux, and a non-acidic reflux 22.2%. LPR occurrence of majority at upright position (66.7%). Non-acid reflux patients consistently for all symptoms/complaints, indicating quality of life is disrupted based on questionnaires found in the LPR-HRQL (100%). **Conclusion**: The quality of life of non-acid reflux patients is more disturbed than the acidic and mixed reflux group.

***Keywords*** *: laryngopharyngeal reflux, 24hour - MultichanneI Intraluminal*

## Introduction

Laryngopharyngeal reflux (LPR) is a disease that often raises controversial opinion in diagnosis and treatment. In the LPR there is a retrograde flow of gastric contents into the larynx and pharynx subsequently causing discomfort and laryngeal changes[1.2] When the condition of the patient does not experience improvement in clinical symptoms or reduction of complaints either subjective or through objective examination with the endoscope, after undergoing empirical treatment of proton pump inhibitor (PPI)/standard therapy for a minimum of 3 months, this condition will develop into a refractory laryngeal reflux[3-5]

The diagnosis oh LPR has so far been based on anamnesis and clinical findings assessed using the scoring system introduced by Bellafsky at Al[6.7] namely Reflux Symptom Index (RSI) and Reflux Finding Score (RFS). The values of RSI > 13 and RFS > 7 are expressed abnormal. There are other test methods that are considered more effective for LPR diagnosis is with 24-hour multi-channel Intraluminal Impedance (pH-MII) pH monitoring, specifically detecting LPR patients who do not respond to PPI therapy. On that basis, the examination with 24 hours- pH MII is said to more accurately evaluate the chronology of reflux episodes and larynx symptoms.[6, 8, 9.10]

It is also the underlying study examines the relation between laryngeal reflux characteristic with the patient's quality of life using the tested LPR-HRQL questionnaire[11]

## Materials and Method

This study is an experimental analytical using the design of the cross sectional method. The subject of

the study was the refractory laryngeal reflux patients who came to the hospital Dr. Wahidin Sudirohusodo Makassar period in July until October 2019. The number of samples of 10 patients who have been diagnosed with refractory LPR is based on anamnesis, physical examination, and endoscopic examination. The ten patients undergo a pH-MII test, one sufferer on exclusion because the results of the pH-MII show no impedance activity. The sample consisted of three males (33.3%) and six women (66.7%). This study was declared to fulfill the ethical requirements to be implemented from the Biomedicine Research Ethics Commission on the Human Faculty of Medicine at Hasanuddin University.

**Inclusion criteria:**

The refractory LPR patients is willing to be the subject of study after being informed consent, cooperative and able to understand Indonesian language well, and range between 18-65 years old.

**Exclusion criteria**

History of laryngeal surgery or laryngeal trauma, patients with intralaryngeal disorders (e.g. mass), degenerative diseases, pregnant and smokers.

**Physical examination**

Anamnesa about the history of LPR patients treatment to ensure that the patient actually includes refractoryLPR that is the patients does not experience improvements in the clinical condition after three months empirical therapy with PPI And objectively confirmed by laringoscopy fiber optic examination[12] Further positive patients diagnosed with LPR refractory will undergo a 24-hour pH monitoring examination-Multichannel Intraluminal Impedance (pH-MII)

**24 Hour -*Multichannel Intraluminal Impedance pH monitoring (pH-MII)***

The pH-MII dual probes used in the study consists of a 2.3 mm polyurethane catheter that combines 6 impedance segments and two pH gauge electrodes. The catheter Model (UNISENSOR AG Bahnstrasse 12a 8544 Attikon, Switzerland) is used adjusted to the length of the patient's esophagus. This catheter form allows recording of changes in the impedance at each point achieved. In addition, pH monitoring of the Hypopharynx (proximal, pH1) and esophageal (distal, pH 8) is performed. With the direct visualization, the scope of the optic fiber is inserted in the nasal cavum to help put the prob. The pH-MII dual probe catheter is then inserted into the nose on the opposite side of the fiberoptic that has entered earlier. The electrode has two pH sensors along the appliance, the bottom is placed on the bottom oesophagus, about 5 cm above the lower sphinkter of the esophagus and the top is laid on the larynx, about 1-2 cm above the spinkter of the oesophagus. Then 6 channels of in impedance (Z1, Z2, Z3, Z4, Z5, and Z6) were placed on 17.15, 9, 7, 5, and 3 cm above the sphingter of the esophagus below respectively. The inspection equipment (prob) is attached to the external electronic data recorder for 24 hours to monitor the pH of the esophagus. During the 24-hour appliance, the patient is instructed to record and suppress the recorders data during meal times, changes in the position of the body (when lying or standing), drug consumption, and when the complaint arises. The tool is then released the next day, then the pH data is downloaded for analysis (Medical Measurement system Database Program).

LPR-HRQL (Laryngopharyngeal Reflux-Health Related Quality of Life)

This questionnaire consists of 43 question points, more specifically, and easy to use. LPR-HRQL uses a standard 7 point Likert scale to group patients based on the symptoms complained of. Scale for each question range 0 (never) to 6 (6-7 days per week). LPR-HRQL consists of 5 domains: voice/hoarseness (12 questions), cough (6 questions), throat clearing (6 questions), swallowing (5 questions). In addition, each domain is followed by a question aimed to explaining the primary domain affecting the overall quality of life (HRQL). The last domain, the Overall Impact Of Acid Reflux (OIAR), consists of 10 questions that assess the combination of symptoms that are associated with Refluks. The last question of each domain and OIAR question is worth a range of 1 (no effect on quality of life) up to 10 (a big impact on quality of life). In the Carrau et al study, this questionnaire showed convincing results. [12]

## Results and Discussion

The proximal reflux that is assessed as a meaningful reflux for the LPR diagnostic Enforcement is an episode of reflux that reaches two impedance sensors closest to

the oropharynx and occurs more than one reflux time. Reflux that reads with the pH of < 4 is expressed as an acid reflux (RA), a reflux with a pH > 4 expressed non-acidic reflux (RnA). And if the proximal reflux episode shows the pH of < 4 and > 4 alternately during the inspection process, then the patient is placed in the mixed reflux group.[13.14]

**Table 1. General characteristics of subjects (age and gender)**

| Variable | N= 9 | Percentage (%) |
|---|---|---|
| Age (year): | | |
| 20 - 30 | 1 | 11.1 |
| 31 - 40 | 4 | 44.4 |
| 41 - 50 | 3 | 33.3 |
| 51 – 60 | 1 | 11.1 |
| gender: | | |
| man | 3 | 33.3 |
| woman | 6 | 66.7 |

In this study, there were the most sample life distribution in the age group of 31-40 years (44.4%). With female samples (66.6%), males (33.3%). The average age of patients diagnosed with LPR in this study was 41 years.

Most of refractory LPR patients presented with a globus faringeus complaint (a sense of bump in the throat) as much as 66.7%. Two LPR patients (22.2%) comes with the main complaint of disphony and one person (11.1%) with heartburn complaints. Although *heartburn* is commonly found in GERD, ± 70% of cases, some previous studies have stated that < 40% of LPR patients are reported to have complained of *heartburn*[15, 16,17]

Based on the results of the pH-MII test, the patients is grouped into three categories based on the reflux type of non-acid reflux (NAR) group of 2 patients (22.2%), the Acid Reflux Group (AR) 3 patients (33.3%), and the mixed reflux group as much as 4 patients (44.4%).

It appears that mixed reflux patients dominates as much as 44.4%. In line with Lee JS's research at Al (2017) in his research on comparison of reflux characteristics based on LPR reflux type which also found that from 83 samples there were 59% that suffered from LPR mixed reflux and 41% non-acid reflux[18]

Previous studies have shown that not only acid reflux which causes damage to LPR patients but also pepsin (weak/non-acidic acid) and bile acids (can cause inflammation of both acidic and non-acidic ph conditions based on experimental studies) [(19,20)] Furthermore, recent studies have shown that pepsin is an agent that responsible for damage to the laryngeal mucosa of non-acidic reflux categories[19.21]

**Table 2. The category of reflux based on the content of reflux is fluid (liquid reflux) or a mixture of fluid + gas and the position of the reflux.**

| No. | Reflux Characteristics | Reflux content | | Body position when reflux occur | | |
|---|---|---|---|---|---|---|
| | | Liquid | Liquid + | Upright | Supine | Upright + |
| | | | gas | | | Supine |
| 1 | NAR | - | 2 | 1 | - | 1 |
| | | | 22.20% | 11.10% | | 11.10% |
| 2 | AR | 1 | 2 | 1 | - | 2 |
| | | 11.10% | 22.20% | 11.10% | | 22.20% |
| 3 | Mixed | - | 4 | 4 | - | - |
| | | | | | | |
| | (NAR+ AR) | | 44.50% | 44.50% | | |
| Total | | 1 | 8 | 6 | - | 3 |
| | | 11.10% | 88.90% | 66.70% | | 33.30% |

Abbreviations :

NAR : Non Acid Reflux

AR : Acid Reflux

Table 2 illustrates that the majority of patient reflux detected by pH-MII is a mixture of fluid and gas reflux content, which is 88.9%. Only 11.1% have reflux with purely fluid content alone, regardless of any reflux characteristics (acid, non-acid, or mixed).

The majority of faringeal reflux is gases, without pH decreased and is the same in normal people and laryngitis patients. Reflux in the form of a mixture of gases and liquids and only gas reflux with a significant decrease in pH more often in patients with laryngeal reflux disease[14, 22,23,24.]

It is apparent that majority of reflux occur when upright position (66.7%), while 33.3% patients experience reflux event in both positions when the upright and supine. None of these samples were subjected to reflux events while lying alone. LPR patients generally experience reflux when an upright position is known as a day-time reflux term, while the GERD sufferer is subjected to the main reflux when lying down. [(1,5,11)] in line with this, previous research by Arash et al against 109 reflux events at the time of TLESr, showing 91% of reflux events occurring in the upright position (upright) and 88% at the Baring position (supine). The relaxation of (Upper Sphincter Esophagus) USE at the transient of (Lower Sphincter Esophagus) LSE's relaxation is at an upright position with the occurrence of gastric fluid reflux and gas (81%), whereas USE contraction occurs most frequently in a bearing position dominated by gastric fluid regurgitation (82 %).[(25)]

**Table 3. Correlation of Acid reflux (AR), non-acid (NAR), and mixture (AR+ NAR) with complaints based on the LPR-HRQL questionnaire**

| No. | Complaints | Questionnaire | Reflux Characteristics | | | Total |
|---|---|---|---|---|---|---|
| | | LPR-HRQL | NAR | AR | Mixture | |
| 1 | Voice/hoarse | Disturbed | 2 (100%) | 2 (66,7%) | 1 (25%) | 5 (55,6%) |
| | | Not disturbed | 0 (0%) | 1 (33,3%) | 3 (75%) | 4 (44,4%) |
| 2 | Cough | Disturbed | 2 (100%) | 1 (33,3%) | 1 (25%) | 4 (44,4%) |
| | | Not disturbed | 0 (0%) | 2 (66,7%) | 3 (75%) | 5 (55,6%) |
| 3 | Clear Throat | Disturbed | 2 (100%) | 0 (0%) | 2 (50%) | 4 (44,4%) |
| | | Not disturbed | 0 (0%) | 3 (100%) | 2 (50%) | 5 (55,6%) |
| 4 | Swallow | Disturbed | 2 (100%) | 3 (100%) | 2 (50%) | 7 (77,8%) |
| | | Not disturbed | 0 (0%) | 0 (0%) | 2 (50%) | 2 (22,2%) |
| 5 | Overall impact | Disturbed | 2 (100%) | 2 (66,7%) | 4 (100%) | 8 (88,9%) |
| | Of Acid Reflux | Not disturbed | 0 (0%) | 1 (33,3%) | 0 (0%) | 1 (11,1%) |

Impaired quality of life due to complaints swallowing 100% occurred in the acid and non-acid reflux group, while in the mixed reflux group only 50% that disturbed the quality of life due to complaints of swallowing disorders.

The final scoring point of the LPR-HLQR Questionnaire on table 3 is that the overall reflux effect on the quality of life appears to greatly affect the non-acid reflux group and the mixture is reaching 100%, while in the Acid Reflux group, as much as 66.7% expressed overall reflux effect disrupting quality of life.

The correlation between the characteristics of reflux (acid, non-acidic, and mixed) with quality of life assessed using the LPR-HRQL questionnaire appears on tables 3. Consistently, a group of non-acidic reflux (NAR) patients demonstrated impaired quality of life (reaching 100%) based on the five main complaints that are focused on the questionnaire that is related to sound disorder/hoarseness, cough disorders, clear throat, swallowing disorders, and overall reflux impact on quality of life.

For a group of acid reflux, the quality of life seems disturbed with regards to cough, swallowing, noise disturbances, and overall reflux effects. The value of 100% disturbed quality of life only appears on complaints due to swallowing disorders. Likewise with a mixed reflux group, the value of 100% of quality of life is disrupted only at one point of the questionnaire that is related to the overall reflux impact on the quality of life.

In line with the research of Lee JS et al comparing the physical components of the non-acidic reflux group and the mixture based on the SF-12 questionnaire found that non-acidic reflux groups complained more symptoms compared to mixed reflux groups.[18]

Baclofen has been advised on the treatment of refractory GERD patients with the provision of twice daily. Although it shows improvements in handling the symptoms of GERD, its use in clinical practice is still limited due to the effects of intolerance.

## Conclusion

From this study can be concluded that there are differences in the quality of life of patients with refractory LPR reflux based on the difference in reflux character where the quality of life of non-acid reflux group is more disturbed than the acid and mixed reflux group.

# Tympanogram and Audiogram Presentation after Tympanomastoidectomy Surgery Using Musculus Temporalis Fascia Profunda Graft and Composite Graft

**Sandrianto Lande,[1] Riskiana Djamin[1],Sutji Pratiwi Rahardjo[1]**

*[1-3]Associate Professor of Department of Otrhynoolaryngology-Head and Neck Surgery, Hasanuddin University School of Medicine, Makassar, Indonesia*

## Abstract

In recent decades, there has been an increase in the use of composite graft in the closure of the tympanic membrane perforation. The aim of this research is to know the change of tympanogram and audiogram presentation after tympanomastoidectomy surgery using musculus temporalis fascia profunda graft and composite graft. Experimental research was being conducted on 22 Otitis Media Suppurative Chronic patients without cholesteatoma such as 14 patients using musculus temporalis fascia profunda graft and 8 patients using composite graft. The Audiometric tests were being administered twice, before and after tympanomastoidectomy surgery, in other hand tympanometry test was being performed after surgery. Data analysis using independent-t test, paire-t test, and chi square test. The research has shown that the Pure Tone Audiometry post-surgeries were being found higher on composite graft (68,4) in comparison with musculus temporalis fascia profunda graft (55,1), but statistically non-significant (p>0,05). On the contrary, on fascia graft group was being found significantly higher 1,47 than amplitudo composite graft (0,87), statistically significant (p<0,001). Clinical meaning of using musculus temporalis fascia profunda graft is better than composite graft in terms of hearing and tympanic membrane elasticity.

***Key words:*** *musculus temporalis fascia profunda graft, composite graft, tympanomastoidectomy*

## Introduction

The tympanic membrane is a living tissue located in the middle ear. The first component of the middle ear that is useful for receiving sound waves is the tympanic membrane, also known as the eardrum. Sound waves vibrate the tympanic membrane through a small series of auditory bones, namely malleus, incus and stapes[1]. The time limit of 2 months varies from country to country. WHO set a time limit of 2 weeks. Most ENT-KL specialists take a 3-month limit[2].

Chronic suppurative otitis media (CSOM) is divided into two namely chronic otitis media without cholestatoma and with cholesteatoma, both of which are distinguished by looking at the inflammatory process, the presence or absence of cholesteatoma and the location of the tympanic membrane perforation with different management. The incidence of otitis media is influenced by various factors including age, nutrition, socio-economic level, immunity factors and the frequency of suffering from upper respiratory tract infections[3]

Closure of the tympanic membrane is very important to prevent recurrent infections, restore hearing, and protect the structure of the middle and inner ear. Timpanoplasty can be performed with a variety of different graft techniques and materials[4,5]. In recent decades, there has been an increase in the use of composite graft in the closure of the tympanic membrane perforation. Timpanoplasty using a graft composite as tympanic membranes have a better success rate in the treatment of CSOM, due to the low need for graft nutrition, suitable for difficult conditions, in subtotal perforations, adhesive otitis media, revision surgery and tubal dysfunction[6,7].

Many autologists use composites as a graft material because of their good stability, resistance to negative middle ear pressure and not easy postoperative perforation.

Regular control after tympanomastoidectomy prevents reperforation from Chavan et al.,[8] Kumar et al.,[9] and Previous research by Tao et al[10] found that temporal graft fascia has more advantages such as being easier to extract, more quantity, relatively transparent, thinner and more flexible, but its elasticity strength as a low tympanic membrane makes it far more susceptible to negative pressure from the middle ear. Based on the background above, this study aims to determine changes in the image of tympanogram and audiogram postoperative tympanomastoidectomy using deep temporalis muscular graft fascia and composite graft.

## Materials and Method

Research Location and Time

The study was conducted at the Wahidin Sudirohusodo Makassar hospital at the central ENT-KL and COT clinic, which began in July - September 2019.

Research Design and Variables

This research is an experimental research (prospective observational study) with a design using groups with simple randomization. The research variables consisted of: independent variables (CSOM), dependent variables (pure tone audiometry (PTA) and Timpanogram), control variables (composite graft and temporalis muscular graft fascia), and intermediate variables (perforation and closure of the tympanic membrane perforation).

**Population and Sample**

The study population was Chronic Rhinosinusitis sufferers who met the inclusion criteria who came to the ENT-KL Polyclinic at the General Hospital. Dr. Wahidin Sudirohusodo and RS Network in Makassar.

**Method of collecting data**

In the ear with otore, first clean the secretions with an applicator and suction. Investigations were carried out: laboratory, plain mastoid photographs, temporal bone CT scans and PTA. Then the sample was divided into 2 treatment groups, namely: Group 1 using composite graft (temporalis and composite muscular fascia) and Group 2 using temporal muscular graft fascia, and tympanomastoidectomy and postoperative procedures.

**Data analysis technique**

The data collected is then processed and analyzed using the SPSS for windows program. The statistical test used was a t test to compare audiological results before surgery and after surgery between graft composites (temporal muscular fascia and composite) and temporal muscular graft fascia with tympanomastoidectomy techniques, the level of significance used was $\beta = 0.20$. All analysis results are displayed in tabular or graphical form accompanied by an explanation.

## Results

An experimental study (prospective observational study) has been conducted with a design using a group with simple randomization to determine changes in the image of tympanogram and audiogram postoperatively of tympanomastoidectomy using deep temporalis musculature fascia graft and composite graft. The highest tympanogram type obtained in this study is type A with sample 12 (54.54%) compliance value 0.3-1.6, As type with sample 7 (31.81%) compliance value <0.3, and type of Ad sample number 3 (13.63%) compliance value> 1.6 (Table 1).

**Table 1. Type of Tematogram Post Timpanomastoidectomy Surgery**

| No | Tipe Timpanogram | N | % |
|---|---|---|---|
| 1 | Tipe Ad | 3 | 13,63 |
| 2 | Tipe As | 7 | 31,81 |
| 3 | Tipe A | 12 | 54,54 |

The use of bone gap water (ABG) with graft fascia obtained a value of <10db of 5 (35.71%), 10-15db of 5 (35.71%) and> 15db of 4 (28.57%). In the use of composite graft, there was a water bone gap (ABG) with a value of <10db as much as 1 (12.5%), 10-15-15 as many (25%) and> 15db as much as 5 (62.5%) (Table 2)

**Table 2. Air Bone Gap (ABG) Pasca Operasi Berdasarkan Jenis Graft**

| No | Air Bone Gap (ABG) | Graft Fascia Muskulus Temporalis Profunda | | Graft Komposit | |
|---|---|---|---|---|---|
| | | Total | % | Total | % |
| 1 | < 10 | 5 | 35,71 | 1 | 12,5 |

Comparison of PTA by graft type shows that Preoperative PTA was found to be higher in composite graft (74.0) than in deep temporalis muscular fascia (65.5), but not statistically significant (p> 0.05). Postoperative PTA was found to be higher in the composite graft (68.4) than in the deep temporalis muscular fascia (55.1), but not statistically significant (p> 0.05) (Table 4).

**Table 4. PTA Comparison by Graft Type**

| No | Variabel | Graft | N | Mean | SD | p |
|---|---|---|---|---|---|---|
| 1 | PTA Preoperasi | Fascia | 14 | 65,5 | 22,1 | 0,379 |
| | | Komposit | 8 | 74,0 | 19,6 | |
| 2 | PTA Post Operasi | Fascia | 14 | 55,1 | 19,6 | 0,165 |
| | | Komposit | 8 | 68,4 | 23,1 | |

Independent-t test

Comparison of preoperative and postoperative PTA showed that in the graft fascia group, it was found that postoperative PTA was significantly lower than preoperative PTA, which was 65.5 compared to 55.1 ($p < 0.05$). In the composite graft group, postoperative PTA was found (68.4) lower than preoperative PTA (74.0), but not statistically significant ($p > 0.05$) (appendix, Table 5).

| | | PTA post operasi | 8 | 68,4 | 23,1 | |

Paired-t test

## Discussion

This study showed that postoperative pure tone audiometry (PTA) was found to be higher in composite graft compared to deep temporalis muscular fascia, but not statistically significant. Whereas in the graft fascia group, post operative amplitude was significantly higher than composite graft amplitude, and was statistically significant. In the study the most samples were found in the age group of 08-20 years with 10 samples (45.45%) followed by the age group of 21-40 years with 6 samples (27.27%) and the age group 41-60 years each as many as 6 samples (27.27%), the number of samples in adults and parents is less than in the age of children and adolescents.

Most sex in this study were women with a ratio of 1.8: 1 compared to men. The total sample of men was 8 samples (36.36%) and women contained 14 samples (63.63%). Based on the size of the perforation, obtained subtotal perforation of 13 (59.09%) and total perforation of 9 (49.90%). The main factors contributing to the area of tympanic membrane perforation are chronic infection, impaired tubal function and a history of allergies This study uses 2 types of graft, namely composite graft and deep temporalis musculature graft fascia. The number of graft composites used was 8 (36.36%) and temporalis fascia graft as many as 14 (63.63%), more widely used compared to graft composites. The use of temporal fascial grafts in subtotal perforations is most commonly used in tympanomastoidectomy operations, with success rates between 93% and 97%. But in recent decades, there has been an increase in interest by using cartilage graft (composite) as the main alternative.

Research conducted in India by Santhanakrishnan et al, [5] also used more temporalis graft 23 samples (54.76%) and graft composite as many as 19 samples (45.23%). Santhanakrishnan et al (2017), using deep temporalis graft fascia to cover small and subtotal perforations, while for large (total) perforations using graft composites. Temporalis fascia graft is an excellent graft material for closure of the tympanic membrane perforation accompanied by increased hearing.

The results of the tympanogram type from this study showed that the highest tympanogram type was type A as many as 12 (54.54%), followed by As type tympanogram as much as 7 (31.81%) and tympanogram type Ad as much as 3 (13.63%). The state of pressure in the middle ear, tympanic membrane integrity and mobility of auditory bones can be evaluated after tympanomastoidectomy surgery. Different results are

obtained from the two types of graft used. The results of tympanogram using temporalis graft were better than that of composite graft. Compliance of the tympanic membrane and ocular system under various positive and normal pressure conditions is better in deep temporalis muscular graft fascia. It can easily be understood that compliance the maximum tympanic membrane will be reached when the air pressure on both sides is balanced or equal[10-12].

Based on the degree of hearing loss and deafness, this study was divided into conductive type hearing loss, sensorinueral type hearing loss and mixed type hearing loss. In patients with CSOM who treated Wahidin Sudirohusodo Hospital and RSPTN Hasanuddin University Makassar obtained hearing loss and conductive type deafness as many as 14 samples (63.63%), hearing loss and mixed type deafness were 8 samples (36.36%) and hearing loss and sensorinueral deafness is absent. In a study in India conducted by Kumar et all[9], it was slightly different where it only took hearing impairment and conductive deafness with a total sample of 46. From research conducted at Wahidin Sudirohusodo General Hospital and RSPTN UNHAS it was found that the types of hearing loss and deafness were highest in patients is a conductive type of hearing loss.

In this study, it was found that postoperative PTA using temporalis muscular graft fascia was 14 (63.63%), composite graft was 8 (36.36%). Using the Paired t-test found in the graft fascia group, it was found that postoperative PTA was significantly lower than PTA Pre surgery, which was 65.5 compared to 55.1 ($p < 0.05$). In the composite graft group, postoperative PTA was found (68.4) lower than preoperative PTA (74.0), but not statistically significant ($p > 0.05$). Using preoperative Independent PTA t-test was found to be higher in composite graft (74.0) than in deep temporalis muscular fascia (65.5), but not statistically significant ($p > 0.05$). Postoperative PTA was found to be higher in composite graft (68.4) than in deep temporalis muscular fascia (55.1), but not statistically significant ($p > 0.05$). In the preoperative PTA examination results obtained for the hearing threshold value of 26-40 db sample size 1 (4.54%), 41-60 db sample size 7 (31.81%), 61-80 db sample size 7 (31.81 %) and> 81db of sample size 7 (31.81%). While post-operative PTA obtained results for the hearing threshold value 26-40 db sample size 6 (27.27%), 41-60 db sample size 8 (36.36%), 61-80 db sample size 5 (22.72%) and> 81db sample size 3 (13.63%). There was an improvement in the results of postoperative audiometry examination at the hearing threshold of 26-40db for 5 samples, 41-60db for 1 sample, 61-80db for 2 samples and> 80db for 4 samples.

In this study showed that in the deep temporalis muscular fascia, PTA Air Bone Gap <10db of 5 samples (35.71%), 10-15db of 5 samples (35.71%) and> 15db of 4 samples (28.57%) , while those using graft composites obtained <10db of 1 sample (12.5%), 10-15db of 2 samples (25%) and> 15db of 5 (10%). From the results of our research at Wahidin Sudirohusodo General Hospital Makassar and RSPTN UNHAS using temporalis graft fascia graft, the water bone gap (ABG) was improved compared to those using graft composites. In this study the amplitude comparison results can be seen by using 2 different types of graft. This study used 22 samples in which 14 patients used deep muscularis fascia graft and 8 used composite graft. From the results of postoperative tympanomastoidectomy, type A with a sample size of 12 (54.54%), then type As with a sample size of 7 (31.81%) and type Ad with a sample size of 3 (13.63%). Postoperative amplitude was found to be significantly higher in the deep temporalis muscle graft fascia of 1.43 compared to composite graft, which was 0.80 ($p < 0.05$).

Using the Paired t-test obtained in the fascia graft group, the postoperative amplitude was significantly higher 1.47 compared to the composite graft amplitude of 0.87, statistically significant ($p < 0.001$). From our research at RSUP Wahidin Sudirohusodo Makassar and RSPTN UNHAS using temporalis graft fascia graft results obtained tympanometry with better amplitude compared to using graft composites. There was a very significant increase before and after surgery. In this study there are limitations of the study, namely: not carried out monitoring in a sufficient period of time in the growth of the graft both temporal fascia and composite graft, the number of samples is limited, and no examination of PTA and tympanometry 6 months postoperatively.

## Conclusions and Recommendations

Researchers concluded that the use of temporalis muscular graft fascia was better than composite graft in

terms of hearing enhancement (PTA). Tympanometry and elasticity of the tympanic membrane using temporalis muscular graft fascia are better in terms of amplitude values compared to graft composites. The process of healing from a wound better postoperatively in the temporalis muscular graft fascia. Graft composites in terms of resistance to middle ear pressure are better than temporalis muscular graft fascia, so graft composites are not easily perforated. Researchers suggest that further research be done with a longer research time. Conducted research with a larger number of samples.

# Risk Factors of Lung Tuberculosis Occurence in the Working Area of Kaluku Bodoa Health Center Makassar City

**Stang[1], Anwar Mallongi[2], Indra Dwinata[3], Sumarni[4]**

*[1]Professor of Department of Biostatistics, Faculty of Public Health, Hasanuddin University, [2]Professor of Department of Environmental Health, Faculty of Public Health, Hasanuddin University, [3]Lecturer of Department of Epidemiology, Faculty of Public Health, Hasanuddin University, [4]Lecturer of Department of Midwifery Mega Rezky University*

## Abstract

Makassar City is one of the coastal areas that are vulnerable to the transmission of pulmonary Tuberculosis (TB). The condition of population density in the area can increase the risk of transmission.

The aims of the study to determine the risk factors for the occurrence of pulmonary TB in the coastal area of Makassar city. The Design study is case control. Cases are pulmonary TB patients recorded in the medical record of Kaluku Bodoa Health Center. Control is TB suspects who have experienced symptoms of a cough more than 2 weeks and do not have positive TB. The number of samples is 120 with details of 60 cases and 60 controls. Data analysis was used by bivariate and multivariate with odds ratio & logistic regression tests.

The results showed that occupancy density (OR: 2.33; 95% CI: 1.103-4.935) and TB contact (OR: 9.077; 95% CI: 1.098-75.02) were risk factors for pulmonary TB, while poor families (OR : 1.909; 95% CI: 0.811-4.493) and smoking behavior (OR: 1.336; 95% CI: 0.463-3.856) is not a risk factor for the incidence of Pulmonary TB. The conclusion in this study is the probability of the occurrence of pulmonary TB in subjects whose home density is <10 $m^2$ / person and has a contact history with pulmonary TB patients, which is 92%.

For Suggestions need health promotion for coastal communities regarding healthy life behavior (PHBS) and ways to reduce the risk of pulmonary TB transmission.

***Keyword*** *:Pulmonary TB, contact TB, occupancy density*

## Introduction

Pulmonary tuberculosis (TB) is one of the largest infectious diseases in the world. This disease is still a serious problem, especially in developing countries like Indonesia[1]. The number of new cases of AFB (+) pulmonary TB in Indonesia was recorded at 1561723 and 74.96% of it belonged to the productive age with a Case Detection Rate (CDR) of 60.59%. South Sulawesi Province was one of the provinces that had the largest AFB (+) cases, namely 12.972 cases and a prevalence of 257 per 100.000 population[2].

The case of pulmonary TB in Makassar City showed fluctuating numbers. There were 2.166 cases in 2014, then increased to 2.372 new cases of positive AFB TB in 2015. In 2016, the total cases became 3.917 cases, but new positive AFB cases decreased to 1.850[3]. Although new cases had decreased, the prevalence of TB in the community was still quite high. This high prevalence rate allowed a large number of infections to occur. This was supported by the high density of Makassar City and residential environment that supported TB transmission, especially in the western part of Makassar City, which was a populous and poor coastal area.

Coastal area is vulnerable to the spread of infectious diseases, including tuberculosis (TB). One of the coastal areas in Makassar City that had a quite high number of pulmonary TB cases was the working area of Kaluku Bodoa Community Health Center. Based on the data of Public Health Office of Makassar [3] the number of cases in Kaluku Bodoa Village was 77 cases with the proportion of positive AFB reaching 46.6% of the number of suspected

pulmonary TB found. In addition to poor environmental condition, several things also became risk factors for TB cases, such as age, occupancy density, socioeconomic status, smoking behavior, distance between houses, and contact history. Those factors contributed to the increase of TB cases in an area[4]. Therefore, this research was to find out risk factors that affected TB cases in the coastal areas of Makassar City.

## Material and Method

This was an observational research with a Case Control research design. Data was obtained from Kaluku Bodoa Health Center in Makassar City. Case population was positive AFB pulmonary TB patients recorded in TB 03 form (TB register) in 2018 and 2019. Control population was suspected TB patients recorded in TB register. Sample was 120 people divided into case and control group with a ratio of 1: 1 so that each group consisted of 60 people. Sample calculation used was the Lameshow formula. Sampling technique used was the simple random sampling. Data collection instrument used was a structured questionnaire. The data were analyzed in descriptive, bivariate, and multivariate analysis.

## Results

Results of the descriptive analysis can be seen in table 1. The case group was dominated by male respondents, namely 43 people (71.7%). The number of respondents was higher in the Productive age group (11-50 years old) in the case group by 41 people (68.3%) and in the control group by 43 people (71.7%). The education background of respondents was mostly in the high school graduate group by 21 people (35%) and 30 people (50%). The occupation of respondents was dominated by workers and housewives in both case and control group.

**Table 1. Distribution of respondents' characteristics in the coastal area of Kaluku Bodoa Village, Makassar City**

| State Civil Apparatus | 4 | 6.7 | 1 | 1.7 | 5 | 4.2 |
| Student | 4 | 6.7 | 3 | 5.0 | 7 | 5.8 |

Table 2 presents the results of risk factors analysis for pulmonary TB cases in the coastal area of Makassar City. From the analysis results, it was found that there were 2 main variables that were statistically significant as risk factors for pulmonary TB cases in the coastal area of Makassar City, namely residential density and contact history with patients with pulmonary TB. Respondents with occupancy density that did not meet the requirements (<10m2/person) had 2.33 times greater risk of developing pulmonary TB disease compared to respondents with qualified occupancy density (95% CI: 1.103-4.935). In addition, the research results also showed that people with a history of household contact with pulmonary TB patients having 9 times greater risk (95% CI: 1.098-75.02) for the case of pulmonary TB disease compared to people who did not have any history of household contact with pulmonary TB patients. The results were statistically significant.

**Table 2. Results of Bivariate Analysis of Pulmonary TB Risk Factors**

The research results also showed that there were two research variables that had no statistically significant relationship, namely the poor family variable with an OR value of 1.909 (95% CI: 0.811-4.493) and smoking behavior with an OR value of 1.336 (95% CI: 0.463 -3.856). Nevertheless, it can be seen that this variable had the potential to become a risk factor. One of them was the poor economic/financial family condition. Poor families who had pulmonary TB was 18 people (30%) greater in proportion than poor families who did not have pulmonary TB, which was 11 people (18.3%). Smoking status also showed no statistically significant results, because the proportion of smokers in both the case and control groups was relatively the same, namely 53 (88.3%) people in case group and 51 people (85%) in control group.

**Table 3. Multivariate logistic regression analysis**

| No | Risk Factors | B | OR | 95% CI | p-value |
|---|---|---|---|---|---|
| 1 | Occupancy Density | 0.806 | 2.239 | 1.041-4.817 | 0.039 |
| 2 | Contact History | 2.135 | 8.461 | 1.006-71.169 | 0.049 |
| | Constant | -0.441 | 0.643 | - | 0.074 |

Table 3 shows the results of the multivariate logistic regression analysis of the independent variables affecting pulmonary TB. From the analysis results, a suitable model was obtained with the equation as follows:

Ln $(\frac{p}{p-1}\frac{p}{p-1})$ = -0.441+ 0.806 occupation density + 2.135 contact history

With this equation, it was possible to calculate the chance of pulmonary TB occurring in the coastal area of

Makassar city on subjects whose house density was <10 m2/person and had a history of contact with pulmonary TB patients with the following calculation:

$$= -0,441 + (0,806 \times 1) + (2,135 \times 1) = 2.5$$

The result was:

$$P = 1 / (1 + \exp^{(-2.5)}) = 0.92 \text{ or } 92\%$$

So, the chance of pulmonary TB case in the coastal area of Makassar city on subjects whose house density was <10 m2/person and had a history of contact with pulmonary TB patients was 92%.

## Discussion

Occupancy density is a risk factor for pulmonary TB case. Dense housing allows the proliferation of microbes that is quite high and increases the risk of high pulmonary TB transmission, especially if there are people with pulmonary TB in the house. This condition can increase the risk if the house environment has less ventilation and unqualified lighting[5]. This is also supported by previous research conducted by Wulandari et al (2015)[6], showing that one of the factors that have proven to be influential as risk factors for pulmonary TB disease is the occupancy density factor (p = 0.002).

The research results also show that household contact with previous pulmonary TB patients has a high risk of transmission of pulmonary TB. This indicates that household contact is a significant threat to other family members because the exposure occurs in the environment around the house. So, the risk for contracting is very high. The similar case occurs in research by Fitriani (2013)[7], which shows the correlation between contact history and pulmonary TB.

The rate of TB transmission in the environment of patients' family is quite high, in which a patient can transmit it to 2-3 people in his/her home, while the risk of transmission for households with more than one patient with pulmonary TB is 4 times greater than households with only one patient with pulmonary TB. Other research by Mahpudin and Mahkota (2007)[8] shows that the source of household contact is significantly associated with the case of AFB (+) pulmonary TB. Those who live in a house with contacts are at risk of suffering from tuberculosis 3.46 times greater than those who have no household contact. Likewise, research by Kirenga *et al* (2015)9 in Uganda find that contact with TB patients has 11.5 times risk (95% CI: 8.4-15.2) to suffer pulmonary TB. Delay in health check/pulmonary TB screening can result in late treatment which can worsen pulmonary TB disease suffered by other family members. TB program implementation in each region is constrained by several factors, one of which is the discovery of new cases that are still lacking and the limited human resources of the TB program will be a challenge in reducing the case of pulmonary TB[10].

The research results also find that poor family status and smoking habits are not risk factors for pulmonary TB events. However, the poor family variable has the potential to be a risk factor because the proportion of poor families who suffer from TB is greater than those without pulmonary TB. This is due to the early examination and relatively cheap pulmonary TB treatment since underprivileged members of the community are supported by the government through the Indonesian National Health Insurance (BPJS kesehatan). Research in Uganda show different results, income below the poverty threshold (1.25 USD/day) generates a high risk of tuberculosis transmission with an OR = 39.5 (95% CI: 34.4-44.7)[9]. Likewise, research by Mahpudin and Mahkota,[8] states that in the health aspect, those with poor economic capacity find it difficult to meet the nutritional needs, healthy shelter, and health care so that the risk of pulmonary TB disease is very high.

In addition, the smoking variable in this research has no correlation with the case of pulmonary TB. Research by Wen *et al* [11] shows different results, which mention that smoking is a risk factor for the case of pulmonary TB with an OR value of 1.17 (95% CI: 1.1-1.3).

However, the results of our research are relatively similar to research in India conducted by Bhat *et al* [12], which also indicates that smoking is not a risk factor for TB with an OR value of 1.03 (95% CI: 0.72-1.48). Similarly, research in Wonogiri Regency, Central Java, shows that smoking is not a risk factor for the case of pulmonary TB with an OR value of 1.4 (95% CI: 0.5-3.7)[13].

In principle, smoking behavior is not the cause of pulmonary TB. The pulmonary TB agent, namely *Micobacterium tuberculosis*, is transmitted through air/

droplet. Smoking is a factor that exacerbates pulmonary TB[14].

## Conclusions And Suggestion

### Conclusions

From the research results, it can be concluded that:

1. Occupancy density (<10 m2/person) and contact history with pulmonary TB patients are risk factors for pulmonary TB.

2. Poor family status and smoking behavior are not risk factors for pulmonary TB.

3. The probability of pulmonary TB case in the coastal area of Makassar city on subject with a house density of <10 m2/person and a history of contact with pulmonary TB patients is 92%.

### Suggestions

1. Special attention needs to be paid to coastal communities, especially those who live in densely populated settlements with high occupancy density. They need to learn clean and healthy living behaviors and ways to reduce the risk of pulmonary TB transmission.

2. Families who have family members suffering pulmonary TB should use masks and separate tableware with the patients to minimize transmission. They also need to check their health frequently at the health center if symptoms of pulmonary TB appear so that treatment can be performed quickly.

### Acknowledgement

The researcher would like to thank the Head of Makassar City Health Office and Kaluku Bodoa Public Health Center for the assistance during the research.

# Difference of Predisposing Factors with Notification Pulmonary TB through Rapid Moleculer Test and Specimen Transportation Method of TB Health Centre Staff

**Tukiman[1], Syarifah[2], Hiswani[2]**

*[1]Doctoral Program of Department of Health Education and Behavioral Sciences, Universitas Sumatera Utara, Medan, North Sumatera, 20155, Indonesia, [2] Lecturer of Universitas Sumatera Utara, Medan, North Sumatera, 20155, Indonesia*

## Abstract

In 2017 North Sumatera province had a TB incident of 73,488 with CDR BTA(+) 65,7%, and CNR of 185/100.000 population higher than Indonesia. CDR BTA(+) Deli Serdang District is 61,6% is below than CDR average of North Sumatera province 65,7%. The Deli Serdang District is one of the fostered area of the international NGO KNCV to accelerate the process of elimination of TB by providing facilities assistance and improvement of human resources. The purpose of this research is to analyze the relationship predisposing factors of pulmonary TB staff in Health Centre to achieve the case notification of pulmonary TB through Rapid Moleculer Test with Xpert MTB/RIF and Specimen Transportation methods. This research using cross sectional design and population is all TB staff (34 staffs) in the Health Centres in Deli Serdang District where is each Health centre has 1 TB staff. Data collection is conducted with interviews using pre-tested questionnaires and get approval from the Ethics committee of the Faculty of Nursing Universitas Sumatera Utara. Analyzed using the Mann-Whitney test and Kruskall Wallis. The result of this research there is no relationship of predisposing factors with the Pulmonary TB case notification using Rapid Moleculer Test and Specimen Transportation method in Deli Serdang District.

***Keywords:*** *Pulmonary TB, Rapid Molecular Test, Specimen Transportation, Predisposing factor*

## Background

In 2016 the estimated pulmonary TB incident in Southeast Asia at the highest of 45%. Indonesia has a new case of TB as many as 420,994 cases in 2017 with the Case Notification Rate (CNR) 161/100,000 population, and Case Detection Rate (CDR) 47%[1].

In 2017 North Sumatera province had a TB incident of 73,488 with CDR BTA(+) 65,7%, and CNR of 185/100.000 population higher than Indonesia. CDR BTA(+) Deli Serdang District is 61,6% is below of CDR average North Sumatera province 65,7%[2]. In 2016 the total number of TB cases in the health facilities of Deli Serdang 2,806 cases are divided in several places such as hospitals, Health centre, clinics, and prison. There was a significant difference in the discovery of a new case after an equitable intervention of lung TB in all regencies/ cities. Deli Serdang is one of the demonstration areas of the international Non Government Organization Koninklijke Nederlandse Centrale Vereniging (NGO KNCV) to accelerate the process of elimination of TB by providing facilities and improvement of human resources in North Sumatera province. KNCV in each Regency/city, be equipped a facility for notification of the case with a Rapid Moleculer Test and also given Specimen Transportation.

The strategy of TB case notification in Deli Serdang District followed the WHO recommendation diagnosis of bacteriological examina-tion using microscopic of the Acid Fast Bacillus (AFB).

Rapid Molecular Test with GeneXpert Mycobacterium Tuberculosis / Rifampisin (Xpert MTB/RIF) is fast and can identify the presence of MTB and resistances against rifampicin simultaneously, so that early initiation of accurate therapy can be administered and can reduce the incidence of TB in general. At this time, the only molecular examination includes all the necessary reaction elements including the entire reagent for the Polymerase Chain Reaction (PCR) process in one cathrid with a Rapid Moleculer Test examination with Xpert MTB/RIF. Xpert examination of MTB/RIF can be qualitatively detect complex MTB DNA from specimens directly through sputum and non-sputum and also can detect mutations in the rpoB gene that causes resistance to rifampicin. TB and resistance to rifampicin can be diagnosed with Xpert MTB/RIF examination quickly and accurately[3]

Information systems to monitor the movement of delivery of package test samples ranging from order process, courier pickup, acceptance confirmation, feedback related test sample conditions to the recapitulation of test sample results which are Development of information Systems Tracking for specimen Transport. Specimen Transportation is used to send and receive test samples, consisting of a web-based application for managing data, Specimen Transportation user accounts and Android-based mobile applications. The Program management staff, laboratory analysts of the health centre and jail clinics, couriers, health office and Sub-Directorate of TB are the primary users of this information system. In addition to having functions as a tracking tool, Specimen Transportation also supports recording recapitulation and delivery reporting of test samples electronic[3]. Saomi's research et al (2013) states there is an educational background relationship ($p$ = 0,027; OR = 8.0) and knowledge ($p$ = 0,023; OR = 9.75) to the invention of the lung TB[4]. Rye, et,al (2007) states there is a relationship in the between suspect of TB (OR = 8.92; 95% CI 2.36-38,65), Communication Information and Education about TB (OR = 8.85; 95% CI = 2.16-36,97), and training DOTS (OR = 5.84; 95% CI = 1.54-26,77) with the invention of a new case in Palu City[5].

## Method

This research using Cross sectional design. The purpose of this research is to analyze the relationship predisposing factors of pulmonary TB staff in Health Centre to achieve the case notification of pulmonary TB through Rapid Moleculer Test with Xpert MTB/RIF and Specimen Transportation methods. This research using cross sectional design and population is all TB staff (34 staffs) in the Health Centres in Deli Serdang District where is each Health centre has 1 TB staff. Data collection is conducted with interviews using pre-tested questionnaires and get approval from the Ethics committee of the Faculty of Nursing Universitas Sumatera Utara. The invention of TB case in Health centre is obtained from secondary data that is calculated by the number of cases of lung TB obtained per Health centre divided by the case target per Health centre. Categorized into: above average if ≥ median and below average if < median. The Mann-Whitney test and Kruskall Wallis were used to see the relationship between the predisposition factor of TB staff with the discovery of TB cases.

## Results

Relationship Characteristic of TB Program with the Notification of Pulmonary TB Through Rapid Moleculer Test and Specimen Transportation Method in the Health Center of Deli Serdang

**Table 1. Relationship Characteristic of TB Program with the Notification of Pulmonary TB Through Rapid Moleculer Test and Specimen Transportation Method in the Health Center of Deli Serdang**

| Characteristic | | Case Finding TB | | | |
|---|---|---|---|---|---|
| | n | % | Mean | SD | p |
| Age | | | | | |

***Cont...*** **Table 1. Relationship Characteristic of TB Program with the Notification of Pulmonary TB Through Rapid Moleculer Test and Specimen Transportation Method in the Health Center of Deli Serdang**

| | | | | | |
|---|---|---|---|---|---|
| <45 years | 13 | 38,2 | 37,46 | 5,77 | 0,649 |
| ≥45 years | 21 | 61,8 | 50,57 | 3,44 | |
| Gender<br>Male<br>Female | <br>3<br>31 | <br>8,8<br>91,2 | <br>0,001<br>0,001 | <br>8,8<br>91,2 | 0,121 |
| Last Education | | | | | |
| SMA | 4 | 11,8 | 1 | 0,001 | 0,153 |
| D-III | 21 | 61,7 | 2 | 0,001 | |
| S1 | 9 | 26,5 | 3 | 0,001 | |
| Long time duty | | | | | |
| <8 years | 11 | 32,4 | 2,53 | 2,42 | 0,359 |
| ≥ 8 years | 23 | 67,6 | 19,21 | 7,58 | |
| Training<br>Never | <br>3 | <br>8,8 | <br>1 | <br>0,001 | 0,832 |
| Ever | 31 | 91,2 | 2 | 0,001 | |

According to the table above the majority of TB cases were found by TB staff aged ≥ 45 years with a total of 21 people (61.8%). Based on the Mann-Whitney test There is no difference between the age of the staff and the notification of the Pulmonary TB ($p > 0.05$). In accordance with the research Widjanarko (2006) indicates that age and gender have no relationship to the notification of the Pulmonary TB[6].

The majority of women's genital female TB staff as much as 31 people (91.2%) And there is no difference between the gender of the officer with the notification of pulmonary TB ($p > 0.05$).

This is in line with the research of Widayat (2006) which suggests that there is no association between the genders of TB staff with the role of health staff in the notification of the case TB[7]

The last education staff of TB D-III as many as 21 people (61.7%). Based on the Kruskall Wallis test, there was no difference between the last education and the notification of a Pulmonary TB ($p > 0.05$). Maryani Research (2015) received a majority of TB staff have a D-III education (66%)[8].

The length of duty of TB staff for ≥ 8 years with the number of 23 people (67.6%). Based on the Mann-Whitney test, the value of $p > 0.05$ is that there is no

difference between the duration of the notification of the Pulmonary TB. The results of the research of Husein (2012) also showed no relationship between long working with the notification of the Pulmonary TB[9].

The notification of Pulmonary TB in Health centre Deli Serdang more than in the staff who have already conducted training compared to the one that has not been, namely the discovery of 31 people (91.2%). Based on the Mann-Whitney test, the *p*-value > 0.05, there is no difference between the experience of training and the notification of pulmonary TB. Rye (2009) states there is a connection between DOTS training and the notification of Pulmonary TB through training provided on staff[5].

Table 2. Relations of Knowledge, Attitudes, Actions of TB Program with the Notification of Pulmonary TB Through the Method of Rapid Moleculer Test and Specimen Transportation in the Health Center of Deli Serdang District

| Variable | Case Finding TB | | | |
|---|---|---|---|---|
| | n | Mean | SD | p |
| Knowledge | | | | |
| Low | 14 | 15,64 | 3,20 | 0,904 |
| High | 20 | 25,70 | 5,06 | |
| Attitudes | | | | |
| Not good | 16 | 32,25 | 3,37 | 0,105 |
| Good | 18 | 38,67 | 1,02 | |
| Action | | | | |
| Not Good | 13 | 4,38 | 0,87 | 0,304 |
| Good | 21 | 6,71 | 0,84 | |

According to the Mann-Whitney test the *p*-value >0.05 i.e. there is no difference between the knowledge of the officer with the invention of the Pulmonary TB.

In comparison with the results of Maryani Research (2015) in Kartasura Health centre which stated that there is a relationship between the level of knowledge of health staff with the role of the case notification TB (Spearman test: $p < 0.05$)[8]. From the results of the study obtained an overview of staff who have an above average attitude score but have a low case notification results. There is no difference between the attitude of the officer and the notification of the pulmonary TB ($p > 0.05$). This is different from the research results of Widjanarko (2006) which indicates that there is a relationship between the attitude of TB staff with the notification of suspect TB[6]. Ratnasari Research (2015) also shows the same results that there is a connection between the attitude of staff with the achievement of staff against case detection rate in the Pulmonary TB program in Rembang District[10-13].

There is no difference between action staff TB with the notification of pulmonary TB ($p > 0.05$).

## Conclusion

There is no difference of predisposing factors with the notification of TB using Rapid Moleculer Test and Specimen Transportation method in Deli Serdang District.

# The Influence of Duration, History of Contact and BMI on the Incidents of Pulmonary TB in patients with DM

**Sorimuda Sarumpaet[1], Evawany Aritonang[2], Syarifah[3]**

*[1]Senior Lecturer of Department of Epidemiology, [2]Senior Lecturer of Department of Community Nutrition, [3]Senior Lecturer of Department of Health Education and Behavioural Sciences, Universitas Sumatera Utara, Medan, North Sumatera, 20155, Indonesia*

## Abstract

In the world 9.4 million people have been infected with TB disease and each year 1.7 million people die (WHO, 2013). The risk of lung TB increased in patients with DM as a defect in immune cell function and defence mechanism. In addition, it is also determined by the reduced leukocytes in patients with DM, especially for those whose sugar levels are not controlled. The purpose of research is to analyze the duration of DM, contact with TB and BMI on the occurrence of lung TB in patients with DM. Research conducted at the Puskesmas Glugur Darat, Puskesmas Sering and Puskesmas Padang Bulan Selayang in Medan City with a case-control study design. The population of the case is all patients DM with a lung TB recorded in Puskesmas and control is all patients with DM without lung TB. Samples taken with consecutive those are patients with DM who came to the puskesmas during the research until obtained 54 cases and 54 control. Data is analyzed by chi-square test and OR measuring. The results showed that there was influence of contact history of DM sufferers on the incidence of lung TB with OR = 4.38 (95% CI: 1.34-14.33) and BMI with OR = 3.5 (95% CI: 1.52-8.06).

***Keywords:*** *DM patients, duration of DM, contact history, BMI, incidents of lung TB.*

## Introduction

Pulmonary tuberculosis (TB) is an infectious disease as a leading cause of morbidity and death around the world, especially in countries with lower-middle socioeconomics. In the world 9.4 million people have been infected with TB disease and each year 1.7 million people die in the world[1].

The increasing incidence of lung TB in patients with DM is caused by a defect in immune cell function and defence mechanism. In addition, it is also determined by the reduced leukocytes in patients with DM, especially for those whose sugar levels are not controlled.

Some research also shows the impact of DM in lung TB is the treatment of lung TB tends to fail and sufferers tend to die during therapy compared to non DM. Research of Corona et al (2013) states that patients suffering from TB-DM have a more severe clinical manifestation than without DM with OR = 1.8 (95% CI 1.35-2.41), conversion of sputum delayed OR = 1.51 (95% CI 1.09-2.1), higher therapeutic failure OR = 2.93 (1.18-7.23), recurrence Hazard Risk (HR = 1.76 (95% CI 1.11-2.79) and relapse HR = 1.83 (95% CI 1.04-3.23)[2].

Based on Juwatiningsih Research, influential variables increase the risk of lung TB infection in patients with DM is the level of education (OR = 203.84), socio-economic (OR = 3.19), duration of DM (24.35), infectious diseases (OR = 11.14), direct contact with patients with pulmonary TB (OR = 478.31) with $p$-value < 0.05, but the variables of nutritional status, occupation, and knowledge do not show any influence on pulmonary TB infection in patients with DM[3].

According to Siddiqui, et, al, there are age influences ($p < 0.001$), education ($p < 0.003$), marital status ($p < 0.001$) and Weight loss ($p < 0.003$) to the

**Corresponding Author:**
**Sorimuda Sarumpaet**
Email : sorimuda_sarumpaet@yahoo.com, Address: Jl University No. 21, Medan

risk of pulmonary TB and extra TB Paru[4]. Until now there has been no research explaining the risk of lung TB in patients with DM in puskesmas. Therefore, it is important to know the factors that influence the risk of lung TB in patients with DM.

Research objectives is to analyze the influence of duration of DM, contact history and BMI with lung TB to the occurrence in patients with DM.

## Materials and Method

This research is a longitudinal observational research with case-control design. Cases are patients with DM with lung TB while the control is a patient with DM without lung TB. Population all sufferers of adult DM (≥ 18 years) is recorded in Puskesmas Sering, Glugur Darat, Padang Bulan Selayang. The case population is all patients with lung TB, while the control population is all people with DM without lung TB. Case sample is a person who is DM with lung TB who is following the program of TB which has been recovered and recorded in Puskesmas Sering, Glugur Darat, Padang Bulan Selayang. The control sample size is a DM sufferer who is following the treatment and is listed at the puskesmas. Samples size were calculated based on 90% CI, OR = 3.19, power 1-β = 80%, 1:1 ratio control case, hence the sample of 108 with 54 cases and 54 controls. Samples is taken with consecutive sampling that are patients with DM who come to the health center during the research until the sample is fulfilled. Collecting data using questionnaire that have been test both validity and reliability and have been approved by the Ethics Committee of the Faculty of Nursing at the Universitas Sumatera Utara. Analysis is conducted using the univariate analysis by presenting the frequency distribution data of the proportion of cases and control. Bivariat analysis conducted a chi-square test to assess the degree of significance (p) and calculation of OR to know the magnitude of influence of independent variable with the dependent variable.

## Results

Based on the results of the risk factors obtained pulmonary tuberculosis in patients with Diabetes Mellitus as follows:

**Table 1. Influence Duration of DM sufferers with the Pulmonary TB Incidence**

| Duration of DM (years) | Respondent Status | | | | OR 95%CI) | P |
|---|---|---|---|---|---|---|
| | TB | | Non TB | | | |
| | f | % | F | % | | |
| New (≤3) | 20 | 37 | 16 | 29,6 | 1,40 (0,63-3,12) | 0,540 |
| Old (>3) | 34 | 63 | 38 | 70,4 | | |
| Total | 54 | 100 | 54 | 100 | | |

Based on the table above can be learned that the proportion of respondents who suffer from TB with a DM suffered less than 3 years by 37% and in patients with DM Non TB with less than 3 years of DM suffered by 29.6%. Based on the results of statistical test analysis obtained the *p* value = 0.540 which means there is no prolonged influence suffered DM against the incidence of lung TB. The results of the study Lusiani (2019) which examines the risk factors of lung TB in patients with type 2 DM with a long group suffering from DM 1-10 years and >10 years stated that no old relationship suffers from DM with pulmonary TB incidence in DM sufferer[5]. Although in this research there is no long influence suffered DM against TB event but in the table above can be seen the old proportions suffer >3 years more in cases (63%). This suggests that long-suffering DM can exacerbate the durability of DM sufferers so that it can cause chronic hyperglycaemic due to insulin deficiency either relative or absolute. Weak body endurance in patients with DM coupled with no control of good sugar levels then another chance of a statement attacking in patients with DM tends to be greater.

According to the research of Emma et,al, (2018) patients with TB-lung susceptible to DM, likewise vice versa. The DM incidence rate in TB patients is obtained by 12%. The risk of development of active TB occurs through two processes, starting with initial exposure and infection by Mycobacterium tuberculosis followed by the development of the continiuing disease[6].

**Table 2. Influence of Contact History in DM Sufferes with the Pulmonary TB Incidence**

| **Contact History Of DM Patients** | **Respondent Status** | | | | **OR(95% CI)** | **P** |
|---|---|---|---|---|---|---|
| | **TB** | | **Non TB** | | | |
| | f | % | f | % | | |
| Have | 14 | 25,9 | 4 | 7,4 | 4,38 (1,34-14,33) | 0,020 |
| None | 40 | 74,1 | 50 | 92,6 | | |
| Total | 54 | 100 | 54 | 100 | | |

Based on the table above showed that the proportion of DM respondents who suffer from TB and have a contact history of 25.9% and in groups of DM respondents who do not suffer from TB and have a contact history of 7.4%, based on test analysis obtained $p$=0.02 which means there is influence of contact history of DM sufferers on lung TB events. Obtained OR value = 4.38 (CI: 1.34-14,33) which means that people with DM who have contact history have a risk of 4.38 times greater suffering from lung TB compared with people with DM who do not have contact history. This is in line with the research of Hermiaty et, al which examines the risk factors of TB in type 2 DM sufferers stating that there is a significant influence of pulmonary TB contact history of pulmonary TB incidence in patients with DM type 2 (p = 0,000). Some factor may also affect the severity of the pulmonary TB on patients.[7-10]

**Table 3. Influence of BMI in DM suffers with the Pulmonary TB Incidence**

| BMI | **Respondent Status** | | | | ***OR (95% CI)*** | ***p*** |
|---|---|---|---|---|---|---|
| | **TB** | | **Non TB** | | | |
| | **f** | **%** | **f** | **%** | | |
| Skinny/Normal | 42 | 77,8 | 27 | 50 | 3,50 (1,52-8,06) | 0,005 |
| Fat | 12 | 22,2 | 27 | 50 | | |
| **Total** | **54** | **100** | **54** | 100 | | |

Based on the table above, it can be noted that the proportion of DM respondents who suffer from TB with skinny/normal BMI is 77.8% and DM respondents who do not suffer TB by 50%. Based on the analysis obtained the *p*-value = 0.005 which means there is the influence of DM sufferers with the lung TB incidence and obtained OR value = 3.50 (95% CI: 1.52-8.06). Patients with skinny/normal DM have a risk of 3.50 suffer from TB compared with DM patients with obese BMI. Based on the interviews conducted, patients with TB DM stated that they have fat loss before suffering from lung TB. But after suffering the lung TB their weight decreased drastically which made them have a thin/normal BMI.

## Conclusion

The results showed that there was no influence the duration of suffering DM on pulmonary TB incidence ($p$ = 0.540), and there was an influence of TB contact history of DM sufferers ($p$ = 0,020) and BMI ($p$ = 0,005) with the lung TB incidence.

# Analysis Relationship of the Pulmonary TB Prisoners with the Prevention Measures in Jail In Province of Sumatera Utara

**Lina Tarigan[1], R. Kintoko Rochadi[2]**

*[1,2]Senior Lecturer of Faculty of Public Health, Universitas Sumatera Utara, Medan Indonesia*

## Abstract

According to the WHO (2013), the pulmonary TB as the second order of death and has infected 9.4 million people and killed 1.7 million people in the world each year. Indonesia ranks second highest number of TB cases in the world with an incidence of 391 per 100,000 inhabitants. The prevalence rate of pulmonary TB in prison is estimated to be 3 times higher than the general population. The research aims to analyze the characteristics relationships of the prisoners community with pulmonary TB with precautions and transmission in jails in Sumatera Utara province. The research was conducted in jails in the city of Medan and Lubuk Pakam using cross sectional design. The population is all prisoners with pulmonary TB undergoing treatment. The research sample is all the pulmonary TB sufferers recorded at the both jail clinics. The results showed there was a relationship between the characteristics of prisoners with precautions in ethics of cough (p = 0.01), precautions in habit of throwing sputum (p = 0.046), preventive measures in habit of using masks (p = 0.001) in the jail of Sumatera Utara Province

***Keywords**: Pulmonary TB, jail, preventive measure.*

## Introduction

The incidence of pulmonary TB is still high in society, so that Indonesia still ranks the 2 highest number of sufferers in the world. There are reportedly 1 million cases of pulmonary TB or 399 cases per 100,000 population[1]. Based on a survey of the prevalence of TB 2013 and Global Report 2015 estimated pulmonary TB incident in Sumatra Utara Province in 2017 at 73,488 with incidence rate 515/100,000 and total death of 5,847 with Case Specific Date Rate (CSDR) 41/100,000 inhabitants. Case Detection Rate (CDR) Sumatra Utara Province in 2017 is 37.17%, still 50% under target achievment[2].

The prevalence rate of pulmonary TB in prison is estimated to be 3 times higher than the population of common[3]. Agung Setiadi and Reviono (2016) stated that TB's disease occupies the 4th most common illness and is one of the main causes of pain and death in jail all over Indonesia[4]. The prisoners situation where the exceeds capacity make worse the vulnerability and increase the transmission of pulmonary TB. The research conducted by Sadi at the jail of Narcotics prisoners in Jakarta showed that the implementation of the program has not been effective because it has not been achieved getting to zero case TB.

Research conducted by Rosalina Thuffi and Milla Herdayati (2013) on the risk of TB incidence with Case Control Study at the jail of narcotics in Jakarta in 2013 showed that there was influence of marital status in unmarried groups, education level less than high school, injected drugs use, nutritional status, long prisoners, history of ever held, TB history in family, and the existence of TB in one room with the risk of occurrence of TB[5].

Based on the research of Putri, EA et al (2018) there was an influence of cough behavior on the incidence of pulmonary TB in Semarang Jail ($p$ = 0.022; OR = 3.93; 95% CI: 1.29 -8,44)[6]. Research Chiang CY et al (2002) that from 51,496 prisoners were diagnosed 107 pulmonary TB (258.7 per 100,000 population) where 88 (82.2%) is a new case. This shows the high risk of transmission of pulmonary TB among prisoners in jail[7]. Larouzé B et, al (2015) found that there was an influence of age (≥30 years) on the occurrence of pulmonary TB in the Abidjan prison, Ivory Coast of West Africa (OR =

3.8; 95% CI: 1.1 – 13.3) and a case of pulmonary TB in prison 10 to 44 times higher than common population[8].

The Department of Law and Human Rights report of Sumatera Utara Province said that during the period 2009-2011, the new pulmonary TB case of prison occupants tends to increase every year, the increase was an average of 7.2%. Research of Milla and Rosalina Thuffi's stated that the management of the prison needs to cope with the transmission of pulmonary TB in accordance with the policy and the National Action Plan against the Public Private Mix[5]. Some elements may influence the occurrence transmission of pulmonary TB among communities and to certain people including the management, patient care and nutritional food consumption[9-13]. Based on the background above, it is necessary to do research on the relationship of the pulmonary TB prisoners with the prevention measures in jail in Province of Sumatera Utara

## Method

This research design is cross sectional study. The population is all prisoners with pulmonary TB who are undergoing treatment in jail in Sumatra Utara Province. Samples amounted to 59 prisoners. The Data is done by conducting interviews using questionnaires. Questionnaires were disseminated to respondents after approval from the Faculty of Ethics Committee of the Universitas Sumatera Utara and approval from respondents.

## Results

### Precautions In The Ethics Of Cough

**Table 1. The Relationship of characteristics of prisoner with the ethics of cough pulmonary TB in the Jail of Sumatra Utara Province**

| Characteristics of Prisoners | Ethics Cough | | | | Total | | p |
|---|---|---|---|---|---|---|---|
| | Bad | | Good | | | | |
| | F | % | f | % | f | % | |
| Age | | | | | | | |
| ≤40 yrs | 9 | 30 | 21 | 70 | 30 | 100 | 0,831 |
| >40 yrs | 7 | 24,1 | 22 | 75,9 | 29 | 100 | |
| Last Education | | | | | | | |
| Low | 7 | 24,1 | 22 | 75,9 | 29 | 100 | 0,831 |
| High | 9 | 30 | 21 | 70 | 30 | 100 | |
| Marital Status | | | | | | | |
| Not Marriage | 8 | 32 | 17 | 68 | 25 | 100 | 0,67 |
| Marriage | 8 | 23,5 | 26 | 76,5 | 34 | 100 | |
| Length in jail | | | | | | | |
| ≥ 24 month | 13 | 50 | 13 | 50 | 26 | 100 | 0,01 |
| < 24 month | 3 | 9,1 | 30 | 90,9 | 33 | 100 | |

Based on table 1 It showed that the proportion of patients with a pulmonary TB aged ≤ 40 years have poor cough ethics by not covering the mouth when coughs of 9 people (30%) higher than that of the pulmonary prisoner aged >40 years, 7 people (24.1%). Based on the results of the chi-square test obtained the *p*-value >0.05 which means there is no age relationship with the ethics of cough. The proportion of prisoner with a pulmonary TB who has a low education with a poor cough ethics of 7 people (24.1%) lower than with prisoners with pulmonary TB who has a higher education of 9 people (30%), the test results of the chi-square obtained the *p*-value >0.05 which means there is no last education relationship with the ethics of cough.

Prisoners with pulmonary TB who did not married with poor ethics cough is 8 people (32%) higher than prisoners with married prisoners pulmonary TB, which is 8 people (23.5%). Based on the results of the chi-square test obtained the *p*-value >0.05 which means there is no relationship of marital status with the ethics of cough. The proportion of prisoners with pulmonary TB who stay in jail ≥ 24 month with a poor cough ethics is 13 people (50%) higher than that of prisoners who stay in jail < 24 month for 3 people (9.1%) Chi-Square test results obtained the *p*-value <0.05 which means there is a relationship of length stay in jail with the ethics of cough.

**Throwing Sputum Prevention**

**Table 2 The Relationship characteristic of Prisoner With The Habit of Throwing Sputum in the Jail of Sumatera Utara Province**

| Characteristic Of prisoners | Throwing Sputum | | | Total | | | p |
|---|---|---|---|---|---|---|---|
| | Bad | | Good | | | | |
| | f | % | f | % | F | % | |
| Age | | | | | | | |
| ≤40yrs | 5 | 16,7 | 25 | 83,3 | 30 | 100 | 0,950 |
| >40yrs | 6 | 20,7 | 23 | 79,3 | 29 | 100 | |
| Education | | | | | | | |
| Low | 6 | 20,7 | 23 | 79,3 | 29 | 100 | 0,950 |
| High | 5 | 16,7 | 25 | 83,3 | 30 | 100 | |
| Marital Status | | | | | | | |
| Marriage | 5 | 14,7 | 29 | 85,3 | 34 | 100 | 0,502 |
| No Marriage | 6 | 24,0 | 19 | 76,0 | 25 | 100 | |
| Length in jail | | | | | | | |
| ≥ 24 month | 8 | 30,8 | 18 | 69,2 | 26 | 100 | 0,046 |
| < 24 month | 3 | 9,1 | 30 | 90,9 | 33 | 100 | |

Based on the table known that the proportion of patients with pulmonary TB at age ≤ 40 years that has a habit of poor throwing sputum is 5 people (16.7%) lower than with prisoners with pulmonary TB at the age of > 40 years is 6 people (20.7%). Based on the test Chi Square obtained the *p*-value >0.05 which means there is no

relationship between the age with the habit of throwing sputum. Proportion of prisoners with pulmonary TB who have a low education with a habit of poor throwing sputum (20.7%) higher than that of patients with a pulmonary TB who has a higher education of 5 people (16.7%), the test results of the Chi Square are obtained $p > 0.05$ which means there is no relationship between education and the habit of throwing sputum.

Proportion of prisoners of pulmonary TB who has married the habit of bad throwing sputum is 5 people (14.7%) lower than the proportion of prisoners of pulmonary TB who do not married is 6 people (24%), the results of the Chi square test obtained the *p*-value > 0.05 which means there is no relationship between marital status and the habit of throwing sputum.

Prisoners with a pulmonary TB who has ≥ 24 month in jail have a poor habit in throwing sputum is 8 people (30.8%) higher than the proportion of prisoners pulmonary TB who had been <24 month is 3 people (9.1%), the test results of the Chi square was obtained *p*-value <0.05 which means there is a relationship between the length in jail with the habit of throwing sputum.

## Precautions In Smoking Habits

**Table 3 The Relationship of Characteristics of Prisoners with Smoking Habit in the Jail of Sumatra Utara Province**

| Characteristic of Prisoners | Smoking Habit | | | | Total | | P |
|---|---|---|---|---|---|---|---|
| | No | | Yes | | | | |
| | f | % | f | % | F | % | |
| Age | | | | | | | |
| ≤40yrs | 16 | 53,3 | 14 | 46,7 | 30 | 100 | 0,355 |
| >40yrs | 11 | 37,9 | 18 | 62,1 | 29 | 100 | |
| Education | | | | | | | |
| Low | 14 | 48,3 | 15 | 51,7 | 29 | 100 | 0,905 |
| High | 13 | 43,3 | 17 | 56,7 | 30 | 100 | |
| Marital Status | | | | | | | |
| Marriage | 15 | 44,1 | 19 | 55,9 | 34 | 100 | 0,975 |
| Not Marriage | 12 | 48,0 | 13 | 52,0 | 25 | 100 | |
| Length in jail | | | | | | | |
| ≥ 24 month | 9 | 34,6 | 17 | 65,4 | 26 | 100 | 0,207 |
| < 24 month | 18 | 54,5 | 15 | 45,5 | 33 | 100 | |

According to table 3 the proportion of prisoners with pulmonary TB aged ≤ 40 with smoking habit is 14 people (46.7%) lower than the proportion of the prisoners of pulmonary TB aged >40 years is 18 people (62.1%). Based on the results of the Chi square test obtained the *p*-value >0,355 which means there is no relationship between the age with the habit of smoking.

Prisoners with pulmonary TB who have a low education smoking habit is 15 people (51.7%) lower than the proportion of pulmonary TB who has a higher education of 17 people (56.7%). Based on the results of the Chi square test obtained the *p*-value> 0,905 which means there is no relationship between education and smoking habit.

The proportion of unmarried prisoners with pulmonary TB with a smoking habit is 19 people (55.9%) higher than the proportion of married prisoners of pulmonary TB is 13 people (52%), the test results of Chi Square are obtained the *p*-value >0,975 which means there is no relationship between marital status and smoking habit.

Prisoners with pulmonary TB who has ≥ 24 month in the jail with smoking habit is 17 people (65.4%) higher than the proportion of prisoners with <24 month in the jail is 15 people (45.5%). Based on the results of the Chi square test obtained the *p*-value > 0,207 which means there is no relationship between the length of stay in jail with smoking habit.

**Precautions In Habit Using Masks**

**Table 4 The Relationship of Characteristics of prisoners with the habit of using masks in the Jail of Sumatra Utara Province**

| Characteristic of Prisoners | Using Mask | | | | Total | | P |
|---|---|---|---|---|---|---|---|
| | No | | Yes | | | | |
| | F | % | f | % | F | % | |
| Age | | | | | | | |
| ≤40yrs | 9 | 30 | 21 | 70 | 30 | 100 | 0,831 |
| >40yrs | 7 | 24,1 | 22 | 75,9 | 29 | 100 | |
| Education | | | | | | | |
| Low | 7 | 24,1 | 22 | 75,9 | 30 | 100 | 0,831 |
| High | 9 | 30 | 21 | 70 | 29 | 100 | |
| Marital Status | | | | | | | |
| Marriage | 8 | 23,5 | 26 | 76,5 | 34 | 100 | 0,669 |
| No Marriage | 8 | 32 | 17 | 68 | 25 | 100 | |
| Length in jail | | | | | | | |
| ≥ 24 month | 13 | 50 | 13 | 50 | 26 | 100 | 0,001 |
| < 24 month | 3 | 9,1 | 30 | 90,9 | 33 | 100 | |

Based on table 4 proportion of patients with pulmonary TB at age ≤ 40 years who did not use a mask is 9 people (30.0%) higher than the prison aged > 40 years is 7 people (24.1%). Based on the results of the chi-square test obtained the *p*-value >0.05 which means there is no relationship between age with the habit of using masks.

Prisoners with pulmonary TB in low education who did not use a mask is 7 people (24.1%) lower than prisoners with pulmonary TB who has a higher education is 9 people (30.0%). The test results of the chi-square obtained the *p*-value >0.05 which means there is no relationship between education with the habit of using masks.

The proportion of unmarried prisoners with pulmonary TB with not using a mask is 8 people (23.5%) higher than the proportion of married prisoners of pulmonary TB is 8 people (32%), the test results of Chi Square are obtained the *p*-value >0,975 which means there is no relationship between marital status and using a mask habit. Prisoners with pulmonary TB who has ≥ 24 month in jail have using mask is 13 people (50%) higher than the proportion of prisoners pulmonary TB who had been <24 month is 30 people (90,9%), the test results of the Chi square was obtained *p*-value <0.05 which means there is a relationship between the length in jail with the habit of using a mask.

## Conclusion

There is a relationship between length stay in jail with the cough habit ($p = 0.01$), the habit of throwing sputum ($p = 0.046$), and the habit of wearing masks ($p = 0.001$) in the Jail Sumatra Utara Province.

There is no relationship between age, education, and marital status with the cough habit, the habit of throwing sputum, and the habit of wearing masks in the jail Sumatera Utara Province

# The Influence of Distance from Health Facility, Family Number at Home and TB History in Starting Treatment of MDR-TB in Medan

**R. Kintoko Rochadi[1], Erna Mutiara[2]**

*[1] Lecturer of Department of Health Education and Behavioral Sciences, University of Sumatera Utara, Medan, Sumatera Utara, 20155, Indonesia, [2] Lecturer of Department of Biostatistics And Population, University of Sumatera Utara, Medan, Sumatera Utara, 20155, Indonesia*

## Abstract

The national TB Program according to the long-term plan is to prevent and control of drug resistance through Management Program of MDR-TB. The objective of the program are reducing morbidity, mortality and transmission of MDR-TB. Medan is an area with the highest case of MDR-TB in Sumatera Utara Province. Until November 2018 MDR-TB case has been confirmed in the city of Medan as many as 324, which has not started the treatment are 61 patients (19%). This research using case-control design and population is all people with MDR-TB in Medan city that recorded in E-TB Manager data. Sample case is the confirmed MDR-TB person who has not started the treatment as many as 13 people while the control is a confirmed person MDR-TB and willing to start the treatment as many as 31 people. The data is collected through interview using questionnaires and has received approval from the Ethics committee of the Faculty of Nursing University of Sumatera Utara. The data analysis is conducted with the chi-square test and the OR calculation to assess which variables affect the action of beginning MDR-TB treatment. Results showed that there was no influence of the distance of health facilities ($p$ = 0.188) and family number at home ($p$ = 0.507) with the status of starting treatment MDR-TB. There was influence of historical of TB with the status of starting treatment respondent MDR-TB ($p$ = 0.021).

***Keywords:*** *Confirmed MDR-TB, Starting treatment, Distance of health facility, Family number at home, Historical of TB*

## Introduction

National TB Program in accordance with the long-term plan is to prevent and control the transmission of drug resistance through Management Program of MDR-TB. In general, this program aims to reduce the number of morbidity, mortality and transmission of MDR-TB so that it is not a public health problem[1].

Challenges faced in the response of MDR-TB cases from officers ie increased incidence of MDR-TB caused by low number of success of MDR-TB treatment, especially in hospital health services facilities, clinics and private practitioners. Challenges for patients, families and communities, namely low understanding of MDR-TB and its dangers for patients, families and the environment so that many MDR-TB patients refuse to undergo treatment. Infectious pulmonary tuberculosis patients are potentially transmitted to 10 to 15 people annually[2].

Medan is an area with the highest case of MDR-TB in Sumatera Utara province. Until November 2018 MDR-TB case has been confirmed in the city of Medan as many as 324, which has not started the treatment of 61 patients (19%). The rest of the patients who have conducted the treatment of 282 cases (81%), with the status in the treatment is 119 patients (42%), more patients with no status in the treatment (56%). For that

**R. Kintoko Rochadi**
**R. Kintoko Rochadi,**
Email: kintokorochadi2@gmail.com ,
University Street No. 21

it is necessary to know the factors that affect MDR-TB patients confirmed to start treatment in Medan city.

## Materials and Method

This research was conducted in the city of Medan. Using the case-control study design is analyzing the factors that affect the start of treatment in TB-RO sufferers in the city of Medan. The population of all TB-RO patients and registered and has an address corresponding to the E-TB manager in the city of Medan. The case is all people with TB-RO who have not started the treatment and can be traced the address based on data in the E-TB manager of Medan City as many as 13 people. Control is all people with MDR-TB who have started treatment and can be traced based on data in the manager of E-TB Kota Medan as many as 31 people. Collection of data using interviews using questionnaires which have been tested and approved by the Ethics Committee of the Faculty of Nursing at the University of North Sumatera. Data is analyzed with Chi-square test for category data and t-independent test for numerical data.

## Results and Discussion

The Influence of Distance from Health Facility with The Starting Treatment of MDR-TB in Medan

**Table 1: The Influence of Distance from Health Facility with The Starting Treatment of MDR-TB in Medan**

| Variable | Treatment Status | | | | p |
|---|---|---|---|---|---|
| | Not yet started | | Already started | | |
| | n | Mean | n | Mean | |
| Distance From Health Facility | 13 | 9,38 | 31 | 12,45 | 0,188 |

Based on the table above, it is obtained that the average distance of residence MDR-TB people who have not started treatment to distance from health facility (9.38 km) lower than those who have started treatment (12.45 km). Based on the test obtained the *p*-value = 0.188 which means there is no influence between the distance from health facility with the status of Treatment MDR-TB. Research in line with Wulandary in Indonesia acquired value P = 0,278 which means there is no meaningful influence between the distance from health facility with health seeking for pulmonary TB[3].

However, it is unlike to G, Cheng et al. in China, indicating that the distance from the health care house significantly affects the delay in drug search[4]. Risks factor of the TB occurrence are differs in any area due to some environmental factors[5,8-13]. Based on the research of Syarifah, et al in Medan, obtained the results of the inconsistency of the address of the person with TB MDR address when registering in RS, this leads to not optimizing the confirmed patients of TB MDR for treatment because the address is unclear[9].

The Influence of Family Number at Home with The Starting Treatment of MDR-TB in Medan

**Table 2: The Influence of Family Number at Home with The Starting Treatment of MDR-TB in Medan**

| Variable | Treatment Status | | | | *p* |
|---|---|---|---|---|---|
| | Not Yet Started | | Already Started | | |
| | n | Mean | n | Mean | |
| Family number at home | 13 | 4,54 | 31 | 5,00 | 0,507 |

According to the table above, it is known that the average number of respondents who have not started the treatment of MDR-TB (4.54) is smaller than the average number of occupants who have initiated the treatment of MDR-TB (5.00) with the *p*-value = 0.507 means there is no influence between the family number at home with the treatment status MDR-TB

Houses that have a high density of housing will be at risk of developing TB disease because the air circulation in the housing with a high density has an effect on the moisture of the house so that the germ Tuberculosis easily develops and It is scattered in the house that is dense[5]. The results of the study differ from the theory, this is because that has not started the treatment nor has started the treatment has the same average density and has an opportunity to be exposed to lung TB.

Effect Of TB History with The Starting Treatment of MDR-TB in Medan

**Table 3: Effect Of TB History with The Starting Treatment of MDR-TB in Medan**

| TB History | Treatment Status | | | | P | OR | 95% CI |
|---|---|---|---|---|---|---|---|
| | Not Yet Started | | Already Started | | | | |
| | n | % | n | % | | | |
| Already | 4 | 30,8 | 21 | 70,0 | 0,016 | 0,21 | 0,067-0,613 |
| Not Ready | 9 | 69,2 | 10 | 30,0 | | | |
| Total | 13 | 100 | 31 | 100 | | | |

According to the table above, the proportion of respondents who have not started treatment 4 people (30.8%) and who have a previous TB history of 21 people (70.0%). This data shows there is a significant influence of TB history with the starting of treatment of MDR-TB patients (OR = 0.21, 95% CI: 0.067 – 0.613).

Non-compliance with treatment is the main cause in treatment failures, relapse, and drug resistance research Nurwanti and Bambang in Puskesmas in the city of Semarang, obtained the *p*-value = 0,005 in the previous treatment status variable, this means that there is an influence of previous treatment status with pulmonary TB events[8]. Supported by Janan Research[7] in Brebes District, in the variable of the treatment history TB obtained the *p*-value = 0.02 which means there is the influence of TB treatment history with the increase in the prevalence of TB MDR cases[7]. According to a latitude research done by the Mekonnen et al., against 124 respondents in West Armchiho District and Ethiopian Metema, a history of TB treatment has a significant relationship to TB MDR events with OR = 7 and *p*-value 0,025[5].

## Conclusion

Results showed that there was no influence of the distance of health facilities (*p* = 0.188) and family number at home (*p* = 0.507) with the status of starting treatment MDR-TB. There was influence of historical of TB with the status of starting treatment respondent MDR-TB (*p* = 0.021).

# The Influence of Education, Existence of Sufferers, and Ventilation with TB Incidence in Batak Etnics in Pematang Bandar Health Centre

**Alam Bakti Keloko[1], Lina Tarigan[1]**

*[1]Lecturer of Faculty of Public Health, Universitas Sumatera Utara, Medan, Indonesia*

## Abstract

Bandar Manis Village is in area of Pematang Bandar Health Centre, with majority population is Batak Ethnics and have a high number of lung cases. This developed as an innovation of health care program for Pulmonary TB response by the name of GEROBAK TIKA (Local Activity of Ethical Cough Behavior) to make the village free of Pulmonary TB. The aims of this research to analyse the influence of education, the existence of sufferers, ventilation with TB incidence in Batak Ethnics people. This research using case-control design, cases are patients with Pulmonary TB and control is people who does not have Pulmonary TB. Sample cases are patients with Pulmonary TB who follow the treatment of TB at Pematang Bandar Health Centre amounted to 43 people and samples of control with the same amount taken from neighbors of nearby sufferers and performed matching of age and sex with analysis of chi-square test. The results showed no educational influence ($p$ = 0,515) and ventilation area ($p$ = 0,596) to Pulmonary TB incidence. There is a significant influence the existence of sufferers with the Pulmonary TB incident in the Batak Etnics in Pematang Bandar Health Centre ($p$ = 0,002) and OR = 9.89 ( 95% CI: 9,89-46,91).

***Keywords:*** *Pulmonary TB, Education, Ventilation, Existence of TB sufferers, Batak Etnics.*

## Introduction

Pulmonary TB is an infectious disease as a leading cause of morbidity and mortality around the world, especially in countries with lower-middle socioeconomics. According to WHO (2013), TB disease as the second sequence of death causes that have infected 9.4 million people and killed 1.7 million people in the world each year. Indonesia ranks second highest with the number of cases in the world's most TB incident, which is 391 per 100,000 inhabitants (WHO, 2017)[1]. Patients with TB disease in North Sumatera province in 2013 recorded as many as 22,627 people[2].

The home environment is one of the contributing factors in the spread of TB. TB germ can live within 1-2 hours to several days depending on the absence of sunlight, good ventilation, humidity, home temperature and the density of home occupancy. Occupancy density is the result of a spacious room with the number of occupants in one house. The size of the house that is not comparable to its occupants will result in high density of home occupancy.

Pulmonary TB disease in Indonesia is an infectious disease on the 2nd rank. One of the areas endemic to the pulmonary TB is North Sumatra with the prevalence rate of 794/1000, incidence rate 515/100,000 and deaths due to Pulmonary TB of 41/100,000 in 2017. In the Bandar Manis Village many people suffer from TB disease as many as 40 people, based on report head of Health Center Pematang Bandar. On August 10, 2018 Pematang Bandar Health Centre was declared the Bandar Manis Village as a TB Village, Bandar Manis Health Centre develops an innovation of Puskesmas program for TB disease under the name of the GEROBAK TIKA (Local Activity of Ethical Cough Behavior) with the aim of making the TB free village.

Most of the villagers of Bandar Manis are Batak people, according to the research of Bintang Y.M Sinaga (2014) indicates that there is a genotyping relationship with the vulnerability to the risk of pulmonary TB incidence there is a BB genotyping relationship compared to bb genotypes with OR = 0.22, (95% CI: 0.11-0.45). Most of the Batak tribes have Bb genotypes.

## Method

This research is conducted in Bandar Manis Village District health Centers of Pematang Bandar because this village is a village where many population suffer from TB and is designated as TB village.

This research is a longitudinal observational research with case-control design. Case is pulmonary TB patients, while the control is not suffering pulmonary TB, 43 samples as cases and 43 samples as controls. Samples of cases is all pulmonary TB sufferers who were having treatment in Pematang Bandar Health Centre. The sample control is taken from the nearest neighbor sample case which does not suffer Pulmonary TB. Data collection is conducted with interviews using questionnaires have tested the validity and reliability, which has been approved by the Ethics Committee of the Faculty of Nursing at the Universitas Sumatera Utara.

## Results

**The Influence of Education with TB Incidence in Batak Etnics in Pematang Bandar Health Centre**

**Table 1. The Influence of Education with TB Incidence in Batak Etnics in Pematang Bandar Health Centre**

| Latest Education | TB Disease | | | | P | OR (95% CI) |
|---|---|---|---|---|---|---|
| | Case | | Control | | | |
| | n | % | n | % | | |
| Low | 26 | 60,5 | 22 | 51,2 | 0,515 | 1,46 (0,62-3,43) |
| High | 17 | 39,5 | 21 | 48,8 | | |
| Total | 43 | 100 | 43 | 100 | | |

Based on the table above, the proportion of the respondents were low educated in the case group as much as 60.5%, this percentage is greater than the control group which is 51.2%. The proportion of sufferers who has a higher education lowered than sufferers in low education with higher educated sufferers this is in line with the theory that bias education affects the incidence of lung. According to Green theory said that education is a major factor in behavioral building. In general the higher a person's education will be have better behavior. But the results of the Chi-square test indicate there is no influence between education and Pulmonary TB ($p > 0.05$).

Research in line with research of Wang X et.,al in Tianjin, China on the risk factors of pulmonary TB from year 2006-2011 acquired *p*-value = 0.61, which means there is no influence level of education with the incidence of Pulmonary TB[3]. The research of Fitriani (2013) in the working area of Ketanggungan Health Centre Semarang obtained the *p*-value = 0.098 which means there is no influence of education with Pulmonary TB events[4].

Influence Existence of Sufferers, with TB Incidence in Batak Etnics in Pematang Bandar Health Centre

**Table 2. Influence Existence of Sufferers, with TB Incidence in Batak Etnics in Pematang Bandar Health Centre**

| Family Members Suffering from TB | TB Disease | | | | p | OR (95% CI) |
|---|---|---|---|---|---|---|
| | Case | | Control | | | |
| | n | % | n | % | | |
| Yes | 14 | 32,6 | 2 | 4,7 | 0,002 | 9,89 (9,89-46,91) |
| No | 29 | 67,4 | 41 | 95,3 | | |
| Total | 43 | 100 | 43 | 100 | | |

Based on the table above, the proportion of respondents who have family members who suffer from previous TB in the case group as much as 32.6%, this number is greater than the control group as much as 4.7%. The results indicate that there is influence of existence of family members who had suffered earlier TB with the incidence of Pulmonary TB in the respondent (*p*-value < 0.05). OR = 9.89 (95% CI :2.09-46,91). Respondents who had family members suffered from pulmonary TB 9.89 times have the risk of pulmonary TB compared to those who did not have family members suffering from pulmonary TB.

This is in line with the research of Budi I, et,al (2018), showed that there is an influence of TB history in the family with the incidence of pulmonary TB ($p$-value = 0.001)[6]. Contact history with sufferers TB affects the incidence of pulmonary TB, this is in line with the Ministry of Health of the Republic of Indonesia where living together continuously with the sufferers of pulmonary TB will spreading the germ to the air in the form of splashes sputum[7].

The degree of transmission of TB in the family environment of the sufferer can transmit to 2-3 people in their home. While the risk of transmission to their neighborhood with the sufferer more than 1 person with TB is 4 times compared to households with only 1 person TB. This occurs because there are TB sufferers in the home and surrounding areas increase the frequency and duration of contact with TB, which is an important factor of TB pathogenesis[8].

Houses that have a high density of housing will be at risk of developing TB disease because the air circulation in the housing with a high density has an effect on the moisture of the house so that the germ Tuberculossis easily develop and scattered in the house that have a high dense of people.

The Influence of Ventilation with TB Incidence in Batak Etnics in Pematang Bandar Health Centre

**Table 3. The Influence of Ventilation with TB Incidence in Batak Etnics in Pematang Bandar Health Centre**

| Variable | TB Disease | | | | p | OR 95% CI |
|---|---|---|---|---|---|---|
| | Case | | Control | | | |
| | n | % | n | % | | |
| Good | 10 | 23,3 | 8 | 18,6 | 0,596 | 1,326 0,47-3,77 |
| Not good | 33 | 76,7 | 35 | 81,4 | | |
| Total | 43 | 100 | 43 | 100 | | |

According to the table above, it can be noted that the ventilation area is good in the respondents case of 23.3% while the respondents control 18.6%, the ventilation area is not good for respondents a case of 76.7% while the control is 81.4%, with the $p$-value = 0,596 which means there is no influence between the area of ventilation with TB disease.

This is in line with the research of Rosiana (2013) in Kedungmundu Health Centre Semarang which means there is no influence between the ventilation area with the occurrence of TB Paru ($p$ = 0,569)[9]. Supported also by the research of Sidiq, N et al (2011) at Somba Opu Health Centre, Sulawesi obtained the value OR = 1,220 (95% CI: 0,35-4,22)[10].

Izzati et al (2015) research in the working area of Andalas Health Centre, the $p$-value = 0,324 which means there is no influence between the area of ventilation with the incidence of TB[11]. Ventilation serves to relieve room air from pathogenic bacteria, good ventilation always occurs continuous flow of air so that the bacteria do not last long in the house[12-14].

## Conclusion

No educational influence ($p$=0.515) and ventilation area ($p$=0.596) with pulmonary TB incidence. There is influence of family members suffering Pulmonary TB with incidence of Pulmonary TB ($p$=0.002).

# Proximate Characteristics and Nutritional Value of White Anchovy Flour

**Hendrayati[1], Theresia Dewi KB[1], Laras Budyghifari[2], Adriyani Adam[1]**

*[1]Lecturers of Department of Nutrition, Health Polytechnic Makassar, [2]Lecturers of Food technology study program student at Hasanuddin University Makassar*

## Abstract

Low fish consumption in some parts of Indonesia is caused by the high price of several types of fish. Its include types of fish that have a low social value in the community so it is less desirable although their value of nutrients is very good. Anchovy is actually the best source of calcium and protein. Calcium in white anchovy (*Stolephorus sp*) is very stable resistant and not easily soluble in water. White anchovies (*Stolephorus sp*) are excellent as a source of calcium and protein in children who are in their infancy, expectant mothers, nursing mothers and adult women to prevent osteoporosis. When the production volume of white anchovy (*Stolephorus sp*) is increased, making fish flour is a preservation method, It will make the benefits of anchovy can be maximised. White anchovy flour quality can be measured by proximate characteristics and nutritional quality. Proximate parameters in this study are determination of water content, ash content, peroxide numbers, acid numbers, and saponification numbers. Nutritional quality analysis such as carbohydrates, protein, fat, calcium, iron, fiber, zinc, DHA, EPA and trans fat. The characteristics of the proximate are good and meet the quality standards of a food product from fresh anchovy (*Stolephorus sp*) such as fiber content, ash content, number of peroxide and trans fatty acids. The best nutritional quality of fresh anchovy (*Stolephorus sp*) are the content of protein, calcium, iron ,zinc, DHA and EPA.

***Keywords**: Anchovy, Nutritional quality, Proximate characteristics and Stolephorus sp*

## Introduction

Indonesia is a country with excellent natural resources. Indonesia is an archipelago nation with number of waters wider than its land. It provides high production of marine products such as fish. The use of fish as a source of protein has not been optimally fulfilled. At the present time, protein intake is still dominated by vegetable protein about 68.3%, while animal protein has only reached 31.7%. The high intake of vegetable protein during growth has an unfavorable impact, considering the bioavailability of vegetable protein is very low. Animal protein is much better in supporting growth[1].

Anchovy is consumed by the middle to lower classes so it is considered as type of fish that is not popular in the community. Anchovy is actually the best source of calcium that is resistant and does not dissolve easily in water. Anchovy is very good as a source of calcium in children who are growing up, pregnant women, nursing mothers and adult women to prevent osteoporosis[1]. Consumption of small fish provides benefits such as fish bones containing most minerals that can contribute significantly to reducing levels of micronutrients and protein malnutrition[2]. Abbey *et al*[3]stated that consumption of small-sized fish species as a whole can contribute significantly to reducing the level of micronutrient and protein malnutrition.

When the production volume of white anchovy (*Stolephorus sp*) increases, the preservation method is needed, so that the benefits of anchovy can be maximized. One method of preserving fish is making fish flour. Fish flour is a dry solid product produced by removing most of the liquid and some or all of the fat contained in the body of the fish. Fish flour can be made from all types of

**Corresponding Author :**
**Hendrayat**i
hendrayati@poltekkes-mks.ac.id
081524005261

fish, but only pelagic and demersal fish are widely used as raw materials for making fish flour. Anchovy is part of the demersal fish group[4].

Fish flour has many benefits such as easy storage, can be processed into various food products, and has good nutritional value. The process of making anchovy fish into flour causes a change in the proximate characteristics of the product. Proximate analysis is the analysis of components of materials such as water, protein, fat, and ash (minerals)[5]. Analysis of these food components is interesting in the food industry for product development, quality control or regulatory objectives[5,6]. This study aims to determine the proximate characteristics and nutritional quality of anchovy flour (*Stolephorus sp.*)

## Materials and Method

White anchovy fish flour (*Stolephorus sp*) was made in the food technology laboratory of the Department of Nutrition Poltekkes Kemenkes Makassar, fish flour production is refers to Alfianto with modification. White anchovy washed and their head and entrails are disposed. Headless fish and entrails are cleaned squeezed with gauze then soaked in lemon juice 0.2-0.3% for 1 hour, blended, squeezed with gauze, oven dried at 50ºC for 8 hours, and sieved with 60 mesh size. Anchovy flour making is done in three replications.

Parameters in this study are determination of proximate characteristics such as water content, ash content, peroxide numbers, acid numbers, and saponification numbers. Nutritional quality analysis such as carbohydrates (Luff Schoroll), protein (Micro Kjedhal), fat (Soxhlet), calcium (Molumetri), iron (Spectrophotometry) and fiber (Crude Fiber) carried out in the Quality Control Laboratory at SMTI Makassar. Analysis of Zinc levels (18-13-1 / MU / SMM-SIG, ICP OES), DHA (18-6-1 / MU / SMM-SIG, GC), EPA (18-6-1 / MU / SMM-SIG , GC) and trans fat (18-6-1 / MU / SMM-SIG, GC) are carried out at the GIS Laboratory. PT. Saraswanti Indo Genetech Bogor, West Java.

## Results

### Rendement

White anchovy flour was made by obtained the right method to get the highest rendement. This research was conducted with three replications and the results are shown in Table 1.

**Table 1. Rendement of White Anchovy Flour (*Stolephorus sp*)**

| Replications | Fish weight (g) | Edible part weight (g) | Flour weight (g) | Rendement (%) |
|---|---|---|---|---|
| 1 | 5000 | 3750 | 653.25 | 17.42 |
| 2 | 5000 | 3780 | 707.61 | 18.72 |
| 3 | 5000 | 3765 | 717.60 | 19.06 |

Source: Primary Data Research Results, 2019

Table 1 illustrate that the percentage of rendement in each replication of white anchovy flour (*Stolephorus sp*) is different. This is influenced by several factors, for example the treatment factor at the time of sifting. Sifting that carried out carefully resulting higher rendement of flour. The results of this study obtained a mean rendement of 18.40%.

### Proximate Characteristic

The results of the proximate characteristics on white anchovy flour (*Stolephorus sp*) shown in table 2.

**Table 2. Proximate Characteristics of White Anchovy Flour (*Stolephorus sp*)**

| Sample | Fiber (mg) | Water content (%) | Ash content (%) | Peroxide number (mEq) | Acid number (%) | Saponification number (mg/g) | Trans fatty acid |
|---|---|---|---|---|---|---|---|
| 1 | 60.91 | 6.70 | 7.78 | 59.39 | 73.66 | 129.93 | Not detected |
| 2 | 60.90 | 6.06 | 7.74 | 59.23 | 73.57 | 126.83 | Not detected |
| Mean | 60.91 | 6.38 | 7.76 | 59.31 | 73.62 | 126.88 | Not detected |

Source: Primary Data Research Results, 2019

Table 2 gives an overview of the results of the proximate analysis in duplicate for each indicator. The result shows that trans fatty acid is not detected, this shows that the content of trans fatty acids in fresh white anchovy flour (*Stolephorus sp*) was below the minimum limit of the method used <0.02. White anchovy flour (*Stolephorus sp*) can be said have no trans fatty acids or hydrogenated fats.

**Nutritional quality**

This study also carried out analysis of good macronutrients such as carbohydrates, proteins, fats and micronutrients including iron, calcium and zinc. The results can be seen in Table 3.

**Table 3. Nutrient content of fresh white anchovy flour (*Stolephorus sp*)**

| Sample | Carbohydrate (g) | Protein (g) | Fat (g) | Iron (mg) | Calcium (mg) | Zinc (mg) |
|---|---|---|---|---|---|---|
| 1 | 5.73 | 82.967 | 6.04 | 5.817 | 503 | 6.56 |
| 2 | 5.72 | 82.963 | 6.04 | 5.815 | 505 | 6.56 |
| Mean | 5.73 | 82.965 | 6.04 | 5.816 | 504 | 6.56 |

Source: Primary Data Research Results, 2019

Table 3 shows that the protein content of white anchovy flour (*Stolephorus sp*), is very high. Protein content mean valued 82.965% that means each 100 g of flour contains 82.965 gram of protein. In addition, white anchovy flour also contains high calcium which reach 504 mg for every 100 g of flour.

**DHA and EPA**

DHA and EPA are essential fatty acids, especially for children who are growing up. White anchovy flour (*Stolephorus sp*) is also analyzed for DHA and EPA content. The results of the analysis can be seen in Table 4.

**Table 4. The content of essential fatty acids in white anchovy flour (*Stolephorus sp*)**

| Sample | DHA (mg) | EPA (mg) |
|---|---|---|
| 1 | 826.7 | 382.7 |
| 2 | 826.7 | 382.7 |
| Mean | 826.7 | 382.7 |

Source: Primary Data Research Results, 2019

The results of DHA and EPA (essential fatty acids) from white anchovy flour (*Stolephorus sp*) in sequence are 826.7 mg and 382.7 mg in every 100 g.

## Discussion

### Rendement

Rendement analysis in a flour product aims to determine the weight of flour produced from a number of raw materials used. In this study, the ratio between white anchovy flour (*Stolephorus sp*) produced from fresh white anchovy flour (*Stolephorus sp*) was measured. The average yield of rendement reached 18.40%. These results indicate that from 1000 g the weight of fresh anchovy (*Stolephorus sp*) produces 184 g of fresh white anchovy flour (*Stolephorus sp*). The results of this analysis are lower than the catfish head rendement by 26.97% and higher than the body flesh of catfish by 15.70%. This research only use edible part of fish (without head and entrails). The greater bone mass will result in a higher flour rendement[8].

### Proximate Characteristic

Proximate analysis can also provide a reference to the standard substances that must be present in a food product. In addition, proximate analysis can be used to evaluate and develop better food product formulas and evaluate existing food products so that other food ingredients can be added to produce better food products (In this research, proximate analysis includes crude fiber content, water content, ash content, peroxide numbers, acid numbers, saponification numbers, and trans fatty acids[9].

Analysis of fiber content of white anchovy flour (*Stolephorus sp*) showed an average of 60.91 mg. This shows that in 100 g of white anchovy flour (*Stolephorus sp*) contains 6.09 g fiber. This fiber content shows a fairly high level from fish species. Fiber is more commonly found in plants or vegetables and fruits. If the fiber requirement of 1-3 years children is 10 g (Nutritional Adequacy Rate, 2013), then fiber from 100 g of white anchovy flour (*Stolephorus sp*) can meet 60% of their needs. The usage of this fiber must be supported by sufficient fluid consumption, where the average fiber in fish is 70% water soluble[10].

Acid number is a measure of the amount of free fatty acids, the molecular weight of acids. Acid numbers are expressed as the number of milligrams of KOH used to neutralize free fatty acids found in 1 gram of oil or fat. A large acid number indicates a large free fatty acid, derived from oil or fat hydrolysis because of poor food processing. The higher value the acid number indicate lower quality of food products. The results of this study showed the levels of acid from fresh anchovy (*Stolephorus sp*) reached 73.62%. Fish flour production should be carried out by oven drying using low temperature below 50ºC to reduce their acid number. The higher the acid number, the lower the quality of a food product[11].

Trans fatty acids are a type of fat that is not good for health. This fat is classified as a type of unsaturated fat. Trans fatty acids are hydrogenated fats. Hydrogenation is a process of adding hydrogen molecules to a substance. The role and function of trans fat in the body can be obtained at the end of the hydrogenation process which can cause disruption of body function at the cellular level. The results of the analysis of trans fatty acid in white anchovy flour (*Stolephorus sp*) stated no detectability. This shows that the content of trans fatty acids in this flour is declared safe[12].

### Nutritional quality

Carbohydrate analysis results show that white anchovy flour (*Stolephorus sp*) contains 5.73 g carbohydrate from 100 g total ingredients. If we look at the role of carbohydrates as an energy contributor, 100 g of fish flour will produce 22.92 Kcal of energy or fulfill 3-4% of the needs of 11-month-old children as complementary foods for breast milk (MP-ASI). This fulfillment is not a problem considering that white anchovy flour (*Stolephorus sp*) is basically intended for protein sources[13].

The results of protein analysis on white anchovy flour (*Stolephorus sp*) showed an average of 82,965 g. This shows a high protein content that 100 g fish flour containing 82,965 g of protein. The protein content of fish has high quality because fish contain complete amino acids and excellent digestive quality. If the protein needs of 4-6 years children are 40 g, 50 g white anchovy flour (*Stolephorus sp*) is enough to fulfill daily protein needs[14].

The result shows that white anchovy flour (*Stolephorus sp*) in average contains 6.03 g of fat. This shows that in 100 g white anchovy flour (*Stolephorus sp*) only contains 6.03 g fat. Low-fat foods are very necessary in the current era, where changes in activity and eating patterns trigger the emergence of degenerative diseases. The fat content of white anchovy flour (*Stolephorus sp*) only contributes energy by 54.27 Kcal / 100 g product. Low fat content and high protein is food elements that is needed in children who are growing up to avoid obesity[15-20].

**DHA and EPA**

The results of the analysis of DHA content in white anchovy flour (*Stolephorus sp*) in 100 g contain an average of 826.67 mg. The DHA content of white anchovy flour (*Stolephorus sp* is very high so it is appropriate if given to children in the form of complementary foods for breast milk MP-ASI[16].

EPA analysis results on white anchovy flour (*Stolephorus sp*) in average shows 382.7 mg./100 g of flour. The high EPA content in this product shows that the quality of the fatty acids in this product is quite good. However, to maximize the use of EPA and DHA other nutrients needed are Vitamin C, Vitamin $B_6$, Vitamin $B_3$, Zinc, and Magnesium. Because in the process of fatty acid metabolism, especially the conversion of Alpha Linoleic Acid (ALA) to DHA and EPA requires these nutrients. DHA and EPA intake directly from food is very good, but their source is quite expensive. White anchovy flour (*Stolephorus sp*) is an alternative to fulfill both of these nutrients, in addition to being cheap and easy to obtain[17].

## Conclusion

Rendement of white anchovy flour (*Stolephorus sp*) made from their edible parts reaches 18.40%. This flour have good proximate characteristics and fiber, ash content, peroxide numbers, and trans fatty acids meet the quality standards of a food product from white anchovy flour (*Stolephorus sp*). Proximate characteristics that do not meet the quality standards of food products from white anchovy flour (*Stolephorus sp*) are acid numbers and saponification numbers. The best nutritional quality of white anchovy flour (*Stolephorus sp*) is the content of protein, calcium, iron and zinc. The content of carbohydrates and fats can contribute energy of 22.92 Kcal and 54.27 Kcal in every 100 g of white anchovy flour (*Stolephorus sp*). Nutritional quality of essential fatty acids (DHA and EPA) is very high, so it can be used as an alternative to fulfilling the intake of both essential fatty acids that are cheap and easily obtained. The process of making white anchovy flour (*Stolephorus sp*) can be implemented in the industry with advanced technology or carried out by domestic industry with simple technology.

# Distribution of RNA M. Leprae Household Contact in Endemic Area Indonesia

**A. Rizki Amelia**

*Lecturer of Department of Public Health, Universitas Muslim Indonesia*

## Abstract

**Background and Objective:** Chronic leprosy disease is caused by the transmission of *Mycobacterium leprae* bacilli, and leprosy is still as an enigmatic disease which is not fully understood. In terms of the national level, leprosy disease in Indonesia remains a public health problem. 16S rRNA gene is a gene that encodes which codes the 16S part of the ribosome and it has specific nucleotides and can specifically be used to detect the cases of leprosy.

**Materials and Method:** This study was classified as the observational study using a case-control research design. The total samples were 81 individuals that consisted of 27 leprosy patients (the case group) and 54 non-leprosy patients (the control group). Analysis of 16S rRNA gene expression was conducted using the RFLP-PCR method to detect the risk of leprosy.

**Results:** All samples of swabs of ear lobes for the case group (27 samples) were definitely positive infected by *M. leprae* and 2 dust samples (7%) collected from houses of the case group showed positive infected by *M. leprae* bacilli, i.e. S05 and S09 respectively. Of all samples of dust collected from houses of non-leprosy patients (the control group), 4 dust samples (14%) was positive infected by *Mycobacterium leprae*, i.e. C03, C05, C09, C11 respectively, and 2 non-leprosy patients were infected by *M. leprae* due to close social interactions with leprosy patients.

**Conclusion:** Dust medium and close social interactions were the causal factors for the transmission of leprosy disease. Therefore, it is suggested to conduct strict control to prevent the widespread of leprosy disease by keeping the cleanliness of houses at the local areas and the surrounding environment as well as the caution to do social interactions with leprosy individuals.

***Key words :*** *leprosy patients,16s rRNA gene, RFLP-PCR*

## Introduction

Leprosy is a chronic disease due to infections by *Mycobacterium leprae* that first attacks peripheral nerves and the upper respiratory tract. Clinical manifestation of the diseases varies greatly with different spectrum between two clinical forms of leprosy and tuberkuloid from lepramatosa.[1]

Although there is a descending trend of new cases, leprosy disease is still considered as a health problem in some countries, including India, Brazil, and Indonesia.[2]

Clinical manifestation of the disease varies widely among individuals. The transmission of *M. leprae* not only consider the cycle of transmission in the form of the source of leprosy disease, contact with the host, but also it is important to consider the source of infection., bacterial virulence, frequency of contacts and the characteristics of the host, including his/her immunity, specific immunity, age, sex and nutritional status and other factors.[3]

16S rRNA gene encodes a ribosomal RNA in a small sub-unit of the ribosome and it has a distinct nucleotide sequence in each bacterium.[5] In addition, 16S

rRNA gene is more stable and it is suitable to be used a specific molecular marker for the identification[6] of 16S rRNA gene in bacteria (its existence is always retained in any conditions) and has identical characteristics in all organisms.

The 9.1% sequence difference contrasts sharply with the 0.005% difference uncovered by genome sequencing and multi-locus genotyping between M. leprae strains worldwide. To explore whether this novel leprosy pathogen is present in China, we analyzed 171 leprosy skin biopsy tissue samples from patients in different provinces of China by using nested PCR[21]

Based on the problem background as stated above, this study aims to assess the distribution of leprosy disease using the PCR method through the transmission of *M. leprae* at the local settlements by examining samples collected from swabs of leprosy individuals and dust medium and identification of social interactions (household contact) among leprosy patients and non-leprosy patients at the study area.

## Materials and Method

### Samples of the study

The study was classified as population in this study as the observational study using a case-control research design. The population in this study consisted of both the case group and control group. The case group was leprosy patients (BTA+), whereas, the control group was non-leprosy patients in Makassar municipality. Statistical analysis for both the case group and the control group was done using the Lameshow formula.

This study was classified as the observational study in which the authors did not control the assignment of treatments by using a case-control research design where the exposures to risk factors for the case group were compared to exposures for the control group. Samples in this study were leprosy patients (BTA+) and non-leprosy patients (BTA-) in Makassar municipality. The total samples were 81 individuals that consisted of 27 leprosy patients as the case group and 54 non-leprosy patients as the control group.

### Statement of Ethics

All experimental procedures for the treatment of individuals as the samples in this study were reviewed and approved by the Research Ethics Committee of Medicine Faculty, Hasanuddin University

## Results

### Distribution of leprosy disease for both the case group and the control group

Dust medium and close social interactions (household contact) were identified in the distribution of leprosy disease for both the case group to identify the transmission of *Mycobacterium leprae* bacilli. The transmission of *M. leprae* is classified into three categories, i.e. detection of samples of swabs of ear lobes and dust samples from houses for the case group, detection of dust samples collected from houses of non-leprosy patients and examination of infected non-leprosy patients by *M. leprae* due to close social interactions (household contact) with leprosy patients. The three examination categories are shown in the following tables.

**Table 1. Results of examination of *M.leprae* from samples of swabs of ear lobes in a slit skin smear for 27 leprosy patients (BTA +) and dust samples collected from houses of 27 leprosy patients (the case group).**

| No. of Samples | *M. Leprae* in Samples | Swabs of Ear Lobes | Dust Samples |
|---|---|---|---|
| 5 | S05 | Positive (+) | **Positive (+)** |
| 9 | S09 | Positive (+) | **Positive (+)** |

As shown in Table 1, results of examination of *M. leprae* bacilli in swabs of ear lobes of leprosy patients (the case group) from a slit skin smear showed that all leprosy patients were positive infected by *M.leprae*, and there were 2 dust samples (7%) collected from houses for the case group showed positive contained *M.leprae* bacilli, i.e. S05 and S09. Houses of all leprosy patients are commonly next to each other within the average distance of 25 m, whereas, the average distance for other houses are 50 m

**Table 2. Results of examination of *M.leprae* from dust samples collected from houses of non-leprosy patients (household contact).**

| No. of Samples | M. leprae in Dust Samples | Results of Examination |
|---|---|---|
| 3 | C03 | Positive (+) |
| 5 | C05 | Positive (+) |
| 9 | C09 | Positive (+) |
| 11 | C11 | Positive (+) |

Of the 27 dust samples collected from houses of non-leprosy patients in Table 2, 4 dust samples (14%) were positive contained *M. leprae*, i.e. C03, C05, C09, C11 respectively. This incidence was caused by relatively close distance between houses of non-leprosy patients and houses of leprosy patients (household contact) with the average distance of their houses is approximately 20 m.

Analysis of the 16S rRNA gene using the PCR method

Results of PCR amplification and sequencing of 16S rRNA genes in the study samples derived from agarose gel electrophoresis of 16S rRNA genes were shown in the three following figures.

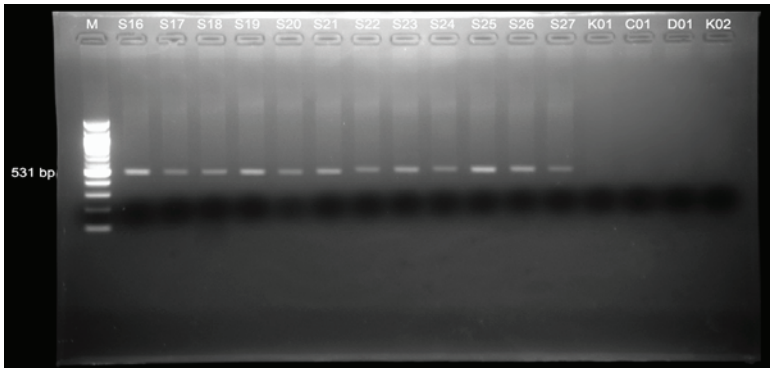

**Figure 1. Results of agarose gel electrophoresis of 16S rRNA genes in the samples of leprosy individuals.**

In Figure 1, results of agarose gel electrophoresis of 16S rRNA genes in the amplification of *Mycobacterium leprae* genes showed positive infection at 531 bp for the samples of S16, S17, S18, S19, S20, S21, S22, S23, S24, S25, S26, S27 respectively.

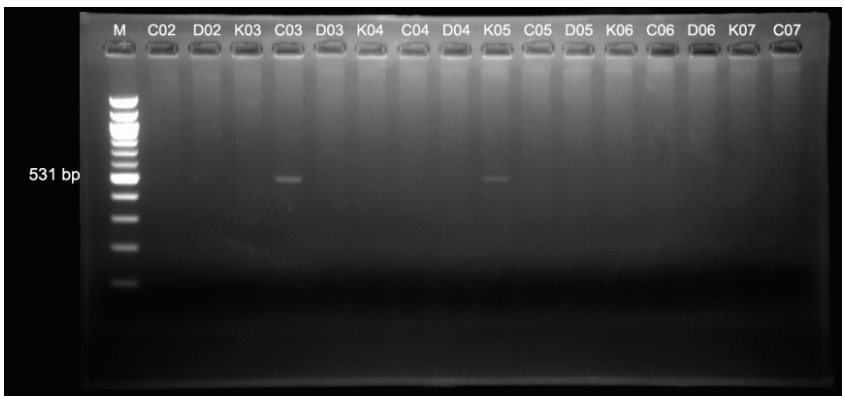

**Figure 2. Results of agarose gel electrophoresis of 16S rRNA genes in dust samples.**

As shown in Figure 2, results of agarose gel electrophoresis of 16S rRNA genes in dust samples collected from houses at 531 bp for the C03 sample, whereas, dust samples for non-leprosy individuals (BTA -) at 531 bp for the K05 sample.

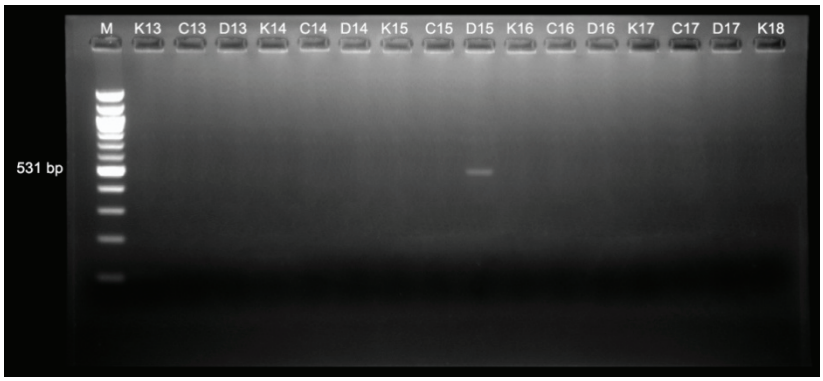

**Figure 3. Results of agarose gel electrophoresis in dust samples that contained *M. Lepra* in the control group infected by *M. leprae.***

In Figure 3, results of agarose gel electrophoresis of 16S rRNA genes for non-leprosy patients (the control group) at 531 bp for the D15 sample.

From the quantitative analysis for all samples, distribution of leprosy disease through the transmission of *M. leprae* based on the examination of dust samples and household contact is shown in Table 4.

**Table 4. Distribution of leprosy disease through the transmission of *M. leprae* in dust samples and household contact.**

| Dust | Leprosy Patients (BTA +) | | Household Contact (HC) | | Household Contact (HHC) | | Total | |
|---|---|---|---|---|---|---|---|---|
| | n | % | n | % | n | % | n | % |
| Positive | 2 | 7.41 | 4 | 50 | 2 | 25 | 8 | 100 |
| Negative | 25 | 92.59 | 23 | 31.4 | 25 | 34.3 | 73 | 100 |
| Total | 27 | 100 | 27 | 33.3 | 27 | 33.3 | 81 | 100 |

## Discussion

Leprosy is a chronic disease that mainly affects the periphal nerves and skin. It is caused by an acid bacillus *Mycobcaterium leprae* which was first described by Hansen in 1874. Although *Mycobcaterium leprae* was the first agent to be linked to an infectious disease, leprosy is still today as an enigmatic disease which is not fully understood. The contact is not limited to household relationships, but also social relationship[3]

Global standardized guidelines for the diagnosis and treatment of leprosy for the elimination of this disease have been available and the efforst to do prevention of this disease has been practiced for more than 2 decades[9]. Classical epidemiology and leprosy control program

have frequently identified household contacts of patient as objects for higher risk of infections than the general populations,[10,11,4], explanation or tools are not routinely in place for tracing the origins and relationship of these and remaining new cases[12,13,23]

There is no easy quick method for the reliable detection and identification of *M.leprae* in clinical samples. Acid fast staining is a common method to detect *M.leprae* in a slit skin smear, but this method lacks specificity and sensitivity. Although *in vivo* culture of *M.leprae* in mice is a possibility, this methodology is not suited within a large scale. The polymerase chain reaction (PCR) is a novel, quick and reliable method of detecting small number of organisms through the amplification of a species DNA sequences to a detectable level[14]

All leprosy patients (BTA+) analyzed in this study were definitely positive infected by *M. leprae* and 2 dust samples (7%) collected from two houses for the case group showed positive contained *M. leprae* bacilli. They commonly stay at dirty areas. In addition, they have low consciousness on healthy life on how to keep the cleanliness of house and their surrounding environment.

There were 4 dust samples were positive contained *M. leprae* in houses of the non-leprosy patients due to relatively close distance of houses of non-leprosy patients and houses of leprosy patients (household contact). The local communities at the study area always close social relationship in daily activities. Such a social behavior with high interaction intensity increases the risk of transmission of leprosy disease, especially social interactions between leprosy and non-leprosy individuals who live under one house that enhance the transmission of *M.leprae* bacilli.

Most individuals in the category of leprosy have low level income and they stay at unsuitable settlements as the common socioeconomic and cultural problems in several developing countries. Moreover, their houses are witihin a relatively close distance. Social interactions among local families at the study area commonly occur at afternoon as the spare times as observed in their daily activities.

This study is in line with the study conducted by Massi et.al. at the Tukamasea Village Administration.[17] 46 dust samples collected from house in the leprosy endemic area were examined and they found 3 samples (6.52%) were positive infected by *M.leprae,* and MLPA test from 144 person showed 48.6% positive (70 individuals) infected by *M.leprae*, but only 5 individuals (7.1%) indicated positive infected by *M. leprae* who live in houses using the PCR method.

Another study reported the transmission of *M. leprae* from dust collected from houses using the PCR method, but no significant different between IgM antibody titers for individuals with infection of DNA *M.leprae* was positive in dust samples collected from houses and their study supported the transmission of *M.leprae* in endemic area[15]

Several studies show a correlation between higher incidents of leprosy with lower SES[18,19-22]. Individuals in the category of low socioeconomic are 3.35 times more likely having the risk of leprosy disease. Lower SES is also related to low level of education. Illiteracy and low level of education of less than eight years of schooling is associated with the increase of leprosy cases. Low level of education has been reported as the risk factor of leprosy in studies conducted in CE.[16,19]

## Conclusion

Based on results of the analysis 16s rRNA expression using RFLP-PCR, it was concluded that all samples (27 samples) of swabs of ear lobes for the case group were definitely positive infected by *M. leprae* and 2 dust samples (7%) from houses for the case group showed positive contained *M. leprae* bacilli, i.e. S05 and S09 respectively. Of all samples of dust collected from houses of non-leprosy patients (the control group), 4 dust samples (14%) was positive contained *Mycobacterium leprae*, i.e. C03, C05, C09, C11 respectively, and 2 non-leprosy patients were infected by *M. leprae* due to close social interactions (household contact) with leprosy patients. It is suggested to conduct strict control of the distribution of leprosy disease to do preventive measures that include keeping the cleanliness of houses at the local areas and the surrounding environment the caution to do social interactions with leprosy individuals to minimize transmission of *M.leprae* at a wider scale.

## Abstract

Malaria is transmitted by female Anopheles mosquito bites. Plasmodium carried by mosquito bites will live and multiply in human red blood cells. This study aims to determine the relationship between environmental risk factors and treatment efforts in patients with Imported Malaria in the work area of the District Health Center of Segeri, Pangkep Regency.

This type of research is observational analytic using a case-control design. The sampling technique for case groups is exhaustive sampling. Control group sampling is adjusted based on the number of sample cases as many as 40 cases with a ratio of 1:1 with a total of 80 respondents. Data analysis was performed univariate, bivariate (Chi-square yielded Odds Ratio (OR), and multivariate (logistic regression).

The results of the bivariate analysis showed an association between malaria sufferers in the migration area (p=0.017; OR=3.273), nighttime habits (p=0.025; OR= 2,786), wearing closed clothes (p=0.044; OR=2.500), using mosquito nets at night (p=0.043; OR=2.538), history of suffering from malaria (p=0.029; OR=9.750), knowledge about the causes of malaria (p=0.012; OR=6.333), knowledge about malaria transmission (p=0.027; OR=2.143), knowledge about the clinical symptoms of malara (p=0.029; OR=9.750), knowledge about the type of malaria treatment (p=0.025; OR=3.857), knowledge about malaria prevention (p=0.025; OR=3.857 ), and have attended/heard of malaria counseling (p=0.027; OR=2.143) with imported malaria. Multivariate analysis showed that the most dominant factor associated with imported malaria was the use of mosquito nets in the migration area (Wald = 6.604; Exp. (B) = 5.239; 95% CI 1.481-18.526).

The solution provided is the need to increase awareness of protecting the environment specifically with the use of mosquito nets in the migration area, increasing knowledge of malaria and prevention by counseling and awareness to take chemoprophylaxis for people who want to migrate.

***Keywords*****:** *Environment, Medicine, Import Malaria, Pangkep*

## Introduction

Risk factors for malaria transmission, such as environmental factors, the presence of vectors and uncontrolled Plasmodium can cause malaria to re-emerge. Plasmodium sp can hide in the human body, but does not cause symptoms (carrier). If there are environmental changes that support the development of Anopheles sp, contact will begin and malaria can reappear[1]. Other influential factors are the existence of mosquito breeding sites around the house, the environment inside and outside the house, the habit of going out at night, and the level of knowledge about malaria treatment[2]. That is why eradication of malaria through appropriate treatment needs to be done.

Eradication of malaria through treatment can break the chain of transmission if done properly and correctly. In addition, related to the time of seeking treatment, a delay in treatment can cause death in adults up to 25%

in 2 weeks after the occurrence of primary infection. In addition, the impact of malaria infection and treatment failure can result in anemia, fetal death, prematurity, low birth weight, and high economic loss. Therefore, treatment and treatment need to be done quickly and precisely to reduce morbidity, prevent severe and complications, prevent transmission, and minimize the impact of the disease on public health[2]

Data from the Pangkep District Health Office in 2016, the clinical Malaria number was 202 cases with 53 positive cases (API 0.16 ‰). In 2017 the clinical Malaria number was 145 cases with 65 positive cases (API 0.21 ‰) and in 2018 the number of clinical malaria cases was 52 with 26 positive cases (API 0.11 ‰). One of the Subdistricts in Pangkep Regency that has a high API number of 3 consecutive years is the Segeri Subdistrict with a high import Malaria case found in two villages (Segeri and Baring) each year and is fluctuating, namely in 2016 the API values are respectively 0 , 07 ‰ and 0.56 ‰, increased in 2017 to 0.59 ‰ and 0.70 ‰, and again declined in 2018 with API values 0.39 ‰ and 0.42 ‰[3].

Even though malaria positive cases over the past three years are still categorized as Low Case Incidence with API value <1/1000 population, but it remains a big concern in efforts to eliminate Malaria because it cannot be categorized as a Malaria-free area and almost all sufferers are imported Malaria sufferers who cases continue to be found every year.

## Materials and Method

### Design of Research and Location

Research using quantitative methods, analytic observational design with a case control approach with matching age and gender categories in the control group. Environmental risk factors and treatment efforts in this study are independent variables while imported malaria sufferers are the dependent variable.

### Population and sample

The population of this study were all respondents whose blood preparations were found by Plasmodium based on the results of microscopic examination / Rapid Diagnostic Test (RDT) in the work area of Segeri Puskesmas and Baring Puskesmas that migrated / migrated in the last 3 years 2017-2019. The sample in this study consisted of 40 respondents in the case group namely respondents who were migrants and positive malaria and the control group were respondents who were migrants and negative malaria, with a comparison of case: control samples was 1: 1, so the number of samples was 80 respondents.

### Data analysis

The data analysis technique of this study used univariate analysis, bivariate with Chi Square test resulted in Odds Ratio (OR), and multivariate analysis with logistic regression with Statistical Package for the Social Sciences (SPSS) 21.0 for windows program.

## Results

### *Environmental risk*

Table 1. The results of risk factor analysis of the habit of going out at night show that the p-value of the study was 0.025 (0.025 <0.05) with Odds ratio (OR) = 2.786 with lower limit (LL) = 1.125 and upper limit (UL) = 6,899 indicates a positive relationship between the habit of going out at night in the migration area with imported malaria.

## Discussion

Respondents in this study were 100% using ordinary mosquito nets, not insecticide-treated nets, even though they were living in malaria endemic areas. One of the efforts to prevent malaria transmission is personal protection by reducing contact between humans and vectors, namely interventions to use insecticide-treated mosquito nets[4]. The use of insecticide-treated

mosquito nets in some rural areas has been acceptable to the community, although not all family members use mosquito nets to bedtime continuously[5]

Meanwhile, the p-value in this study for the habit of wearing closed clothing at night was 0.044, which means that there is a relationship between the habit of wearing closed clothing with imported malaria sufferers in the migration area. The use of long-sleeved clothes and long pants when going out outside the house at night is still not a habit for respondents. Not wearing long sleeves and long pants when doing activities outside the house at night is a risk factor for malaria in the Kapoposang Pangkep island area[6]. Respondents said that they were accustomed to not wearing long sleeves and long pants when leaving the house at night, except for certain activities such as recitation and going to the mosque[7,8].

Consumption of anti-malaria drugs or commonly known as chemoprophylaxis in this study 100% or 80 total respondents did not take anti-malaria drugs before migrating. The main reason for respondents is not knowing about this drug and not having time to take it. So it cannot be tested in a bivariate analysis because all respondents' answers are homogeneous. Even though the respondent's response was homogeneous, not taking this anti-malaria drug is a risk factor for imported malaria that deserves attention.

The history of suffering from malaria in this study was interpreted as respondents who had experienced malaria before migrating / to overseas areas. The value of p = 0.012 and OR of 9,750 which means a history of suffering from malaria before migrating is one of the factors of the occurrence of imported malaria. Research by Pratamawati et al.,[9] in the area of Magelang Regency which is a combination of import cases and indigenous cases. The case description is known to be mostly male with age <45 years, as well as most occupations as laborers and all case respondents had experienced malaria before.

Respondents' knowledge in this research is knowledge related to the type of medication and how to prevent malaria. The results of the bivariate analysis showed that the value of each research p-value was 0.025 with a p value <0.05 meaning Ho was rejected, meaning that there was a relationship between knowledge of malaria against imported malaria sufferers. The majority of respondents to the study conducted by Spjeldnæs et al.[10] 82.1% of respondents correctly identified mosquitoes as an infectious agent, mosquito nets as a prevention tool (85.2%) and hospitals according to the needs of care facilities (96.4%). On the other hand, there are conflicting opinions about general malaria symptoms, more than half (58.2%) cite fever as a symptom of malaria, and only one third (32.7%) cite other common symptoms such as headaches, vomiting and body aches. Overall only 17.3% of the total respondents were able to answer correctly.

People who get health education will be well-informed compared to people who have not been provided health education[11]. According to (Notoatmodjo, 2012) knowledge consists of various levels, namely know, understand, application, analysis, synthesis and evaluation. Referring to the theory, it can be concluded that the majority of respondents to this study were only at the level of tofu, against malaria. Knowledge is usually influenced by the level of education[12].

Based on the results of bivariate analysis shows that the research p-value of 0.027 (0.027 <0.05) means that Ho is rejected, meaning that there is a relationship between having attended / heard of malaria counseling by Malaria interpreters at the local health center against imported malaria patients. Then the Odds ratio test value obtained OR value = 2,143 shows that respondents who did not follow / hear counseling about malaria had a risk of getting malaria 2,729 times greater. Respondents in this study 87.5% or the majority never attended or listened to malaria counseling, either at the migration / overseas location or in their place of residence.

Research also conducted by Arisanti et al.,[13] obtained the results of counseling programs on malaria carried out by health workers that have not touched the community, so that in general the public expects counseling to be carried out by health workers that goes on continuously. Based on the results of the analysis of the research questionnaire by Trisnadewi et al.,[14] most respondents did not get information related to the importance of malaria prevention efforts. The low level of knowledge owned by respondents is because respondents have never attended counseling, so the lack of information received by respondents related to the above. The statement is consistent with the theory that the purpose of counseling

is to change unhealthy behaviors into healthy ones. New behaviors that are formed are usually limited to aspects of knowledge, while changes in attitudes and behaviors are indirect effects of counseling[15-16].

## Conclusions

Based on the results of research and discussion, it can be concluded that the environmental risk variables and treatment efforts affect imported malaria patients. The habit of using mosquito nets is the most dominant factor against imported malaria. The solution provided is the need to increase awareness of protecting the environment specifically with the use of mosquito nets in the migration area and awareness of taking chemoprophylaxis for people who want to migrate.

# Formulation and Effectiveness Test of Matoa Stem (Pometia Pinnata) Skin Extract Cream Combination of Honey on Staphylacoccus Aureus Bacteria

**Norma**

*Lecturer of Politeknik Kesehatan Kemenkes Sorong*

## Abstract

Matoa (Pometia Pinnata) is a typical Papua fruit plant, classified as a large tree with an average height of 18 meters with a maximum average diameter of 100 cm. Generally bear fruit once a year, flowering in July to October and fruiting 3 or 4 months later. Some research shows that the leaves, fruit bark and matoa tree bark contain tannins, saponins and alkaloids. The purpose of this study was to produce a formulation and test the effectiveness of a cream extract of matoa tree bark (pometia pinnata) honey combination on staphylacoccus aureus bacteria. This research is a purely experimental research to produce an extract of the matoa tree bark cream and then test its effectiveness in the treatment of staphylococcus aureus bacteria, with a completely randomized design (CRD) design. The results showed that the matoa rind extract cream was effective against staphylacoccus aureus bacteria with a significant value of 0.00 <0.005. This study recommends a combination of honey bark stem extract cream for the treatment of staphylococcus aureus bacterial infections.

***Keywords:*** *Matoa, cream, extract and Staphylacoccus Aureus*

## Introduction

Matoa (Pometia pinnata) is a typical Papua fruit plant, classified as a large tree with an average height of 18 meters with a maximum average diameter of 100 cm. Generally bear fruit once a year, flowering in July to October and fruiting 3 or 4 months later[1].

Matoa grow in groups in certain places in the forest. Generally it grows naturally in flat textured soils when it rains a little inundated. In the fruiting season this tree can produce quite a number of fruits and if eaten the fruit tastes sweet so it is often referred to as the matoa fruit tree. Besides producing fruit, leaves, fruit bark and matoa tree bark can be used as medicine[2].

Previous research conducted by Ngajow, Abidjulu, & Kamu,[3] with a concentration of 2 grams of matoa bark extract in 2 mL aquades, showed that the bark of matoa rods had a strong antibacterial effect on Staphylococcus aureus bacteria, each inhibition zone was obtained. 16.84 mm, 12.5 mm and 14.5 mm with positive controls 29.67 mm and negative controls 0 mm. The results obtained are supported by the presence of secondary metabolites phytochemical test results, namely tannins, flavonoids, terpenoids and saponins.

Staphylococcus aureus is a pathogenic bacterium in humans that causes various clinical manifestations. Staphylococcus aureus lives on the skin and nasal membranes with great pathogenic potential to cause various infections[4] It is a gram-positive bacterium with a diameter of 0.7-1.2 μm in diameter, arranged in irregular groups such as grapes, facultative anaerobes, does not form spores, and does not move. More than 90% of clinical isolates produce S. aureus which have polysaccharide capsules or thin membranes that play a role in bacterial virulence.

Honey can help wound healing, because it contains antibacterial and antiseptic effects thanks to the hydrogen peroxide content. In addition, the pH of honey that is

**Corresponding author:**

Email Address: normaepid@gmail.com

acidic (between 3.2-4.5) can inhibit bacterial growth. The addition of honey in cream preparations aims to help speed the healing of stapylacocus aures infections and its healing does not cause scars, because honey has anti-inflammatory effects and the ability to disguise scars. Honey accelerates repair of blood vessels (due to damage to blood vessels when injured), helps accelerate the growth of damaged skin layers, increases collagen which is very good to help repair skin, and prevents scars and keloids[5].

The results of a preliminary study conducted by researchers in the community in the city of Sorong on the use of the matoa tree as a medicine, showed that the matoa tree, not yet used as a medicine by him, through this research will be produced formulations cream extracts of the matoa tree bark (pometia pinnata) effective honeybee combination against treatment of staphylacocus aureus bacterial infections.

## Materialsand Method

This research is an in-vitro laboratory experimental study to produce matoa tree bark extract cream preparation and then test its effectiveness on the staphylococcus aureus bacteria, with a completely randomized design (CRD) design.

1. Population and Samples

The population in this study were all staphylococcus aureus bacteria raised in Nutrient Agar (NA) media. Samples are part of the staphylococcus aureus bacteria which are raised in the Nutrient Agar (NA) media. Using a diffusion technique with 3 treatments and 9 repetitions.

2. Materials and Tools

1) Material

The materials used in this study were matoa bark extract, honey bee, glisein, sodium lauryl sulfate, methyl pareben, propyl paraben, cetyl alcohol, propylenglycol, glycerin monostearate, α tocopherol, alcohol, aquadest, nutrient agar, and Staphylococcus aureus and Broth nutrients.

2) Tools

The tools used in this research are mortar, stamper, funnel, porcelain cup, test tube, water bath, measuring cup, Erlenmeyer flask, dropper, cotton, stirring glass, stove, wood clamp, rotary evaporator, vaporizer cup, petri dish, maserator tubes, platinum plates, Beckham pH meters, Rion viscomometers, Memmert incubators.

**3. Data Analysis**

The purpose of data analysis is to test hypothetical: Data analysis of antibacterial activity was carried out by measuring the diameter of inhibitory regions using calipers in each intervention. Then statistical analysis using one-way ANOVA and Tukey's test, using SPSS.

The results of the analysis are concluded:

1) If rvalue ≤ a, Ho is rejected, it means that Matoa Bark Extract Cream combination of honey is effective in staphylococcus aureus bacteria.

2) If rvalue ≥ a, Ho fails to reject, it means that the combination of Madato Stem Matoa Bark Extract Cream is effective in staphylococcus aureus bacteria.

**4. Data Presentation**

## Results

A. **Research Results**

1. Cream Evaluation Results

**Table 1. Evaluation Results of Matoa Stem Bark Extract Cream**

| No | Evaluation Test | Evaluation Formulation Results |
|---|---|---|
| 1 | Organoleptic Test | Light brown color, characteristic odor of matoa tree bark, thick consistency. |
| 2 | Homogeneity Test | Evenly dispersed |
| 3 | PH Test | 4,54 |

**2. KHM Results**

**Table 2. Test Results of Matoa Stem Skin Cream Extract Combination of Honey on Staphylacoccus Aureus Bacteria**

| Bacteria Test | Treatment | Obstacle Zone (mm) | | | | | | | | | Average ± Standard Deviation |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | R1 | R2 | R3 | R4 | R5 | R6 | R7 | R8 | R9 | |
| Staphylacoccus Aureus | Cream | 17 | 15 | 18 | 15 | 17 | 17 | 15 | 21 | 15 | 16,67±2,000 |
| | Extract | 17 | 15 | 17 | 17 | 17 | 16 | 18 | 14 | 17 | 16,44±1,236 |
| | Honey | 7 | 7 | 6 | 4 | 6 | 4 | 4 | 5 | 6 | 5,67±1,118 |

Table 2, shows that from nine times the repetition of matoa bark extract cream has an average value of 16, 67, a standard deviation of 2,000. Matoa bark extract has an average value of 16.44, a standard deviation of 1.236 and Honey has an average value of 5.67 and a standard deviation of 1.118.

**3. Data Normality and Homogeneity Test**

Before the bivariate test, the data normality test and test are performed first homogeneity, presented in the following table:

**Table 3. Data Normality Test**

| | Group | Shapiro-Wilk | | |
|---|---|---|---|---|
| | | Statistic | df | Sig. |
| Intervention | Cream | 0,929 | 9 | 0,027 |
| | Extract | 0,839 | 9 | 0,056 |
| | Honey | 0,863 | 9 | 0,102 |

Based on the table above, the three interventions showed a significant value> 0.05, meaning that the data is normally distributed.

**Table 4. Homogeneity Test Results**

| Levene Statistic | df1 | df2 | Sig. |
|---|---|---|---|
| 1.184 | 2 | 24 | 0,323 |

Based on the table above shows that a significant value of 0.323> 0.05, means the distribution of homogeneous data, because the data is normally distributed and homogeneous, then it is continued with the parametric statistical test, namely the one-way ANOVA test and the Tukey test.

4. Effectiveness Test of Matoa Stem Bark Extract, Matoa and Honey Stem Bark Extract

**Table 5. ANOVA Test Analysis Results**

| **Intervention** | | | | | |
|---|---|---|---|---|---|
| | **Sum of Squares** | **Df** | **Mean Square** | **F** | **Sig.** |
| Between Groups | 711,630 | 2 | 355,815 | 157.492 | 0,000 |
| Within Groups | 54,222 | 24 | 2,259 | | |
| Total | 765,852 | 26 | | | |

Based on the table above shows that a significant value of 0,000 <0.05, this means that the cream of matoa bark extract, matoa bark extract and honey are effective in inhibiting bacteria.

**Table 6. Similarities and Differences in Intervention Group Average (Post-Hoc Test)**

| **Multiple Comparisons** | | | | | | | |
|---|---|---|---|---|---|---|---|
| **Dependent Variable: Intervensi** | | | | | | | |
| | **(I) Group** | **(J) Group** | **Mean Difference (I-J)** | **Std. Error** | **Sig.** | **95% Confidence Interval** | |
| | | | | | | **Lower Bound** | **Upper Bound** |
| Tukey HSD | Cream | Extract | .222 | .709 | .947 | -1.55 | 1.99 |
| | | Honey | 11.000* | .709 | .000 | 9.23 | 12.77 |
| | Extract | Cream | -.222 | .709 | .947 | -1.99 | 1.55 |
| | | Honey | 10.778* | .709 | .000 | 9.01 | 12.55 |
| | Honey | Cream | -11.000* | .709 | .000 | -12.77 | -9.23 |
| | | Extract | -10.778* | .709 | .000 | -12.55 | -9.01 |

Based on the table above, the average difference rate of inhibition of bacteria between cream and extract is 0.222 mm, the lower and upper boundary values are -1.55 to 1.99 with a significant level of 0.947> 0.05, this indicates that there is no difference significant between the extraction of matoa rod bark extract with the matoa bark extract in inhibiting bacteria. While Cream and honey, the average difference rate is 11 mm, the lower and upper limit values are 9.23 to 12.77 with a significant level of 0.00 <0.05, this indicates that there is a significant difference between the bark extract cream creams matoa with honey in inhibiting bacteria.

## Discussion

Matoa bark contains alkaloids, triterpenoids,

steroids, flavonoids, saponins and tannins, which have anti-bacterial properties, from the results of research conducted by Ngajow et al.,[3] about the anti-bacterial influence of extracts of the bark of the stem skin (Pometia Pinnata) against bacteria staphylococcus aureus from three repetitions carried out by the widest bacterial inhibition with an average diameter of 16.84 mm with strong disinfecting properties (susceptible bacteria).

The results of the study were then developed in the form of a honeycomb combination of sunflower bark extract. Cream composition consists of preservative combination of methyl paraben as much as 0.3 g and propyl paraben as much as 0.3 g. The oil phase used is 1.8 ml of glycerin as much as 1 ml of antioxidant α tocopherol as much as 1 ml, and as much as 5 g of cetyl alcohol which is also soluble in the oil phase. Sodium lauryl sulfate as much as 5 grams and propilenglycol as much as 1 gram are the water phases then both phases are heated to a temperature of 65 ° C above the water bath. Then the two phases are put in a stirrer, stirring to form a cream mass. Then propyl and methyl paraben are added to the preparation after first dissolving it in 1 ml of warm water. After a cold base, 1 g of honey is added then the cream is placed in a geometric stirer and stirred until homogeneous and stirring is continued for 15 minutes until the cream is completely homogeneous.

Cream evaluation (Table 1.), shows the results of the organoleptic test of light brown color, the characteristic odor of matoa stem bark with thick consistency. The homogeneity of the uniformly dispersed cream with a pH of 4.54 is safe for the skin, which is between 4.2 - 5.6. The results of the light brown color comes from the skin color of the stem, the thickness due to the thickening agent used is cetyl alcohol. Thickening is a thickener that functions as a binder to the oil phase and water phase associated with Hydrophilic Lipophyll Balance (HLB). Thickening agents or thickening agents are used to regulate the thickness of the product so that it is suitable for the purpose of using the cream and maintain the stability of the product[7].

According to Rowe et al. in Udayana et al.,[7] the concentration of cetyl alcohol for sttifening agents ranged from 2-10%. In this optimization, a concentration of 5% cetyl alcohol is chosen. After the formulation process, the evaluation of the preparations is carried out in order to maintain the quality of the preparations that have been produced. Performed a physical evaluation On the homogeneity test, the results showed that the preparation has good homogeneity because there are no visible particle granules.

After the cream preparation test is carried out, then followed by staphylococcus aureus bacterial inhibition test using a combination of honeycomb stem skin extract, as a control is the extract of matoa bark and honey. The repetition is done nine times for each intervention.

Based on the results of the Analysis of Variance (ANOVA) shows (table 5) that the significance value is 0.00 <0.05. This means that the matoa bark extract cream, matoa bark extract and honey are effective in inhibiting bacteria.

The mechanism of action of flavonoids as antibacterial is to form complex compounds with extracellular protein and dissolved so that it can damage the bacterial cell membrane and followed by the release of intracellular compounds. In addition to playing a role in inhibition of DNA - RNA synthesis by intercalation or hydrogen bonding with a buildup of nucleic acid bases, flavonoids also play a role in inhibiting energy metabolism. This compound will disrupt energy metabolism in a way similar to inhibiting the respiratory system, because it requires sufficient energy for the active absorption of various metabolites and for macromolecular biosynthesis[3].

The terpenoid compounds are also known to be active against bacteria, but the antibacterial mechanism of triterpenoids is still not really known. The terpenoid antibacterial activity is thought to involve membrane breakdown by lipophilic components. In addition, according to[3] phenolic compounds and terpenoids have the main target of cytoplasmic membrane which refers to its hydrophobic nature. The mechanism of action of saponins as an antibacterial is to reduce surface tension resulting in increased cell permeability or leakage and cause intracellular compounds to come out. These compounds diffuse through the outer membrane and cell walls of the vulnerable, then bind to the cytoplasmic membrane and disrupt and reduce that stability.

Similarities and differences in the mean of the intervention group are shown by the results of Tukay's

analysis (Table 6). The average difference rate of bacterial inhibition between cream and extract is 0.222 mm, the lower and upper limit values are -1.55 to 1.99 with a significant level of 0.947> 0.05, this shows that there is no significant difference between extract creams Matoa bark extract with Matoa stem bark in inhibiting bacteria. While Cream and honey, the average difference rate is 11 mm, the lower and upper limit values are 9.23 to 12.77 with a significant level of 0.00 <0.05, this indicates that there is a significant difference between the bark extract cream creams matoa with honey.

The difference in inhibition between cream combination of matoa stem bark combination of honey with matoa bark extract caused by the addition of cream and honey ingredients gives an average difference of 0.222 mm even though the difference is not significant. The strength of the basic ingredients of the bark of the matoa stem, namely alkaloids, triterpenoids, steroids, flavonoids, saponins and tannins, is very dominant in inhibiting the bacterium Staphylococcus aureus.

The difference of inhibitory power between honey and honey matoa stem bark extract cream was 11 mm, showing significant results. Differences in the content of each intervention cause differences in inhibition.

While research conducted by Sulastri & Sari,[7] lauric acid cream preparations tested on staphylococcus aureus bacteria showed antibacterial activity by forming inhibitory diameters for concentrations of 10%, 20% and 30%. The inhibitory diameters were 10.479 mm, 14.8 mm, and 21.589mm, respectively.

The highest inhibitory zone of honey extract combined with honey is in the 8th loop (R 8) of 21 mm (Table 4) when compared with research conducted by Sulastri & Sari,[7] the highest inhibitory zone of lauric acid cream is 21,589 . Although there is a difference of 0.589 mm, but both creams have a very strong inhibition against staphylococcus aureus bacteria. The inhibition zone formed ≥20 mm is considered to have very strong inhibitory activity, 10-20 mm is stated to have strong inhibitory activity, 5-10 mm is stated to have moderate inhibitory activity and ≤ 5 mm is stated to have weak inhibitory activity[9-12].

# Relationship between Level of Knowledge of Childbearing Age Women About Cervical Cancer and Behavior of Preventing Cervical Cancer in Mayamuk District, Sorong Regency

**Sunaeni, S.ST, M.Keb**

*Lecturer of Politeknik Kesehatan Kemenkes Sorong*

## Abstract

Cervical cancer is the second highest cancer prevalence in women in the world. Cervical cancer usually occurs among women aged 30-50 years. In Indonesia, an estimated 40,000 new cases of cervical cancer each year. Women with cervical cancer mostly late for medical management because lack of knowledge about cervical cancer that resulted in late medical examination.

The research design used was correlational analytic with cross sectional approach. The population was women of childbearing age from 20-35 years old in Mayamuk District, Sorong Regency with a total of 66 respondents who were taken by using total sampling. Data collection instruments used were questionnaires. The data analysis used was Chi Square test with 5% level of significance.

From the research results it is obtained that 41% (27 respondents) have insufficient knowledge, and 55% (36 respondents) have negative behavior. From the analysis with Chi Square test with 5% level of significance it was obtained that the count $X^2$ (20.602)> $X^2$ table (5.99), meaning that there is a relationship between the knowledge of women of childbearing age about cervical cancer with the behavior of preventing cervical cancer in the Mayamuk District, Sorong Regency.

It is expected that health workers will further enhance the provision of counseling to the community and optimize prevention programs against cervical cancer and the community can further enhance their knowledge of early prevention of cervical cancer especially women in childbearing age.

***Keywords:*** *Knowledge of women of childbearing age, cervical cancer, prevention behavior*

## Introduction

Cervical cancer ranks second after breast cancer as the most common cancer suffered by Indonesian women. In Indonesia an estimated 40 thousand new cases of cervical cancer are found each year[1]. Ignorance of the community and low socioeconomic status are the main obstacles for having a check up[2]. In a preliminary study conducted by researchers in the Mayamuk District of Sorong Regency, out of 20 women of childbearing age, there were 16 women (80%) had less knowledge about cervical cancer, 3 women (15%) had fair level of knowledge and only 1 women (5 %) who have good level of knowledge. And out of the 20 women, 9 (45%) have negative behavior in preventing cervical cancer.

This study aims to determine the relationship between the level of knowledge of women of childbearing age about cervical cancer with cervical cancer prevention behavior in Mayamuk District, Sorong Regency in 2014.

## Materials and Method

The study used a correlational analytic design with a cross sectional approach. The population is women of childbearing age aged 20-35 years in Mayamuk District, Sorong Regency with a total of 66 respondents that were chosen using Total Sampling. Data collection instruments using a questionnaire. The data analysis used was Chi Square test with 5% level of significance.

## Results

**A. General data**

**1. Characteristics of Respondents According to Level of Education**

**Table 1 Characteristics of Respondents Based on Level of Education in Mayamuk District, Sorong Regency in 2014**

| No | Level of Education | f | % |
|---|---|---|---|
| 1 | Not Graduate Elementary School | 7 | 11% |
| 2 | Elementary School | 21 | 32% |
| 3 | Junior High School | 18 | 27% |
| 4 | Senior High School | 16 | 24% |
| 5 | Higher Education | 4 | 6% |
| | Total | 66 | 100% |

From table 1, the result shows that out of the 66 respondents, majority of 32% (21 respondents) were elementary school graduate.

**2. The Source of Information about Cervical Cancer**

**Table 2 The Source of Information about Cervical Cancer in Mayamuk District, Sorong Regency in 2014.**

| No | Source of Information | f | % |
|---|---|---|---|
| 1 | Magazine | 2 | 4% |
| 2 | Health Personnel | 40 | 60% |
| 3 | Radio | 0 | 0% |
| 4 | Television | 24 | 36% |
| Total | | 66 | 100% |

From table 2 majority of respondents or 60% (40 respondents) obtain information from health workers.

**B. Special Data**

**1. Characteristics of Respondents Based on Knowledge about Cervical Cancer**

**Table 3 Characteristics of Respondents Based on Level of Knowledge About Cervical Cancer in Mayamuk District, Sorong Regency in 2014**

| No | Level of Knowledge | f | % |
|---|---|---|---|
| 1 | Good | 20 | 30% |
| 2 | Fair | 19 | 29% |
| 3 | Low | 27 | 41% |
| | Total | 66 | 100% |

From table 3, the results show that the majority of respondents or 41% (27 respondents) have low level of knowledge, and lowest presentage or 29% (19 respondents) have fair level of knowledge.

**2. Characteristics of Respondents Based on Behavioral Prevention of Cervical Cancer**

Table 4 Characteristics of Respondents Based on Preventive Behavior of Cervical Cancer in Mayamuk District, Sorong Regency in 2014

**Chi-Square Tests**

| | Value | df | Asymp. Sig. (2-sided) |
|---|---|---|---|
| Pearson Chi-Square | 20,602[a] | 2 | ,000 |
| Likelihood Ratio | 22,302 | 2 | ,000 |
| Linear-by-Linear Association | 19,792 | 1 | ,000 |
| N of Valid Cases | 66 | | |

a. 0 cells (,0%) have expected count less than 5. The minimum expected count is 8,64.

**Symmetric Measures**

| | | Value | Approx. Sig. |
|---|---|---|---|
| Nominal by Nominal | Contingency Coefficient | ,488 | ,000 |
| N of Valid Cases | | 66 | |

a. Not assuming the null hypothesis.

b. Using the asymptotic standard error assuming the null hypothesis.

| No | Preventive Behavior of Cervical Cancer | f | % |
|---|---|---|---|
| 1 | Positive behavior | 30 | 45 |
| 2 | Negative behavior | 36 | 55 |
| Total | | 66 | 100 |

Based on table 4, it indicates that out of the 66 respondents, the highest percentage or 55% (36 respondents) had negative behaviors towards cervical cancer prevention.

## Data analysis

Table 5 Cross Tabulation of Level of Knowledge of Women of Childbearing Age about Cervical Cancer with Preventive Behavior of Cervical Cancer in Mayamuk District, Sorong Regency in 2014.

| No | Level of Knowledge of Cervival Cancer | Preventive Behavior of Cervical Cancer | | | | Total | |
|---|---|---|---|---|---|---|---|
| | | positive | | negative | | | |
| | | f | % | f | % | f | % |
| 1 | Good | 17 | 25 | 3 | 5 | 20 | 30 |
| 2 | Fair | 8 | 12 | 11 | 17 | 19 | 29 |
| 3 | Low | 5 | 8 | 22 | 33 | 27 | 41 |
| | | 30 | 45 | 36 | 55 | 66 | 100 |

Based on table 5, it shows that out of 20 respondents who had good level of knowledge, 17 respondents had positive behavior and 3 respondents had negative behavior. In the other hand, out of 27 respondents had low level of knowledge, 5 respondents had positive behavior and 22 respondents had negative behavior.

Chi Square statistical test was performed to analyze the relationship of level of knowledge women in childbearing age with cervical cancer prevention behavior at ($\alpha$) = 0.05.

The data analysis resulted the $X^2$ count results obtained = 20.602 and $X^2$ tables = 5.99. Therefore $X^2$ count> $X^2$ table means that there is a relationship between the level of knowledge of childbearing age women about cervical cancer with the preventive behavior of cervical cancer.

## Discussion

From the findings of the research shows that mostly

41% (27 respondents) have low level of knowledge, and 55% (36 respondents) have negative behavior. From the analysis with Chi Square test with 5% level of significance, it was obtained that the count $X^2$ (20.602)> $X^2$ table (5.99), means that there is a relationship between the level of knowledge of women of childbearing age about cervical cancer with the preventive behavior of cervical cancer in the Mayamuk District, Sorong Regency.

In Rogers research[2-4] Notoatmodjo, states that behavior based on knowledge will be more lasting than behavior that is not based on knowledge. Knowledge will affect individual behavior which will further influence community behavior towards healthy promoting behavior. It is especially the knowledge about cervical cancer and its prevention. In addition to knowledge, level of education is also an internal factor that influences one's knowledge and behavior. Higher level of education of the person enable their ability to receive information obtained from various sources such as through magazines, television, radio, and from health workers easier[5-11].

From the results of this study it can be seen that there is no gap between theory and research results. Because the results of the study indicate that the source of information actually affects the knowledge of women of childbearing age who majority of them never obtain information about cervical cancer. Knowledge is also influenced by level of education as supported by finding that majority of them were elementary school graduate[12-15].

While in terms of behavior, women of childbearing age in preventing cervical cancer are mostly having negative behaviors. The cause of this is the lack of knowledge that is not sufficient to support good behavior. Even though they lack knowledge, they are expected not to have negative behavior as well.[16-18]

## Conclusion

There is a relationship between the level of knowledge of women of childbearing age about cervical cancer with the behavior of cervical cancer prevention in Mayamuk District, Sorong Regency in 2014

**Suggestions**

**1. For Respondents**

It is expected that women of childbearing age make the effort to improve their knowledge and information about cervical cancer through various mass media and electronic media (magazines, newspapers, television, etc.) and from health workers, so that they better understand cervical cancer and its prevention.

**2. For Health Agencies**

Information about cervical cancer and its prevention programs must be disseminated more broadly and optimally. Health workers further enhance the provision of counseling to the community and optimize prevention programs against cervical cancer, especially in women of childbearing age.

**3. For the Wider Community**

The public is expected to improve their knowledge more broadly by participating in counseling programs and examinations for early detection of cervical cancer that are given and programmed by the government and health workers.

*[2]Lecturer Prima Physio Clinic, Makassar, Indonesia*

## Abstract

**Introduction**. Osteoarthritis is a common condition that affects elderly people, especially knee osteoarthritis. It can cause pain, muscle weakness, imbalance and low functional activity of elderly people. Knee osteoarthritis not only affects muscles in the knee joint area but also those in the hip joint. To improve symptoms of knee osteoarthritis, strengthening exercise is often conducted only on muscles in the knee joint area, but not muscles in the hip area. This study aimed to compare the effect of strengthening exercise conducted in knee joint muscles only with the strengthening exercise in both knee and hip muscles on pain, strength, balance and functional activity.

**Method**. A pre- and posttest design was chosen as the design of this study. Two groups were formed in this study. Group 1 received strengthening exercise on knee joint muscles only and Group 2 received strengthening exercise on knee joint and hip joint muscles. This study was conducted in Prima Physio Clinic for Group 1 and Tajuddin Chalid Hospital, Makassar for Group 2. On each group, there were 10 subjects with osteoarthritis. The strengthening exercise was conducted for 3 times a week for 4 weeks. The outcome measure used was numeric pain rating scale (NPRS), manual muscle strength (MMT), Berg balance scale (BBS) and Western Ontario McMaster (WOMAC). Manual muscle strength was measured in all major muscles of the joints: iliopsoas, gluteus, tensor fascia lata, quadriceps and hamstring.

**Results**. The statistical analysis was conducted using Wilcoxon and Mann Whitney tests. In group 1 analysis, pain, balance, functional activity, and all major muscle strengths were found to be a statistically significant difference between baseline and 4 weeks post-exercise. In group 2 analysis, pain, muscle strength, balance, and functional activity were found to be a statistically significant difference ($p<0.05$). The comparison between the two groups showed statistically significant differences in all muscle group strength except for hamstring. Pain, balance, functional activity and hamstring strength were not statistically significantly different between the groups.

**Conclusion**. From the results, we concluded that the strengthening program for both knee and hip muscles is recommended than only to the affected joint muscles.

***Keywords**: knee osteoarthritis, strengthening exercise, pain, muscle strength, balance, functional activity*

## Introduction

In Indonesia, the prevalence of knee osteoarthritis that appears radiologically reaches 15.5% in men and 12.7% in women aged between 40-60 years. In the knee osteoarthritis, the affected joints are tibiofemoral and patellofemoral joints depending on the severity of the osteoarthritis[1]. Muscle weakness, balance and postural problem can increase the fall risk among osteoarthritis patients. It can be compounded with the loss of proprioceptive sense of the joints. Sufferer loses the sense of joint position and affects balance ability[2].

According to Geenen et al.[3], osteoarthritis management aims to reduce pain, increase functional activity, and reduce individual and societal costs. According to a meta-analysis by Fransen et al.[4], exercise, advice and education for the management of osteoarthritis symptoms are supported with the highest level of evidence. Research has shown that exercise therapy is effective in improving pain and increasing function of people with osteoarthritis[5].

Research has shown that strengthening exercise can improve muscle strength and increase bone mass[6]. Strengthening exercise on the knee muscles, especially quadriceps, is correlated with the improvement of knee osteoarthritis symptoms. A study showed that quadriceps muscle weakness is common among people with knee osteoarthritis and can become one of the risk factors of knee osteoarthritis[7]. Thus, the quadriceps strengthening exercise becomes the focus of knee osteoarthritis strengthening exercise.

In people with knee osteoarthritis, the addition of hip muscle strengthening exercise to the quadricep strengthening can improve pain, function, walking ability and quality of life compared to quadriceps exercise alone[8]. The previous study showed that the hip and knee exercise group has better improvement of pain and function after 12 weeks of intervention the knee exercise group, especially in patients with patello femoral pain[9]. This study aimed to investigate the effectivity of hip and knee muscle strengthening exercise compared to knee muscle exercise alone in improving function, muscle strength and balance in people with knee osteoarthritis.

According to Kurniawan[10], the limitation of functional activity of people with stroke is caused by the pain the knee joints. When performing daily activities, knee pain can interfere and make the patients limit their activities to avoid pain. This study aims to investigate the effectivity of knee and hip muscle strengthening on muscle strength, balance, pain and functional activity of people with knee osteoarthritis.

## Materials and Method

Subjects were recruited from Prima Physio Clinic and Dr Tadjuddin Chalid Hospital from March to April 2019. A total of 20 patients were enrolled to participate in this study. Patients were eligible to participate if they were diagnosed with primary or secondary unilateral knee osteoarthritis according to clinical and radiological examination and experienced almost daily knee pain. Patients with other medical problems that can interrupt their participation such as cancer and infectious disease were excluded. Upon agreeing to participate, all patients signed informed consent. Participants were then assigned into two groups according to their recruitment sites. Patients in the Dr Tajuddin Chalid Hospital were assigned to group 1 and received knee muscle strengthening exercise. Patients in the Prima Physio Clinic were assigned to group 2 and received knee and hip muscle strengthening exercise. Both groups were given intervention three times a week for 4 weeks.

The intervention was given in the form of muscle strengthening exercises. In group 1, the strengthening exercise was focused on knee joint muscles, m. hamstring and m. quadriceps. The strengthening exercise was conducted by one of the physiotherapists at the study site of group 1. In group 2, in addition to knee joint muscle strengthening exercise, the hip muscles were also targeted including iliopsoas, gluteus and tensor fascia lata. The strengthening exercise was also conducted by one of the physiotherapists at the study site of group 2. All subjects in both groups were received other standard physiotherapy modalities such as infrared heating, interference, transduction electrical nerve stimulation (TENS), taping, and general exercise.

The outcome measure used was MMT, BBS, NPRS, and WOMAC to measure muscle strength, balance, pain, and functional activity respectively. All measurement was conducted by one of the authors (NTP) who had been trained in using the measurement tools. The measurement was conducted at the Prima Physio Clinic for both groups. The persons who perform the measurement was not aware of the subject assignment as the subjects were told not to reveal their groups, received intervention or study site during measurement. The same person measures all variables and in both groups, at baseline and posttest.

Wilcoxon test was used to compare the pre and posttest in each group. Mann Whitney test was used to compare the difference between groups. Statistical significance was set to 0.05. Ethical approval for this study was obtained from the Ethics Committee of Health Research, Hasanuddin University Makassar.

## Results

**Table 1. General characteristics of subjects**

| **Characteristic of Samples** | | **Group 1** | **Group 2** |
|---|---|---|---|
| Gender | Male<br>Female | 5<br>5 | 4<br>6 |
| Age | 41-50<br>51-60<br>61-70<br>71-80 | 1<br>2<br>3<br>4 | 4<br>2<br>2<br>2 |
| Weight | 44-53<br>54-62<br>63-73<br>74-84 | 2<br>3<br>3<br>2 | 2<br>4<br>4<br>- |
| Height | 145-155<br>156-166<br>167-177 | 4<br>2<br>4 | 4<br>5<br>1 |
| Body Mass Index | Ideal<br>Overweight<br>Pre-obesity | 4<br>-<br>6 | 6<br>1<br>3 |

Table 1 shows that the proportion of female and male is similar in both groups. Most subjects are more than 60 years old in both groups. The proportion of the Body Mass Index is relatively even in both groups between ideal and pre-obesity.

**Table 2. Effect of the knee and hip muscle strengthening exercise on the improvement of muscle strength, balance, pain and functional activity**

| **Variables** | **Group 1** | | | **Group 2** | | |

| m. Gluteus | 3 | 4 | 0.046 | 3 | 5 | 0.004 |
| m. Tensor fascia latae | 3 | 4 | 0.046 | 3 | 5 | 0.006 |
| BBS | 19.20±6.663 | 22.40±5.542 | 0.007 | 20.60±7.321 | 25.30±3.620 | 0.000 |
| NPRS | 7.00±1.49 | 5.10±1.59 | 0.000 | 7.30±1.25 | 3.60±2.01 | 0.000 |
| WOMAC | 66.30±11.52 | 53.80±12.13 | 0.000 | 71.10±1.25 | 36.60±16.39 | 0.000 |

*Wilcoxon test

Table 2 shows that muscle strength in all muscle groups around the hip and knee is improved after the intervention given in both groups. The balance, pain, and functional ability are also improved significantly at the posttest.

**Table 3. Differences in the effects between groups on the improvement of muscle strength, balance, pain and functional activity.**

| Variables | Group 1 | Group 2 | P* |
|---|---|---|---|
| MMT | | | |
| m. Quadricep | 8.50 | 12.50 | 0.029 |
| m. Hamstring | 9.00 | 12.00 | 0.067 |
| m. Iliopsoas | 7.00 | 14.00 | 0.005 |
| m. Gluteus | 6.70 | 14.30 | 0.002 |
| m. Tensor fascia latae | 6.50 | 14.50 | 0.001 |
| BBS | 10.10 | 10.90 | 0.578 |
| NPRS | 1.90 | 3.70 | 0.519 |
| WOMAC | 12.50 | 34.50 | 0.393 |

*Mann-Whitney test

Table 3 shows that there is a significant difference in the strength of quadriceps, iliopsoas, gluteus and tensor fascia lata muscles between the groups ($p<0.05$). Higher results can be observed in group 2 compared to group 1. Only one muscle group that shows no significant difference between the groups, m. hamstring. However, the higher result can also be observed in group 2 compared to group 1. There were no significant differences between the groups in terms of balance, pain, and functional activity.

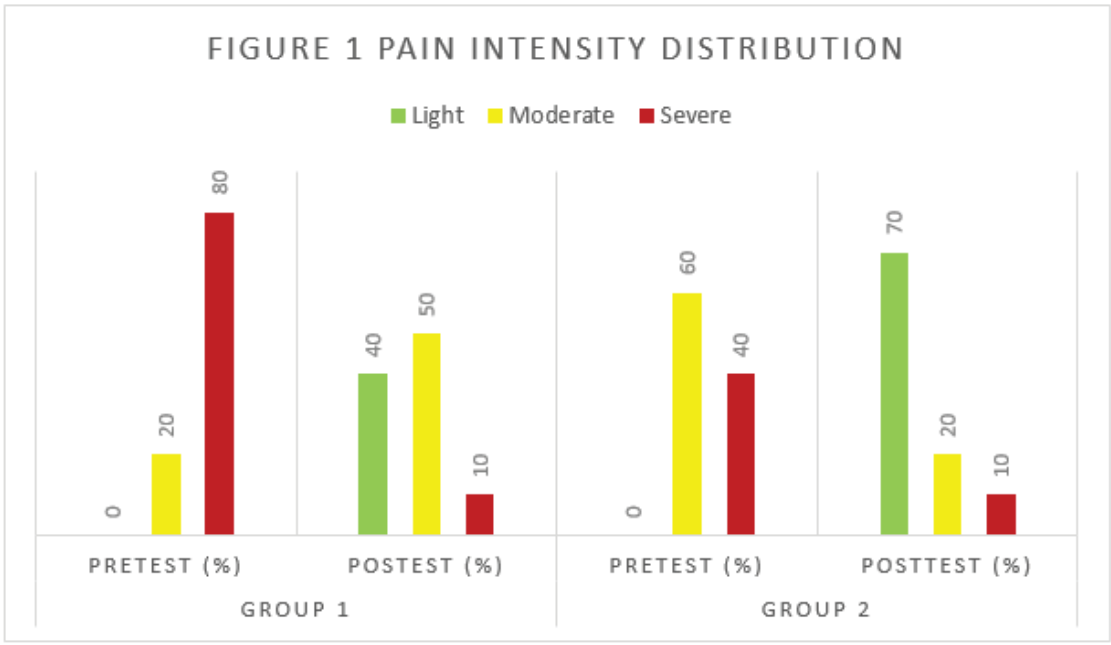
Figure 1 shows that the pain intensity at posttest is improved compared to that at baseline. At baseline, 80% of subjects in group 1 are in severe pain, while 60% of group 2 is in moderate pain. At posttest, 50% of group 1 are in moderate pain compared to 70% of group 2 are in light pain. This result shows that knee and hip muscle strengthening combination is better in improving pain compared to knee muscle strengthening alone.

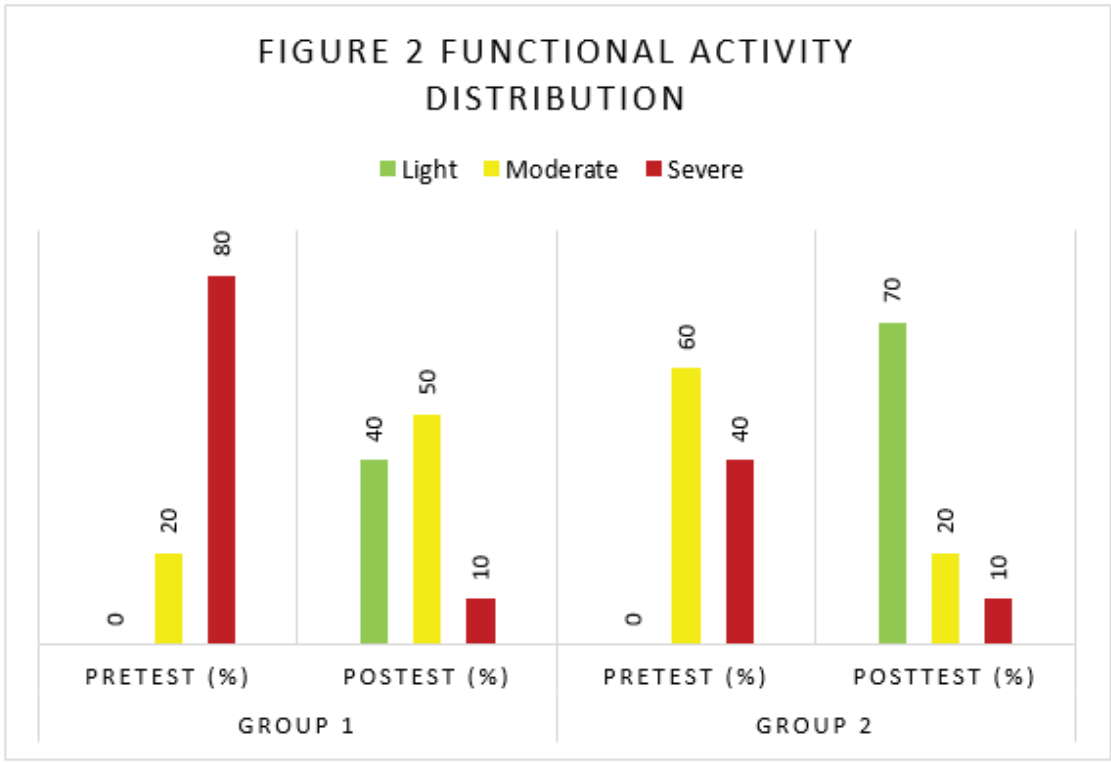
Figure 2 shows the improvement of functional activity in both groups. At baseline, 80% of subjects in group 1 are in heavily dependent compared to 60% of subjects of group 2 are in moderate dependent. At posttest, 50% of subjects in group 1 are in moderate dependent compared to 70% of subjects in group 2 are in light-dependent. This result shows that the combination of knee and hip muscle-strengthening exercise is better in improving functional activity compared to knee muscle strengthening exercise alone.

**Table 4. The correlation between pain and functional activity**

| | Variable | P | Correlation Coefficient |
|---|---|---|---|
| Pre-test | Pain and functional activity | 0.000 | 0.974 |
| Post-test | | 0.000 | 0.841 |

Table 4 shows that there is a statistically significant correlation ($p<0.05$) between pain and functional activity in people with osteoarthritis. The positive correlation was shown in both pretest and posttest measurement of pain and functional activity. According to the correlation coefficient, the correlation is stronger at pretest compared to posttest (0.974 vs. 0.841).





## Discussion

### Strength

The result of this study shows that strengthening hip and knee muscle can improve muscle strengthening significantly. This effect can be explained that the exercise provides neuromuscular adaptation in the long term. Physiologically, the improvement of muscle strength depends on motor unit recruitment. In several weeks of exercise, most of the adoption involves the ability to recruit motor unit that leads to contraction of muscle fibre. As a response to strengthening exercise, neuron activity increase and make actin and myosin number in the muscle fibre also increases. This led to an increase in myofibril hypertrophy and lead to an increase in muscle strength[7].

This study showed that there is a significant difference in muscle strength between the groups except for m. hamstring. Both m. quadriceps and m. hamstring are knee muscles and was given strengthening exercise in both groups, but only quadriceps showed a significant difference. This means that the additional exercise on hip muscles may affect the quadriceps, but not m. hamstring.

### Balance

This study showed that knee and hip muscle exercise can improve balance in people with knee osteoarthritis. Hall[11] stated that during muscle contraction, protein synthesis of muscle contractile is faster than its disintegration, which leads to a progressive increase of actin and myosin number inside myofibril. Moreover, the myofibril is multiplying in each muscle fibre to form myofibril hypertrophy. Inside the hypertrophic muscle fibres, the component of the phosphor metabolic system increase, including the ATP and phosphocreatine[13].

### Pain

This study showed that knee and hip muscle strengthening can improve pain. This result is supported by some previous studies. A study by Kus and Yeldan[12] show that the strengthening focused on m. quadriceps femoris can reduce pain and improve functional activity in people with knee osteoarthritis. A study by K. L. Bennell et al.[14] shows that strengthening of adductor and abductor hip muscles for 12 weeks can improve strength, pain, and function in people with medial knee osteoarthritis. A systematic review by Kus and Yeldan[12] shows that quadriceps muscle strengthening has a positive effect in improving pain and function in people with knee osteoarthritis compared to other treatments that are not included quadriceps muscle strengthening.

### Functional Activity

This study shows that the functional activity of subjects was improved after the application of knee and hip muscle strengthening on people with osteoarthritis. The statistical tests showed that no significant difference in both groups in terms of functional activity improvement. The functional activity in both groups was improved significantly. This can be attributed to the effect of knee and hip muscle strengthening exercise in improving muscle weakness. During repeated exercise, the muscles become hypertrophy and the myofibril increase.

## Conclusion

This study shows that the muscle strengthening on both knee and hip muscles is beneficial in people with knee osteoarthritis in terms of muscle strength, balance, pain, and functional activity. The positive benefit is better showed in the strengthening of muscles in both joints compared to only focus on muscles around affected joints.

## Abstract

**Background**: Some evidence suggests that genetic factors contribute to susceptibility to drug abuse such as methamphetamin and that dopamine-quinone produced by dopamine might be involved in the mechanism of symptoms associated with psychotic methamphetamine (MAP). Quinone detoxification is catalyzed by a group of proteins, namely quinone oxidoreductase (NQO). In this study we analyzed serum NQO2 levels by examining ELISA Sandwich in clients who used methamphetamine. **Methods:** This research is a Case-Control to determine the contribution of NQO2 to the emergence of psychotic disorders due to methamphetamine abuse. The case group is residents who consume methamphetamine with psychotic characteristics, while the control group is clients who consume methamphetamine without psychotic characteristics **Results:** The mean value of NQO2 gene protein in the Elisa Sandwich examination for the case group was lower than the value of the control group (1,246 < 3,657). The t test showed the value of sig (Equal variances not assumed) = 0,000 that value is less than 0.05 (<0.05), this shows the difference in the value of content protein NQO2 between the case group and the control group. Then the cut-off point of the Receiver Operating Characteristic (ROC) curve in this study is recommended statistically between 1,960 and 2,165, meaning that if the expression value of protein content > 2.165 then the potential for psychotic suffering is great, on the other hand if < 1.960, the potential is small for suffering from psychotics**.** **Conclusion:** The protein content of the NQO2 gene in the Elisa Sandwich examination between the case and control groups is different, the case group is lower than the control. While the CURVE ROC (Receiver Operating Characteristic) Cut-Off value is recommended statistically between 1,960 and 2,165.

***Keywords:*** *Methamphetamine, Dopamine, NQO2 serum level, Methamphetamine Psychotic.*

## Introduction

Recently, methamphetamine abuse has become a major problem and developed into an international problem[20]. According to the *United Nations Office on Drugs and Crime* (UNODC), methamphetamine is a dangerous substances and the 2nd ranks after hashish/ cannabis in the 1st rank of the 20 types of substances that are often misused[19]. The prevalence of narcotics abuse in the world from 2006 to 2013 has increased[19]. In the last five years, the trend of amphetamine type has declined by around 15% in various countries, while the use of ecstasy has been reported to be stable (12). However, there has been a drastic increase (158%) in the last five years namely the consumption of methamphetamine[14,19,20]. Methamphetamine abusers can also cause psychotic symptoms similar to schizophrenia (Schizophrenia-like psychosis) but there are also methamphetamine abusers who do not experience psychotic symptoms[24,25]. As a reference from several previous studies that contributed to our research, there are two sources of reference that we can point out, namely:

*a. Functional polymorphisms of the NQO2 gene is associated with methamphetamine psychosis. (Ohgake, S. at all,*[14,17].

*b. Cognitive impairment is related to oxidative stress and chemokine levels in first psychotic episodes. (Martínez-Cengotitabengoa M at all, Schizophr Res 2012, 137:66–72*).

## Material and Method

### Study Design and Subject

This research is a case-control to determine the effect of NQO2 gene on the onset of psychotic symptoms due to methamphetamine abuse[1,22]**.** The Selection Criteria for clients who only consume methamphetamine with a diagnosis of Behavioral Mental Disorders due to the use of methamphetamine addictive substances with psychotic characteristics for the case group, while those who do not have psychotic characteristics as a control group and are currently undergoing inpatient rehabilitation programs at the BNN Baddoka Rehabilitation Center. Inclusion Criteria: Methamphetamine abusers, aged 20 - 50 years old, qualify as methamphetamine abuse. Exclusion Criteria: Clients suffering from Mental Disorders and Behavior due to addictive substances other than methamphetamine. There is a history of hereditary disorders in the Psychotic group, suffering from Severe Physical Disease and consumption of polysubstance during the past year[9,13].

**Population of Research:** a. Case group: Methamphetamine users have Psychotic disorders, after being examined with the criteria of the Brief Psychiatric Rating Scale (BPRS) and the Diagnostic And Statistical Manual of Mental Disorder (DSM V).

b. Control group: Methamphetamine type who do not experience Psychotic disorders (examination instruments also with BPRS and DSM V).

### 2.3 Statistical Analysis

Analysis of the data in this study (Elisa's protein content) using statistical application assistance, IBM SPSS version 24. To see the difference between the two samples, namely the case group and the control group, an independent t test was performed. Then to determine the cut-off point between psychotic and non-psychotic (Specificity and Sensitivity), by Receiver Operational Characteristics Curve (ROC) test and then performed AUC test (Area Under Curve) so that cut-off from data obtained in both groups.

## Results

**Table 1. Characteristic of subject based on age and gender**

| **Distribution of case subjects (n = 30)** | | | **Distribution of control subjects (n = 30)** | | |
|---|---|---|---|---|---|
| Ages | n | % | Ages | n | % |
| 20-35 yrs<br>36-50 yrs | 27<br>3 | 90<br>10 | 20-35 yrs<br>36-50 yrs | 27<br>3 | 90<br>10 |
| Gender | | | Gender | | |
| Men<br>Women | 29<br>1 | 96,7<br>3 | Men<br>Women | 30<br>0 | 100<br>0 |

Table 1 shows that the age of the subjects in the case group ranged from 20-35 years (90%), most of the men were 29 (96.7%), and the rest were women.

**T-Test**

Independent t test is a test to see the difference between the two sample groups, namely cases and controls.

The mean value of Elisa protein levels in the case group (1,246) is smaller than the control group (3,657).

**Table 2. Independent Samples Test**

| | | Levene's Test for Equality of Variances | | t-test for Equality of Means | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | F | Sig. | t | df | Sig. (2-tailed) | Mean Difference | Std. Error Difference | 95% Confidence Interval of the Difference | |
| | | | | | | | | | Lower | Upper |
| Content Sandwich Elisa | Equal variances assumed | 10,668 | ,002 | 12,144 | 58 | ,000 | 2,41100 | ,19853 | 2,01359 | 2,80841 |
| | Equal variances not assumed | | | 12,144 | 49,684 | ,000 | 2,41100 | ,19853 | 2,01217 | 2,80983 |

The result of *t-test* showed the sig. value of 0.000 was less than 0.05 (< 0.05). It shows that $H_0$ rejected and $H_a$ accepted, meaning that there were significant differences between case and control groups.

**ROC (Receiver Operating Characteristic) KURVE**

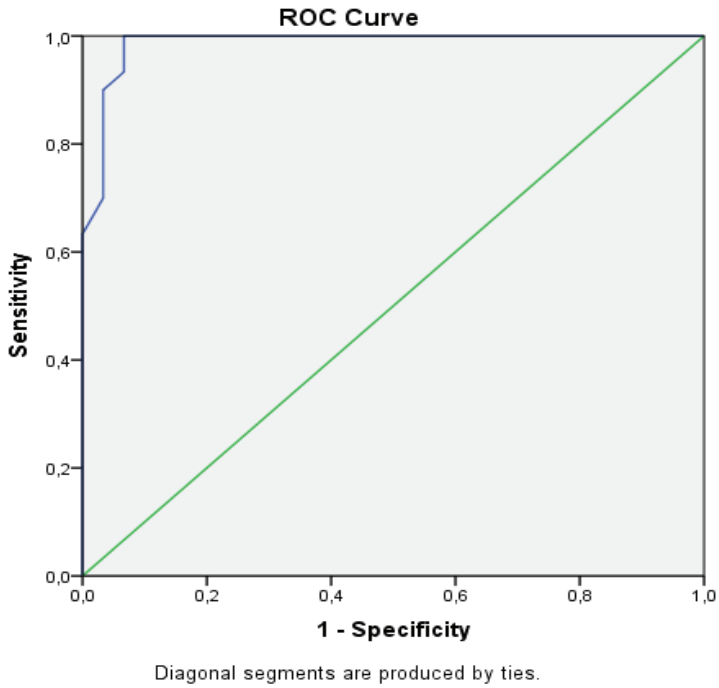

**Figure 1. ROC Curves in Case Control Groups**

The ROC (Receiver Operating Characteristic) curve shows that the value is far from the 50% line and close to 100%.

**Table 3. Area Under the Curve**

**Test Result Variable(s): PROTEIN LEVELS SANDWICH ELISA**

| Area | Std. Errora | Asymptotic Sig.b | Asymptotic 95% Confidence Interval | |
|---|---|---|---|---|
| | | | Lower Bound | Upper Bound |
| ,986 | ,012 | ,000 | ,962 | 1,000 |

The test result variable(s): PROTEIN LEVELS SANDWICH ELISA has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

The AUC (Area under the Curve) value is 98.6% (IK95%; 96.2% - 100%), meaning that if the ELISA Sandwich protein content / content score is used to diagnose the presence or absence of psychotic symptoms due to methamphetamine abuse in 100 clients, then the right conclusion will be obtained at 98.6 clients.

**Table 4. Coordinates of the Curve**

**Test Result Variable(s): PROTEIN LEVELS SANDWICH ELISA**

| No. | Positive if Greater Than or Equal Toa | Sensitivity | 1 - Specificity |
|---|---|---|---|
| 25 | 1,9600 | 1,000 | ,100 |
| 26 | 2,1650 | 1,000 | ,067 |

The test result variable(s): PROTEIN LEVELS SANDWICH ELISA has at least one tie between the positive actual state group and the negative actual state group.

The smallest cut-off value is the minimum observed test value minus 1, and the largest cutoff value is the maximum observed test value plus 1. All the other cut-off values are the averages of two consecutive ordered observed test values.

## Discussion

As is known that methamphetamine is one type of narcotics that are stimulant, if consumed will affect all parts of the brain, especially in the limbic system, namely the Nucleus Acumbens and Ventral Tegmental Area to activate dopamine (DA), then dopamine is released[16]. from storage. divesicular sites to the cytoplasm so that the amount of DA increases in the brain. Furthermore, DA can carry out automatic oxidation to produce DA-Quinones. DA-Kuinon is a very reactive molecule and easily produces semi-quinones that are not stable by the reduction process. Semi-quinones enter the redox cycle together with oxygen molecules to form reactive oxygen species (ROS).

Then, ROS and semi-quinone cause oxidative stress. Therefore, it can be said that this oxidative

stress plays an important role in the mechanism of MAP, where this is evidenced by the involvement of DA-Kuinon in the mechanism of MAP which induces neurotoxicity and psychotic symptoms in humans[14, 15]. DA-quinone is usually detoxified by genes catalyzed by the Quinoneoxidoreductase (NQOs) protein group and also this gene protects brain cell damage from oxidative stress. In humans, genetic evidence indicates that Quinoneoxidoreductase (NQOs) has four gene loci, both of which have been identified as NAD (P) H-quinone oxidoreductase 1 (NQO1) (Ross et al.) and NRH quinoneoxiductase 2 (NQOs) NQO2)[9, 11].

In a research article such as that conducted in Japan by Ohgake, S., et.al with the title "NQO2 gene polymorphism associated with methamphetamine psychosis", in his research found a percentage (11.7%) D / D of NQO2 genes in patients with prolonged psychosis had double the control (4.8%). On the other hand, this study shows that the NQO1 polymorphism (Pro187Ser), in which this gene is not associated with MAP abuse. The NQO1 gene is proven to be a risk factor for breast, lung and leukemia[3, 14, 18]. It has been explained that methamphetamine is a type of narcotic that is stimulant, because it affects the release of excessive dopamine neurotransmitters from Nucleus Accumbens (NA) and Ventral Tegmental Area (VTA) in the Limbic System that causes psychotic disorders. Meanwhile, the NQO2 gene serves to detoxify the effects of excessive dopamine, as well as protect brain organs from the effects of excessive dopamine poisoning which can cause permanent brain damage[14].

This NQO2 gene is "Helper", so it is normatively assumed that the lack of regulation of the NQO2 gene causes expression of the protein content of the low NQO2 gene, this can cause psychotic disorders in methamphetamine users[14,15], due to insufficiency. detoxification function and protection of the NQO2 gene. Further studies such as those conducted by Ohgake et al. (regarding the NQO2 gene polymorphism), we then tried to conduct another study, namely how the influence or contribution of protein levels from the NQO2 gene to psychotic disorders in methamphetamine users[6, 11]. Analysis of NQO2 gene protein content through Sandwich Elisa examination for occupants / perpetrators of methamphetamine abuse in the control group (Mental Disorders and Causative Behavior of Amphetamine Type Non Psychotic Stimulant Type) and case groups (Mental Disorders and Behavior of Addictive Substances of Amphetamine Type of Stimulant with Addictive Substance with Psychotic Type) ) gives different results, where the average value of the protein content in the control group is higher (3,657) than in the case (1,246). Whereas the recommended KURVE ROC (Receiver Operating Characteristic) cut-off is statistically recommended between 1,960 and 2,165, with a sensitivity value of 100% and specificity ≥ 90%, it means that a cut-off value osf 1,960 to 2,165 which can be used as a reference for the presence or absence potential psychotic disorders in methamphetamine abuse

## Conclusion

a. The mean value of the NQO2 gene protein level in the Sandwich Elisa examination for the case group ie MAP users = 1,246, lower than the value of the control group ie non Psychotic MA users = 3,657. b. The t-test results show the value of sig. (2-tailed) = 0,000 (smaller than alpha = 0.05 (<0.05)), so it can be assumed that there are differences between the samples in the case and control groups. c. Cut-Off CURVE ROC (Receiver Operating Characteristic) recommended statistically in both groups is between 1.960 and 2.165, meaning that if the expression value of protein content> 2.165 then the potential for psychotic suffering is great, on the other hand if <1.960, the potential is small for suffering from psychotics[2, 21].

# Application Pis (Indonesia Wellness Progrsam) PK Model with Decision and Matriarchal Patriarchal Family of Compliance on the Family of the Suffering of Disease TB Lung Health in the Work Remu City Sorong

**Maria Loihala**

*Poltekkes Ministry of Health Sorong*

## Abstract

**Background :** Indonesia Healthy Family Approach (PIS PK) is done by visiting the family, with the target and the target is a PK PIS family. Indonesia has a health problem that is in the public spotlight in 2018, namely the high number of cases of pulmonary *tuberculosis* (TB). Based on 2016 WHO *Global Tuberculosis Report*, Indonesia ranks second with the highest TB burden in the world. This includes many cases that have not been detected and have not been treated and have not been reported. In the family structure and cultural dimensions based on decision making known as Patriakal and Matriakal. By knowing the pattern of household decision making, it can also be seen whether there is dominance in a household.

**The Research Objective :** Knowing overview and analyze the application of PIS PK (Healthy Indonesia Program) model of decision making patriarchal and matriarchal families on treatment compliance in family members who suffer from pulmonary tuberculosis in Puskesmas Remu Sorong.

**Research design** : Quantitative and qualitative research. Quantitative research method is *case control* design The qualitative research method is phenemoenology . The population in this study is the manager of the PK PIS program and all family members who suffer from TB in the work area of the Remu Puskesmas in Sorong City. The sample in this study amounted to 32 respondents.

**Results :** They have been done and they have the document but not maximum home visits, and patients taking the medicine lazy. Test using the *Old Ratio* (OR) with an *estimate* of 8.333 means that the application of PIS PK in accordance with the guidelines on matriarchal decision making is 8 times the risk of being folded from patriarchal decision making. The implementation of PIS PK in accordance with the guidelines for medication compliance 10 times the risk of compliance with treatment compliance .

**Conclusion :** Application of PIS PK has documents, but not optimal, PIS Application of PK with decision model testing friendly *old ratio of* 8 times the risk in decision-making, and PK of the compliance application PIS treatment 10-fold risk of adherent treatment. Suggestions for community health centers as a result of data collection to the community to discuss further interventions and empower the community.

***Keywords :*** *Application of PIS (Program Healthy Indonesia) PK, Model Making*

## Introduction

The Healthy Indonesia Program with a Family Approach (PIS PK) is carried out by visiting families, and the target of PIS PK being families. Family approach support the achievement of healthy Indonesia program[1].

In PIS-PK has been set twelve major indicator as a marker of health status of a family that includes the family followed the family planning program, deliver at a health facility, the baby gets fully immunized, infants received breast milk (ASI) exclusive, toddler get growth monitoring, tuberculosis patient pulmonary receive treatment according to standard, people with

hypertension take medication regularly, people with mental disorders receive treatment and neglect, family members no one smokes, the family has become a member of the National Health Insurance (JKN), the family has access to clean water facilities, families have access to or use a toilet. The Government may establish addition indicator to principal indicator in accordance with the conditions and needs of the region so that West Papua add one indicator is the examination and treatment of malaria, according to the standard so that, in West Papua has become a healthy thirteen indicators[1] .

Based on 2016 *WHO Global Tuberculosis Report*, Indonesia ranks second with the highest TB burden in the world[2].

Globally in 2016 there were 10.4 million TB incident cases (8.8 million - 12, million) which is equivalent to 120 cases per 100,000 population. WHO data in 2017 Indonesia ranks third highest sufferers. The number of new TB cases in Indonesia was 420,994 cases in 2017[3].

Data and information from the province of West Papua show that the number of cases of all types was 1921 cases, the highest in 658 cases in Manokwari, while in Kota Sorong it was 332 cases and. Of these, there were 1061 new positive BTA tuberculosis cases .

The results of the focus group discussions (puskesmas staff) most of the informants stated that the personnel involved in the data collection of PIS-PK at the puskesmas who had been running PIS-PK had not yet received a decree as PIS-PK implementer. The data collection officer is only given a special assignment letter. Most informants objected to the policy requiring HR in all puskesmas involved in the collection of PIS-PK to have attended training.

In the family structure and cultural dimensions based on decision making known as Patriakal and Matriakal. Patriarchal is a condition where decision making by the husband or the husband's extended family. While matriacal is a household condition where decision making is on the part of his wife or extended family .

The family approach is one way to increase the reach of targets and bring closer/improve access to health services in the work area by visiting .

Puskesmas Remu Sorong city is one health center under the Government of Sorong that organizer outdoor activities building one by direct observation of spaciousness which is the implementation of the Indonesia Program Healthy Approach Family (PIS-PK). The total residents of four villages that 31,532 inhabitants. Of these, until March 2018 there were 15 TB positive people . Meanwhile those with suspected tuberculosis recorded 57 people . In 2019 there were 48 patients suffering from positive pulmonary TB. as for the application of PIS PK through new manager 2018 year program is applied in South Remu village, and in 2019 will be carried out in Sub Malabutor[7].

## Materials and Method

This type of research is a *mixed* research that is quantitative and qualitative. Quantitative research methods that use *case control* design. Qualitative research methods with using a phenomenological approach .

**Finansial Source**: The source of funding in this study is DIPA Poltekkes Sorong 2019.

## Research Results

**Table 1. Characteristics of Respondents**

Table 1. shows the many aged 31-40 years (31.2%), most of the male sex (62.5%), Education least a lot of high school (37.6%) and most work as self-employed (40.6 %).

**Univariate Analysis**

**Table 2. Frequency Distribution According To The Application Of Respondent PK PIS**

| No | Lung TB | Amount | % |
|---|---|---|---|
| 1 | In accordance with the Guidelines | 27 | 84,4 |
| 2 | Not in Accordance with the Guidelines | 5 | 15,6 |
| 3 | Total | 32 | 100.0 |

Application of PIS PK the most appropriate guidelines which 27 (84.4%) compared to not match the guidelines which 5 (15.6%) of respondents.

**Table 3. Frequency Distribution According To Patriarchal And Matriarchal Family Decision Making**

| No | Decision-making | Amount | % |
|---|---|---|---|
| 1 | Matriarchal | 20 | 62,5 |
| 2 | Patriarchal | 12 | 37,5 |
| 3 | Total | 32 | 100.0 |

The decision of the mother's family (matriarchal) of respondents is more that 20 people (62.5%) compared to the family decision of the father (patriarchal) which is 12 people.

**Table 4. Frequency Distribution According To The Treatment Compliance Of Pulmonary TB Respondents**

| No | Treatment Compliance | Amount | % |
|---|---|---|---|
| 1 | Obedient | 27 | 84.4 |
| 2 | Not obey | 5 | 15.6 |
| 3 | Total | 32 | 100.0 |

The highest number of obedient pulmonary tuberculosis respondents were 27 (84.3%) compared to 5 (15.6%) disobedient.

**Bivariate Analysis**

**Table 5. Cross Table of The Implementation Of PK PIS With Patriarchal And Matriarchal Decision Making Models For Family Members Affected By Lung TB In The Work Area Of The Remu Health Center In 2019**

| NO | Application of PIS PK | Decision Making Model | | | | Total | |
|---|---|---|---|---|---|---|---|
| | | Patriarchal | | Matriarchal | | | |
| | | f | % | f | % | f | % |
| 1 | Corresponding | 9 | 33,3 | 18 | 66,7 | 27 | 100 |
| 2 | It is not accordance | 3 | 60,0 | 2 | 40,0 | 5 | 100 |
| | Total | 12 | 37,5 | 20 | 62,5 | 32 | 100 |

Test Statistics *Old ratio* shows that the value of "Estimate" which means 8.333 application of PIS PK according to the guidelines in the decision-making matriarchal 8 times as much risk of the patriarchal decision making.

Asymp Value *Sig (2-Sided)* shows p value of 0,000<0.05, so it can be concluded that there is a significance of the application of PIS PK with patriarchal and matriarchal decision making models in family members suffering from pulmonary TB in the working area of Remu Puskesmas in Sorong City.

**Table 6. Cross Table The Application Of PIS PK To The Compliance Of Medical Treatment Of Family Members Suffering From Pulmonary TB In The Work Area Of The Remu Health Center In 2019**

| No | Application Of PIS PK | Treatment Compliance | | | | Total | |
|---|---|---|---|---|---|---|---|
| | | Obedient | | Not Obey | | | |
| | | F | % | F | % | F | % |
| 1 | Corresponding | 21 | 77.8 | 6 | 22.2 | 27 | 100 |
| 2 | It Is Not Accordance | 3 | 60.0 | 2 | 40.0 | 5 | 100 |
| | Total | 27 | 84.4 | 5 | 15.6 | 32 | 100 |

Test statistics *old ratio* shows that the value of "Estimate" which means 10.333 application of PIS PK according to the guidelines on treatment compliance risk is 10 times higher than in non-adherent treatment .

Asymp Value *Sig (2-Sided)* shows the p value 0.000 <0.05, it can be concluded that there is a significance to the application of PIS PK obedience treatment to family members who suffer from pulmonary TB in the region of Puskesmas Remu Sorong.

**Determination of Sub Themes**

Based on the coding process, determining sub themes, 5 themes are found:

**6.** They Have A Cross-Program Meeting Discussed The Results Of Family Visits At The Puskesmas Level And What Are The Documents

The informant said that the meeting had been held. The informant said that the document exists and available.

**7.** Constraints Found

The informant said that the obstacle found was that the house visit was not optimal.

**8.** Documents On The Results Of Family Visit Presentations At The Puskesmas Level And The Variables Included

The informant said that documents were available on the results of the family visit and the variables included were TB patients who had *dropped out.*

**9.** Disseminate The Presentation Of The Analysis Of The Family Visit And Form The Dissemination Is Carried Out

The informant said that repeated home visits had been carried out, but those dropouts still did not seek treatment again for various reasons. Infoman also said that there were some patients who did not want to take medicine.

**10.** Dissemination Constraints Found

Infoman said that there were some patients who

did not want to take medicine .Informant said that he would announce the names of patients who did not seek treatment or coordinate further with cross-sectors.

## Discussion

Implementation Of PIS PK (Healthy Indonesia Program) With Patriarchal And Matriarchal Decision Making Models Of Adherence To Family Members Suffering From Pulmonary TB In The Working Area Of Puskesmas Remu

Healthy Indonesia program became the main program of Health Development which then planned accomplishments through the Strategic Plan (Strategic Plan) Ministry of Health of the Year 2015-2019, established by Decree of the Minister of Health No. HK.02.02/Menkes/52/2015, Minister of Health, 2016[2] .

Family approach is one way to increase outreach to target health centers and perform/improve access to health care in their working area to visit family, Minister of Health[2] .

In the implementation of PIS PK, it has been carried out according to the guidelines with home visits, in fact many people responded well to the presence of PIS PK in the working area of the Sorong City Puskesmas Remu, but many people also refused to be treated. Repeated home visits have been carried out but the *dropouts* still do not seek treatment anymore by sharing reasons.

**Implementation Of PIS PK (Healthy Indonesia Program) With The Model Of Patriarchal And Matriarchal Decision Making In Family Members Who Suffer From Pulmonary TB In The Working Area Of The Puskesmas Remu Sorong City**

The results showed application of PIS PK according to the guidelines in the decision-making matriarchal 8 times as much risk of the decision-making patriaka l. In get value p value 0.000 <0.05, it can be concluded that there is a significance the application of PIS PK with decision-making model of patriarchal and matriarchal family members who suffer from pulmonary TB in the region of Puskesmas Remu Sorong, almost similar to the research study that viewpoint in family decisions are mainly taken from family members with direct parenting duties.

The model of family decision making in dealing with family members suffering from pulmonary TB in the working area of the Puskesmas Remu is 62.5% dominant in mothers (matriarchal). According to the researchers' assumptions, it is in accordance with the culture of the local community where the decision maker decides to listen more to a wife or mother. This is because there are decisive aspects in making decisions such as: the type of household work, office work, family needs, basic needs and additional equipment and facilities available in the family, the time and energy available, which dominates is the mother. Mothers have the feeling high worried when a family member is sick, so the phenomenon in found that the mother is to play a role in encouraging and motivating family members who suffer from pulmonary tuberculosis, even the existing situation the mother also act as watchdogs to take medication pulmonary tuberculosis.

**Application of PIS PK (Healthy Indonesia Program) To The Compliance Of Medical Treatment Of Family Members Suffering From Pulmonary TB**

The results showed estimate the value of 10.333 means application of PIS PK according to the guidelines on treatment compliance risk is 10 times more than the non-adherent treatment and get the value *asymp* show 0,000 p value <0.05, it can be concluded that there is no significance to the application of PIS PK treatment Compliance in family members suffering from pulmonary TB in the working area of the Sorong City Puskesmas Remu.

As many as 32 respondents, most of them (84.4%) were obedient in undergoing treatment for pulmonary TB that lasted 6 months. According to the researchers' assumptions, because respondents were still in the category 1 treatment (87.5%), apart from that many family members who adhered to TB treatment because of family support in this case the mother (wife), the mother was able to make decisions, the family in terms of this mother is able to care for family members who experience health problems, mothers are able to encourage families to seek treatment at existing health facilities in order to deal with health problems in this case the treatment of pulmonary TB. Besides family members who visited regularly influenced by the level of education in which the vast majority were high school

(37.6%).

According to the researchers' assumptions that the obstacles found were not optimal, the visits were made, due to lack of time and human resources. The existence of TB patients who *drop out* because the patient feels bored with the consumption of taking large amounts of medicine and for a long period of time, so that patients think to stop taking the drug and switch to other treatments, such as herbal medicine[10,11]. Besides that, it can also be influenced by socio-economy in this case the work of family members who are mostly self-employed (40.6%) where this work takes time to fulfill their living needs.

## Conclusions

Based on the results of the research, it can be concluded :

4. Application of PIS PK (Program Healthy Indonesia) pulmonary TB disease in the region of Puskesmas Remu has been done and have the document. But in practice, there are obstacles that are not yet a maximum of home visits, and patients are lazy to take medication.

5. It was concluded that there was a significance of the implementation of PIS PK with Patriarchal and Matriarchal Decision Making Models in family members suffering from pulmonary TB in the working area of Remu Puskesmas in Sorong City

6. There is a significance of the implementation of PIS PK with Compliance with treatment to family members who suffer from pulmonary TB in the working area of the Puskesmas Remu in Sorong City.

# Decompression Sickness Indicators in Traditional Divers in Bajo, Boalemo District

**Syamsiar S. Russeng[1], Lalu Muhammad Saleh[1], Muhammad Syafar[1,] Muliadi Rais[1]**

*[1]Lecturer of Faculty of Public Health, UniversitasHasanuddin Makassar*

## Abstract

Decompression is a health problem due to changes in ambient pressure in the body due to the accumulation of nitrogen which forms bubbles in the body when the dive takes place. The bubbles are not released which leads to the clogging in the blood flow and the nervous system of the diver. This study aims to determine the indicators of decompressionoccurence in traditional divers in BajoVillage, Boalemo District. This was a cross sectional study with a population of 69 people (exhaustive sampling). Data collection is conducted through interviews and physical examinations on divers. The instruments used were questionnaires, history sheets, height and weight measurements. Multivariate data analysiswas carried out using smart PLS applications. The results of this study indicate that of 69 respondents, 41 people (59.4%) of them experienced symptoms of decompression sickness, both at mild and severe level. From the results of multivariate data analysis, it is obtained the results of variables that have a significant relationship (> 1.96) with the incidence of decompression problems, namely the duration of diving (2.453), rising to the surface attitude (3.703) and depth (3.516). It is concluded that the length of diving, the way the diver rise to the surface and depth of divingwere some of indicators of the incidence of decompression in traditional divers in Bajo Village, Boalemo District. It is suggested that divers carry out dives in accordance with safe procedures.

***Keywords:*** *Decompressionsickness,traditional divers, duration of diving, rise to the surface*

## Introduction

Indonesia is the largest maritime country in the world. Its sea area covers 5.8 million km2 or around 2/3 of the entire territory of the Republic of Indonesia. The area of Indonesia's Exclusive Economic Zone (EEZ) reaches 2.7 million km2 with a total of 17,504 islands. Apart from that, marine resources in the form of fisheries are also very abundant. There are about 8,500 species of fish, 555 species of seaweed, 950 species of coral reef biota[1].

One type of occupation that we often encounter in coastal or island communities is traditional divers. It is estimated that there are around 7 million divers worldwide(Lee an ye, 2013). In Indonesia, these traditional divers generally still apply the traditional methods. This traditional traditional diver is often called the Compressor Fisherman, a diver who uses very limited equipment [2.3].

The submersion of divers into the water will affect the condition of divers. Evenmore, it may have a high risk to their health, such as pain, paralysis, disability, and death. The risks in question are not only due to the dive itself, but are also influenced by the underwater environment, the diving technique used and the mental and physical condition of the divers [4].

One of the many diseases that occur in divers is decompression sickness or also known as Caisson Disease. This disease is a disease caused by the formation and increase in bubble size when the partial pressure of inert gases in the blood and tissues that exceeds ambient pressure [5].

The formation of air bubbles will block blood flow and the nervous system and eventually cause symptoms such as pain in the joints, headaches, itching,

**Corresponding author:**
**Syamsiar S. Russeng**
Email :syamsiarsr@yahoo.co.id

numbness, paralysis and even death. The incidence rate of decompression disease based on the Divers Alert Network (DAN) report on commercial dives was reported as many as 35.3 cases per 10,000 dives [6]. In addition, in the United States, the incidence of Caisson Disease for type II (severe) was 2.28 cases per 10,000 divers.In Timilnadu, India, there were 21 deaths due to diving within a period of 2 years, namely in 2012 and 2013 [7].

In Indonesia, decompression is a sickness that is often experienced by traditional divers. The Ministry of Health's research on accidents and diseases that occur in traditional fishermen and divers shows that 57.5% of fishermen on Bungin Island, West Nusa Tenggara experience joint pain and 11.3% experience hearing loss. Whereas in the KepulauanSeribu, DKI Jakarta, 41.4% of fishermen experienced barotrauma and 6.9% experienced decompression sickness[8].

In Makassar, particularyon the island of BarrangLompo, the results of research conducted on 47 people with decompression sickness. Risk factors that influence statistically with the incidence of decompression in traditional divers are the period of work and how to rise to the surface, while rest periods do not affect statistically with the incidence of decompression in traditional divers. Multivariate analysis shows that tenure is the variable most at risk of decompression in traditional divers on BarrangLompo Island[9].

From the data above shows that in Indonesia there are many cases of occupational diseases experienced by traditional divers. Furthermore, there may be more cases that are similar but have not been reported or have not been found. In BoalemoDistrict, Gorontalo province, there is a village where most of the residents' livelihoods are fishermen, including traditional divers who use compressors, namely Bajo Village. Most of the residents are of Bajo tribe. We often encounter people with disabilities and are paralyzed as a result of diving work. Some of them do not go to health service facilities resulting in unrecorded number of cases. Consequently, this problem has not become a targetto be intervened by the parties concerned. Based on the above, a study the indicators of the incidence of decompression sickness in traditional divers is needed in Bajo Village, Boalemo District.

## Materials and Methods

### *Research location and design*

This research was conducted in Bajo Village, BoalemoDistrict, Gorontalo Province. The type of research is an observational analytic using a cross sectional study design.

### Population and sample

The population in this study was all traditional divers who at that time were domiciled in Bajo Village, Boalemo District and the entire population was used as the object of this study (exhaustive sampling) of 69 people.

### Data Collection Method

Data was collected by researchers and physicians through questionnaires, history sheets, height and weight measurements. Data on symptoms of decompression were measured by history and physical examination by the examining physician, age, length of work (tenure), length of diving, depth and how the diver rises to the surface are measured by interview using a list of questions and body mass index data measured by body scales and height measurement tools.

### Data Analysis

Data from interviews and measurements were analyzed using several computer softwares. Univariate analysis was conducted using SPSS for Windows 25 to determine the frequency distribution while multivariate analysis uses the Smart PLS software to determine the relationship between variables.

## Results

### Frequency distribution

Table 1 shows that based on the age of divers, there are 29 people in the category of risk of decompression and 40 people who are not at risk of decompression.

**Table 1. Frequency distribution of risk factors for decompression in traditional divers in Bajo Village, Boalemo District**

| Variables | DCS-Risk | | DCS- Non Risk | |
|---|---|---|---|---|
| | Criteria | n | Criteria | n |
| Age | <16 / >35 y.o | 29 | 16-35 y.o | 40 |
| Body Mass Index (BMI) | > 25 | 51 | ≤ 25 | 18 |
| Tenure | ≥ 5 year | 57 | < 5 year | 12 |
| Length of Dive | > 1 hour | 64 | ≤ 1 hour | 5 |
| Depth | ≥ 15 m | 56 | < 15 m | 13 |
| Rise to the Surface | Fast | 57 | Slowly | 12 |

Based on body mass index, there are 51 people in the category of risk of decompression and 18 people who are not at risk of decompression. Based on the working period of the divers there are 57 people in the category of risk of decompression and 12 people who are not at risk of decompression.

**Table 2. The Relationship Between Variables in Traditional Divers in Bajo Village, Kab. Boalemo**

| | Original Sample | p-value |
|---|---|---|
| AgeàDecompression Sickness (DCS) | 0.128 | 0.227 |
| BMIàDecompression Sickness (DCS) | 0.134 | 0.103 |
| TenureàDecompression Sickness (DCS) | 0.151 | 0.239 |
| Length of Dive à Decompression Sickness (DCS) | 0.243 | 0.015 |
| Rise to the Surface àDecompression Sickness (DCS) | -0.309 | 0.000 |
| Depth àDecompression Sickness (DCS) | 0.350 | 0.000 |

Based on the duration of the dive, there are 64 people in the category of risk of decompression and 5 people who are not at risk of decompression. Based on depth, there are 56 people in the category of risk of decompression and 13 people who are not at risk of decompression. Based on how the diver rises to the surface, there are 57 people in the category of risk of decompression and 12 people who are not at risk of decompression.

**Relationship Between Variables**

Figure 1 shows the relationship between variable length of diving, how to rise to the surface and depth with decompression disease which have significant relationships (> 1.96).

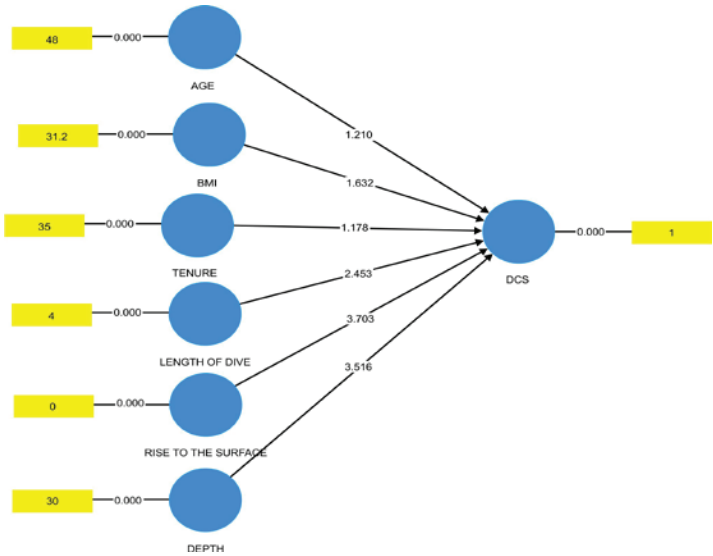

**Figure 1.Relationship between variables in traditional divers**

In detail, the duration of diving (2.453), how to rise to the surface (3.703), and depthof dive(3.516)with the p-value of each dive time (0.015), how to rise to the surface (0.000), and depth of dive (0.000).

## Discussion

***Relationship between length of diving and decompression sickness***

The results of this study indicate that the duration of diving has a significant relationship with the incidence of decompression in traditional divers in Bajo Village, Boalemo District (p-value = 0.015). Every individual has different abilities in terms of the length of diving in the water. The duration of the dive will affect the absorption and release of gases in the body's tissues and blood, especially nitrogen gas. Changing the composition of the gas will cause decompression and barotrauma.

This research is in line with that conducted by [9](Wijaya, 2018) stating that diving duration is a risk factor for the occurrence of decompression. The study is also in line with the results of research conducted by [10](Jusmawati, 2016) and [8](Duke, 2017). However, the results are in the contrary to the study conducted by [11](Sukmajaya2010) where the results of the study showed no significant relationship between the duration of the dive with decompression sickness. This is likely due to the relatively small number of samples in the study so that it cannot state an association with the effect factor.

The diving, the divers in Bajo Village must pay attention to the duration of this dive, the dives should be carried out in a well-planned manner, taking into account the time of the dive and it is best to avoid diving with of high-risk duration. In the current practice, divers do not dive according to the initial plan, but based on the number of catches obtained in the sea. If the catch is deemed insufficient, then the divers will remain in the water as long as their bodies are deemed able to sustain.

Diving using a compressor as an air source is very potentially lead to decompression sickness due to a long dive. The air supplied by compressor is not limited with time where as long as the air tank in the compressor tube is still available, or the compressor engine is still on, the air supply will still be available.

***Relationship betweendepth with decompression sickness***

The results of this study indicate that depth of diving has a significant relationship with the incidence of decompression in traditional divers in Bajo Village, Boalemo District (p-value = 0.000). This study is in line with research conducted by [9](Wijaya, 2018), [8](Duke, 2017) dan[12](Alaydrus, 2014)which found that depth is a risk factor that significantly influences the incidence of decompression in diver.

When a diver submerges into the water, there are two pressures that burden his body, namely the pressure of the air above the water and the pressure from water

itself. The amount of atmospheric pressure varies depending on the altitude of the surface of the sea or lake, while the water pressure is the pressure caused by the weight of the water that is above the body of the diver [13].Every 10meter depth increase, there is an increase in 1 ATA pressure (absolute atmosphere). The deeper a person dives, the greater the pressure received and the risk of decompression will also be even greater.

The deeper a person dives, the higher the pressure towards by the body so that more nitrogen will be dissolved and absorbed by the blood and organs of the body. If the body cannot adjust to this pressure, squeese or trauma can occur. This trauma usually occurs at depths of more than 10 meters. In addition, the deeper the dive, the lower the temperature in the water. Therefore, divers can lose body heat followed by other disorders such as tingling, cramps, etc. [14].

Relationship between how to rise to the surface with decompression

The results of this study also indicate that the behavior by which the diver rises to the surface after diving has a significant relationship with the decompression sickness in traditional divers in Bajo Village, Boalemo District (p-value = 0.000). This study is in line with previous studies conducted by [15](Rahmadayanti, 2017), [16](Linggayani, 2017), [9] (Wijaya, 2018) dan[17](Wahab, 2008)which found that there was a significant relationship between the way the diver rises to the surface and the incidence of decompression.

When a diver rises to the surface after a rapid dive, it will cause air pressure outside the body to be lower than air pressure in the body so that nitrogen dissolved in the blood will come out of the body and form larger nitrogen bubbles and can compress or clog some blood vessels and nerveus system of the body. Lack of knowledge of divers causes them not to carry out proper and correct diving procedures[15-19].Another aspect that usually causes a diver to rise to the surface quickly is if the diver encounters a wild or poisonous sea animal or if the compressor hose is twisted and clogged or the compressor is experiencingdamage.

Based on the results of interviews with traditional divers in Bajo Village, several divers conducted something that was believed to reduce the risk of decompression; once arrive to the surface, the diver did not directly get on the boat, but first dwelled on the surface of the water while holding on the edge of the boat waiting time to feel like urinating, and after urinating then the diver climbed onto the boat.

## Conclusions and Recommendations

Decompression sickness indicators in traditional divers in Bajo Village, Boalemo district are the duration of diving with t statistics (3.703), the way the divers rise to the surface with t statistics (3,516) and the length of work with t statistics (2,453)

.Thus, it is recommended for divers to carry out diving activities in accordance with safe diving procedures and it is recommended that the marine service conduct counseling or training on how to dive safely on these traditional divers. Further research should specify more on the different types of decompression sickness namely type 1 and type 2. It is recommended to research about the effects of using a compressor on divers

## Abstract

**Background:** The growth and development of children is influenced by nutritional factors, one of which is exclusive breastfeeding. It is known that until the age of 6 months of breastfeeding. (ASI) is an ideal food for babies both in terms of physical and psychological health.

**Research Purpose:** This research compare development of babies aged 6 months who were breastfed exclusion and not exclusively breastfed.

**Research method**: This study uses a case control design and conducted in 2017. The research subjects infants aged 6 months were exclusively breastfed and not breastfed exclusively in RSKIA Pertiwi Makassar. Development of infants assessed with the scale **KPSP (Pre-Screening Questionnaire Development).** exclusive breastfeeding effect on the development analyzed by t.

**Conclusion:** The results showed the development of exclusively breastfed infants given a significant (p <0.05), clinically obtained the value of OR 36, 75 means that infants fed exclusively breastfed increased 36, 75 times more suitable compared groups of infants who are not breastfed exclusively.

***Keywords****: Exclusive breastfeeding, Development, KPS*P.

## Introduction

The growth and development of children is influenced by nutritional factors, one of which is exclusive breastfeeding. It is known that until the age of 6 months of breastfeeding. (ASI) is an ideal food for babies both in terms of physical and psychological health.[1] premisesn exclusive breastfeeding until the baby is 6 months old will ensure the achievement of the development of children's intelligence potential optimally. Mother's milk other than as a nutrient that is ideal, with the right composition, as well as tailored to the needs of the baby, breast milk also contains nutrients specialty such as taurine, lactose, AA, DHA, omega 3, omega 6, choline, and tryptophan needed baby's brain to grow sinapto- optimal to assist in the genesis and the process of myelination. The more synapses between nerve cells more complex the ability to receive, process, store and respond stimuli received by the nerve cells. In general the number of synapses increases rapidly between the ages of 3-4 months, then going relationship with visual information processing center until the age of 6 months[2-4].

The Kemenkes[5] recommends exclusive breastfeeding for the first 6 months of life and continued until the age of 2 years. Breast milk is the best food for babies because it contains all the nutrients a baby needs in appropriate amounts and immunologic substances that protect the baby from infection. Based on the accumulated

evidence of the protective effect of breast milk protects against infectious diseases including for example, digestion and breathing. Moreover, the lingering effects where breastfeeding potential to prevent at some of the results that have been studied for preventing obesity in children, improve cognitive function, prevent dental caries, gastric disorders and respiratory disorders. This is due to the presence of antibodies contained in breast milk colostrum. Feeding can regulate energy intake associated with the internal response in recognizing the feeling of satiety[5-7].

The development is increasing the body's structure and function is more complex in coarse motion capability, smooth motion, speech and language as well as socialization and independence. The development is the result of the maturity of the central nervous system interaction with the affected organ, such as the development of the neuromuscular system, speech, emotion and socialization. Impaired development could result in the emergence of several possibilities, including speech delays caused Child Global Development Delay (general psychomotor developmental delay), abnormalities of the sensory nerves to the hearing, Down Syndrome, and autism[8].

Screening / examination using KKSP child development (pre-screening questionnaire development) to know normal child development or not. KKSP used as deemed relevant in analyzing the development of the appropriate stages of the child's age[9,10.]

With regard to the importance of the development of exclusive breast-fed infants, the authors wanted to do research on cognitive function comparison infants aged 6 months who have received and are not exclusively breastfed and selected research sites in Makassar due to declining rates of exclusive breastfeeding in infants in Makassar.

## Materials and Methods

### *Research Location*

Research was conducted The Pertiwi RSKDIA Makassar,

### *Research design*

This research is a kind of analytical research using case control design. Subjects were all infants aged 6 months in RSKDIA Pertiwi Makasar exclusively breastfed and who are not exclusively breastfed.

### *Population*

Population is the research object or object under study Notoadmodjo[11]. As for the population in this study is a 6-month-old baby, either given or not given exclusive breastfeeding in Makassar.

### *samples*

Samples are partly taken from the whole object under study were considered representative of the entire population[11]. The samples in this study were part of the population of babies aged 6 months, either given or not given exclusive breastfeeding in Makassar. To determine the sample, in this study researchers used a purposive sampling technique

## Results

### *The univariate analysis*

Research has been conducted on 60 mothers who had infants aged 6 months. Data characteristics of the respondents in this study include the mother's age, education, occupation, age of the last child, knowledge, exclusive breastfeeding.

1. characteristics of respondents

**Table 1 Characteristics of Respondents by age of mother**

| Age | frequency | Percent (%) |
|---|---|---|
| ≤ 35 years old | 29 | 48.33 |
| > 35 years | 31 | 51.67 |
| Total | 60 | 100 |

*Source: Primary Data Year 2017*

Table 1 shows that 60 respondents, obtained with age ≤ 35 years as many as 29 respondents (48.33%), While respondents with age> 35 years as many 31 respondents (51.67%)

**2. Breastfeeding**

**Table 2 Characteristics of Respondents in Breastfeeding**

| **breastfeeding** | **F** | **%** |
|---|---|---|
| Exclusive breastfeeding | 30 | 50 |
| not Exclusive | 30 | 59 |
| Total | 60 | 100 |

*Source: Primary Data Year 2017*

Table 2 shows that 60 respondents, found respondents give Exclusive breastfeeding 30 (50%), while those not exclusively breastfed were 30 (50%) of respondents.

3. Baby's development

**Table 3 Development of Infants**

| **infant development** | **F** | **%** |
|---|---|---|
| Corresponding | 36 | 60 |
| question | 23 | 38.33 |
| digress | 1 | 1.67 |
| Total | 60 | 100 |

Table 3 shows that out of 60 babies, infant development according the growth obtained a total of 36 (60%), development of infants doubt there are 23 (38.33%), while the development of the baby deviation of 1 (1.67%) infants.

4. Exclusive breastfeeding comparison with developments in Infants

**Table 4: Development of Infants**

| | **infant development** | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | | **Corresponding** | | **digress** | |
| | **Corresponding** | | **question** | | **digress** | **P** | **OR** | **P** | **RR** |
| | n | % | n | % | n % | CI 95% | | CI 95% | |
| care | | | | | | | | | |
| exclusive | 28 | | 2 | | 0 | <0.001 | 36.75 | - | - |
| not Exclusive | 8 | | 21 | | 1 | 6.29-357.42 | | - | |

*Source: Primary Data Year 2017*

Table 4 showed that exclusive breastfeeding comparison to the development of infant outcome was significant (P <0.05). Clinically obtained OR 36.75 value means that infants given breast milk for exclusive development corresponding 36.75 times more than those who are not breastfeeding exclusively.

## Discussion

Breastfeeding will make the baby feel sticky and safe. Sense have a baby in the first and second year of life. Breastfeeding infants will help the optimal development after the perinatal period. Accordingly, the results of this study stated that earned comparisons infant development given exclusive breastfeeding at P <0.05 by babies who are not breastfed exclusively. Clinically obtained OR 36.75 value means that infants given breast milk for exclusive development corresponding 36.75 times more than the group of infants who were not given breast milk exclusively. This suitability is because breast milk has nutrients that are best and most complete comparison with other prelakteal foods including infant formula. Type breastfeeding given to infants 6 months of age can also affect the results. This is in line with research conducted by Any S, *et al*[12] that shows that children who are breastfed exclusively the majority (76.2%) did not have the mental emotional problems, while children who do not consume exclusively breastfed tend to have mental emotional problems (64.3%). Based on the research results Ida, *et al*[13] on the status of breastfeeding in infants aged 0-6 months got that out of 76 respondents there were 42 respondents (55.3%) exclusive breastfeeding to their babies and there are 34 respondents (44.7%) did not exclusive breastfeeding to their babies. Babies who are exclusively breastfed will get all the advantages of breastfeeding and nutritional needs are met to the fullest and will experience optimal growth and development. Research Anes MP[14] also showed significant between exclusive breastfeeding with no developmental differences in infants aged 6 to 12 months in Beji Depok subdistrict health center. The results showed that exclusively breast-fed babies are at risk 9.5 times progressing appropriate than experiencing developmental disorders when compared to babies who are not breastfed exclusively.

This can occur because milk contains vital substances needed by babies including protein, carbohydrate, and fat accumulated alveolar of breast. Here excess milk composition when compared to other formula: first, the protein in breast milk is more easily digested than protein available in infant formula. Protein in milk contains about 6% of calories. Additionally, Lactose is the main carbohydrate. Carbohydrates in Human milk contains about 42% of calories. Then, cholesterol as the most essential substances in the highest brain development contained in breast milk. Milk fat contains about 52% of calories. Breast milk also contains vitamins and minerals that are transferred from maternal plasma and lastly, Breast milk contains antibodies from the maternal system which can reduce the danger of infection of newborns [15-17]. Thus, exclusive breastfeeding can boost development in infants because of all the nutrients that the baby needs to achieve the developmental stage, can be met by breast milk. Other research also has the same result is the research conducted by Lidya. N.M and Rodiah[13] in Karang Anyar health center which shows the significance of the development of exclusive breastfeeding in infants aged 3 to 6 months.

In addition, research conducted states that there is a positive relationship between the duration of exclusive breastfeeding within months with the motor component in children and in the overall index of development of children up to the age of 6 years[18]. Another study conducted by Bodnarchuk and Jenifer[19] in Canada also said that the long duration of breastfeeding can enhance cognitive abilities and motor development of infants; motor development (particularly the ability to crawl in infants) can trigger significant changes in the baby's cognitive ability. In another study conducted in Europe with a cohort design, the data found that children who were exclusively breastfed up to 3 full months, had an average rate of intelligence (IQ) 2, 1 point higher than the other children. While the children are breastfed up to 4-6 months had an average rate of intellect 2.6 points higher than that of other children. And the benefits for children who are breastfed longer (> 6 months) may increase the child's intellectual intelligence to 3.8 points higher than children who are not breastfed exclusively. Increased intelligence in infants, will have an impact on improving the development of gross motor, fine motor, language and social independence in infants 8 points higher than children who are not breastfed exclusively. Increased intelligence in infants, will have an impact on improving the development of gross motor, fine motor,

language and social independence in infants 8 points higher than children who are not breastfed exclusively. Increased intelligence in infants, will have an impact on improving the development of gross motor, fine motor, language and social independence in infants

Other studies obtained different results with this study is the result of research conducted in sragen known to most of the growth of children 1-6 months are breastfed exclusively or non-exclusive breastfeeding in the normal category. Most child development given 1-6 months exclusive breastfeeding and exclusive breastfeeding is not normal. No difference between the growth of children breast-fed exclusively with not exclusive ASI. No difference between the child's development in breastfed exclusively with the non-exclusive breast-fed.

## Conclusions and Suggestions

The results showed that there are 60% of infants who breastfed exclusively had been developed accordingly. While38.33% Were not given exclusive breastfeeding progressing dubious and there 1.67% deviate baby development because it is not exclusively breast-fed. The study states that there is a significant relationship between exclusive breastfeeding with the development in infants. Infants given breast milk for exclusive development corresponding 36.75 times more than those who are not breastfeeding exclusively

Further studies on the things that relate to the development of children who are limitations to this study as a stimulus factor, systemic disease factors, and comparison of the frequency of breastfeeding and giving PASI. In addition, other researchers also need to use the data scale and measuring devices are better than the ones used in this study. The study design with the case-control approach also will show better results.

## Abstract

Caesarean delivery will cause mother to experience anxiety. It can cause interference to the physiological processes in the body. This research aims to find effectiveness of classical music therapy on anxiety level of casarean section mother at Syekh Yusuf Regional General Hospital, Gowa district, by using Hamilton Rating Scale (HARS). This research was an experimental research with a pre-experimental design of one group pre-test and post-test design. The sample was 30 caesarean mothers who met the criteria.

Based on the results of Wilcoxon rank statistical analysis test, p value = 0,000 and smaller than the α value determined at 0.05. Therefore, it can be concluded that classical music therapy is effective to reduce anxiety level of caesarean mothers.

***Key words:*** *Classical music, anxiety, casarean section*

## Introduction

Childbirth is a process of expelling the product of conception from the uterus through the vagina to the outside world. Maternal Mortality Rate (MMR) in Indonesia has not yet reached 102 per 100,000 live births. According to data from 2012 Indonesian Health Demographic Survey (IDHS), Maternal Mortality Rate (MMR) in Indonesia is around 359 per 100,000 live births, an increase compared to 2007 with 228 per 100,000 live births. Although global intervention urges that the development to Millennium Development Goals (MDGs) in 2015 is below the achievement target.1,2

World Health Organization (WHO) sets standard rate for caesarean section in a country is around 10-15% per 1,000 births in the world. According to WHO, the increasing rate in sectio caesarea childbirth among many countries all over Asia reaches 110,000 during 2007-2008. In Indonesia the incidence of caesarean increased in 2000 by 47.22%, in 2001 by 45. 19%, in 2002 by 47.13%, in by 46.87%, in 2004 by 53.2%, in 2005 by 51.59%, and in 2006 by 53.68% and in 2007 there was no significant data.6 National Survey in 2009 stated there is 921,000 caesarean section from 4,039,000 childbirths or around 22, 8% of all childbirths.[1,3]

Caesarean section is the delivery through an incision on uterine wall through the front wall of abdomen. It can also be defined as hysterotomia to give birth to a fetus from uterus. Caesarean section is a priority consideration because it can save the lives of both mother and baby. However, the caesarean section process is not a safer alternative because it requires special supervision of indications and post surgical care for cesarean section to prevent inappropriate supervision that will result in death.[4,5]

Anxiety is unreasonable fear and is not supported by the situation. When an individual feels anxious, he/she feels uncomfortable or afraid or may have a hunch even though he/she does not understand why the disruptive emotions occur. There is no object that can be identified as anxiety stimuli. Further definition stated that anxiety is an emotion and subjective experience of an individual that is communicated interpersonally, having its own strengths and difficult to be observed directly.[6-10]

The data was obtained from Regional General Hospital Sheikh Yusuf Gowa regarding normal and caesarean section childbirth from 2015 to 2017. Normal delivery in 2015 is 1,011 patients, in 2016 there is 1,143 patients, and in 2017 there is 558 patients. While

caesarean birth in 2015 is 308 patients, in 2016 there is 250 caesarean childbirths, and in 2017 there is 443 caesarean childbirths. The number of patients indicate that there are a large number of caesarean childbirth every year. Based on the preliminary study at Regional General Hospital of Sheikh Yusuf Gowa, those who chose normal delivery are 1-2 patients and they experience anxiety symptoms, while caesarean is around 2-3 patients and most of them experience anxiety.

Further, the researcher is interested to conduct a research on "Classical Music Therapy Effectiveness on Anxiety Level of Casarean Section Mother at Sheikh Yusuf Gowa Regional General Hospital".

## Material and Method

### Research Design

This research was quantitative. The method was Pre-Experimental uisng One Group Pre-Test - Post Test, as the measurement of anxiety before and after the administration of classical music therapy on caesarean mothers.

### Population and Sample

There were 83 mothers who gave birth by caesarean section at Regional General Hospital of Sheikh Yusuf Gowa in 2019. Meanwhile, the sample was 30 people who met the sample criteria at Regional General Hospital of Sheikh Yusuf Gowa.

### Sampling Technique

The technique was purposive sampling. The purposive sampling with inclusion criteria as follows:

1) Willing to be a respondent.

2) Inpartu mothers scheduled for caesarean

3) Primigravida mothers

Data Analysis

The data analysis to determine the effects of classical music therapy to reduce anxiety level on caesarean section mothers was Wilcoxon rank test with alpha = 0.05.

RESULT AND DISCUSSION

This research was conducted on caesarean section mothers in 2019 by using one group pre test and post test design pre experimental design involving 30 respondents, the results are as follows:

**Table 1: Efectiveness of Classical Music Therapy on Reducing Anxiety Level of Caesarean Section Mothers at Regional General Hospital of Syekh Yusuf Gowa 2019**

| Variable | F | P | α |
|---|---|---|---|
| Negative Ranks | 30 | 0.000 | 0.05 |
| Positive Ranks | 0 | | |
| Ties | 0 | | |
| Total | 30 | | |

Data source: Wilcoxon test

The table indicates that from the 30 respondents given the music therapy, all respondents experience a decrease in their anxiety levels. The results of non-parametric statistical tests analysis using Wilcoxon with a confidence level of 95% ($\alpha = 0.05$), obtain p-value of 0,000, therefore, it can be concluded that classical music therapy is effective to reduce anxiety levels of caesarean section mothers.

## Discussion

Anxiety is a subjective and emotional aspect of an individual since it involves subjective unpleasant feelings and arising due to stress, fear of failure, insecurity and conflict that is usually experienced by patients when they will experience childbirth process.(11) (6) ( (12)

The decreased anxiety level by music therapy occurs because listening to music can activate cells in limbic system that is associated with emotional behavior and autonomic nerves. The limbic system is activated and the individual becomes relax. Trappe also stated that Mozart's classical music with a tempo of 60 seconds/ minute can activate the left hemisphere and right hemisphere of the brain. Both hemispheres are required to prepare music rhythm. Therefore, it will make someone become relax and comfortable after listening to classical music. Music evoked[11,13]

When a person listening to classical music (audio), the sound will travel through ear, vibrate the eardrum, then shake the fluid within ear and vibrate the hair cells in cochlea to further through the cochlear nerve to brain and create imagination in the right brain and left brain which will have an impact in the form of comfort and mood changes. Mood changes (feelings) caused by classical music can reach the left cerebral cortex area.[14,15]

The data analysis using Wilcoxon test obtained p value of 0,000. It can be concluded that classical music therapy is effective to reduce anxiety level of caesarean section mothers at Regional General Hospital of Sheikh Yusuf Gowa. Based on the Research, from a total of 30 samples there are 25 respondents who experience severe anxiety levels before classical music therapy. After the classical music therapy these 25 respondents experience mild anxiety level. There are 3 respondents who experience mild anxiety level before classical music therapy and after given classical music therapy, those 3 respondents experience moderate anxiety level. There are 2 respondents who experience moderate anxiety level before given classical music therapy and after given classical music therapy, those 2 respondents do not experience anxiety at all.

The results of the research are relevant with the research conducted by Dian Novita regarding the effects of classical music therapy on postoperative pain in open reduction and internal fixation (orif) at Dr.H.Abdul Moelok Regional General Hospital in Lampung Province. It is a quasi experiment research and non-equivalent pretest-posttest with control group, sampling uses causative sampling. Further, the results of the study states there is a significant effect of music therapy to reduce level of pain in patients with postoperative ORIF (p-value = 0.000; $\alpha = 0.05$).[16,17]

The results of the research is also relevant with Farhaatun Hayati's research on the effects of classical music therapy on anxiety levels of menopausal women in Pisangan region, Eastern Ciputat, Southern Tangerang. This study used a pre-experiment method with one group pre-post test design. The result indicates there is an effect of classical music therapy to the anxiety level of menopausal women with a value ($p = 0.000$).[16-19]

The anxiety experienced by respondents are also differed from one another. It is because each respondent has a different psychological state so, they have different attitudes in coping with any changes. So, one of the therapy to be used is music. Music can increase creativity, build self-confidence, develop social skills, and improve motor skills, perception, and psychomotor development. It can also be used as a therapy for various needs, such as substituting depressant drugs for those who will face a surgery at the hospital. [17,20-24.]

This is relevant with Djohan who explains that music therapy aims to help expressing feelings, assist physical rehabilitation, give a positive effect on mood and emotional condition, improve memory, and provide a unique opportunity to interact and build emotional closeness. Therefore, music therapy can also help to deal with stress, prevent illness and reduce pain.[15]

The selection of classical music therapy is relevant to music characteristic that is non-dramatic, dynamically predictable, soft, harmonious tone and without lyrics at a tempo of 60-80 bpm (beat per minute) . Therefore, it is expected that listening to Mozart's classical music therapy can help reduce anxiety in inpartu mothers for caesarean[14].

The researcher concludes that the anxiety of mothers decrease after Mozart's classical music therapy, Sonata for Two Pianos in Major, Type 448. It occurs because classical music which has alpha and tetha frequency categories of 5,000-8,000 Hz can stimulate the body and mind to be relax so, it stimulates the brain to produce serotonin and endorphin hormones to make the body relax and make the heart rate stable. Serotonin is a chemical substance that transmits nerve impulses throughout the space between nerve cells or neurons and has a role to prevent anxiety, vomiting and migraines. Changes of serotonin level into melatonin hormone has a regulatory effect on relaxation, so it can improve mood, create a calm, relaxed, safe, or pleasant atmosphere to make patients feel comfortable[9,14].

## Conclusion

Based on the results and discussion in the previous chapter, it can be concluded that: Classical music therapy is effective to reduce anxiety of caesarean section mother at Syekh Yusuf Gowa Regional General Hospital.

# Effectiveness of Baby Spa and Music Therapy on Growth and Development of Baby

**Sri Handayani[1], Anwar Mallongi[2]**

*[1]Lecturer of Department Of Midwifery, Health Polytechinic Jakarta 1, [2] Professor of Department of Environmental Health, Faculty of Public Health, Hasanuddin University, Makassar*

## Abstract

Providing a stimulus given shortly after the baby is born gives a very important effect for the development of children. In the development of a child, stimulation is a basic need and also plays an important role to develop. Dewanti,[1] revealed that baby spa is one form of nonverbal communication that can be done by the mother. This spa treatment is very beneficial for baby's health and development. Infants who have been treated with the spa will look fresh, healthy, vibrant and growth and development faster than infants who never did at all spa.

In addition to the baby spa, music therapy is also one therapy that can stimulate thinking, improve concentration and memory, and can improve the cognitive development of infants and children. Music therapy is an effort to improve physical and mental quality with sound stimuli consisting of melodies, rhythms, harmony, timbre, shapes and styles that are organized in such a way as to create useful music for mental and mental health[2].

This study was conducted to determine the development of infants through baby spa and music therapy, and useful as a follow-up to improve the growth and development of the baby so that the maximum. The population in this study is 6-12 months old baby with sampling using quota sampling technique with a sample of 60 babies. Quantitative quasi-experimental research method with the only posttest with control group design approach, where in the case group was given continuous intervention for 16 days while in the control group only 1 interval was given at the beginning of the meeting, at the end of the study the two groups will be measured the level and compared the results, with the General Linear Model Repeated Measures (GLM RM) test.

The result showed that the average of the first measurement scores in the lower case group was slightly lower than the control group that was 8.97 (SD = 0.928), while the mean score on the second measurement and the third measurement in the case group was higher than the control group 9.53 (SD = 0.776) and 9.80 (SD = 0.484). The result of the analysis with multivariate approach showed significant difference KPSP score for growth and development on the third level of measurement (p-value <0,007). Multivariate analysis can explain the variation of growth and development variable amount of 16,1%, there was a significant effect difference between case group and control group in improving growth and development score (p-value <0.000) amount of 44.7%.

***Keywords**: Baby spa, music therapy, the growth and development of the baby.*

## Introduction

Babies born already have a number of innate reflexes and an urge to explore the surrounding environment. Reflex occurs when the baby receives a stimulus or stimulation, because the baby is very sensitive to the

**Corresponding Author :**
**Sri Handayani**
Email : handayani3069@gmail.com

environment and the stimulus given. Touch is one type of stimulation. This was stated by Widyastuti and Widyani (2008) where types of stimulation can be visual, auditory, kinetic and touch stimulation. Touch stimulation that has been given by the community to their children is by touch and massage[3].

Aspects of growth and development in children, today is one aspect that is taken seriously by experts, because it is an aspect that is very influential in the process of forming a person in the future to adulthood both physically and psychosocially[2]. In the development of a child, stimulation is a basic need and also plays an important role to be able to develop optimally. At the age of 1-3 months the baby also needs cuddles, touches and cradles of his parents, especially the mother[4].

Dewanti[5] revealed that the baby spa is one form of non-verbal communication that can be done by the mother. This spa treatment is very beneficial for baby's health and development. Infants who have been treated with spas will look fresh, healthy, vibrant and their growth and development are faster than babies who have never done a spa at all. According to Hammer and Turner in Soedjatmiko, baby spas are one tactile stimulation in infants that is a kind of sensory stimulation that is important for optimal infant development. These tactile stimuli can take the form of massaging or swimming. Nowadays, experts have been able to prove naturally about what is long known to man, namely touch therapy and massage in infants have many benefits to the physiological changes of the baby let alone carried out by the baby's mother. The mother is the person closest to the baby, where the mother's massage to her baby is a gentle sweep of the bonding of affection. Mother's skin is the earliest skin known to babies[1]. The results of research conducted by Suharto, there is an effect of baby stimulation in the form of massage, gymnastics and games on gross motor development of 3-8 months old infants, followed by research conducted by Dewi, et al, showing that babies who routinely do the majority of baby spas experiencing normal development, namely 86.7%[6].

Several studies have proven that music has a strong influence on human life. Experts argue that music affects human intelligence, physical, mental and emotional health. Such research was carried out by Dr. Alferd Tomatis and Don Campbell. They termed the "Mozart effect". Compared to other classical music compositions, melodies and high frequencies in Mozart's works are able to stimulate and empower creative and motivational areas in the brain[7].

## Materials and Method

The research design used a quasi-experiment with pre-posttest with control group design, where in the case group were given interventions continuously for 3 months, whereas in the control group only given intervention 1 (one) time at the beginning of the meeting, during the study the two groups would be measured the rate of growth and development every month for 3 times during posyandu visits and compared the results. The population and sample in the study were all 6-12 months old babies at Pondok Benda health center and Benda Baru health center in South Tangerang using a minimum sample of 30 respondents in the intervention group and 30 respondents in the control group in a total sample of 60 respondents. The analysis was carried out by testing the General Linear Model Repeated Measures (GLM RM).

## Results

Table 1 shows that the average age of respondents in both groups in the case group was 29.6 months and the control group was 29.2 months. The highest average parity group in the case group and control group was 2 people. The sex of the respondents with the largest proportion were men in both groups. The largest proportion of respondents' level of education is tertiary education, namely high school and PT in both groups and the largest proportion of maternal employment status does not work in both groups. Based on the history of exclusive breastfeeding the proportion of the majority said giving exclusive breastfeeding to the baby both in the intervention group and in the control group.

**Table 1. Description of characteristics respondents**

| Yes | 21 | 70.0 | | 20 | 66.7 | |

Table 2 shows the average value of growth and development of infants experiencing an increase in measurements I, II and III in the intervention group and tended to decrease in the control group. Statistical test results showed no differences in growth and development of infants between the intervention group and the control group at measurement I after 1 month of treatment (p value = 0.080), but there were differences in growth and development of infants in measurement II after 2 months of treatment ( p value = 0.044), and there are differences in growth and development of infants at measurement III after 3 months of of treatment (p value = 0.001).

**Table 2 Growth and Development of Babies in Measurements I, II and III**

**In the intervention group and control group**

| Variable | Intervention Group (n=30) | | Control Group(n=30) | | P value |
|---|---|---|---|---|---|
| | Mean | 95% CI | Mean | 95% CI | |
| Growth and development of babies: | | | | | |
| measurements I (after 1 month) | 8,97 | -0,850-0.050 | 9,37 | -0,850-0.050 | 0,080 |
| measurements II (after 2 months) | 9,53 | 0,011-0,789 | 9,13 | 0,011-0,789 | 0,044 |
| measurements III (after 3 months) | 9,80 | 0,377-0,957 | 9,13 | 0,377-0,957 | 0,001 |

The average of the first measurement scores in the intervention group was lower than the control group, which was 8.97 (SD = 0.928), while the average score in the second measurement and the third measurement in the intervention group was higher than the control group, which was 9.53 (SD = 0.776) and 9.80 (SD = 0.484). This can also be seen in the plot analysis as below:

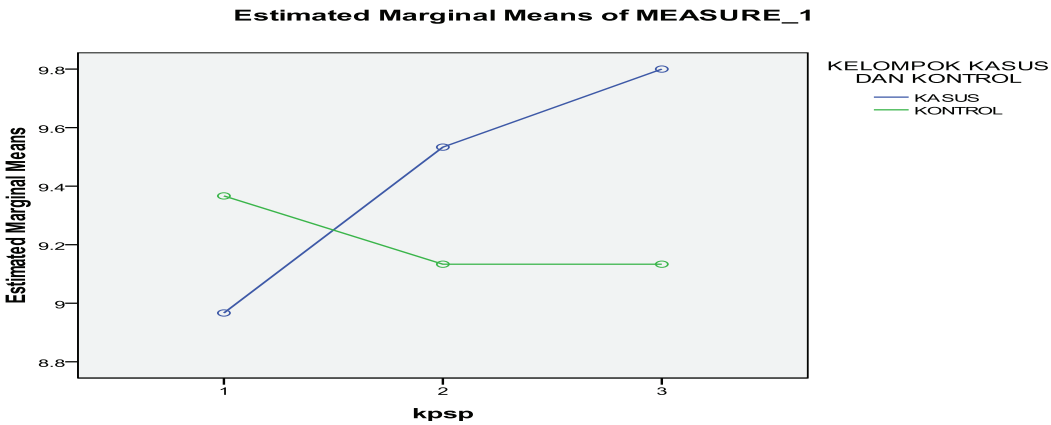

**Figure 1. Graph of interaction between measurement time and group on growth and development with KPSP form**

In general, the interaction analysis contained differences in growth and development between measurements (at month 1 and month 2 and month 3) between the intervention group and the control group (p value <0.001) with a power difference of 32.3%. The results of the analysis with the GLM-RM analysis approach showed that there was a significant difference in the score of KPSP for growth and development at the three measurement levels (p-value = 0.007), with a power of difference of 16.1%. Interaction analysis between the intervention group and the control group showed a significant difference in the effect of increasing growth and development scores (p-value = 0,000), with a strength of difference of 44.7%.

## Discussion

The results showed that the age of respondents in the two groups on average in the case group was 29.6 months and the control group was 29.2 months. The highest average parity group in the case group and control group was 2 people. The sex of the respondents with the

largest proportion were men in both groups. The largest proportion of respondents' level of education is tertiary education, namely high school and PT in both groups and the largest proportion of maternal employment status does not work in both groups. Based on the history of exclusive breastfeeding the proportion of the majority said giving exclusive breastfeeding to the baby both in the intervention group and in the control group. Based on the results of the study we can see that the characteristics of respondents in the intervention group and control group mostly have similarities.

Growth and development of infants during the intervention showed that the average value of growth and development of infants experienced an increase in measurements I, II and III in the intervention group and tended to decrease in the control group. There are differences in growth and development of infants in measurement II after 2 months of treatment (p value = 0.044), and there are differences in growth and development of infants at measurement III after 3 months of treatment (p value = 0.001).

In general, the interaction analysis contained differences in growth and development between measurements (at month 1 and month 2 and month 3) between the intervention group and the control group (p value <0.001) with a power difference of 32.3%, there was a significant difference in the score of KPSP for growth and development at all three levels of measurement (p-value = 0.007), with a strength of difference of 16.1%. Interaction analysis between the intervention group and the control group showed a significant difference in the effect of increasing growth and development scores (p-value = 0,000), with a strength of difference of 44.7%.

Based on the results above shows that the combination of baby spa and music therapy has an impact or influence on the growth and development of the baby. The combination of these two treatments produced a significant effect on the growth and development of the baby. Esti (2016) mentions in his research, Solus Per Aqua is a body treatment using water media. Babies or children who have been treated with a spa will look fresher, healthier, more vibrant[8].

According to Minister of Health Regulation No.1205 / Menkes / X / 2004, Solus Per Aqua is a traditional effort that uses a holistic approach, through comprehensive treatment using a combination of hydrotherapy (water therapy) and massage (massage) methods that are carried out in an integrated manner to balance the body, mind and feelings. The baby spa itself is having 2 treatments namely massage and also hydrotherapy. Which is where one of the treatments has a function as a medium that can stimulate the baby's motor movements. By playing water, the baby's muscles will develop very well, the joints grow optimally, body growth increases and the body becomes supple. The baby's motor skills will develop more rapidly than if he only plays on the floor, because when swimming in the water, the effects of gravity are very low. According to a study from the University of Science and Technology in Norway, babies who can swim have a better balance, and are able to reach objects around them more easily than babies who are not swimmers[9].

Based on the results above shows that the combination of baby spa and music therapy has an impact or influence on the growth and development of the baby. The combination of these two treatments produced a significant effect on the growth and development of the baby. Esti mentions in his research, Solus Per Aqua is a body treatment using water media. Babies or children who have been treated with a spa will look fresher, healthier, more vibrant. According to Minister of Health Regulation No.1205 / Menkes / X / 2004, Solus Per Aqua is a traditional effort that uses a holistic approach, through comprehensive treatment using a combination of hydrotherapy (water therapy) and massage (massage) methods that are carried out in an integrated manner to balance the body, mind and feelings. The baby spa itself is having 2 treatments namely massage and also hydrotherapy.

Regular massage can improve child growth and development. Research conducted by Schanberg in 1989 cited by Setyaningsih shows that touch, tactile or massage affect the production of enzyme ODC (ornithin decarboxylase), an enzyme that is a sensitive indicator of cell growth and tissue development, release of growth and development hormones[3].

In addition to baby massage and water therapy, another action combined in this study is music therapy. Baby music therapy can be an alternative to educate the

child's brain since he was still in the womb. Baby music therapy is indeed proven to affect baby growth later on. Children who have been playing music in the womb have higher intelligence, are easier in mathematics, have a stronger personality and more easily absorb many things that occur in their environment. This is because music for babies can balance the development of the right and left brain. Not only that, psychologically baby music therapy can bring the emotional connection between mother and child closer. Baby music therapy also affects the condition of the mother. Mothers can experience relaxation and calm themselves from activities when listening to music. This is certainly very good because mothers who are psychologically calm and furthest from stress will have a good impact on the child[10-12].

## Conclusion

The results obtained were significant differences between the measurements of resistance I, II, and II in infants carried out a combination of Baby Spa and music therapy. Based on the results of the study found a significant difference between stage I, II and II measurements between babies carried out combination of Baby Spa and therapy music with babies that is not done. The growth and Campball, Donald (2002). Efek Mozart Untuk Anak-Anak, Jakarta :PT.Gramedia Pustaka Utama.of infants in the group of infants who carried out the baby spa and music therapy regularly were higher than the group of babies that were not performed[8].

# The Role of Kamoro Traditional Leaders in Communities Empowerment and Health in Mimika District

**Vince Tebay[1], Anwar Mallongi[2]**

*[1]Senior Lecturer of Cenderawasih University, Jayapura, Papua,[2]Professor of Faculty of Public Health, Hasanuddin University, Makassar Indonesia*

## Abstract

This study uses a qualitative method. Researchers as research instruments, collect, process, analyze, interpret, and verify any data and information obtained from informants. Data obtained from participants is enriched, supplemented, and refined through in-depth and free interviews, to good informants who meet the requirements so that the validity and reliability of the data can be justified. The results of this study have shown that the role of Kamoro traditional leaders in community empowerment and health in Mimika Regency. Pioneering traditional leaders who marry programs of teaching traditional values into various aspects of life, increasing public interest in formal and informal education. These traditional leaders are also one of the bridges between the government and the community and also with the company, in this case PT. Freeport. The social interaction of traditional leaders with the government and other community leaders in the context of empowering and improving public health in rural areas, is done through social contact and communication through various channels, both formal and informal, both with the community or with other regional leaders such as the government.This traditional figure has played a role in providing an understanding of the concept of empowerment to the community where they have also been involved as members of community organizations Angmume and Kamoro community development institutions which are present as institutions for community empowerment and health protection. Giving an understanding of empowerment is conveyed in a conceptual framework according to the Kamoro tribal culture approach. In relation to empowerment, related to the problem of stages in the representation of adat in the form of programs, and the higher the stages (local, regional and national), the empowerment perspective is broader and does not go directly to technical issues.

***Keywords****: Role of Customary Leaders, empowerment, agent of change, work ethic, health*

## Introduction

Changes in socio-economic opportunities in various sectors of life in the Kamoro tribe as one of the products of accelerating modernization that are difficult to avoid, apparently cannot be captured and examined equally among the people. This is caused by differences in abilities, education, attitudes, and tempo of adjustment to developing phenomena or new symptoms in modern life so that it becomes a major factor causing socio-cultural inequality both in general society but also for Kamoro people in Mimika Regency.

The gap in ability to overcome difficulties and life challenges faced by one group with other groups in society, tends to cause differences in attitudes between the groups. Besides that, the unequal contribution of ownership and control of living facilities can also threaten the continuity of emotional solidity that has been well established within a community. These differences led to the growth of conflict and dichotomy between sub-groups and between groups themselves in the community in the Mimika area.

In this context, the government and PT Freeport through the Amungme and Kamoro Community Development Institute (LPMAK), have involved many

**Corresponding author**

email address: tebayvince@gmail.com

community leaders or traditional leaders to oversee various community empowerment programs, hoping that they can be more effective in the implementation process. Community empowerment in this case is more directed at disadvantaged communities through efforts to change social structure (realocation of power), so that the community is expected to be able to master their lives by understanding and implementing the concepts of self-help, participation (participation) participation), net working, and equity[1-4]

Meanwhile the reality that exists at the level of rural communities in the Kamoro tribal region, is still far from what is expected to change. This is where the role of community leaders and local elites turned out to be quite effective in influencing the lives of the people themselves, both in the social, economic and political fields. The elite group, among others, work as officials or officials of the local government and community leaders, and one of the community leaders who have a strategic role in this case is the community leader. Community leaders in the Kamoro tribe are figures who have important and central positions in the community, their position is related to their position as educated people and has more wealth economically compared to the economic life of other general public, so that if there is a problem this traditional leader can provide a solution. As elites, traditional leaders provide knowledge to the inhabitants of the village, and with the wealth they have, traditional leaders always become a patron to anyone and there are many villagers who depend on and hope for these traditional leaders.[5-7]

## Materials and Method

### Research Design

This research uses a case study approach with the aim of examining Kamoro traditional leaders in Timka in its activities to empower the community. The study was conducted through qualitative methods that focused on cultural research with participatory methods. The qualitative method contains the meaning of a description of the data using words and sentence lines. Qualitative research aims to understand a social situation, events, roles, interactions, and groups. The study was carried out in stages by understanding social phenomena by differentiating, comparing, cataloging, and grouping study objects.

### Data source

The research data were sourced from informants, namely data from interviews with the main actors, both from the ulama and from rural communities related to the empowerment program. While secondary data sourced from articles, literature studies, documents, statistical data, archives from the government and private parties, as well as mass media.

### Informant

Informants are people who provide data and or information in the form of words or actions, and know and understand the problem being investigated. Informants are obtained according to specific objectives, meaning that selected informants who meet the requirements based on the characteristics of the research objective.

## Results and Discussion

The Role of Kamoro Indigenous People in Customary Institutions The first pillar concerns aspects of the use-value customs for the economic development of the Kamoro people to answer the challenges of meeting the economic needs of the community. The second pillar concerns the survival aspect of the socio-cultural identity of the people which supports the integration of the Kamoro people but also as Papuans and the National people so that the outside world can also get to know the Kamoro people. The third pillar deals with the ability of the community to carry out the organization of potential customs and socio-cultural values in an autonomous, independent and professional manner.

The Objectives of the Kamoro Indigenous Peoples Institutions in general are, the Preservation and Development Program of Kamoro customs and the socio-cultural values of the Kamoro people that aims to preserve and develop local customs and cultural values, especially in the existing local arts and culture.

Besides the general objectives, they also have a specific purpose, namely; a.) Increase community participation in the assessment of the socio-cultural potential of the community (especially in the field of local art and culture) as a social capital for development, as well as mapping opportunities and threats in the framework of planning, implementing, controlling, evaluating and following up and taking responsibility

for rural community development activities; b) Empowering community groups developing local art and culture, especially in the context of improving the welfare of these groups in an effort to continue to preserve the said cultural arts, through the development of appropriate productive economic ventures. c) Support the development of the Kamoro regional culture that can compete with other cultures in bringing economic value to the Kamoro tribe residents to achieve an increase in the quality of sustainable cultural resilience and develop the tourism economic sector going forward.

Development of indigenous potential in the Kamoro community

There are a number of roles played by Kamoro adat leaders in Mimika Regency in providing an understanding of empowerment to the community, through the following: Changing the Kamoro People's View of Social Change. The views of Philip, et al[7] factors that influence social change, namely because of the driving factors and inhibiting factors of social change. The driving factor is a factor that encourages and triggers social change, while the inhibiting factor is a factor that inhibits or complicates social change. These driving factors can occur from the community and factors from outside the community concerned.

Questions related to the above aspects are addressed to the traditional leader of Acting Chairperson Lemasko, Gergorius Okuare in February 2020 in a meeting which was also attended by the author, according to him related to the question whether social change also influences the cultural and health changes of the Kamoro community; For Kamoro people themselves, we always follow the changes that occur, but in those changes we still respect our cultural values. The Kamoro people have seasons and climate in the Kamoro adat area and for a long time we Kamoro people have made peace with our nature.

**Protecting the Environment & Culture**

The universe has its own meaning for the lives of our people, especially inland communities. Nature is like a mother who always accompanies and accompanies the lives of her people, nature always accompanies, each tradition is so united with the pattern of life. Alignment becomes evidence or a real sign of every set of daily needs. Nature is still a sign to share. The shade of trees as a hue and a complement in the process of life blend and coexist. Proof of creating harmony. Formation based on true stories, steps and life seems to grow in harmony. The close relationship between culture and the environment is very clear to indigenous peoples.

Questions relating to the above aspects are addressed to other Lemasko traditional leaders namely, Dominikus Mitoro, in the same month namely February 2020 in a meeting he said that;

"The existence of the Komoro indigenous territories has been completely eroded apart from the garbage disposal by PT Freeport, but also many investors who entered the Kamoro area they encroached on our forests, our sago hamlets, our mangrove forests which are the source of our lives, The question is whether we Kamoro adat institutions can save our environment that is still separated from this life. That is why our role here is to provide counseling to the Kamoro community so that every investor who enters the traditional Kamoro area must get the blessing or permission from our institution. Even though in the past our land, our hamlet, everything we owned was taken by all those who entered our area, but we still have hope even though it is small, we want to protect our village.

This is the task of our indigenous community institution. "The Kamoro tribe is also known as a tribe that has a high ability in terms of sculpture. A National Geographic publication. stated that: In their daily life, Kamoro tribe residents used to make various types of carvings, for various purposes. Shields, paddles, sago bowls, drums and other everyday items, they make them so beautifully. In addition they also make special carvings. Wemawe, a statue in the form of a human and mbitoro, totems made for ancestors, is the creation of Kamoro carving artists that are difficult to find in the world. All these carvings they made with two purposes: for the traditional ceremony and also for them to sell.

Preparing Kamoro Tribe Human Resources National development policy by adhering to Law Number 22 Year 1999 concerning Regional Autonomy brings strategic changes to the quality of Human Resources that each region needs to be able to compete positively with other regions in Indonesia. Various efforts need to be made to realize the quality of Human Resources. Education is

one of the main efforts to imply these desires, but it also requires a long time and large costs. Various types and levels of education offered by the government. Improving the quality of human resources is the responsibility of all parties. Thus, development in education is one of the successes of a country / region.[8-10]

The Kamoro tribe community also faces problems faced by Kamoro tribes today, he said, ranging from minimal household economic capacity, not to mention the customs and cultural habits that prevent a person from being able to progress and develop. One example of the case, he said, was that Kamoro residents had a habit of living in a nomadic life (kapiri kame) to collect food supplies provided by nature because of their pattern of living as gatherers. "There are many Kamoro people's habits that are not so easily removed, such as closeness to children. Children are always taken away from the village to look for fish and sago," he said. As a result, children cannot go to school. Children should be left independent and encouraged by parents to go to school.

The question is how is Lemasko's role in overcoming, increasing and preparing Kamoro human resources? Following is the answer;

"The urgency of developing Kamoro's human resources is a key factor in winning global competition at this time, so we Lemasko also does not remain silent. This is our consequence as an adat institution that we realize will be increasingly intense competition amid uncertainty. So that the strategic steps that have also received full support from all stakeholders. Besides that, strengthening the Kamoro tribe human resources who also want to lead to superior humans has a close correlation with improving the quality of the children of the young Kamoro tribe. At one time the Kamoro children could also win the competition amid the rapid changes in the world of business, political economy and culture.

The commitment and realization that we have done is that as traditional leaders of the Kamoro community we have utilized the one percent budget funds provided by PT Freeport so that in strengthening human resources through the program which we have encouraged the Amungme and Kamoro community development agencies to increase the annual budget allocation in the field of education, health so that the funds financed can have an impact on the development of human quality that continues to move up and can be put to good use by the Kamora children. We as Kamoro traditional leaders have planned in the work program of our traditional institutions that natural resources and human resources are the most important and most strategic factors in developing prosperity, as well as the success in building our better society.

**Understanding independence**

Understanding Independence according to Masrun[11], independence is an attitude that allows someone to act freely, do something on their own and for their own needs without help from others, or think and act original / creative, and full of initiative, able to influence environment, have confidence and get satisfaction from their business. Self-understanding means being able to act according to circumstances without asking or depending on others. Independent is where a person wants and is able to realize his own desires / desires which are seen in real actions / actions in order to produce something (goods / services) for the fulfillment of his life needs and his fellow man. Every activity carried out by someone in order to succeed according to his wishes, then it requires a strong independence[12].

**Self-Awareness**

In community empowerment is inseparable from the awareness of independence where Community Empowerment Strategies There are three main strategies of community empowerment in the practice of social change, namely traditional, direct action, and transformation which are described as follows: Traditional strategy, Direct strategy -action and transformative strategy.

***Responses to questions by Mr. Robertus Waraopea, are also the chairman of Lemasko and the chairman of the LPMAK Management Board;***

"In this section what the Kamoro traditional leaders do is how they use the 3 approaches above, namely; traditional approach, direct action or direct approach and transformative strategy in fostering the independence of the Kamoro tribe community. According to the results of the interview that if this traditional institution encourages the three approaches above, in community

empowerment it is certain that the Kamoro community will be independent and prosperous.

**Ethical Clearance** - Taken from University ethical clearance committee

**Source of Funding**- Self

**Conflict of Interest** – Nil

## Conclusion

It can be concluded that in playing its role as Kamoro traditional figure, it can encourage the community to be able to plan, implement and oversee the running of programs for the benefit of social, health, education and economic life in the Kamoro, Mimika community.

# Effect of Brown Algae Extract Sargassum sp on Malondialdehyde Levels in White Rats (Rattus Norvegicus) Pregnant Wistar Strains

**Dahniar[1], Suryani As'ad[2], Nasrudin A.Mappeware[3], Gemini Alam[4], Budu[5], Rosdiana Natzir[6], Burhanuddin Bahar[7]**

*[1]Postgraduate Doctoral Program, Faculty of Medicine, Universitas Hasanuddin, [2]Department of Clinical Nutrition, Faculty of Medicine, Universitas Hasanuddin, [3]Faculty of Medicine, Universitas Muslim Indonesia, [4]Faculty of Pharmacy, Universitas Hasanuddin, [5]Faculty of Medicine, Universitas Hasanuddin, [6]Department of Biochemistry, Faculty of Medicine, Universitas Hasanuddin, [7]Faculty of Public Health, Universitas Hasanuddin.*

## Abstract

Pregnancy is an inflammatory condition that produces unstable oxidative stress and can damage macroeconomic tissue including DNA and protein which disrupt the placentation process. Increased levels of malondialdehyde as an indicator of lipid peroxidation and decreased levels of antioxidants. This research was conducted experimentally with pretest-posttest Control Group Design. Using three treatment groups for the white rat (Rattus Norvegicus) test for Pregnant Wistar Strains. Twenty-one samples consisted of three groups (Group 1 negative control, Group 2: sea algae extract Sargassum sp dose 300 mg/kg bb/day, Group 3: sea algae extract Sargassum sp dose 600 mg/kg bb/day. Malondialdehyde levels were determined by examination Eliza sandwich The results showed that Sargassum Sp brown algae extract had a significant effect on decreasing levels of malondialdehyde (300mg p: 0.008 dose; 600mg p: 0.001 dose) in white rats (Rattus norvegicus) Pregnant Wistar Strains.

***Keywords:*** *Sargassum sp, Malondialdehyde, Rattus norvegicus.*

## Introduction

In pregnancy will increase, increase, increase. Oxidative stress that occurs can occur because antioxidants do not compensate. Therefore, under certain conditions triggered by oxidative stress, endogenous antioxidants become insufficient and require exogenous antioxidants to maintain optimal cellular function.

Malondialdehyde (MDA) levels in pregnant women are higher than in nonpregnant women. Increasing MDA levels increase with increasing gestational age from the first, second and third trimesters, in this case, there has been an increase in peroxidation which is a marker (marker) to increase free radicals in the blood[1]. Oxidative stress will disrupt the placentation process. Abnormalities associated with certain diseases for example preeclampsia, mola hydatidosis, and abortion. Increased risk of failure associated with increased free radicals that increase in the development of placental function and effect on the fetus[2]. The increase in oxidative stress corresponds to an increase in lipid peroxidation formation. Oxidative stress will cause damage to trophoblast cells which will start to become abortion (miscarriage).

Reactive oxygen species (ROS) can be obtained endogenously or exogenously but both can affect oocytes and embryos and can also cause oxidative DNA damage which increases the speed of mutagenesis and chromosomal instability[3]. Mitochondrial dysfunction by stress or improper mitochondrial integrity control causes an increase in electron leakage from the respiratory chain. Very reactive superoxide causes itself to be very unstable. This can damage the different macromolecules in the mitochondria including fats, proteins, and DNA that can affect mitochondrial function and stimulate extensive electron leakage and ROS production[4].

Brown algae Sargassum sp has the highest antioxidant activity compared to red and green seaweed and the main antioxidant component found in Sargassum sp is a polyphenol compound[5]. Most compounds in the brown algae Sargassum sp are carotenoids which act as antioxidant activities. The ability of polyphenols as antioxidants is based on the presence of hydroxyl groups which are aromatic compounds as contributors to hydrogen atoms for free radicals and the ability of electron delocalization which has a double bond for conjugation, as well as the stability of the resonance structure[6].

## Materials and Method

This study used a simple randomized design method using three groups of test animals of white rat (Rattus norvegicus) strains of pregnant Wistar and were treated as follows:

a. Negative Control Group (Group 1): mice were only given distilled water on days 7-19 of pregnancy with a frequency of 1 time per day.

b. Treatment group 1 (Group 2): rats were given seaweed extract Sargassum sp on days 7-19 of pregnancy with a dose of 300 mg/kg rat frequency 1 time per day

c. Treatment group 2 (Group 3): rats were given seaweed extract Sargassum sp on days 7-19 of pregnancy with a dose of 600 mg/kg rat frequency 1 time per day.

In this study, the sample was adjusted to the inclusion criteria, while the prospective white rat (Rattus norvegicus) strain of female Wistar with a bodyweight of 200-250 grams with age 3-4 months. Female mice were mated with male rats during the estrous phase with a system of one female and one male partner for 24 hours which had previously been examined by vaginal smears to confirm the lust phase of the estrus period(7). The next day the female rat was examined to ensure marriage by checking vaginal smears containing much sperm and examined signs of pregnancy such as signs of plugs (vaginal redness, swelling and thick lumps in the vaginal introitus) which were stated as the first day of pregnancy. The cage is placed at room temperature using 12 hours of bright lighting and 12 hours of darkness, as well as maintaining the humidity of the room. Each rat was given once a day according to the treatment set.

The three groups of test animals, each consisting of seven white rats (Rattus norvegicus) strains of pregnant Wistar, were examined for Malondialdehyde levels on the 7th day of pregnancy as a pre-test examination, and given the intervention of brown algae extract Sargassum sp in both treatment groups according to the dose of treatment predetermined and negative control groups are only given equates once a day. The treatment began on the 7th day until the 19th day. Furthermore, on the 19th day, the level of malondialdehyde was examined as a post-test.

All conditions and handling of test animals are carried out by following a protocol approved by the medical research ethics committee of the Faculty of Medicine, University of Hasanuddin, number: No.199 / UN4.6.4.5.31 / PP36 / 2019.

Manufacture of Sargassum sp brown algae extract

The tools needed for the manufacture of Sargassum sp brown algae extracts are trash, blender, 30 mesh sieve, scales, stirrer, 1-liter tube, filter paper, Erlenmeyer flask, measuring flask and rotary evaporator, while the material for extracting is Sargassum sp. water, and ethanol 96%. Sargassum sp brown algae powder which has been mashed in maceration with 96% ethanol solvent, then allowed to stand for 3 days but still stirring every day. The ethanol extract is then stored in the Ellen Meyer flask to be evaporated with a Rotary vacuum evaporator at 40°C to produce a familiar extract (concentrated) with a constant weight.

Measurement of malondialdehyde levels using an enzyme-linked immunosorbent assay (ELISA) sandwich technique.

Prepare all reagents (standard, control) and samples. Prepare a strip well that is conditioned at room temperature for ± 30 minutes. Add 50 µl of standard solution to well A1-A6. Add 40 µl of serum to the well and then add 10 µl of anti-MDA antibody to the wells. Add 50 µl of streptavidin-HRP each to the sample well and standard well. Cover well with seal. Incubate at 37°C for 60 minutes. Remove the seal and wash the plate with buffer washing 5 times. Add 50 µl of substrate A solution to each well then add 50 µl of substrate B solution to the well (standard and sample). Cover the plate with a seal. Incubate at 37°C for 10 minutes. Add 50 µl stop solution

into the well (standard and sample), there will be a color change from blue to yellow. Measure the optical density (OD value) of each well using a microplate reader using a wavelength of 450 nm within 10 minutes after stopping adding solutions.

## Results

a. Malondialdehyde (MDA) levels in white rats (Rattus norvegicus) pre and post-test strains of pregnant women by a group.

MDA levels at the lowest pre-test were found in the negative control group (0.26 ± 0.11 nmol / ml) compared to the Sargassum sp extract group with a dose of 300 mg / kgBB / day (0.43 ± 0.10 nmol / mL) and Sargassum sp extract group dose 600 mg / kgBB / day (0.41 ± 0.07 nmol / mL). At the post test, the lowest MDA level was found in the Sargassum sp extract group at a dose of 600 mg / kgBB / day (0.25 ± 0.10)) nmol / mL) compared to the Sargassum sp extract group at a dose of 300 mg / kgBB / day (0, 40 ± 0.12 nmol / mL) and negative control group (0.41 ± 0.06 nmol / mL) (Table. 1).

**Table 1. Malondialdehyde (MDA) levels in white rats (Rattus norvegicus) Pregnant Wistar Strains Pre and Post Test by Group**

| Group | n | MDA levels (nmol / mL) | | | | | |
|---|---|---|---|---|---|---|---|
| | | Pre Test | | Post Test | | Change | |
| | | Mean (SD) | Median (Min-Max) | Mean (SD) | Median (Min-Max) | Mean (SD) | Median (Min-Max) |
| Negative Control | 7 | 0,26 (0,11) | 0,27 (0,10–0,38) | 0,41 (0,06) | 0,43 (0,28–0,45) | 0,14 (0,11) | 0,11 0,03 – 0,35) |
| Sargassum sp 300 mg dose | 7 | 0,43 (0,10) | 0,45 (0,25 –0,60) | 0,40 (0,12) | 0,43 (0,15–0,51) | -0,03 (0,10) | 0,02 (-0,1 – 0,08) |

b. Differences in levels of malondialdehyde (MDA) in white rats (Rattus norvegicus) strains of pre and post-test pregnant Wistar by group

MDA levels in the negative control group increased 0.14 ± 0.11 nmol / mL and based on the results of the Pairet T-Test statistic, there was a significant difference in the increase in MDA levels in white rats (Rattus norvegicus) strains of pregnant Wistar between pre-test and post-test (p: 0.012).The MDA levels in the Sargassum sp extract group at a dose of 300 mg/kg bb/ day decreased 0.03 ± 0.10 nmol/mL.While the MDA levels in the Sargassum sp extract group dose 600 mg/ kg bb/day there was a decrease of 0.15 ± 0.12 nmol / mL and based on the results of the Pairet T-Test statistic it was found that there was a significant difference in the decrease in MDA levels in white rats (Rattus norvegicus) strains of pregnant Wistar between pre-test and post-test (p: 0.019) (table.2)

**Table 2. Differences in levels of Malondialdehyde (MDA) in White Rats**

(Rattus norvegicus) Pregnant Wistar Pre and Post Test Strains Based on group

| Group | Time | N | MDA levels (nmol / mL) | | p-Value |

## Discussion

The results of this study found that administration of Sargassum Sp brown algae extract had a significant effect on decreasing levels of malondialdehyde (MDA) in white rats (Rattus norvegicus) strains of pregnant Wistar at a dose of 300 mg/kg bb/day (p: 0.008) and a dose of 600 mg/kg bb/day (p: 0.001) compared to the negative control that had increased. This indicates that the brown algae Sargassum sp at a dose of 300 mg/kg bb and 600 mg/kg bb gave a positive effect on the decrease in levels of malondialdehyde in pregnant Wistar strain white rats.

The content of bioactive compounds than brown algae Sargassum sp is a flavonoid compound that directly reacts with free radicals by capturing unpaired electrons to free radicals without producing other free radicals as a result of the reaction[8]. Flavonoids can inhibit initiation by capturing major radicals such as superoxide. The effects of flavonoids on ROS are through two mechanisms by increasing endogenous antioxidants and capturing free radicals or neutralizing free radicals[9].

The flavonoid groups identified in the Sargassum sp extract are catechins and quercetin[10]. These two groups of flavonoids are thought to have a role to ward off free radicals so that they can reduce levels of malondialdehyde in the white rat group of pregnant Wistar strains that have been treated. Quercetin is a flavonoid compound that has the most powerful antiradical properties against hydroxyl radicals, peroxyl and superoxide anions[11].Flavonoids protect cells from attack by reactive oxygen compounds such as singlet oxygen, superoxide, peroxyl radicals, hydroxyl radicals, and peroxynitrite. Lipid damage occurs through three phases, namely the initiation, propagation and the termination stage which is the final stage by binding a free radical with other free radicals so that they are no longer reactive[12].When a hydrogen atom is removed by a molecular lipid some compounds will react with a hydrogen atom that forms hydroxyl radicals (●OH),alkoxy (RO),peroxyl (ROO) and possibly also with HO2 but not including H2O2.Membrane lipids are phospholipids consisting of unsaturated fatty acids that facilitate peroxidation due to the presence of hydrogen atoms containing only one electron, in this case, there is a carbon atom without electron pairs. The double bonds in fatty acids will weaken the CH bonds in carbon atoms adjacent to the double bonds which makes it easy for hydrogen atoms to transfer. Likewise, if there are sufficient oxygen concentration of lipid radicals, it will react with oxygen to form peroxyl radicals (ROO●),this stage occurs in propagation. For the termination stage, peroxyl radicals (ROO●) will attack other hydrogen atoms originating from other lipid molecules that are close and produce lipid peroxides and peroxyl radicals or interact with other antioxidants. Therefore this process causes the cessation of the oxidation process by neutralizing free radicals that are formed during oxidation.

This study shows that in test animals with control groups there was a significant increase in malondialdehyde levels between pre-test and post-test (p: 0.012).This illustrates that in pregnancy two phenomenological oxidative stress phenomena are found, which occur in the trimester in the peripheral part of the placenta.Therefore there is an increase in local oxygen concentration at a stage of pregnancy so that the trophoblast has a concentration and activity of major or endogenous antioxidants such as superoxide dismutase (SOD) is low[13]. The presence of major trophoblastic oxidative damage and progressive degeneration of the villi will trigger the formation of the fetal membrane which is an important developmental step for vaginal delivery.

## Conclusion

Based on research conducted found Sargassum Sp brown algae extract gives a significant effect on decreasing levels of malondialdehyde (MDA) in white rats (Rattus norvegicus) pregnant Wistar strains at a dose of 300 mg/kg bb/day and a dose of 600 mg/kg bb/day.

# Factors Corresponded to Health Service Utilization of Chronic Disease Management Program (Prolanis) Patient in Health Center Lateri Ambon City Post-Earthquake

**Ervina Imelda Souhaly[1], Muhammad Alwy Arifin[2], Darmawansyah[2], Amran Razak[2], Anwar Mallongi[3], Syamsuddin Wadi[4], Muh. Yusri Abadi[2]**

*[1]Reserach Scholar of Magister Program Departement of Health Adminitration and Policy, Public Health Hasanuddin University, [2]Associate Professor of Departement of Health Adminitration and Policy, Public Health Hasanuddin University, [3]Professor of Departement of Environmental Health, Public Health Hasanuddin University, [4]Associate Professor of Faculty Economics and Business, Hasanuddin University*

## Abstract

The objective of chronic disease management Program (Prolanis) encourages patient with chronic illness to achieve optimal quality of life and 75% of patient have the "good" results on the specific examination of the disease DM type II and hypertension so as to prevent the onset of disease complications. The purpose of this research is to know the factors related to the utilization of post-earthquake service Prolanis. This type of research is analytic survey research using cross sectional approach design. The population in this study is all prolanis patient who utilize the service in the Public Health center after the earthquake as many as 69 patient. The sampling techniques in this study were the total sampling so that the number of samples in this study of 69 respondents showed that there was no age-old relationship with the utilization of Prolanis services in post-earthquake community health centres (P = 0,271) However, there was a gender relationship (0.000), education (P = 002), and marital status (P = 0,006). Therefore, the Lateri Public Health Center can play an active role and reach out to prolanis patient who utilize the post-earthquake service so that they can maintain and increase the degree of health especially in people with chronic diseases such as hypotensions and diabetes mellitus.

***Keywords**: Prolanis, utilization, post-earthquake, Public health Center*

## Introduction

The Chronic Disease Management Program (Prolanis) is an integrated healthcare system and proactive approach that involves patient, health facilities and BPJS healthcare in order to maintain health care for the optimal patient of BPJS Health with the cost of effective and efficient health services. The target of Prolanis activities are all patient of BPJS health with chronic disease especially Diabetes Mellitus (DM) type II and hypertension. This is carried out by first-rate health facilities (FKTP) both in government FKTP and private FKTP. Prolanis aims to encourage patient with chronic illness to achieve optimal quality of life and 75% of patient have the "good" results on the specific examination of the disease of DM type II and hypertension so as to prevent the onset of disease complications.[1]

The number of sufferers of Diabetes mellitus type 2 continues to increase in Indonesia. Based on RISKESDAS 2018 the prevalence of Diabetes mellitus in population aged > 15 years for Indonesia is 2.0%. In addition to diabetes mellitus type, hypertension is also a burden of non-infectious diseases that are harmful because of its effects that can spread to other diseases. The prevalence rate of hypertension based on the measurements in population aged ≥ 18 years in regional health research 2018 increased sharply by 34.1%. [2]

Based on secondary data at the Leteri Public Health center obtained by researchers, the number of pronalists patient registered in Leteri Public health centers as many

as 134 patient and who utilize prolanis services from January to October 2019 as many as 69 patient per month. [3] in November 2019 until December 2019 there was a decrease in the number of visits in each month as many as 69 patient in 40 patient. The decline in the number of visits occurred in the aftermath of the earthquake that occurred in September 2019 in the city of Ambon caused many people to evacuate so as not to utilize the service of Prolanis in the Lateri Community Health Center. By the time this research aims to determine what factors influence the utilization of the service of Prolanis patient in the health center post earthquake Lateri society

## Materials and Method

The type of research used is an analytical survey using the design of a cross sectional approach. The population in this study is all prolanis patient who utilize the service in the Public Health care center after the earthquake as many as 69 patient. The sampling technique in this study was a total sampling so the number of samples in this study was 69 respondents. Data collection is obtained through a live

## Results

According to table 1, it is revealed that from 69 respondents based on the respondent's age, most of the age group > 60 years as many as 37 respondents (53.7%) And the least number of respondents in the age group of 41-50 years as many as 2 respondents or amounting to (2.9%). According to gender, respondents were the most female groups of 53 people (76.8%) And the fewest number of respondents in males is as much as 16 people (23.2%). Based on the most recent education is the category SMA/equal to 28 people (40.6%) And the least number of respondents were the group did not end the elementary school as much as 2 people (2.9%). Based on the marital status, the most widely married category of 53 people (76.8%) And the fewest number of respondents were not married for 2 people (2.9%)

Source: Primary Data, 2020

Table 2 shows that out of the 32 respondents who have grouped adult categories, there are 23 respondents (71.9%) That utilize the Prolanis health services in the Lateri Public Health center well and 9 respondents (28.1%) Who undertakes the use of medical services in the Lateri Public health center while from 37 respondents grouped by elderly there are 31 respondents (83.8%) Who utilize the Prolanis service in the Lateri Public health Center and 6 respondents (16.2%) Who undertakes the Prolanis service at the Public Health center of Post-earthquake. Statistical test results using the chi-square test obtained the value P = 0.271, because the value of p > 0.05 then there is no age group relationship to the utilization of the service patient in the Post Earthquake.

According to category of gender shows that of 16 respondents who have male gender, there are 6 respondents (37.5%) Utilizing the Prolanis Health Care Center in the Lateri Public health Centre and 10 respondents (62.5%) Who undertakes the use of medical services in the Lateri Public health center while 53 female respondents are 47 respondents (90.6%) Who utilize the Prolanis service in the Lateri Public health Center and 6 respondents (9.4%) Who undertakes the service of Prolanis at the Lateri Public Health Center. Statistical test results using the chi-square test obtained the value P = 0.000, because the value of p < 0.05 then there is a gender relation to the utilization of the service of the patient in the post-Earthquake Department center.

Based on the education category shows that out of 6 basic educated respondents, there were 3 respondents (50%) That utilize the Prolanis health services in the Lateri Public Health center well and 3 respondents (50%) Who undertakes the use of medical services in the Lateri Public health center while from 63 further educated respondents there are 51 respondents (81%) Who utilize the Prolanis service in the Lateri Public health Center and 12 respondents (19%) Who undertakes the Prolanis service at Public health centers. Statistical test results using the chi-square test obtained the value P = 0.002, due to the value of p < 0.05 then there is an education level relationship to the utilization of the Ministry of Prolanis patient in the lateri health center of Post Earthquake.

Based on the marital status indicates that of 53 respondents who are married, there are 43 respondents (81.1%) That utilize the Prolanis health services in the Lateri Public Health center well and 10 respondents (18.9%) Who is less utilizing the medical service in the Lateri Public Health Center while the 16 respondents who are not married or divorced/widowed there are 11 respondents (68.8%) Who utilize the Prolanis service in the Lateri Public health Center and 5 respondents (31.2%) Who undertakes the Prolanis service at Public health centers. Statistical test results using the chi-square test obtained the value P = 0.006, due to the value of p < 0.05 then there is a marital status relationship to the utilization of the service of the patient in the post-Earthquake Department center.

## Discussion

### Age relationship with the use of Prolanis patient service

Based on adult category age, there are 23 respondents (71.9%) That utilize the Prolanis health services in the Lateri Public Health center well and 9 respondents (28.1%) Who undertakes the use of medical services in the Lateri Public health center while from 37 respondents grouped by elderly there are 31 respondents (83.8%) Who utilize the Prolanis service in the Lateri Public health Center and 6 respondents (16.2%) Who undertakes the Prolanis service at the Public Health center of Post-earthquake. This research is not in line with Jenry et al, 2017 which indicates there is age relationship with the utilization of Public health Center service with value P = 0.004. [4] The research conducted by Kim & Hong (2018) stating that the age level does not affect the level of utilization of health care for the elderly with or without chronic illness [5]

### Gender relations with the use of Prolanis patient services

Gender can influence in decision making to conduct treatment search. [8] This is because women need special health services such as pregnancy health services and specific diseases that require women to utilize health care. Another study mentions that gender does not affect people to be able to use health care services. Both men and women have the same risk utilizing health services [6]. The results of the above studies show that Bivariate

was obtained from 69 respondents, consisting of 53 female respondents and 16 male respondents. According to the table above, it can be seen that the utilization of Prolanis in post Earthquake Community Health center is dominated by female gender. One of the factors that make the utilization rate of Prolanis dominated by female types. Statistical test results using chi-square indicate a value of P = 0.00 which means the gender relates significantly to the utilization of the prolanis patient in the Lateri public health centers of post-earthquake. The results of research research of Risman et al (2020) which shows that female gender is more utilizing the Ministry of Prolanis in health services UPT Unpad compared to male gender. [7]

**The establishment of a relationship with Prolanis patient service**

The status of education is closely related to the awareness and knowledge of one, so that the status of education has a significant influence on the utilization of healthcare services. Usually low-educated communities, lacking awareness and good knowledge of the benefits of healthcare services [8]

This research shows the educational variables related to the utilization of Prolanis services in the Public health center post-earthquake leteri with a value of P = 0.001 < 0.05. This is in line with the results of the research of Napirah which shows there is a relationship level of education with the utilization of health care in the working area of community health centers of East Coast Poso District of Poso Regency.[9]

**Marital Status relationship with the use of Prolanis patient service**

Marital Status can improve health for individuals with chronic diseases. [10-16]. The majority of Prolanis patient in the Lateri health center are married. A total of 53 Prolanis patient were married to utilize the Ministry of Prolanis. According to Riaz et All arital status is one of the factors that can control the patient's condition in his chronically-controlled disease management efforts. This research is in line with the Syafa'at et al, 2019 indicates there is a influence of marital status (P = 0,015) on the utilization of Prolanis in FKTP Depok [11]. Couples or families can be a figure that can help the disease management process. It is not in accordance with the research which et all (2018) that there is no relationship between the status of married than that is not P = 0738. 5

## Conclusion

The study concluded that there is no age relation to the utilization of Prolanis services in post-earthquake community health centres (P = 0,271) However, there are gender relations (0.000), education (P = 002), and marital status (P = 0,006). Therefore, the Lateri Public health center can play an active role and reach out to Prolanis patient who utilize the post-occurrence service of the earthquake so that it can maintain and improve the degree of health especially in people with chronic diseases such as hypotensions and diabetes mellitus.

# The Influence of Occupational Safety and Health on Job Satisfaction and Organizational Commitment of Hospital Nurses in Makassar City

**Andi Niartiningsih[1], Irwandy[1], Masyitha Muis[1]**

*[1]Lecturers of Departement of Hospital Management, Faculty of Public Health, Hasanuddin University*

## Abstract

Occupational safety and health is a system used to prevent the possibility that will arise due to work accidents and prevention of the emergence of diseases caused by work relationships with employees in the environment. This study aims to analyze the effect of occupational safety and health on job satisfaction and organizational commitment of hospital nurses in the city of Makassar. This type of research is quantitative research using observational studies with cross sectional study design and using path analysis. Sampling using stratified random sampling so that the sample in this study were nurses in charge of Inpatient Installation, IGD, ICU and OK, amounting to 230 respondents. The results showed there was an effect of occupational safety and health variables on job satisfaction (p = 0.001), there was an effect of occupational safety and health on organizational commitment (p = 0.001), there was an effect of job satisfaction on organizational commitment (p = 0.001), and there was no the effect of occupational safety and health on organizational commitment through job satisfaction (coefficient = 0.419). It is recommended to the hospital management to encourage nurses to work in an innovative way and provide opportunities in making decisions that pose a risk to the welfare of employees by providing benefits, prioritizing comfort and safety of nurses' work in order to increase nurse job satisfaction so that it has an impact on improving the quality and performance of the hospital.

***Keywords:*** *Occupational Safety and Health, Job Satisfaction, Organizational Commitment*

## Introduction

Job satisfaction also has a direct influence towards organizational commitment Companies or organizations that fulfill the desires or desires of employees will increase their work productivity either through incentives, support, recognition and rewards that are assessed on the performance results.According to Mathis & Jackson[1] states that job satisfaction reflects one's feelings towards work, when someone is satisfied with their work then they will be more committed to the organization.

Research conducted by Sembe and Amos[2] entitled "The Effect of Selected Occupational Health and Safety Management Practices on job satisfaction of Employees at University Campuses in Nakuru Town, Kenya". His findings reveal that Occupational health and safety management practices lead to increased job satisfaction among employees. Ward[3] in his research entitled The impact of health and safety management on organizations and their staff, states that this study examines the impact of proactive OHS management on organizational performance, employee attitudes towards work and their organization, and employee health and welfare. At the organizational level, the proactive OSH approach is associated with more positive organizational attitudes and perceptions of the safety climate. At the level of individual employees, a more positive perception of safety and organizational attitude is associated with better health and well-being[4-6].

RSUP Dr. Tadjuddin Chalid, Makassar City Hospital and Stella Maris Hospital are class B general hospitals in Makassar City and have been accredited. Based on a preliminary study with unstructured interviews with informants, namely the Head of Occupational Safety and Health & infection prevention and control in December 2019 to January 2020, it was found that workplace

accidents that occurred in officers, especially nurses in 2017-2019, were punctured by used syringes in inpatient installations, emergency room , ICU and operating room. This happens because officers who do not comply with SOPs such as not wearing Personal Protective Equipment (PPE), and using repeated needles. In addition to conducting interviews with the head of Occupational Safety and Health, while conducting interviews with nurses some of them did not know Occupational Safety and Health so it cannot be known how the success of Occupational Safety and Health implementation.

## Materials and Method

### Design of Research and Location

This research was conducted at the Dr. Tadjuddin Chalid, Kota Makassar Hospital and Stella Maris Hospital. This type of research is quantitative research using observational studies with the Cross Sectional Study approach.

### Method of collecting data

The instrument used in data collection was a questionnaire, regarding the independent variables in the form of occupational safety and health while the dependent variable was the variable job satisfaction and organizational commitment.

### Data analysis

The data analysis technique of this study used univariate analysis, bivariate with Chi Square test, and multivariate analysis with path analysis with Statistical Package for the Social Sciences (SPSS) 22.0 for windows program.

## Results

### Univariate Analysis

**Table 1: Frequency Distribution of Respondents Based on Research Variables in RSUP Dr. Tadjuddin Chalid, Kota Makassar Hospital and Stella Maris Hospital**

| No. | Research variable | | RSUP Dr. Tajuddin Chalid | | RSUD Kota Makassar | | RS Stella Maris | |

| | Total | | 43 | 100 | 83 | 100 | 104 | 100 |

Primary Data Sources 2020

Amounting to 94.2% stated high for the variable job satisfaction and by 95.2% stated high for the variable organizational commitment.

***Bivariate Analysis***

Table 2 shows the relationship between the independent variable and the dependent variable. Based on the results of the analysis it can be seen the influence of occupational safety and health variables on job satisfaction in Dr. Tadjuddin Chalid, Kota Makassar Hospital and Stella Maris Hospital.

**Table 2: Comparison of Sig. in the Anova Table to Test the Effect of Occupational Safety and Health Variables on Job Satisfaction and Organizational Commitment Nurse General Hospital in Makassar City**

| No. | Variable | Sig Value. (Anova Table) | | |
|---|---|---|---|---|
| | | **RSUP Dr. Tadjuddin Chalid** | **RSUD Kota Makassar** | **RS Stella Maris** |
| 1. | Occupational Health and Safety | 0,001 | 0,001 | 0,001 |
| 2. | Job Satisfaction | 0,001 | 0,001 | 0,001 |
| 3. | Organizational Commitment | 0,001 | 0,001 | 0,001 |

Primary Data Sources 2020

There is an influence of occupational safety and health variables on organizational commitment Dr. Tadjuddin Chalid with p = 0.001 <0.05 and r = 0.762, Kota Makassar Hospital with p = 0.001 <0.05 and r = 0.735, Stella Maris Hospital with p = 0.001 <0.05 and r value = 0.801 and there is an effect of the variable job satisfaction on organizational commitment Dr. Tadjuddin Chalid with p = 0.001 <0.05 and r = 0.796, Kota Makassar Hospital with p = 0.001 <0.05 and r = 0.727, and Stella Maris Hospital with p = 0.001 <0.05 and value r = 0.944.

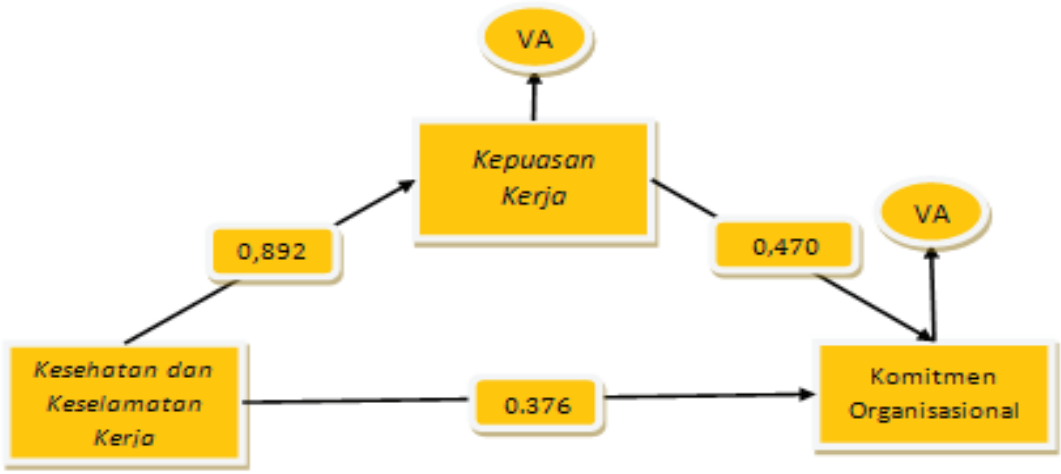
***Multivariate Analysis***

Table 3 explains how closely and indirectly the influence between variables, namely between occupational health and safety variables on organizational commitment variables through job satisfaction.

**Table 3: Results of Analysis of the Pathway between Occupational Health and Safety, Job Satisfaction, and Organizational Commitment of Nurses in General Hospitals in Makassar City**

| Variable | Coefficient | P Value | Explanation |
|---|---|---|---|
| Occupational Health and Safety à Job Satisfaction | 0,892 | 0,001 | Direct |
| Occupational Health and Safety à Organizational Commitment | 0,376 | 0,001 | Direct |
| Job Satisfaction à Organizational Commitment | 0,470 | 0,001 | Direct |
| Occupational Health and Safety à Job Satisfaction à Organizational Commitment | 0,419 | | Indirect |

Primary Data Sources 2020



**The path analysis is based on a path diagram between occupational health and safety to organizational commitment through job satisfaction shown in the figure below:**

The effect of job satisfaction on organizational commitment obtained p = 0.001 <0.05 with a large influence of 0.470 which means that if job satisfaction rises by 1 point, organizational commitment will increase by 0.470 points. Whereas there is no effect of occupational health and safety on organizational commitment without going through job satisfaction because the greater indirect path coefficient = 0.419 than the direct path coefficient between work health and safety on organizational commitment = 0.376.

## Discussion

Occupational safety and health is one of the most important things to consider in the company because this is something that must be guaranteed given to employees in supporting the success of their performance. Therefore, several dimensions that must be considered in the occupational safety and health of employees are Commitment management, Communication, Priority of safety, Safety rules and procedures, Supportive environment, Involvement, Personal priorities and needs for safety, Personal appreciation of risk and Physical work environment[3-6]

Regression test results of Hospitals in Makassar City show that the p-value (0.001), this means that the null hypothesis (Ho) is rejected, meaning that there is an influence between occupational safety and health with nurse job satisfaction. Both these variables have an effect strengthened by a statement according to Mangkunegara[7] which states that every employee to obtain a guarantee of occupational safety and health both physically, socially, psychologically can increase job satisfaction.

Occupational safety and health variables indicate that most hospital nurses stated that they disagreed with the statement given enough time to finish work safely (76.5%), the suggestions I gave related to Occupational safety and health would be considered (83%), the hospital gave protection of employees against physical and emotional losses (80.9%). Special attention to the safety and health of employees at the hospital is a natural thing, but in reality what happens in the field shows attention to occupational safety and health is relatively less comparable to the work risks faced.

This research is in line with what was done by Yusuf et al[8], namely K3 has a significant effect on job satisfaction. The coefficient of entry with a positive standard value of 0.351 indicates that as K3 increases, job satisfaction will also increase. Other research, namely research conducted by Sembe & Amos[3] states the findings reveal that safety and health management practices lead to increased job satisfaction among employees.

Regression test results for Hospitals in Makassar City show that the p-value (0.001) means that the null hypothesis (Ho) is rejected, meaning that there is an influence between occupational safety and health with

the organizational commitment of nurses. Because the significance value or p value of 0.001 <0.05, it means that statistically there is a significant influence between occupational safety and health with organizational commitment of nurses. Organizational members who have a higher level of commitment will be more enthusiastic and motivated to carry out their duties or work.

Research supported by the results above is a study conducted by Amponsah Tawiah and Justice[9]. These findings reveal a positive and significant relationship between the work of health and safety management, and affective, normative, and ongoing commitment. Occupational Safety and Health is important to guarantee employee commitment. The factors that influence nurses' commitment to aspects of OSH regulations are implemented well, OSH obligations and needs, work location conditions, employee perceptions and benefits provided by the hospital. Therefore, the hospital needs to be more active in paying attention to the factors that make employees' commitments at each work level different so that evaluation can be carried out in the future. The results of this study support the theory and previous studies that examine the effect of the application of OSH to organizational commitment namely[10,11].

Regression test results at Hospital in Makassar showed that the p-value (0.001) meant that the null hypothesis (Ho) was rejected, meaning that there was an influence between job satisfaction and organizational commitment of nurses. Because the significance value or p value of 0.001 <0.05, it means that statistically there is a significant influence between job satisfaction with organizational commitment of nurses. Employees who are satisfied with what is obtained from the company will provide more than what is expected by companies with high commitment and he will continue to try to improve performance.Job satisfaction variable shows that most hospital nurses expressed less agree on the statement I was satisfied with the promotion system set according to the length of service, performance and abilities performed in the hospital (90.9%), I was satisfied with the way the hospital apply a policy on sanctions in the promotion of office if violated (sanctions in the form of reprimand or summons) (86.5%), I feel satisfied because the leadership gave a complete answer to questions and complaints (83.5%). Other research, namely research conducted by Liao[12] states that satisfaction also has a positive influence on organizational commitment ($\beta = 0.33$, $p < 0.01$) on all significant models. The average value of job satisfaction and organizational commitment is on the moderate side. Significant positive relationships are being found among the aspects of job satisfaction, demographic factors, and organizational commitment. Supervision, salary, overall job satisfaction, age, and years of service are significant predictors of organizational commitment. The results show support for the first hypothesis because all aspects of job satisfaction are significantly related to organizational commitment at the 0.01 and 0.05 levels. These results are consistent with the results of research from Naderi[13] in the study conducted found a positive and significant relationship between job satisfaction with organizational commitment.

Based on the results of the analysis conducted using path analysis to see the direct effect and the indirect effect between variables, it was found that the indirect path coefficient between occupational safety and health on organizational commitment through job satisfaction is 0.419 and the direct path coefficient between work safety and health on job satisfaction which is 0.892. then the direct path coefficient is greater than the indirect path coefficient which is 0.892> 0.419 meaning indirectly occupational safety and health through job satisfaction does not have a direct influence on organizational commitment. Research conducted by Crow et al[14] and Eslami & Gharakhani[15] which shows that job satisfaction has a positive and significant influence on organizational commitment.

Based on the results of research at three public hospitals in Makassar City, it was found that Stella Maris Hospital is a hospital that has an occupational safety and health effect on job satisfaction and organizational commitment of nurses that is greater than Tadjuddin Chalid General Hospital and Makassar City Hospital. This is in accordance with the respondent's answer stating that the existing work facilities are adequate related to occupational safety and health, so that employees at work can create job satisfaction at Stella Maris Hospital, such as a safe and comfortable work environment, suitable work protection equipment , supporting temperature and lighting conditions and health insurance provided, so that employees at work feel satisfied and comfortable.

## Conclusions

Based on the results of the study, researchers formulated the following conclusions: There is an influence on occupational safety and health on job satisfaction and organizational commitment of nurses, job satisfaction affects organizational commitment and occupational safety and health does not affect the organizational commitment of nurses through nurse job satisfaction. Based on the research results and conclusions that have been formulated.

# Influence of Iur Cost to Patient Satisfaction through Customer Value patients BPJS Hospital in South Sulawesi Province

**Marwah Thaha[1], Amran Razak[2], Indar[2], Fridawat Rivai[3]**

*[1]Postgraduated Student Faculty of Public Health,[2]Lecturer of Health Administration and Policy Department, [3]Lecturer of Hospital Management Department, Faculty of Public Health Hasanuddin University*

## Abstract

Hospitals as a means of public health services are required to perform optimal service. This is because patient satisfaction is very dependent on the quality of hospital services. This research aims to determine the influence of Iur cost to the satisfaction of BPJS patients through customer value in the province of South Sulawesi Research conducted at Dr Sumantri, Hospital, Andi Makkasau hospital and Lasinrang hospital. The research method used is an analytical observational observation with a cross-sectional study approach. The population in this study is BPJS patients with Iur cost. The sample amount of 300 people is obtained by accidental sampling method. Data collection is obtained through interviews using questionnaires. Data is processed and analyzed using SPSS and AMOS. The results showed that the IUR cost significantly affected the customer value (p = 0.001), the customer value is significantly affected the patient satisfaction (p = 0.001) and the cost of the patient to significantly affect patients satisfaction (P = 0.001). Conclusion of this research is Iur cost can directly affect patient satisfaction and influence indirectly to patient satisfaction through customer value.

***Keywords:*** *BPJS, customer value, patient satisfaction*

## Introduction

Health is a very important need for people and is a major capital in conducting daily activities. To create a society that has a high degree of health, the implementation of development in the health sector is a priority.[1] Healthcare business becomes one of the media in supporting the health of people in the world. The establishment of various types of healthcare providers ranging from simple such as clinics or health centres to hospitals that have various health supporting facilities. The presence of various health facilities is expected to assist in providing maximum health services to the community.[2]

Public awareness of the importance of health today is increasing as a fundamental measure of life quality, along with the advancement of communication technology and information, socio-economic, cultural, which encourages the development of the role of the service sector. The Indonesian Government through the Ministry of Health since 1 January 2014 held health insurance for the community through the Social Security Administering Agency (BPJS) held health insurance. Thus the Government is obliged to provide quality healthcare services. Health care is a human right that must be fulfilled by the Government.

Public interest in the BPJS program is demonstrated by the magnitude of interest of the community as a participant of the BPJS program. Data in September 2014 number of participants BPJS Kesehatan in Indonesia as much as 127.3 million people (65%) and continues to increase, in November 2017 recorded 183,579,086 participants or approximately (70%) And in September 2018, the number of participants reached 201,660,548 people, as well as on 1 February 2019 reached 217,549,455 people. With a figure of 217 million, this means that the number of participants BPJS Kesehatan has reached 81.8% of the total population of Indonesia which is about 265 million, as data is quoted from the official website of BPJS. Following data participant BPJS Health South Sulawesi year 2019/2020. BPJS Kesehatan

Report Data of South Sulawesi in 2019, especially in 4 (four) Regency/city consisting of Barru District, Parepare, Pinrang and Sidenreng Rappang who are under the branch office of Parepare, noted that as many as 863,053 people in JKN, in January to July and there are 15% patients using IUR fee, for people without JKN as many as 183,587 people using IUR cost as much as 23%.[3]

Hospitals as a means of public health services are required to perform optimal service. It is as hospital accountability to be able to compete with other hospitals in terms of comprehensive and plenary patient services covering the promotive, preventive, curative and rehabilitative aspects as well as a referral centre for public health.[4] According to Law No. 44 the year 2009 about the hospital that article 29 clause (1) states that each hospital has the obligation to carry out social functions, among others, by providing inadequate/ poor patient service facilities, no upfront emergency services, free ambulance, disaster victims services and extraordinary events, or social service for humanitarian missions.[5]

Patient satisfaction will be fulfilled when the service provided is in accordance with their expectations.[6] Hawkins and Lonney in Tjiptono mention that the satisfaction attribute consists of the suitability of expectations, interest revisit, willingness to recommend.[7] The description elaborates that in essence, service users ' satisfaction is identical to the achievement of hope for the service they receive so that the user wishes service in this

If the expectation is fulfilled, it means that the service has given a remarkable quality and also will cause high satisfaction. Conversely, if the expectation is not achieved, then interpreted the quality of service does not fulfil what he hoped for.[8] hospitals should be able to improve the quality of service because of good quality, will be able to cause (customer value) or good judgment effect in the patient or satisfied, as the purpose of public service is to satisfy the community

The results of the initial survey conducted by researchers for the satisfaction of services held in the Lasinrang hospital and Andi Makassau hospital and Dr Sumantri hospital. There are some views or assessment of the patient's acceptable service is still lacking a good example is that there is no certainty or details of the standard such as the presence of participants in Class 3 BPJS who want to get 2nd-grade treatment must pay the cost of the difference between Class 2 and Grade 3. BPJS only pays class 3 while the difference between Class 3 to Class 2 is paid by the participants. Meanwhile, service in 2nd grade is not maximal.

## Materials and Method

This study included a quantitative research type of analytical descriptive methods with a cross-sectional approach. The research was held in the Lasinrang hospital, Andi Makkasau hospital and Dr Sumantri hospital. The population in this study is BPJS patients who use (IUR cost) or the difference in the cost of service they received in the year 2019. Samples are obtained using the purposive sampling method and obtained a total of 300 respondents. Data collection is conducted through interviews using questionnaires. Data collected is a characteristic of respondents, BPJS membership classes and treatment classes used, customer value, perception of IUR the cost of patients BPJS and patient satisfaction. Data analysis is done in multivariate using the path analysis with the help of AMOS software.

## Results

Based on the results of the study then obtained the results as that based on the category of patient satisfaction level in the Andi Makkasau Hospital known that the number of respondents is satisfied as much as 13 people (13%). The respondent who was satisfied amounted to 48 people (48.0%) while being very satisfied amounting to 39 people (39.0%). In the Lasinrang hospital, the number of dissatisfied respondents amounted to 1 person (1%), a respondent who is quite satisfied as much as 12 people (12%). The respondent who was satisfied amounted to 53 people (53.0%) while being very satisfied amounting to 34 people (34%). Meanwhile, at Dr Sumantri Parepare hospital, the number of unsatisfied respondents amounted to 1 person (1%), the respondent who is quite satisfied as much as 12 people (12%). The respondent who was satisfied amounted to 46 people (46.0%) while being very satisfied amounting to 41 people (41.0%) (Table 1)

**Table 1 Respondents Distribution Based on Patient Satisfaction Rate**

| Hospital | Patients Satisfaction | Amount | |
|---|---|---|---|
| | | n | % |
| Andi Makkasau | Quite satisfied | 13 | 13.0 |
| | Satisfied | 48 | 48.0 |
| | Very satisfied | 39 | 39.0 |
| Lasinrang | Unsatisfied | 1 | 1.0 |
| | Quite satisfied | 12 | 12.0 |
| | Satisfied | 53 | 53.0 |
| | Very satisfied | 34 | 34.0 |
| Dr. Sumantri | Unsatisfied | 1 | 1.0 |
| | Quite satisfied | 12 | 12.0 |
| | Satisfied | 46 | 46.0 |
| | Very satisfied | 41 | 41.0 |
| | Total | 100 | 100 |

Based on the category of customer value, the result that in the Andi Makkasau hospital The number of respondents in the category is quite good that is as much as 4 people (4.0%). Respondents who were in a good category amounted to 67 people (67.0%), while an excellent number of 29 people (29.0%). In the Lasinrang hospital the number of respondents who were in the category of not good 1 person (1.0%), good enough to be as many as 7 people (7.0%). Respondents who were in a good category amounted to 56 people (56.0%), while an excellent number of 36 people (36.0%). While at Dr Sumantri hospital. The number of respondents who are in the category of not good amounted to 1 person (1.0%), good enough that is as much as 7 people (7.0%). Respondents who were in a good category amounted to 54 people (54.0%), while an excellent number of 38 people (38.0%). (Table 2)

**Table 2 Respondents distribution based on Customer Value**

| Hospital | Customer Value | Amount | |
|---|---|---|---|
| | | n | |
| Andi Makkasau | Good enough | 4 | 4.0 |
| | Good | 67 | 67.0 |
| | Excellent | 29 | 29.0 |

| Lasinrang | Not good | 1 | 1.0 |
| | Good enough | 7 | 7.0 |
| | Good | 56 | 56.0 |
| | Excellent | 36 | 36.0 |
| Dr. Sumantri | Not good | 1 | 1.0 |
| | Good enough | 7 | 7.0 |
| | Good | 54 | 54.0 |
| | Excellent | 38 | 38.0 |
| | Total | 100 | 100 |

In the category, IUR cost obtained the result that in the Andi Makkasau hospital number of respondents who are in the category of not good 1 person (1.0%), good enough that is as much as 31 people (31.0%). Respondents who were in a good category amounted to 46 people (46.0%), while an excellent number of 22 people (22.0%). In the Lasinrang hospital the number of respondents who were in the category of Not good 3 persons (3.0%), good enough that is as much as 20 people (20.0%). Respondents who were in a good category amounted to 49 people (49.0%), while those in a very good category amounted to 28 people (28.0%). While at Dr Sumantri hospital the number of respondents who are in the category is not good 3 people (3.0%), good enough that is as much as 16 people (16.0%). Respondents who were in good category amounted to 52 people (52.0%), while a very good number of 29 people (29.0%) (Table 3).

**Tabel 3 Respondents distribution based on Iur Cost**

| **Hospital** | **Iur Cost** | **Amount** | |
|---|---|---|---|
| | | **n** | **%** |
| Andi Makkasau | Not good | 1 | 1.0 |
| | Good enough | 31 | 31.0 |
| | Good | 46 | 46.0 |
| | Excellent | 22 | 22.0 |
| Lasinrang | Not good | 3 | 3.0 |
| | Good enough | 20 | 20.0 |
| | Good | 49 | 49.0 |
| | Excellent | 28 | 28.0 |
| Dr. Sumantri | Not good | 3 | 3.0 |
| | Good enough | 16 | 16.0 |
| | Good | 52 | 52.0 |
| | Excellent | 29 | 29.0 |
| | Total | 100 | 100 |

Analysis of the results using the line analysis with the application AMOS then obtained 0.51 0.87 the results that IUR cost (convenience of service, Security Service and service assurance) directly affect patient satisfaction (suitability expectations, interest revisit, and willingness to inform) with a coefficient of beta 0.43 and affect indirectly through Customer Value (services, quality, cost, social, information and experience) with a The relationship between variables obtained results that the IUR variable cost in conjunction with the Customer Value variable p = 0.001 (significant). The Customer Value variable in conjunction with the patient satisfaction variables generated value P = 0.001 (significant) and IUR variable cost in conjunction with the patient satisfaction also generated value P = 0.001 (significant). As for the relationship between variables can be seen in the image below:

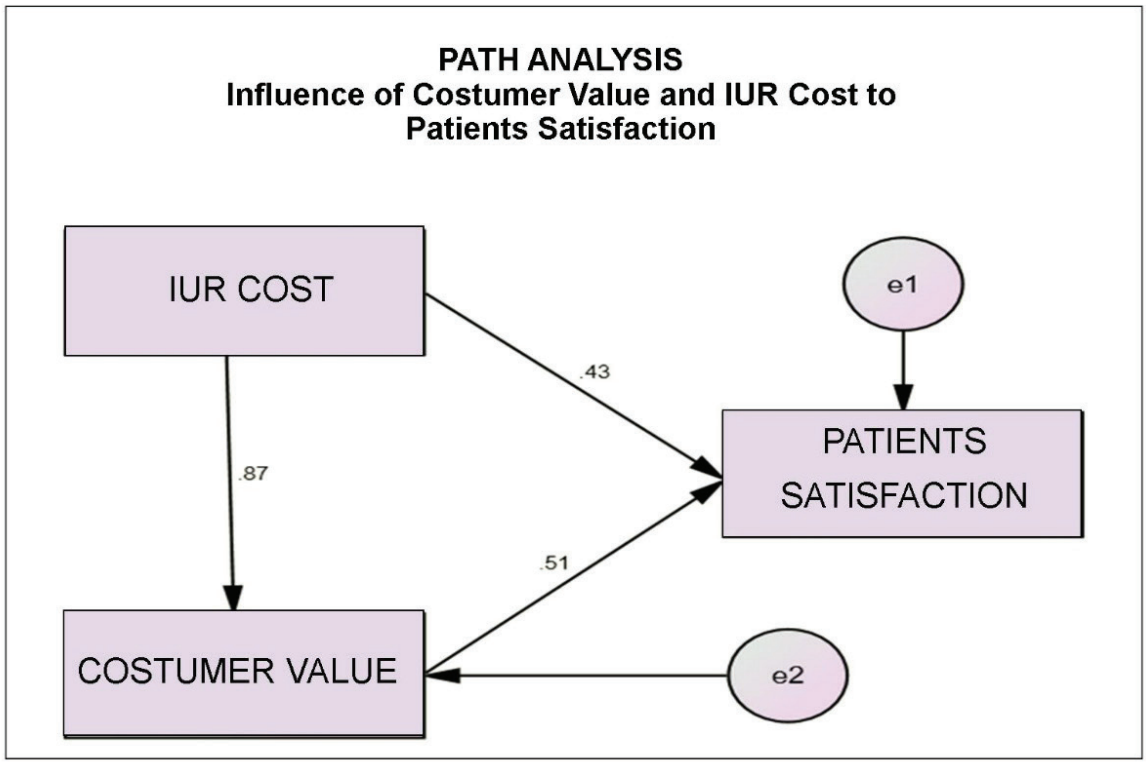

**Figure 1. Customer Value and Iur cost analysis influence on patient satisfaction**

## Discussion

IUR cost is an additional fee paid by the participants of BPJS at the time of obtaining a higher health service benefit of its rights. The rights owned herein are the rights of patients based on their participation. The analysis of the pathway using AMOS shows that in addition to directly affect the IUR costs also influence indirectly to patient satisfaction through Customer Value (services, quality, cost, social, information, experience) with beta coefficient 0.87 and 0.51.

Based on the coefficient, it can be calculated that the indirect effect of the IUR cost is 0.87 x 0.51 = 0.44. It can be interpreted that the indirect influence of IUR costs to the patient's satisfaction of 44%. Based on these results it can be seen that the indirect influence of IUR costs greater than the direct influence of 43%. This positive figure indicates that IUR costs significantly and positively affect patient satisfaction. So the better assessment of IUR cost will boost the increase in customer value or customer value. Better Customer Value will drive the increasing level of patient satisfaction.

Allahham also states that some marketing-related literature states that there is a positive relationship between satisfaction to the cost of the value perceived by the customer. Hospitals that provide customers with a higher value are likely to be able to satisfy them, it can improve patient loyalty. This is in line with the results of the model on research where the influence of iur cost to satisfaction through customer value. So that it can be interpreted that the IUR costs obtained by the patient can affect the customer value or the judgment of the services obtained. The patient's assessment of the service affects the level of contentment he felt.[9]

Satisfaction as a comparison between expectations or expectations of the patient will quality with the quality of service obtained. So the patient's expectation or expectation and quality of service are perceived as a major factor affecting patient satisfaction. But in addition to these two factors, the cost factor incurred today has also been regarded as a major factor in patient satisfaction.[10] in general, patient loyalty and return interest are influenced by the level of satisfaction of the service they received earlier. Therefore, it is very important to understand the factors that affect patient satisfaction based on the service paradigm.

Indonesian Ministry of Health states that the hospital tariff is a reward received by the hospital for services from services and non-service activities provided to the service users. Service users, in this case, our patients. So it can be interpreted that the hospital tariff is a reward received by the hospital for the service provided to the patient.[11] hospitals also need to think about the tariff of its services so that the tariff is appropriate or appropriate in the eyes of consumers. Tariffs that are inappropriate or too expensive will instead make the consumer dissatisfied, complained and eventually moved to another health service.[12] Tariff is part or all of the cost of organizing activities of medical and non-medical services that are charged to the public in exchange for services received.

Tjiptono states that the value can be defined as the ratio between perceived benefits to the price. If the perceived value of the customer is high, it will create maximum satisfaction. This is in line with the research results where the cost is a factor that affects the customer value or customer's assessment of the service provided by the hospital. The value of this patient then affects the feeling of contentment in the patient.[13-15] Customer value) has become an ongoing concern in building and supporting the benefits of competition and creating customer relationship management. The value of a customer related to the use of a or more is something customers feel. Customer value is a strategic weapon in attracting and holding customers. Customer value has become one of the most important factors in the success of a service provider including hospitals.

## Conclusions and Suggestions

The research concluded that IUR costs directly affect patient satisfaction with the beta coefficient of 0.43 and indirectly affect the Customer Value with the beta coefficient 0.87 and 0.51. The IUR variable cost significantly affects customer value. Customer value variables relate significantly to patient satisfaction and the IUR variable costs significantly affect patient satisfaction. The advice that can be given is that the hospital needs to improve the quality of its ministry in order to increase patient satisfaction to the services provided.

# Health Education Influence the Maybrat's Women Early Cancer Cervical Detection

**Yowel Kambu[1], Simon Lukas Momot[1]**

*[1]The Lectures of nursing department of Polytechnic Health Ministry of Sorong, 98417, Papua Barat, Indonesia.*

## Abstract

Until now, cervical cancer is still as the leading cause of the death of women worldwide. WHO was estimates that cancer cases will rises sharply until 2030. Although the cervical cancer data of West Papua is the lowest 0.1% in Indonesia, especially in Sorong Raya region certainly wasn't have the real data, but the iceberg phenomenon is still continues to occur. The study aim was to determine the effect of health education toward the early detection action of cervical cancer by the Maybrat's Women. The research method used was quasi-experimental with one group pretest posttest approach using non-probability puposive sampling technique. From the 30 participants were recruited based on inclusion criteria through the paired t test defined that there was an influence of health education toward early cervical cancer prevention action by Maybrat's Women at Maybrat ($p=0.011$, $\alpha<0.05$). Health promotion of cervical cancer in Maybrat Regency should be strengthen by the adequately funding encouragrment.

***Keywords****: health education, early detection, cervical cancer.*

## Introduction

World Health Organization (WHO) estimates that cancer deaths were 7 million people worldwide, people suffering from cancer were 25 million, but it will increase sharply by the 2030. meanwhile in Indonesia alone, cervical cancer was the first killer, every 30 minutes 1 person dies and every 15 minutes there was 1 new case[1]. Those means that, people who died from cancer increased by 200% and those living with cancer by 300%[2]. The Indonesian Ministry of Health (2014) also reported that cervical cancer was the highest case in all hospitals were 12.8%. Even more worrying is that the data shows is only an iceberg phenomenon, where only very few cases have been detected in hospitals compared to communities that have not[3].

Even so, it turns out the Riskesdas rerearch results showed that the prevalence of cervical cancer in the provinces of Gorontalo and West Papua was the lowest at 0.2% (508 cases) and 0.1% (222 cases) when compared to other 31 provinces, even in Papua province 1.1% (3,642 cases)[2]. Likewise with the Sorong Raya region in general, there were no definitive data on cervical cancer cases. Data from the Sorong District General Hospital shows a referral hospital from other districts in the vicinity, the number of cervical cancer patients who has come for the treatment purpose since 2013-2015 were estimated to be only 1-3 cases and there were no new cases. Based on the National Health Indicator Survey (Sirkesnas) (on May 2016), data obtained from the Maybrat District Health Office in 2014-2015, there were an increases in the number of Fertile Women (WUS) ages 15-49 years from 11,428 to 13,600 people (total population of 45,170 people)[4]. However, from the results of a survey of the actions of Maybrat Women in preventing cervical cancer, no Maybrat Woman was found who had made early detection of cervical cancer.

This has actually become a concern, considering that one of the risky behaviors (sexual transmitted disease) which is a medium of transmission of high risk of human papillomavirus (high risk HPV) that causes cervical cancer[3,5] tends to be high in the West Papua region especially Maybrat. In addition, if it is seen that those ages of women at risk of cervical cancer ranges from 20-50 which is a productive age in terms of reproductive, economic and social social physiological functions will be disrupted.

One of the factors causing the detection of cervical

cancer cases is the lack of knowledge of women about the dangers of cervical cancer that have an impact on the low awareness and actions of Maybrat women to take early detection of cervical cancer[3]. A good knowledge of women about cervical cancer would encourage their actions to take prevent as early as possible[6]. Early recognition of cervical cancer is important because it can reduce new cases with prevention efforts more easily done if the risk factors and symptoms of cancer were identified[7].

## Material and Method

Research method used is quasi experiment with one group pre-postest test only design. Purposive sampling technique used to recruit the respondent. The data analysed with t test[8,9].

## Results

The following data of table 1 below is an univariate analysis result of the 30s respondents characteristics of the Maybrat's women.

**Table 1. frecuency distributions based on the respondent characteristis.**

| The Characteristics | Frequency | % |
|---|---|---|
| Formal Educations | | |
| - none | 3 | 10 |
| - Elementery School | 2 | 6.7 |
| - Yunior School | 7 | 23.3 |
| - Senior high School | 14 | 46.7 |
| - College | 4 | 13.3 |
| Marital Status | | |
| - none | 9 | 30 |
| - Civil Marital | 13 | 43.3 |
| - Cultural Marital | 6 | 20 |
| - Life divorce | 1 | 3.3 |
| - An affair | 1 | 3.3 |
| Number of Couples | | |
| - One | 18 | 60 |
| - More then one | 2 | 6.7 |
| - None | 10 | 33.3 |
| An Occupational | | |
| - Civil duty | 1 | 3.3 |
| - Private | 2 | 6.7 |
| - Parmer | 2 | 6.7 |
| - Vendor | 3 | 10 |
| - House wife | 9 | 30.3 |
| - None | 13 | 43.3 |
| Income (IDR) | | |
| - Less than 1 million | 13 | 43.3 |
| - 1-3 million | 6 | 20 |
| - 3-5 million | 1 | 3.3 |
| - None | 10 | 33.3 |

Notes: From the table 1. Shown that the bigests proportions are senior high school (46.7%), civil marital status (43.3%), lifes couple 1 (60%), non occupation (43.3%) and income less than 1 million (43.3%) and the smallests are elementery school (6.7%), life divorce status and and anaffair (each of these are 1%), the number of life couple are more than 1 (6.7%), work as civil duty (3.3%) and earning 3-5 million (3.3%).

The table 2 follows describe the distribution of mean values and standard deviations and minimum and maximum values based on age of the Maybrat's Women.

**Table 2. The distribution based on ages**

| Variable | Mean | SD | Min-Max | 95% CI |
|---|---|---|---|---|
| Ages | 28.43 | 9.33 | 12-44 | 24.95-31.92 |

Note: The result analysis shown that the Maybrat's women ages mean values are 28,43 (CI: 24,95-31,92), with the SD 9,33. Youngest and oldest are 12 and 44. From the interval results could be concluded that 95% which means it is believed that the average ages of a Maybrat's women are between 24.95 to 31.92 years.

Hypothesis test results with paired t test in table 3 below to test the significance of the mean value, standard deviation, standard error and probability values before and after health education intervention.

**Table 3. The mean distribution values of cervical cancer early detection preventian.**

| Prevention Knowledge | Mean | SD | SE | p value | n |
|---|---|---|---|---|---|
| Before | 64.83 | 11.706 | 2.137 | 0.011 | 30 |
| After | 70.83 | 10.992 | 2.007 | | |

Notes: the knowledge mean average after intervention is 70,83 with the SD 10,992. It shown that the mean value differentiation is 10 with the SD -1,643. The paired t test results shows that the p value equal 0,011, means there is an effect of health education toward the cervixal cancer early detection action of Maybrat Women.

## Discussions

The scope of respondent conducted is carried out at the working area of Ayamaru Public Health Center of Maybrat Regency with a purposive sampling technique, the sample that took in accordance with the research objectives and inclusion criteria.

The study results shows that there was a significant influence between health education on knowledge of preventive measures for early detection of cervical cancer, which indicated that health education through health promotion efforts is important to increase self-awareness of Maybrat's women's self-awareness about the dangers of cervical cancer so that they would motivated to take early cancer detection measures trough the Cervix screenings are both by IVA method and/or pap smear.

Although the May 2016 Sirkesnas data conducted in the Kocuas village showed that Maybrat women in the village had not been exposed to knowledge of preventing early cervical cancer detection, but data from the Kambuaya public health services center revealed by health NGO practitioners Dr. Sraun shows that health promotion and early detection of cervical cancer IVA method and breast cancer were always carried out in other Maybrat regions with ± 63 Maybrat women have been netted undergoing cervical cancer early detection tests in 2015-2016 as follows: Mare village 40 people, Away village 5 people (found 2 suspects), Kamrou Aitinyo village 5 people, Aifat 4 village, Temel village (Ayamaru Jaya) 5 people and Mapura village 4 people (November 2016). Meanwhile, for the East and West Aifat regions (including the Kocuas & Kocuwer villages) there are no Maybrat women who have been netted for early cervical cancer detection. One of the factors that caused it is the "stigma" that is still inherent in the community and husbands who reject their wives which causes people to still be ashamed and avoid not checking their cervical cancer status. This is in line with research by Marván, Ehrenzweig & Catillo-López about knowledge about cervical cancer prevention and psychosocial barriers to cervical cancer testing in 384 Mexican women found that although the majority of Mexican women (80%) had received pap smear information in 3 in the last year, however, only 29% had performed pap smears according to the Noma of Mexico

which indicates inadequate knowledge of Mexican women about risk factors for cervical cancer specifically for women with low education, disrespect for citizens and opinion that pap is an embarrassing examination so that their husbands does not allow his wive to follow the pap examinations[10-12].

This is certainly a serious concern to the local government, specifically related agencies, namely the health department to be able to promote health promotion programs and monitor the performance of 14 public health centers in the Maybrat district government area.

## Conclusion

There is an effect of health education toward the cervical cancer prevention action by the Maybrat's Women at Maybrat Regency.

# Snowball Education Method Effect the Family Support for Plwha Art's Adherence

**Oktovina Mobalen[1], Yowel Kambu[1]**

*[1]Lectures of Nursing Departement at Sorong Ministry Health Polytechnic*

**Absract**

HIV/AIDS epidemic nowadays has become as global effects, even if the prevention efforts still goes to conducted and improved. The aim of research was to knowing the effect of snowball method toward family support role in PLWHA ARV adherence. The research method used is quasy experiment with pre-posttest one group only design with the purposive sampling technique. Research results showed from 20 respondents were found at Malawei Public Health Center of Sorong City was that there are differentiation of mean values between pre-postest are 8,09 and standard deviation values are -0,49 and the Wilcoxon statistical test results was that the p values equal to 0,000 which mean there is a significant effect of the snowball method toward family support role in PLWHA ART's adherence. The snowball as the teaching method technique could be implemented in order to HIV/AID knowlege update and improves the PLWHA ART's adherence.

***Keywords:*** *snowball method, family support, PLWHA.*

## Introduction

Human Immunodeficiency Virus (HIV) /Acquired Immunodeficiency Syndrome (AIDS) now has become as a global impact. The World Health Organization (WHO) noted that since AIDS was discovered until 2015, there were 1.1 million people died, 2.1 million people were infected with HIV and 36.7 million people were living with HIV[1].

Indonesia is the Asian country with the fastest developing HIV epidemic. Until the end of 2009, it was estimated that there were 186,257 PLWHA (15-49 years) spread across 33 provinces in Indonesia[3]. Data from the Sorong City Health Office 2016 shows that 1,519 cases were identified as reactive (HIV+) with 459 cases undergoing ART and 80 cases failing to follow up[6]. Data from the Sorong City Malawei Health Center from January to December 2017 recorded 42 active people taking ARVs and 13 people stopping treatment[7].

The snowball method is a modification of the educational technique by asking to focus on the ability to make questions that are packaged in an interesting game such as throwing paper that is rolled round like a snowball containing questions to fellow friends. This method explains how knowledge is generated, starting with a thought that gathers new perspectives and through the growth of richer collective knowledge[9,10].

Family support can be a factor in determining individual health beliefs and values and determining the treatment program they will receive, providing support and making decisions regarding care of sick family members, especially PLHA who are isolated from the assistance of others related to adherence[12].

## Method

The research method used is Quasi Experiment *with non-equivalent control group* design using *pre-posttest one group only sampling technique* using Wilcoxon hypothesis test.

## Results

**Table 1. The Frequency Distributions of Respondent Characteristics based on demographic data.**

| Characteristics | Frequencies | Percentage |
|---|---|---|
| Ages: | | |
| - Teenager | 2 | 10 |
| - Early adulthood | 7 | 35 |
| - Late adulthood | 9 | 45 |
| - Elderly | 2 | 10 |
| Sex: | | |
| - Male | 10 | 50 |
| - Female | 10 | 50 |
| Formal Education Status: | | |
| - None | 1 | 5 |
| - Low Formal Education | 4 | 20 |
| - Midlle Formal Education | 14 | 70 |
| - High Formal Education | 1 | 5 |
| Tribe: | | |
| - Papua | 7 | 35 |
| - Moluccas | 9 | 45 |
| - Java | 2 | 10 |
| - Sulawesi | 2 | 10 |
| Occupation: | | |
| - None | 11 | 55 |
| - Civil duty/an army/police | 0 | 0 |
| - Work for company | 7 | 35 |
| - Private | 2 | 10 |
| Long HIVs Diagnosed: | | |
| - < 1 years | 2 | 10 |
| - 1 – 6 years | 16 | 80 |
| - > 6 years | 2 | 10 |

**Table Explanation:**

Table 1 shows that the highests respondents distributions are the late adulthood (45%), midlle formal education (70%), Moluccas tribe (45%), none occupation (55%) and has 1–6 years HIV diagnosed (80%) and the lowests are teeneger and elderly (10%vs10%), none formal education and highest formal education (10% vs 10%), both Java and Sulawesi tribes (10%vs10%), civil duty/an army/police (0%) and <1 years and >6 years HIV diagnosed (10% vs 10%). However, there is no any proportion differenttation between male and famale (50% vs 50%).

**Table 2. The Wilcoxon hyphotesis test of Snowball Method.**

| Family Support role | Mean | SD | SE | p value | N |
|---|---|---|---|---|---|
| - Before | 13,65 | 4,73 | 0,51 | 0,00 | 20 |
| - After | 21,74 | 3,24 | 0,51 | | |

Table Explanation:

From the tabel 2 as we see that the mean value before intervention is 13,65 with the SD 4,73 and after intervention is 21,74 with the SD 3,24. The before dan after mean values differentiations are 8,09 dan the SD are -1,49. the *Wilcoxon* test result is equal 0,000, which is mean there is a significant effect of the snowball education method toward the family support role.

## Discussions

The support role of family members remains as an important central part of the initial bastion for PLWHA. The phenomenon of discrimination and stigmatization turns out to be possible for people closest to PLWHA, even by health professionals in various health service units. Coupled with the problem of the still weak coordination of program implementation in various sectors, especially related to the rights of PLHA who have not been proportionately integrated[6]. This will affect PLHA to become depressed, thus triggering a decline in the PLWHA's health status and if it not treated quickly and appropriately could be fatal.

Despite its central role, many PLHA families refused to join in this study for various complex reasons. Some of the reasons that are often expressed are still feeling shy and have not dared to be open up to public. Researchers assume this is due to the high stigmatization both internally from within themselves, as well as externally originating from other families and communities and the assumption that HIV infection is caused by sexual anormative behavior. It turns out also, from the interviews of researchers with case managers of health services center and the hospitals, it is still found that PLHA and their families themselves do not want to open his/her HIV status to their closest people such as husbands, wifes, parents and other closest family members. This will certainly have an impact on the difficulty of reaching health services and the severed role of the family members in order to maintaining the health status of PLWHA.

The study results indicate that there is a significant effect on the application of the snowball method to increase knowledge of the role of family support in PLWHA's adherence. this means that family education and PLWHA can be applied using snowball method. With this technique, an audience that initially only discusses a particular topic in a small group, for example in this study the topic of discussion about PLWHA's ARV adherence, is gathered into a larger group to interactively discuss the same topic to equalize perceptions among discussion groups after being directed by the guider. The knowledge of ODHA families will be further enriched and deepened, rather than the using the classical educational method which is only done in one direction and ends with questions/ discussion without optimal audience involvement.

The similar research results are in line from Siboro (2013), about the effect of family support on the social functioning of PLWHA in Caritas PSE Medan shelter

using analytic observation methods based on statistical tests calculating Spearmen rank correlation coefficient (r'= 0.67) on 50 respondents showing the existence of the effect of family support on the social functioning of people with PLWHA[6]. Another research of Li, et al. (2004) also showed that PLWHA desperately need help and family support because the condition of chronic diseases experienced requires comprehensive treatment[7]. Family support have a positive impact on improving the PLWHA's quality of life[7]. The existence of a family member who is chronically ill will certainly cause tension and hopelessness that lasts long and is very influential on the condition of family member who suffer from illness[7].

From the literature search results, researchers did not found an identical study related to the effect of the snowball education method on increasing knowledge of the role of family support in PLWHA adherence. However, in practice the snowball method has been widely adopted and applied by teachers and lecturers in learning classes for a variety of purposes, particularly in evaluating student activity and for developing ideas on the main ideas of the topic[9,10]. The snowball method can be applied by forming small groups of 4-6 members per group. Formed circle formations in the group to make it look easier in the interaction look natural. The resource person designs the same theme given to each groups. Then each group member are given a paper to write their first thoughts about the theme set on a paper. Thoughts must be expressed in a few sentences but must remain clear enough, so that other members can also understand what the group members mean when writing it. When everyone has written down their ideas about the topic given, each member gives his/her paper to the group members on their right side, then the member who receives the paper rewrites his/her opinion on the same topic. The opinions could be contain various things, for example challenges and/or questions that respond to the opinions of the group members beforehand. Thought ideas written by group members then aim to develop existing thought ideas. After the second group member finishes writing their opinions, the paper is given again to the group members to the right, and so on. This cycle continues until the first member writer gets back the paper. Example: for identifying the mapping of group members' understanding, the exercise were given by the questions as follows: what do you think and understand about ART's adherence?; how should the solution be sought for PLWHA who have ART's dropped out?; what are your arguments about your friend's opinion about ART's droop out? Etc[8,9,10].

It is clear that the role of family support for PLWHA cannot be doubted, if the method of educating related topics is transferred through the snowball education approach in peer group visits every month and or involving PLWHA families in certain gathering forums. If we look at the characteristics of PLWHA, most of those were Papuans and Moluccas ethnic, we need to specify the health education approach who touches on the cultural sphere so that more informative related to HIV/AIDS can be internalized effectively and efficiently without any patronizing elements that are more autocratic. The snowball education method were more flexible in its application in small and large groups, so that it can trigger the exploration of knowledge and understanding of PLWHA in peer groups. So, it will be very conducive to increase the knowledge of PLWHA families, even PLWHA themselves will have a very positive impact on improving PLWHA's quality of life.

PLWHA with supportive support have an opportunity to improve their quality of life. Family support are one of the factors affecting the quality of life of PLHWA[13]. Family support has been become as a factor that could be influence the determination of individual health beliefs and values and determine the treatment program that received by PLHWA. The family provides support and makes decisions regarding the care of sick family members as well[13-16].

## Conclusion

There is an effect of the snowball education method toward the family supports role for PLWHA ART's adherence at the Malawei public health center of Sorong City.

### Recomendation

Familiy can further encourage PLWHA to participate in peer support groups in order to update their knowledge and improve family relationships which incidentally is very important in building the confidence of PLWHA. Family member of PLWHA can also initiate a PLWHA family forum adapted to the situation and condition of

family member to strengthen support for PLWHA to maintain ART compliance and quality of life pattern with the support of authorized health workers.

# Analysis the Influence of Job Embeddednes and Work Engagement on Improving Employee Performance in Rsud Haji of South Sulawesi Province in 2020

**Noviani Munsir[1], Irwandy[2], Syamsuddin[2]**

*[1]Master Degree of Departement of Hospital Management, Faculty of Public Health, Hasanuddin University,*
*[2]Lecturer of Departement of Hospital Management, Faculty of Public Health, Hasanuddin University*

## Abstract

Performance is the result of quality and quantity of work achieved by employees in carrying out their duties in accordance with the responsibilities given to them. The role of reliable and professional employees is very helpful in improving organizational performance. The quality of employees who are still far from adequate will certainly affect the achievements. This study aims to analyze the Influence of Job Embeddednes and Work Engagement on Improving Employee Performance in RSUD Haji of South Sulawesi Province in 2020. The type of research conducted is quantitative research using observational studies with cross sectional study design. The sample in this study were employees who worked at RSUD Haji with 240 respondents. The results showed there was an influence of job embeddedness on employee performance (p = 0,000), there was an influence of job embeddedness on work engagement (p = 0,000), there was an influence of work engagement on performance (p = 0,000), and there was no influence of job embeddedness on employee performance through work engagement (coefficient = 0.146). It is recommended to the hospital management to increase the embeddedness and engagement of employees, where employees can feel the compatibility of the work and improve the formal or informal relationship between an employee and the hospital environment so that the impact on improving the quality and performance of the hospital.

***Keywords:*** *Job Embeddedness, Work Engagement, Employees Performance*

## Introduction

The success of an organization in carrying out its activities is determined by human resources as the executor of the activity. The success of a public organization is determined by human resources. Research from Rivai & Basri[1] has shown that a pleasant work environment is very important to encourage the most productive levels of employee performance. In daily interactions, between superiors and subordinates, various series of assumptions and other expectations arise.

*Job embeddedness* is a picture of an employee who feels attached to his work or employees with high embeddedness will feel they have a compatibility and comfort with their work and will feel a lot of sacrifice if the employee leaves the job. Mitchell et al[2] develop a concept known as job embeddedness, which explains the reasons that make an individual survive in an organization.

*Work engagement* is the latest issue in the management of Human Resources (HR). Work engagement is defined as a positive, satisfying mental condition associated with work characterized by vigor, dedication, and absorption[3]

Bakker et al[4,5] states that employees who have a higher work engagement, will tend to be more creative, more productive and willing to work extra. Referring to some research results, it can be concluded that work engagement is an important aspect for every employee in completing their work that is believed to be able to improve.

RSUD Haji of South Sulawesi Province is a Class B general hospital in Makassar and has been accredited.

Based on preliminary studies conducted by BOR, it decreased from 2014 to 2018. BOR in RSUD Haji in 2014 and 2015 reached 60%, but decreased in 2016 with achievements of 51.57%, in 2017 it reached 55.67% and in in 2018 decreased by 50.57%. Even though the standard value or ideal figure that should be achieved is 60-85%.

Based on the findings in RSUD Haji, warning letters that have been issued in 2017 were 20 warning letters. In 2018 there were 22 warning letters issued by the hospital and in 2019 there were 11 warning letters issued by the hospital. Violations that are often done by employees are late and absent from work. Based on the findings of the number of absences without employee information in 2019 experiencing fluctuations and the most absenteeism in June 2019 that is as many as 454 days. Whereas based on unstructured interviews with patients, patients stated that the services provided to patients who received treatment were still low.

Based on this phenomenon, it can be seen that employee performance control in RSUD Haji is not implemented as well as possible as well as in carrying out the tasks not implemented as well as possible. Mistakes that often occur and happen again due to lack of supervision and evaluation so that the impact on service delivery is less than optimal. The purpose of this study was to analyze the influence of job embeddednes and work engagement on improving employee performance in RSUD Haji of South Sulawesi Province in 2020.

## Materials and Method

### Design of Research and Location

This research was conducted at RSUD Haji South Sulawesi Province. This type of research is quantitative research using observational studies with the Cross Sectional Study approach**.**

#### *Population and Sample*

The population in this study were all employees working at RSUD Haji of South Sulawesi Province. The sample of this study was 240 people. The sampling technique in this study is Stratified Random Sampling.

### Method of Collecting Data

The instrument used in data collection was a questionnaire. There are two endogenous variables, namely work engagement and performance and exogenous variables namely job embeddedness. The measurement used in the data processing is to use a Likert scale, where respondents state the level of agreement or disagreement regarding various objects regarding the behavior of objects, people, or events[6].

## Results

#### *Characteristics of respondents*

Table 1. Showing the characteristics of respondents. Most of the respondents in RSUD Haji are at the age level of 20-35 years (40.4%). In terms of gender, the majority of respondents were female, with 155 respondents (64.6%).

**Table 1. Frequency Distribution of General Characteristics of Respondents in RSUD Haji Of South Sulawesi Province**

| Characteristics of respondents | | N | % | Total |
|---|---|---|---|---|
| Age | 20-35 years | 97 | 40.4 | 240 |
| | 36-45 years | 88 | 36.7 | |
| | > 45 years | 55 | 22.9 | |
| Gender | Male | 85 | 35.4 | 240 |
| | Female | 155 | 64.6 | |

***Cont...*** **Table 1. Frequency Distribution of General Characteristics of Respondents in RSUD Haji Of South Sulawesi Province**

| | | | | |
|---|---|---|---|---|
| Years of Service | 1-2 years | 45 | 18.8 | 240 |
| | 3-4 years | 65 | 27.1 | |
| | 5-6 years | 32 | 13.3 | |
| | > 6 years | 98 | 40.8 | |
| Last Education | SLTA | 40 | 16.7 | 240 |
| | Diploma | 86 | 35.8 | |
| | S1 | 99 | 41.3 | |
| | Others | 15 | 6.2 | |
| Employment status | Civil servants | 106 | 44.2 | 240 |
| | Non Civil Servants | 130 | 54.1 | |
| | Others | 4 | 1.7 | |

***Univariate analysis***

Table 2 explains the percentage of respondents' ratings of the research variables.The results of the study that for the job embeddedness variable which stated good at 45% of employees and those that stated poor at 55% of employees, for the work engagement variable that stated good at 42.9% of employees and those that stated poor at 51.7% of employees for, and for performance variables that state good at 39.2% of employees and those that state bad at 60.8% of employees.

**Table 2. Frequency Distribution of Respondents Based on Research Variables at RSUD Haji of South Sulawesi Province**

| **Variables** | **RSUD Haji** | |
|---|---|---|
| | **N** | **%** |
| Job Embeddedness | | |
| c. Good | 108 | 45.0 |
| d. Poor | 132 | 55.0 |
| Work Engagement | | |
| c. Good | 103 | 42,9 |
| d. Poor | 137 | 57,1 |
| Performance | | |
| c. Good | 94 | 39,2 |
| d. Poor | 146 | 60,8 |
| Total | 240 | 100 |

***Bivariate analysis***

There was an influence of the job embeddeness variable on work engagement with value of p = 0,000 <0.05 which means that the job embeddedness variable has a significant influence on work engagement, there is an influence of the work engagement variable on performance with a value of p = 0,000 <0.05 which means that the work engagement has a significant influence on performance in RSUD Haji, Table 3.

**Table 3. Comparison of Sig. in the Anova Table to Test the Effect of Job Embeddedness and Work Engagement Variables on Employee Performance Improvement at RSUD Haji Of South Sulawesi Province**

| No. | Variables | Nilai Sig. (tabel Anova) |
|---|---|---|
| | | RSUD Haji |
| 1. | Job Embeddedness | 0,000 |
| 2. | Work Engagement | 0,000 |
| 3. | Performance | 0,000 |

Multivariate Analysis

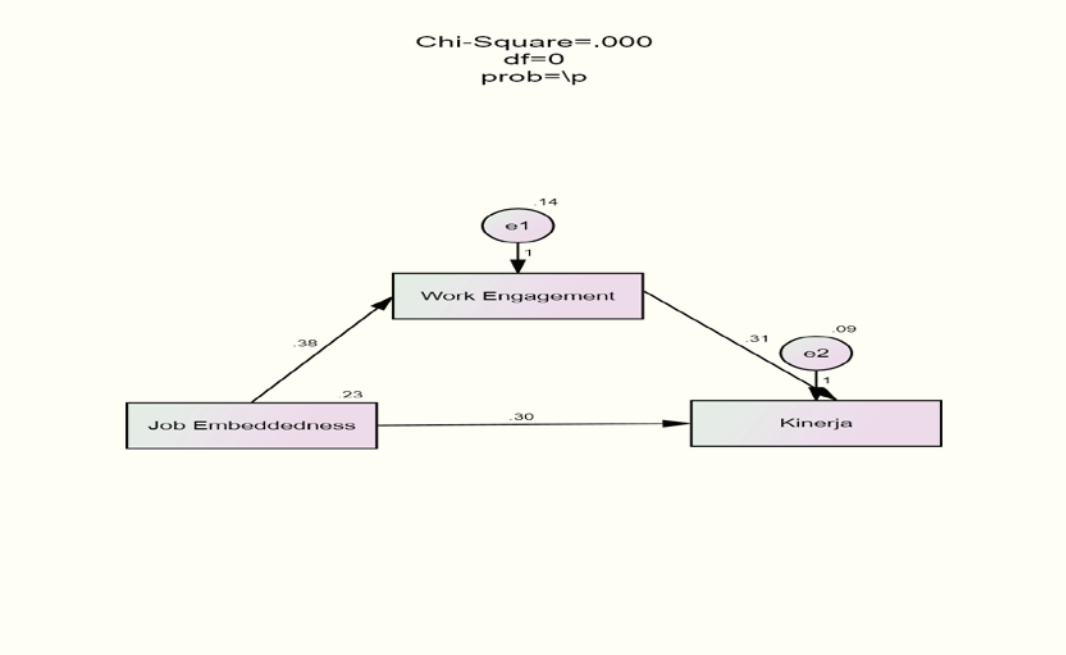

**Figure 1. Analysis of the Path between Job Embeddedness, Work Engagement and Performance**

The picture above explains how closely the direct or indirect influence between variables, namely between the job embeddedness variable to the performance variable through work engagement. Path analysis shows between variables based on a hypothesis. The influence of job embeddedness to work engagement obtained p value (0.000) <0.05 which means that there is an influence of job embeddedness to work engagement with a large influence of 0.376 which means that if job embeddedness increases by 1 point, work engagement will increase by 0.376 points.

## Discussion

### *The Influence of Job Embeddedness on Employees Performance*

The results of this study are supported by Baihaqi (2018) based on inferential statistical analysis using path analysis, states that there is an influence between job embeddedness on employee performance that has been proven and the hypothesis is proven and can be accepted. This can be seen from the value of sig. = 0,000 which is smaller than 0.05. Based on data collection from respondents it was found that the application of on the job embeddedness was not good and the performance of its employees was good.

Based on the results of research conducted, it is found that employees in RSUD Haji still have discrepancies/ incompatibility of employees with work performed so that it causes discomfort and feels that RSUDHaji is not a career destination, the employee's relationship with the work environment has not been well established, and employees have not fully felt lost either material and psychology when leaving work.

Overall, the results of this study indicate that the majority of respondents lack job embeddedness. Employees need to have attachment to the organization and community, so as to make the individual feel comfortable, feel emotions and positive perceptions about the work environment so that it can affect the performance of employees. Mitchell et al[3] explained that employees who feel a connection and attachment in the work environment and their organization will tend to survive and improve their performance with the work he has now so that employees can have a high sense of job embeddedness.

### *The Influence of Job Embeddedness on Work Engagement*

Work engagement is a business management concept that states that employees who have high engagement are employees who have full involvement and have a high work spirit in their work and in matters and related to the company's long-term activities. In other words, the definition of work engagement refers to the involvement, satisfaction and enthusiasm of employees at work[7].

Based on the results of the statistical analysis, it is known that job embeddedness influences work engagement in RSUD Haji. It is important for managers to strengthen work engagement, because employees who are not engaged are the center of the problem if workers lose commitment and motivation and enthusiasm in working[8]. The results of this study are in line with research conducted by Raymond William Ring[9] which states that shows that four of the six dimensions of Job Embeddednes make a significant and unique contribution to Work Engagement. Organizational engagement is positively related to work involvement.

Overall, the results of this study indicate that the majority of respondents lack work engagement. Employees need to have attachment and attachment to their work. There is a positive organizational support associated with welfare at work, so that arises a strong sense of enthusiasm and attachment to work in providing services to patients.

### *The Influence of Work Engagement on Employees Performance*

According to Sinambela[10] argues that employee performance is defined as the ability of employees to do certain skills. Employee performance is very necessary, because with this performance will be known how far the ability of employees in carrying out the tasks assigned.

Based on the results of the statistical analysis conducted, it is known that Work engagement has an influence with the performance of employees in RSUD Haji. The lack of employee engagement not only impacts performance but also increases the desire to move, decreases customer service satisfaction and increases absenteeism.

This is in line with research by Yudha & Fikri[12] which shows that there is a relationship between work engineering and performance at Aisyiyah Hospital in Pariaman City. The effective contribution of the work engagement variable to the performance of the R-square value was obtained, amounting to 26.6%.

Overall, the results of this study indicate that the majority of respondents have low performance. Organizational goals will be difficult or even cannot be achieved if employees do not have good performance,

so they cannot produce good output as well. Employees need to have a sense of attachment and enthusiasm for their work. There is a positive organizational support associated with welfare at work, so that arises a strong sense of enthusiasm and attachment to work in providing services to patients so that it can affect the performance of employees.

***The Indirect Influence of Job Embeddedness on Employees Performance through Work Engagement***

One hypothesis in this study is to see how the direct influence and indirect influence between job embeddedness on performance through work engagement. Based on the results of the analysis conducted using path analysis it was found that indirectly job embedness through work engagement had no direct influence on performance.

There are many things that have been proven to affect individual performance, but during the last decade, a new concept has been developed which is predicted as one of the predictors of performance, namely job embeddedness (Lee, Mitchell, Sablynski, Burton, & Holtom,[12] Sekiguchi, Burton, & Sablynski[13];Wheeler, Harris, & Sablynski[14] from the results of the study, it was found that job embeddedness is related to performance, both directly and indirectly. Performance can affect the ongoing activities of a company organization, the better the performance shown by employees will be very helpful in the development of the organization or company.[14-16]

## Conclusion

The conclusion of this study is that there is an influence on job embeddedness on employee performance, there is an influence on job embeddedness on work engagement, there is an influence on work engagement on employee performance, and indirectly job embedness through work engagement does not have a direct influence on performance.

# Study of Tobacco Smoke and Pregnancy Outcome

**Haerani Harun[1], Anwar Daud[2], Veni Hadju[3], Ridwan Amiruddin[4], Anwar Mallongi[2], Rosmala Nur[5]**

*[1]Student of Doctoral Program, Faculty of Public Health Hasanuddin University, Makassar, Indonesia, [2]Professor, Department of Environmental Health, Faculty of Public Health Hasanuddin University, Makassar, Indonesia, [3]Professor, Department of Nutritional Sciences, Faculty of Public Health Hasanuddin University, Makassar, Indonesia, [4]Professor, Department of Epidemiology, Faculty of Public Health Hasanuddin University, Makassar, Indonesia, [5]Faculty of Public Health, Tadulako University, Palu, Indonesia*

## Abstract

**Introduction**. Pregnant women have a risk for tobacco smoke both actively and passively. Pregnant women are usually exposed to enviromental tobacco smoke (ETS) in various places with different duration of time. Cigarette smoke has a severe effect not only on pregnant women but also on the fetus.**Methods** Various references were collected from online database including reports, journals, mostly in the last 10 years. The journals were mostly from the scholarly journals.

**Results**. Tobacco smoke can effect the immunity, hormonal and metabolic system of the pregnant woman, therefore disturbing the growth of the fetus. Tobacco smoke also known to increase the risk of premature birth and reduce gestational age. Tobacco smoke cause several problems in newborn such as respiration distress, low birth weight (LBW), neural disorder, sudden infant death syndrome (SIDS) and congenital anomaly.

**Conclusion**. The effect of tobacco smoke, actively of passively, have worse outcome for the pregnant women and their babies.

***Keyword**: Pregnancy Outcome, tobacco smoke, ETS, LBW, preterm birth.*

## Introduction

Smoking pregnant women have an increased risk of having an ectopic pregnancy, spontaneous abortion and other complications leading to pregnancy complications as well as the placenta. The fetus also has the risk of exposure to tobacco smoke, more than thousands of types of hazardous chemicals, especially nicotine, tar and carbon monoxide can have an effect on the fetus and cause unwanted disorders or abnormalities[1].

Environmental tobacco smoke (ETS) is a complex mixture consisting of most of the smoke emitted from the smoker's body, the smoke produced by burning cigarettes and the surrounding air[2]. Exposure of ETS in pregnant women causes increased levels of carbon monoxyde (CO), nicotine and cotinin in maternal serum or urine, in the fetus and in amniotic fluid. The effect of ETS on pregnant women can occur from the first semester to the third semester. Pregnant women are usually exposed to ETS in various places with different duration of time. Places that have the potential to become ETS exposure locations include at home, at work and the outside environment[3].

Tobacco smoke and pregnancy

One effect of the cigarette smoke exposure on pregnant women is its effect on the mother's immune system. In pregnancy changes occur in the mother's immune system to prevent rejection of the fetus. Exposure to ETS can cause changes in the immune system of pregnant women. Changes include an increase in activated leukocytes and a decrease in the percentage of regulator T lymphocyte cells (Treg cells). Smoking

**Corresponding author:**
**Haerani Harun**
Presenting author: +6285242010535,
haeraniharun.unhas@gmail.com

during pregnancy also affects the function balance between Th1 cells (T helper lymphocytes) and Th2 cells, causing an increase in the production of cytokines, proinflammatory chemokines and Th1 growth factors. In addition, the percentage of macrophages and NK cell residues is higher in smokers in the first semester

The activation of nicotine receptors causes the release of acetylcholine, dopamine, serotonin, growth hormones and adrenocorticotropic hormones and glutamate, these hormones significantly influence fetal growth. Smoking is also associated with changes in metabolism during pregnancy.[4]

Exposure to nicotine in pregnant women can cause vascular placental vasoconstriction, decrease placental blood flow and reduce trophoblast invasion which results in inhibition of good placental circularization leading to placental hypoxia causes disruption of placental invasion. Placenta previa is a form of placental invasion disorder[4]. Nicotine can cause a significant decrease in the mitotic potential of cytotrophoblast tissue in vitro. This effect is also found in smoker women. This effect can explain the mechanism of impaired placental development during the early phases of pregnancy due to placental ischemia which can cause fetal death[5]. Low placental weight strongly related with LBW[6].

Beside nicotine and cotinin, CO levels are also the found highest in smokers. The presence of CO in the body causes oxygen binding to hemoglobin decrease due to the higher affinity of hemoglobin for CO. CO Exposure to the fetus prevents the release of oxygen and then converted to carboxyhemoglobin. The result is a decrease in tissue oxygenation through competitive inhibition with oxyhemoglobin. Prolonged CO exposure in pregnant women can cause significant permanent damage to the brain of a fetus which sensitive to hypoxia. Nicotine is also considered to have a bad effect due to the stimulation of nicotine cholinergic receptors and their neuroteratogenicity effects.[4,7,8] Nicotine also interferes with the micro RNA which is important for the maturation of fetal stem cells.[9]

The effects of tobacco smok on the fetus are considered to be multifactorial, including indirect effects such as poor nutritional status associated with anorexiagenic effects of nicotine exposure, and CO. Placental blood flow decrease is associated with the vasoconstrictive effect of catecholamines released from adrenals and nerve cells after nicotine exposure.[10]

**Tobacco Smoke and Preterm Birth**

In Europe rates of preterm births are reported between 5 - 9%, while in developing countries and the United States the rate of preterm births reaches 12%. The cause of preterm birth is often difficult to determine. Some risk factors associated with preterm birth include excessive distension of the uterus, low economic status and smoking[11]. Elective preterm birth may be associated with cigarette-related obstetric complications such as placenta previa, placental abruption and impaired fetal growth. Research shows that smoking during pregnancy increases the risk of preterm birth by 25%. The exposure of ETS also specifically has an influence on preterm birth[12,13].

Active smoker mothers have been accepted as a risk for preterm birth, for around 14% of preterm births. One mechanism that links cigarette exposure with preterm birth is the CYP1A1 genotype and GST (glutathione S-transferase). Abnormalities in these genes make mothers more vulnerable to exposure to hazardous substances such as cigarette smoke.[14] Cotinin levels as an indicator of cigarette exposure are also strongly related to preterm birth[4] The danger of non-smoking tobacco is also seen in the research of Munmun et al. Which shows that non-smoking tobacco (chewed and swallowed) increases the risk of preterm birth.[15]

There are four mechanisms proposed by Goldstein et al explain relationship between smoking and preterm birth: (a) Decreased maternal appetite caused by smoking leading to a decrease in nutrition for the fetus, (b) vasoconstriction caused by smoking results in decreased blood supply to the fetus, reduced fetal nutritional supply and slowing the release of catabolism results, (c) cigarettes may have a direct effect of toxins on the fetus and (d) increase in fetal CO levels causes reduced oxygen transport capacity and teratogenic properties.[11,16]

Prostagladin has been known to trigger labor. Prostaglandin levels such as F2-isoprostane as a marker of oxidative stress are found in the amniotic membrane and amniotic fluid in smokers. F2-isoprostane levels increased 3 times compared to non-smokers. Increased

F2-isoprostane levels is considered as a mechanism that associated smoking and preterm birth. Smoking is also considered to increase the sensitivity of the uterus to contractile hormone. Research by Egawa et al in mice shows that inhalation of cigarette smoke increases the contractile activity and sensitivity of myometrium to oxytosis.[11,17] Cadmium found in tobacco smoke interacts with calcium and effects myometrial activity. Cadmium may modulate the function of the oxytocin receptors in the myometrium. Increased levels of cadmium in pregnant women are found to be associated with an increased risk of preterm birth.[11,18] Another condition associated with preterm birth is necrotizing-enterocolitis (NEC)[19]

**Spontanious Abortion**

Spontaneous abortion or miscarriage is one of the most common pregnancy complications, about 12-26% of known pregnancies. Generally the literature on the relationship between smoking and abortion does not show any consistency although some studies have concluded that smoking can cause abortion. A meta-analysis study by Pineles et al. Showed the relative risk of abortion during pregnancy is 1.32. The risk of abortion increases with the number of cigarettes. One cigarette per day increases the risk of abortion by 1%. Secondary smokers have an 11% increased risk of abortion.[20]

**Tobacco Smoke Effect on Newborn**

Various studies provide an overview of the effects of cigarette smoke on fetal growth and development during pregnancy and infant growth and development after birth

**Respiratory Disorder**

Smoking during pregnancy can cause the newborn's lungs failed to reach maximum function and continues with decreased lung function. Preterm births in most smokers also cause disruption of lung maturation. Diseases caused by these infants include wheezing, bronchitis, hospitalization due to lung infections and asthma in children.[21]

Generally, children who are exposed to nicotine during pregnancy also experience exposure to cigarette smoke in childhood. This raises the question whether the increased risk of asthma is caused by exposure to prenatal or post natal cigarette smoke. Research by Pattenden et al showed that exposure to cigarette smoke during pregnancy without post natal exposure still shows an association with an increased risk of asthma.[22,23] Exposure to cigarette smoke pre natal and post natal also shows an imbalance of Th1/Th2 causes susceptibility of airway reactivation.[24]

The mechanism of exposure to nicotine causes various pathological conditions in the lungs is not yet fully understood, but based on some data it was found that nicotine causes various anomalies in the lungs. Histological studies in animals show goblet cell hypertrophy after nicotine exposure, and it is associated with asthma in the community.[22,25,26]

***Low Birth Weight***

Low birth weight babies are the variables most widely studied the effect of smoking mothers during pregnancy or exposure to cigarette smoke in pregnant women on pregnancy outcomes. Data shows that LBW is more common in smokers (12.4%) compared to nonsmokers (7.7%). Women who smoke have a 1.5 to 3.5 times greater risk of giving birth to LBW, and the risk increases along with the cigarette consumption.[1]

Lee et al study showed that exposure to ETS in pregnant women also has the potential to cause LBW, and the effect of smoking on LBW from active smokers has the same mechanism as the effect of smoking on LBW in secondary smokers. The risk of small infants according to pregnancy is also increased in the group of mothers with high ETS exposure compared with mothers with low ETS exposure[27]

**Behaviour and Neural Disorder**

Nicotine exposure to the fetus can affect fetal brain development[10]. A study in Finland shows that heavy nicotine exposure caused the infant born with attention deficit / hyperactivity disorder (AHDH) or attention deficit / hyperactive disorders.[28] Fetuses exposed to tobacco smoke during pregnancy ware found to have a risk of cardiac autonomic abnormalities during sleep especially in preterm babies. Changes in autonomic activity are at risk of causing neurological and cardiological complications[29].

**Sudden infant death syndrome (SIDS)**

One of the most severe complications of nicotine exposure in pregnancy is sudden infant death syndrome or SIDS. The cause of SIDS is not clearly known in infants less than one year old suddenly die without definite explanation even after a thorough investigation. Exposure to nicotine is known to be a risk factor for SIDS, but the mechanism of nicotine exposure that causes infant death is unclear and is still being debated. But some animal studies provide some clues.[22,30,31]

**Congenital Anomaly**

The effects of tobacco smoke on infanst congenital anomalies have been investigated. Exposure to tobacco smoke is known to be associated with fetal heart defects including atrial septal defects, atrioventricular septal defects, transposition of large arteries, craniosynostotic cleft palate and gastroschisis.[4,33.]

## Conclusion

Tobacco smoke effect the immunity, hormonal and metabolic system in pregnant women. The substance found in tobacco smoke were found to be the cause of some pregnancy complication leading to poor pregnancy outcome such as preterm birth, spontaneous abortion, and adverse effect on tha infants. The infants could suffer respiratory disorder, behavior and neural disorder, SIDS and another congenital anomaly.The effect of tobacco smoke, actively of passively, associated with poor outcome for the pregnant women and their babies.

# Environmental Factors and Use of Protective Personal Equipment for the Prevention of Covid-19 in 3 Large Cities in Indonesia (Jakarta, Surabaya and Makassar)

**Anwar Mallongi**

*Department of Environmental Health, Faculty of Public Health, Hasanuddin University, Makassar, Indonesia*

## Abstract

In Indonesia, data from May 19, 2020 showed confirmed cases of 18,496 and 1,221 deaths. Data as of May 18, 2020, DKI Jakarta became the province with the highest cases in Indonesia, reaching 6,059 cases. The other highest case is Surabaya City, East Java Province which ranks second, with 2,296 cases. In addition, South Sulawesi Province became the province with the highest cases outside Java, amounting to 1,064 as of 19 May 2020. SARS-CoV-2 is transmitted mainly through droplets, therefore PPE (Personal Protective Equipment) is one of the most effective methods of preventing transmission. The method in this research is a qualitative method with a case study approach model. The approach model focuses on gathering various information from several sources such as documents, field surveys, observations, interviews, and detailed recordings. Data collection was carried out based on the number of cases infected in 3 major cities of Indonesia (Jakarta, Surabaya and Makassar).The results showed COVID-19 cases in Jakarta, Surabaya and Makassar continued to experience an increase in cases every day. As of March 3-April 19, 2020 confirmed 3033 cases in Jakarta, in Makassar City as many as 453 confirmed cases from March 3-April 25 2020. In Surabaya City there were 392 confirmed cases from March 23-April 28, 2020. Increasing the number of positive cases, in three big cities Makassar, Surabaya and Jakarta because there are still many people who do not follow government regulations related to social distancing. The COVID-19 transmission pathways are breathing and contact, therefore proper use of PPE will be able to prevent the transmission of Cov-2 SARS. However, the availability of PPE sometimes becomes a barrier because strategies are needed to facilitate the availability of PPE

***Keywords:*** *Personal Protective Equipment, Covid-19, Preventing transmission*

## Introduction

The number of cases in DKI Jakarta reached 6059 cases as of May 18, 2020, with the number of death cases reaching 463 cases. Until now, DKI Jakarta is still the province with the highest number of cases in all of Indonesia.

The number of cases in East Java reached 2296 cases as of May 18, 2020, with the number of death cases reaching 209 cases. This makes East Java Province as the province with the second highest number of cases in Indonesia after DKI Jakarta Province. The city with the highest number of cases in East Java Province is Surabaya City, with the number of confirmed cases reaching 1,109 cases and 132 deaths[1].

The number of cases in South Sulawesi reached 1064 cases as of May 19, 2020 with a cumulative number of death cases reaching 55 cases. This resulted in South Sulawesi Province being included in one of the provinces with the highest number of cases in Indonesia. Until May 19, 2020, the number of cases in Makassar City had reached 627 cases. This makes Makassar City one of the cities with the highest number of cases in Indonesia[2].

Personal protective equipment (PPE) is one of the effective methods of preventing transmission during rational use. The PPE component consists of gloves,

face masks, protective goggles or face shields, and long-sleeved non-sterile gowns. Personal protective equipment will be effective if supported by administrative controls and environmental and technical controls. Rational use of PPE is assessed based on the risk of exposure and transmission dynamics of the pathogen[3].

Lack of PPE availability either because the number of patients has jumped sharply or due to the production of PPE that can not meet the needs so that a situation like this is determined by the leadership of the Fasyankes as a crisis period. This alternative is given as a consideration to meet the needs of using PPE in treating patients with COVID-19. 3 APD is a strategic issue related to handling Corona virus in Indonesia. Due to lack of PPE many medical personnel are infected with this virus and must be treated. Even though health workers are at the forefront and demanded to be alert to deal with this virus. On the one hand, the fact is the number of health workers is lacking. Health workers must be protected and given adequate PPE, because of their strategic role in handling Covid-19. We worry that if they are not protected then many health workers will be infected and observed for 14 days or isolated, causing a domino effect. Namely, the reduced number of health workers who can help deal with the virus.

## Materials and Method

The method used is a qualitative method with a case study approach model. Case studies are one model approach that focuses on gathering various information from several sources such as documents, field surveys, observations, interviews and detailed recordings (Prihatsanti, Suryanto and Hendriani, 2018). Data collection was carried out based on the number of cases infected with Covid-19 in 3 major cities in Indonesia (Jakarta, Makassar and Surabaya).

## Results

### 1. Results of Covid-19 Disease Cases in Jakarta

Sumber: covid19.sulselprov.go.id, 2020

The number of cases is increasing every day. Regarding from 3 March 2020 to 25 April 2020 the total number of positive cases of Covid 19 was 453 cases, for PDP there were 781 cases and ODP was 3781 cases.

3. Results of Covid-19 Disease Cases in Surabaya City

**Table 3. Table Number of Covid-19 Patients in Surabaya City**

| Date | Positive | PDP | ODP |
|---|---|---|---|
| 3 March 2020 | 23 | 7 | 135 |
| 24 March 2020 | 29 | 8 | 182 |
| 25 March 2020 | 29 | 8 | 182 |
| 26 March 2020 | 31 | 16 | 189 |
| 27 March 2020 | 31 | 34 | 193 |
| 28 March 2020 | 31 | 34 | 193 |
| 29 March 2020 | 38 | 61 | 206 |
| 30 March 2020 | 38 | 66 | 207 |
| 31 March 2020 | 38 | 73 | 237 |
| 01 April 2020 | 41 | 137 | 258 |
| 02 April 2020 | 41 | 229 | 508 |
| 03 April 2020 | 74 | 221 | 575 |
| 04 April 2020 | 77 | 251 | 653 |
| 05 April 2020 | 84 | 309 | 814 |
| 06 April 2020 | 84 | 318 | 832 |
| 07 April 2020 | 84 | 367 | 1056 |
| 08 April 2020 | 84 | 416 | 1056 |
| 09 April 2020 | 93 | 448 | 1167 |
| 10 April 2020 | 97 | 497 | 1255 |
| 11 April 2020 | 97 | 519 | 1290 |
| 12 April 2020 | 180 | 502 | 1360 |
| 13 April 2020 | 208 | 523 | 1398 |
| 14 April 2020 | 228 | 536 | 1447 |
| 15 April 2020 | 244 | 585 | 1560 |
| 16 April 2020 | 246 | 634 | 1658 |
| 17 April 2020 | 250 | 669 | 1728 |
| 18 April 2020 | 270 | 703 | 1806 |
| 19 April 2020 | 299 | 745 | 1892 |
| 20 April 2020 | 299 | 795 | 1941 |
| 21 April 2020 | 310 | 829 | 2007 |
| 22 April 2020 | 315 | 870 | 2072 |
| 23 April 2020 | 325 | 895 | 2125 |
| 24 April 2020 | 327 | 935 | 2196 |
| 25 April 2020 | 368 | 948 | 2232 |
| 26 April 2020 | 367 | 1004 | 2278 |
| 27 April 2020 | 372 | 1036 | 2314 |
| 28 April 2020 | 392 | 1056 | 2364 |

Based on the table above it can be seen that the number of cases is increasing every day. Regarding from 23 March 2020 to 28 April 2020 the total number of positive cases of Covid 19 was 392 cases, for PDP as many as 1056 cases and ODP as many as 2364 cases.

## Discussion

Environmental factors include physical factors such as geology and climate, biological factors such as insects that transmit agents, and socioeconomic factors such as crowding, sanitation, and the availability of health services. The physical environment, such as a slum area, will speed up the transmission of the virus due to the large number of contacts between humans. The number of facilities and medical devices (laboratories) is also an influential factor. While the socio-cultural environment in question is the existence of events or activities that gather people[4].

The most important benefit of PHBS is the creation of a community that is health conscious and has the provision of knowledge and awareness to live life behaviors that maintain hygiene and meet health standards. Creating a healthy environment will be able to prevent the spread of disease, the community will use health facility services and be able to develop health sourced from the community[5]. PHBS is one way to prevent someone from being infected and COVID-19 transmission. PHBS is implemented by routinely washing hands with soap and running water, using self-protection tools, such as masks, and applying the ethics of coughing and sneezing[3,5].

Furthermore, regarding climate and geology was discussed by the Indonesian Research Institute (LIPI). The result, air temperature, sunlight, and humidity levels affect the speed, death of the Covid-19 virus in the air and on non-porous surfaces. Clearly, the COVID-19 virus can be transmitted in all areas, including areas with hot and humid weather, can attack anyone and anywhere, regardless of race or geographical location[6,7].

Furthermore, the increase in the number of positive cases in the 3 major cities of Makassar, Jakarta and Surbaya is because there are still many people who do not follow government regulations related to social interaction restrictions or social distancing. This is in line with the events that occurred in Lampung, an increase in the number of people infected with the Corona virus in March 2020 in Lampung due to activities that gather many people (Sri, 2020).

The main transmission pathways of COVID-19 are breathing and contact. Sprinkling of breathing originates from coughing or sneezing of an infected person and anyone who has close contact with someone who has symptoms of respiratory problems (such as sneezing and coughing) at risk of infected splash. In the results of studies that have been carried out the risk of being infected with the COVID-19 virus from the feces of an infected person seems to be low. Some studies suggest that the COVID-19 virus might cause intestinal infections and can be found in feces[9-11].

• For the general public, people who experience symptoms that show COVID-19 or who treat COVID-19 patients at home should get a medical mask and instructions for use. Further information can be seen in the home care guide for COVID-19 patients with mild symptoms and management of their contacts. Further information can be seen in the recommendations regarding the use of masks in the community, during treatment at home, and in health care facilities in the context of COVID-19. Coordinate PPM supply chain management mechanisms PPD management should be coordinated through national and international supply chain management mechanisms that include but are not limited to: • Estimated use of PPE based on a rational quantification model to ensure the rationalization of the requested inventory, • Monitoring and controlling PPE requests from countries and responding parties with a large number of members; • Promotion of a centralized demand management approach to avoid duplication of inventory and ensure strict compliance with essential inventory management rules to limit disposal, excess inventory, and lack of inventory; • Monitoring overall PPE distribution; • Monitoring and controlling PPE distribution from medical facility warehouses.

## Conclusion

The Covid-19 pandemic still attacks Indonesia today. One of them is that the increase in Covid-19 cases is still very massive in three big cities, namely Jakarta, Surabaya and Makassar. PSBB is a step implemented by the state to combat Covid-19. However, there are still many violations that occur so that transmission is still

very high. In the PSBB, the PPE factor also determines the success of the PSBB in decreasing cases and breaking the chain of transmission. However, PPE is still very difficult to access by the community to this day. Though PPE like a mask is the main weapon to fight viruses such as Covid-19.

# The Influence of Body Image towards Self-Esteem, Self-Compassion and Psychological Well-Being in Female Exerciser

**Namora Lumongga Lubis[1], Hasnida[2], Anwar Mallongi[3]**

*[1]Research Scholar of Department of Public Health, Universitas Sumatera Utara, Medan, Indonesia, [2]Research Scholar of Department of Psychology, Universitas Sumatera Utara, Medan, Indonesia, [3]Professor of Department of Environmental Health, Hasanuddin University, Makassar, Indonesia*

## Abstract

Human development is a process of change that occurs throughout life. In adulthood, there are many changes in as such as cognitive, socio-emotional and physical changes. Body image is an individual experience in the form of perceptions of body shape and weight, as well as behaviours that lead to an individual's evaluation of his physical appearance. Body image in women is very influential on their psychological factors such as self-esteem, self-compassion and psychological well-being. Sample of this research consisted of as many as 100 female excersicer. The research was conducted in Lapangan Merdeka, Lapangan Cadika, and Lapangan Teladan, Medan. Data were analysed by using simple logistic regression test and multiple logistic regression. The results of bivariate analysis found, the variables of self-esteem and self-compassion have an influence on body image in female exercisers with the value $p<0.05$. From the results of multivariate analysis, it is obtained that the value $p>0.05$, which means there is no relationship between self-esteem, self-compassion, and psychological well-being to body image. The results show that there is no relationship between self-esteem, self-compassion and psychological well-being to body image in female exerciser, these variables do not have a dominant influence meaning, all the three variables have the same influence on body image. Further findings show that self-esteem has a greater influence to body image on female exerciser.

***Keywords:*** *Body Image, Self-Esteem, Self-Compassion and Psychological Well-Being*

## Introduction

At the age of 18-29 years old, body weight in women continues to increase with a percentage of 10.6% to 17.8%[1]. Based on the results of the 2013 Riset Kesehatan Dasar (Risekdas) data, the prevalence of obesity in Indonesia in 2007, in adolescence and adulthood was 13.9% in men and 23.8% in women. In 2013, the national prevalence of obesity in women was higher than in men, which was 32.9% in women and 19.7% in men. In general, females tend to feel they have a negative body shape or size[2]. A study said only 33% of women said they had the ideal body shape and size, while 58% said they wanted to lose weight. Females tend to think that their body size is too big.

email address: hasnida@usu.ac.id

Body image is influenced by several factors such as culture, gender, mass media, parents and family members, interpersonal relationships, self esteem, comparison of others, and the learning process[3,4]. Self-esteem is an important factor in the development of body mage. Those with higher self esteem tend to develop a positive body image. On the contrary, those with lower self esteem tend to develop a negative body image[5]. Self esteem is a person's attitude based on perceptions about how a person values himself as a whole, both in the form of a positive attitude and a negative attitude.

Cash and Fleming[5] revealed that body image has an important role in the physical and psychological health condition of women. Psychological wellbeing is a concept that involves three things in general, namely subjective, social and psychological and health-related behaviors[6]. Psychological wellbeing is an important thing for a female. A good psychological wellbeing can

make someone feel satisfied with herself, maximize one's potential to the fullest and build a good relationship with others, because she does not see the deficiencies or dissatisfaction in her.

## Materials and Method

### Sample

The sample in this study consisted of 100 female exerciser with an age range of 21 to 60 years.

### Instrument

This research used four measuring instruments which have been translated to Bahasa Indonesia, including: 58 items of Coopersmith's Self-Esteem Inventory scale, 25 items of Neff's (2003) Self-Compassion Scale, and 42 items of Psychological Well-Being Scale by Ryff. The body image variable research instrument used in this study was prepared based on the theory of Cash (2000) which consists of 30 items.

### Analysis Method

The data analysis method used in this study is multivariate analysis using a simple logistic regression test.

## Results

### Univariate Analysis

Univarate analysis aims to determine the frequency distribution of the characteristics of each variable studied. The results of the frequency distribution research showed that 51% (51 respondents) of 100 female respondents who worked out had a high body image and 49% (49 respondents) had a low body image in Lapangan Merdeka, Lapangan Cadika, Lapangan Teladan Medan

**Table 1. The distribution of body image respondent on female exercisers 2019**

| Body Image | | n | Percentage |
|---|---|---|---|
| 1. | High | 51 | 51 |
| 2. | Low | 49 | 49 |
| Total | | 100 | 100 |

### Demographic.

In tihs study, the characteristics of respondents included age, marital status, reasons for exercising, duration of exercise, frequency of exercise in a week. Based on the results of the study, from 100 respondents it is known that as many as 56% (56 reponden) are at the age range of 25-40 years, while minorities are found in the age range of > 60 years with the total of 1% (1 responden). Based on marital status, the majority of respondents were married with the total of 60% (60 respondents). Based on the reasons for exercising, as many as 86% (86 respondents) exercised to improve their health. Based on the length of workout, as many as 65% (65 respondents) had performed excercise for 1-5 months, while the minority of respondents or as many as 10% (10 respondents) had performed exercise for > 12 months. Based on the duration of exercise, the majority of respondents or as many as 49 people performed exercise for 15-30 minutes, while 1% (1 respondent) of the respondents performed exercise for 61-100 minutes. Based on the frequency of exercise in one week the majority of respondents or as many as 62% (62 respondents) performed exercise for 3-5 times / week.

Respondents description based on exercise factor.

Based on the results, it is found that femlae exerciser at Lapangan Merdeka, Lapangan Cadika, Lapangan Teladan Medan 2019 based on self-esteem variables, the majority of high self-esteem factor was 53% (53 respondents). Based on the self-compassion factor, the majority of high self-compassion was 51% (51 respondents). Based on psychological well-being factor, the majority of psychological wellbeing was 52% (52 respondents).

### Bivariate Analysis

The influence of self-esteem, self-compassion and psychological well-being on body image in female exerciser.

Based on the results of the Simple Logistic Regression test, the effect of Self Esteem, Self Compassion and Psychological Wellbeing on Body Image in Lapangan Merdeka, Lapangan Cadika, Lapangan Teladan Medan in 2019. Can be seen in the following table 2:

**Table 2. The influence of self-esteem, self-compassion and psychological well-being on body image in female exercisers**

| Variable | Body Image | | | | Total | | P | OR 95% CI |
|---|---|---|---|---|---|---|---|---|
| | High | | Low | | | | | |
| | n | % | n | % | n | % | | |
| Self Esteem | | | | | | | | |
| a. High | 34 | 64,2 | 19 | 35,8 | 53 | 100 | 0,006 | 3,158 |
| b. Low | 17 | 36,2 | 30 | 63,8 | 47 | 100 | | (1,394-7,156) |
| Self Compassion | | | | | | | | |
| a. High | 32 | 62,7 | 19 | 37,3 | 51 | 100 | 0,018 | 2,659 |
| b. Low | 19 | 38,8 | 30 | 61,2 | 49 | 100 | | (1,186-5,964) |
| Psychological wellbeing | | | | | | | | |
| a. High | 31 | 59,6 | 21 | 40,4 | 52 | 100 | 0,074 | 2,067 |
| b. Low | 20 | 41,7 | 28 | 58,3 | 48 | 100 | | (0,931-4,588) |

Based on the data, it is found that self esteem affects the body image of female exerciser, $p<0.005$, OR :3.158 with 95% CI: 1.394 - 7.156. Female with higher self esteem has a 3.158 times greater chance of having a higher body image compared to female with lower self esteem. Furthermore, there is a significant effect of self compassion on body image on female exerciser, $p<0.005$, OR: 2,659 with 95% CI: 1,186-5,964 which means that women with higher self compassion have a 2.659 times greater chance of having a high body image compared to female with lower self compassion.

Based on the result, there is no significant effect of psychological wellbeing on body image of female exerciser, $p> 0.005$

*Multivariate Analysis*

To analyze the relationship between the three independent variables on body image on female exerciser, multiple logistic regression test was used, because the dependent variable is in two categorized, high and low. Multivariate analysis with multiple logistic regression (multiple logistic regression) tests to find the most dominant variable related to body image in female exerciser. Of all the independent variables there are p values <0.25 which are varied entered into the multivariate model as in the following table*:*

**Table 3. p-value < 0,25 Independent Variable**

| Variable | p-value |
|---|---|
| Self Esteem | 0,006 |
| Self Compassion | 0,018 |
| Psychological wellbeing | 0,074 |

As for the independent variable in this study, include self-esteem, self-compassion and psychological well-being. Analysis test result is presented in following table 4:

**Table 4. Multiple logistic regression model of body image in female exercisers**

| Variabel | B | P | Exp B | 95% CI | |
|---|---|---|---|---|---|
| | | | | Lower | Upper |
| Self Esteem | 0,482 | 0,343 | 1,62 | 0,598 | 4,392 |
| Self Compassion | 0,766 | 0,184 | 2,152 | 0,695 | 6,661 |
| Psychological Wellbeing | 0,193 | 0,695 | 1,213 | 0,462 | 3,181 |
| Constant | -0,731 | 0,028 | 0,481 | | |

Based on the results of the multiple logistic regression analysis with the enter method shows that when the variables of self esteem, self compassion and psychological well-being are seen together it turns out that the three variables are not related to body image in women who exercise with a value of p> 0.05, so that the variable does not statistically have a dominant effect.

## Discussion

*The influence of self-esteem on female exerciser's body image*

Based on the results of bivariate analysis, there is a significant influence between self esteem and body image on female exerciser. The results of simple logistic regression tests reveals that the value of p = 0.006 which is less than α = 0.05, then Ha is accepted. Furthermore, the results of multivariate analysis reveals that self esteem is the most important factor in women's body image p = 0.184; OR = 2,152. The results of this research are in accordance with the results of research conducted by Zhafirah and Dinardinata[7] which stated that self-esteem had a contribution to body image in women. The higher ones self-esteem, the higher body image they have and vice versa.

Self-esteem is a predictor of satisfaction toward body image in women and becomes a concern for physical appearance. A study states that women with higher self esteem tend to evaluate their physical appearance positively[8]. Another study states that self-esteem works better to predict risk factors for dissatisfaction with body image in women[9].

In general, women are more likely to perceived they have a negative body image. A study revealed that women who exercised regularly would have better self-evaluation, health and exercise orientation and better self-esteem. In addition female exercisers tend to have satisfaction with a higher body image so that they respect themselves more[10].

Women with concern on body shape and appearance will tend to exercise with the aim of shaping their bodies to be ideal and reducing dissatisfaction with their body shape[11]..

*The influence of self-compassion on female exerciser's body image*

Based on the bivariate test results it can be seen that there is a significant effect between self-compassion and body image on female exerciser. This is in accordance with the results of the simple logistic regression test with a value of $p = 0.018$ which is smaller than $\alpha = 0.05$, then Ha is accepted. It shows that the higher self-compassion in a person, the higher one's body image. The results of this study are in line with the results of previous studies which stated that the higher the self-compassion a person has, the less dissatisfaction of his body image[12]

*The influence of psychological well-being on female exerciser's body image*

The bivariate results show that there is no effect of psychological well-being on body image in female exerciser. It can be seen from the results of simple logistic regression test calculations with a value of $p = 0.074$, then Ho is accepted. Assessment of a person's body image has an impact on health, psychological well-being and quality of life in a woman[12]. The results of the study are different from research Kartikasari[13] who said that the lower the body image dissatisfaction, the higher the psychological well-being and vice versa. Other research also shows that psychological well-being has a significant effect on body image satisfaction

[14]. A negative body image brings a person to a feeling of low self-esteem and low self-compassion which affects happiness and psychological well-being. A study said that there is a correlation between body image and self-esteem, someone with negative body image may have negative self-esteem. This will affect one's psychological well-being. Body image has an impact on health, psychological well-being and quality of life in a woman[12].

Body perception has a relationship with self-esteem and psychological well-being in someone[15]. The researchers revealed that dissatisfaction with body shape was associated with various forms of psychopathology such as depression and anxiety disorders[16,17]. Other studies explain that young adult women associate their physical appearance with overall self worth and psychological wellness more than men[18]. Neff and Pommier[19] found that attention to body image is high in adult women and is positively related to happiness and subjective well-being.

## Conclusion

Based on the results shows that the variables of self-esteem, self-compassion and psychological well-being are not related to body image on female exerciser. In conclusion, these variables do not statistically have a significant effect on body image. It is found that self-esteem is the most influential predictor on female exerciser's body image. Another factor such as self-compassion affects the body image on female exercisers. Moreover, there is no influence of psychological well-being on female exerciser's body image.

# A qualitative Study of Accessibility Health Services among Communities on Small Islands in Makassar City

**Alfiah Ramadhani Amran[1], Muhammad Alwy Arifin[2], Muhammad Syafar[3]**

*[1]Postgraduate Students, Administration and Health Policy, Faculty of Public Health, Hasanuddin University, Makassar, Indonesia, [2]Department of Health Administration and Policy, Faculty of Public Health, Hasanuddin University, Makassar, Indonesia, [3]Department of Health Promotion and Behavioral Sciences, Faculty of Public Health, Hasanuddin University, Makassar, Indonesia*

## Abstract

This study aims to explore barriers to access in health services among small islands in Makassar City.

This research is qualitative research through content analysis by observing phenomena that occur based on the accessibility framework of Levesque, et.al. Data collection was carried out through in-depth interviews with 8 key informants and 9 other informants (n = 17).

This study found that geographical factors (distance, travel time, and transportation costs) were the main considerations in utilizing primary health services in the small island communities around Makassar City which were predominantly fishermen. The two closest islands (Barrang Caddi and Bone Tambung), have enjoyed easy access and free service for Universal Health Coverage (UHC) achievements.

It is different from the outer islands, especially Langkai and Lanjukang, although most of the residents already have National Health Insurance (NHI) they have difficulty using their cards due to geographical constraints. Moreover, fishermen often go fishing for days, becoming another obstacle in accessing quality health facilities available in Makassar City.

Various efforts have been made by the Makassar City Health Office to address the disparity in health services in the islands in Barrang Caddi, such as the use of sea ambulances, and regular visits. The marine ambulance is only one ship on standby between two public health centers in another village office if there is an emergency patient who must be referred to a hospital in Makassar City.

This disparity in access to health services triggers injustice among residents of the islands in the Makassar City area. Very contractual with the slogan: "Makassar City of the World".

This study revealed a special transportation need in the form of a very simple capacity sea ambulance and managed by island community communities that are not reached by sea ambulances from the public health center.

***Keywords:*** *access barriers, small islands, marine ambulance, five dimensions Levesque, Makassar city.*

## Introduction

In the last decade, Makassar was introduced as a 'world city', increasing the cooperation of various countries (sister cities) including waste management, creative industry development, human resource capacity building, and tourism sector development cooperation.

Makassar City is an old city in eastern Indonesia, as a center for transit and education trade. Makassar City has 12 small inhabited islands stretching along the urban coastline as part of the 210 Spermonde islands in the Makassar Strait.

Most of the population lives on the coast and islands, then known as coastal communities. Most of the island's

coastal population is looking to work as a fisherman, depending on the season.[1]

Since the launch of the Universal Health Coverage (UHC) program in Indonesia, most of the population has been able to access the available health services.[2,3]. In Makassar City, the coverage of National Health Insurance (NHI) membership reached 80 percent. Nevertheless, there are still imbalances in health services, especially residents who live on the outer islands of Makassar City. Even among the islands, there are still those who do not yet have health service facilities such as the Supporting Community Health Centers (Pustu).

This study aims to explore the accessibility of health services in the small island communities in Makassar based on the concept of accessibility of Levesque, et.al. includes five dimensions of accessibility including dimensions of approachability, acceptability, availability and accommodation, affordability, and appropriateness to have health services needs fulfilled.[4]

## Materials and Method

This research is qualitative research through content analysis by observing phenomena that occur based on 5 dimensions of accessibility from Levesque, et.al. Data collection was carried out through in-depth interviews with 8 key informants and 9 other informants (n = 17).

The design is considered following this study which aims to explore the 5 dimensions of accessibility based on Levesque, et.al[4] including dimensions of approachability, acceptability, availability and accommodation, affordability, and appropriateness to have health services needs fulfilled.

Data collection was carried out through in-depth interviews with 8 key informants who were deemed to meet the competencies to be studied and 9 other informants (*n = 17*) as having used or were currently using available health services.

Data analysis uses content analysis to analyze the phenomena found in this study.

## Results

This research explores 5 dimensions of health service accessibility according to Levesque, et.al. [3] includes dimensions of closeness (approachability), acceptance (availability ability), availability (availability and accommodation), the ability of users (affordability), and appropriateness to enjoy quality, equal and affordable health services to small island communities on the coast of Makassar City.

1. The dimension of Proximity (approachability)

The proximity dimension covers geographical aspects (distance traveled, travel time, and transportation costs), and health insurance coverage (JKN / KIS)

Distance to health services in Makassar City, between 11 - 46 km, the closest is Barrang Caddi Island and the farthest is Lanjukang Island.

As an example :

*"The distance to the nearest island is about 11 km, and the outermost island is around 46.5 km" (IS, 51 years)*

Travel time between 30 minutes to 4 hours.

"The travel time to Bone Tambung Island and Barrang Caddi is around 30-45 minutes. Whereas to the outer islands around 4 hours, if the weather is good. (KS, 39 years)

Traveled using a 40 PK outboard motorboat with a capacity of 30 passengers, or a rented lifeboat.

As an example :

"Generally passengers use wooden boats carrying 30 people, with rent of Rp. 15,000, - one way to the nearest island. While the outer islands do not yet have public transportation, if you do not have your boat you have to rent a special around Rp. 250,000 - one way "(GSS, 46 years)

It is different if only using the available health facilities on the island in the form of a Puskemas Assistant (Pustu), the location is in the middle of a settlement, so there are no obstacles.

In the region of Barrang Caddi, holders of the Healthy Indonesia Card (KIS) as proof of the National Health Insurance (JKN), still around 70-80 percent have it.

As an example :

*"Coverage of health insurance coverage has not been exhaustive, only about 70-80% have in the Barrang Caddi Village. (MB, 45 years)*

2. Acceptability dimensions

The acceptability dimension includes perceptions of service quality and discrimination in health services for vulnerable groups

3. Service Quality Perception

As an example :

*"..... Public Health Center Assistant (Pustu) is very petrified within the community fulfillment of health services there are also Integrated Service Post (Posyandu) which every month weighing babies. " (IS, 50 years old)*

b. Discrimination Services

As an example :

"Nothing, everything is served by both the rich and the poor National Health Insruance (NHI) members or Social Security Agency of Health (SSAH) Independent." (IS, 50 years)

3. Dimensions of Availability (availability and accommodation)

The availability and accommodation dimensions include infrastructure, health equipment, pharmaceuticals (medicines), and health workforce resources.

a. Infrastructure

As an example :

*"The health service infrastructure already exists but is not sufficient enough, it still needs to be equipped so that the quality of service is adequate. Another problem, if there are emergency patients who must be referred to the Public Health Center or Hospital in Makassar City, there is no medical transportation available. (AR, 43 years old)*

b. Medical tools

As an example :

*"It is said to be adequate, not much is lacking, but there is still something that can be used by medical personnel here. (MB, 45 years old)*

c. Pharmacy (medicine)

As an example :

"*It's still very lacking because the Pustu still sometimes lacks the medicine here" (MU, 37 years)*

d. Health personnel resources

As an example :

*"The available HR for health workers is not sufficient due to the lack of interest of health workers to be placed on the coast, so currently they only rely on human resources for health workers who live on the island." (MS, 39 years old)*

4. Dimensions of user capability (affordability)

The dimensions of user affordability include the description of community work and the level of income.

a. Job description

As an example :

"The work of the community is around 80% anglers, 10% traders, approximately 9% work in the city, and approximately 1% government employees. (MSB, 39 years old)

5. The appropriateness dimension

Dimensions of service suitability (appropriateness) in the form of the appropriateness of requests with services received, and perceptions of services provided following the provider.

a. Appropriate requests with services received

As an example :

*"The health services provided are as requested when the community comes for treatment at the Pustu. Many withered patients (decompressors) who are unable to be treated by a Pustu, must be referred to the hospital. Sometimes patients get frustrated because their illnesses don't heal and medical treatment costs are expensive, eventually resigned. "(MSB, 51 years old)*

b. Perception of services provided following the provider

As an example :

*"We do not open certain hours for examinations, patients can come to the Pustu at any time when they need health care. Both in terms of schedule and time of health workers never provide limits to the community. " (HA, 33 years old)*

## Discussion

This study revealed that since the implementation of the Universal Health Coverage (UHC) program in Indonesia since 2014, the majority of Indonesia's population has been covered by the national health insurance system (NHI) and has enjoyed the available health services[2;3]. In Makassar City, about 80 percent of the fishing communities in the five groups of Barrang Caddi Island have owned National Health Insurance (NHI) as Recipients of Contribution Aid (PBI) for the poor and disadvantaged groups since 2014.

Nevertheless, there are still residents who experience obstacles in accessing available health services due to geographical dimensions (distance, travel time, transport costs), and are not covered by National Health Insurance (NHI), as is the case in remote China.[5,6]

The islands closest to Makassar City such as Barrang Caddi Island, the community can enjoy quality health services in Makassar City almost every day while shopping for their household needs or purchasing merchandise supplies. They have felt the impact of equality in accessing health services according to the UHC program.[2,8]

The results of research by Laksono A.D, et.al. shows that adults living in urban areas tend to use hospital outpatient facilities 1.3 times higher than adults living in rural areas. The likelihood of utilizing outpatient and inpatient facilities at the same time is 1.2 times higher in adults living in urban areas than in rural areas.[10]

Different conditions are felt for residents of the outer islands such as Langkai Island and Lanjukang Island in accessing available health services. The main obstacles in the form of geographical access (distance traveled, travel time, transport costs), including not yet covered by National Health Insurance (NHI). The outer islands such as Lanjukang Island have no health facilities at all, causing residents to have to cross to other nearby islands to get primary health care.

The fate of the inhabitants of the outer islands in Makassar City who generally work as fishermen is not as good as the rural population in Indonesia, where most of the low-income villagers have enjoyed the available health services.[3;9]

Some residents prefer to become traditional divers fishermen chasing high-value species such as sea cucumbers, even though they know the risk is heavy. No wonder, if there are some traditional diver fishermen in the Barrang Caddi Island group found to suffer from decompressors (DCS) even at a young age. The same thing is found in sea cucumber fishermen on the Yucatan Peninsula, Mexico[11] Prolonged treatment time and direct and indirect costs[12], cause decompressor patients to become apathetic. Patients with decompressors (DCS) in Taiwan have a 3.8-fold risk of experiencing psychiatric disorders, and a 5.7-fold risk of sleep disorders[13].

Makassar's slogan "City of the World", feels bitter for a group of fishermen on the outer islands that are neglected. Urban and provincial health facilities even at the national level are available only for the inhabitants of the outer islands of the region.

Unfair access has hampered opportunities for outermost island patients to obtain appropriate health services based on their perception of care needs. This requires consideration not only of service availability but also the quality of care[14-21.]

The urgent need is to provide simple capacity marine ambulances on each island to transport emergency patients. As is the desire of the small island community to manage marine ambulances for emergency patients managed by the local fishing community. [15-18] Speed up the coverage of National Health Insurance (NHI) membership for all residents of the small islands in the coastal city of Makassar in accordance with the mandate of Universal Health Coverage (UHC) so that there are no more populations that are not covered by national health insurance (NHI), especially the poor and poor.

## Conclusions

Around 80 percent of the people in the Barrang Caddi Island group has been covered by National Health Insurance (NHI) and are used to obtain the needed health services, especially fishing communities who live on islands closest to Makassar City such as Barrang Caddi Island.

There is still an imbalance in access to health services, especially in the outer islands of Makassar due to geographical constraints (distance, travel time, transportation costs), and lack of National Health Insurance (HHI).

The discovery of decompressor patients requires special attention to treatment efforts.

## Abstract

Today, air pollution is a serious problem faced by industrial countries. The impact caused by air pollution is not only a direct impact on human health, but also can damage the environment. One of the sources of air pollution are now common is the forest fires which generate a compound emissions are carbon dioxide ($CO_2$).Several studies in the medical literature documenting a causal link between air pollution, especially $CO_2$ and negative impacts on health after short-term exposure, especially the unknown long-term health consequences of exposure to pollution. Some studies related to fire management models and $CO_2$ emission reductions of them use the method of mapping risk of forest fires and the use of reforestation and the elimination of illegal logging is considered effective to implement.

***Keyword:*** *Air pollution, forest fires, carbon dioxide*

## Introduction

Today, air pollution is a serious problem faced by industrial countries. Air pollution raises a very adverse impact. The impact caused by air pollution is not only a direct impact on human health, but also can damage the environment.

One of the sources of air pollution are now common is their forest fires. One of emissions contained in air pollution as a result of the forest fires are compounds of carbon dioxide ($CO_2$).[1]

$CO_2$ emissions and global warming potential to be one of the considerationsbiggest environmental problems today. Due to the increase global population and industrial development quite rapidly result in the concentration of $CO_2$ in the atmosphere has grown an average of 2 ppm / year for the last 10 years.[2]

## Materials and Method

In this literature review, keywords used to get a reference to a related article is “air pollution”, “forest fires” and “carbon dioxide”. The scope of the literature review will be limited beginning in 2011 to the top with the goal of search engines can produce journals - journals and references are more focused on development problems and solutions. Reference is also limited in the famous journal, namely Science Direct, because the journal can be accessed free of charge. Search results using keywords found about 6,200 research articles and 7,800 books. However, based on the criteria of the carbon dioxide, only 12 articles were reviewed,

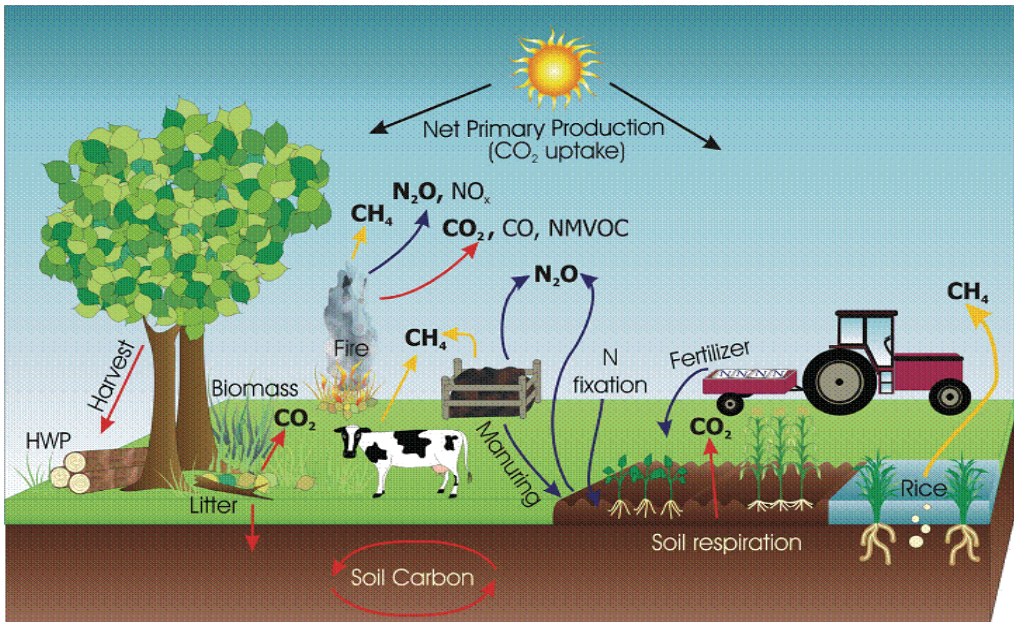
## Result and Discussion

*Air Pollution, Forest Fire and Carbon*

Air pollution can be defined an activity in the atmosphere, where the concentration of the substance - a substance that is sufficiently high and is above the ambient value and can have an impact - the impact on humans, animals, vegetation, or material. In addition to disrupting the aesthetics, small-sized particles in the air can be inhaled into the respiratory system and cause respiratory illness and lung damage. Particles that get into the respiratory system will be set aside depending on the diameter.[3]

One of the sources of air pollution are now common is their forest fires. One of emissions contained in air pollution as a result of the forest fires are compounds $CO_2$.[4]

$CO_2$ is actually a component compound that naturally exist in the air. Effect of CO2 is called the greenhouse effect of $CO_2$ in the atmosphere which can absorb heat energy and obstruct the course of the heat energy from the atmosphere to the surface is higher.[(5)]



**Picture 1**

Cycle greenhouse gas

*Transport, transfer and accumulation of $CO_2$*

The oceans play an important role for the distribution of this is because the $CO_2$ concentration at the level of atmospheric $CO_2$ that is controlled by the concentration of $CO_2$ in the oceans. Cycle $CO_2$ in the oceans separated in two senses, namely $CO_2$ natural and anthropogenic $CO_2$. Since the increase of anthropogenic $CO_2$ in nature, the sea has a role as an absorber of anthropogenic $CO_2$ to maintain the balance of the Earth system. On the other hand, the increase in this concentration in the feared sea will also affect the balance mechanism existing systems in it. Therefore, the amount of $CO_2$ that accumulates in the water column and how its distribution among the oceans of the world, will continue to be examined from year to year due to increased concentrations of anthropogenic $CO_2$ in the atmosphere.[6]

$CO_2$ in the atmosphere is also absorbed by plants through photosynthesis berhijau leaves, but the amount of $CO_2$ available to that used by plants on the earth is not balanced anymore. The more $CO_2$ and other greenhouse gases in the atmosphere, the more infrared radiation is absorbed, the higher the intensity of the greenhouse and consequently the temperature at the earth's surface is also higher.[5]

Diffusion of $CO_2$ from tissues to the bloodstream and lungs are also caused by the pressure difference of $CO_2$. $CO_2$ pressure in tissues, veins, arteries, and alveoli. Therefore, the $CO_2$ in the network will be transported to the alveoli in the lungs.Literature and scientific documents relating to $CO_2$ inhalation exposure effects on human health and psychomotor performance, linear physiological changes in the circulatory system, cardiovascular and autonomic on exposure to $CO_2$ concentrations in the range of 500-5000 ppm. Human experimental studies explain that short-term exposure to $CO_2$ begins at 1000 ppm affect cognitive performance including decision-making and problem solving. Changes in the autonomic system for low-level exposure to $CO_2$ may involve this effect. Further research is needed on the long-term effects of exposure to low levels of $CO_2$ in the autonomous system. A number of epidemiological studies show a link between low-level exposure to $CO_2$ ranging from 700 ppm and symptoms associated with the building. Respiratory symptoms indicated in children who are exposed to indoor $CO_2$ concentrations

higher than 1000 ppm. However, in other comorbidities pollutants may be involved in these effects.[6]

The amount of $CO_2$ that accumulates in the water column and how its distribution among the oceans of the world, will continue to be examined from year to year due to increased concentrations of anthropogenic $CO_2$ in the atmosphere.[7]

*Impact on the environment*

Population growth and the use of fossil fuels at the same time as the main energy source in the region has led to the release of more $CO_2$ into the atmosphere with negative consequences on the environment.[8]

$CO_2$ is a greenhouse gas implicated in global warming trend. Snow and ice have declined closure, the ocean temperature has increased and the level of the ocean's surface also increased over the last century. Rising sea levels could submerge many areas. Extreme weather conditions are causing droughts, floods and typhoons, as well as the distribution of disease-causing organisms may occur predictability.[9]

*Health impacts caused*

Several studies in the medical literature documenting a causal link between air pollution and negative health outcomes immediately after exposure, much less is known long-term health consequences of exposure to pollution. A study using Indonesia's forests in 1997 as a natural experiment, which estimates long-term effects of air pollution on health outcomes that take advantage of the properties of longitudinal from Indonesia Family Life Survey (IFLS), by collecting individual data detail about many health outcomes, both in Discovered in 1997 and 2007. the significant negative impact of pollution, which survive in the long term. Men and older people most impacted, while the children seemed to recover almost completely from this initial shock. For the whole population,[10]

Judging from some of the literature and scientific documents relating to $CO_2$ inhalation exposure effects on human health and psychomotor performance. Linear physiological changes in the circulatory system, car-diovaskular, and autonomous exposure to $CO_2$ concentrations in the range of 500 to 5000 ppm. Human experimental studies have suggested that exposure to short-term $CO_2$ begins at 1000 ppm affect cognitive performance including decision-making and problem solving. Changes in the autonomic system for low-level exposure to $CO_2$ may involve this effect. Further research is needed on the long-term effects of exposure to low levels of $CO_2$ in the autonomous system. A number of epidemiological studies show a link between low-level exposure to $CO_2$ ranging from 700 ppm and symptoms associated with the building. Respiratory symptoms indicated in children who are exposed to indoor $CO_2$ concentrations higher than 1000 ppm.

However, in other comorbidities pollutants may be involved in these effects. In the context of a significant linear increase of the global ambient $CO_2$ concentrations caused by anthropogenic activities and resources, reduce $CO_2$ levels in the room through the vents to the ambient air is increased energy consumption in air-conditioned buildings. To control $CO_2$-efficient energy in the building from the surrounding air, the rise in atmospheric $CO_2$ concentration needs to be suppressed. In the context of a significant linear increase of the global ambient $CO_2$ concentrations caused by anthropogenic activities and resources, reduce $CO_2$ levels in the room through the vents to the ambient air is increased energy consumption in air-conditioned buildings. [6]

**Handling Model That Can Be Applied**

One of the research related to overcoming the problem of forest fires by using Data Base Inventory of Forest Resources, based on four aspects topographical factors, human activities, climate and forest characteristics. A conceptual framework for mapping the risk of fire is developed by integrating Database Forest Resource Inventory. Potential risks of forest fires and map the risk zone in the Chinese heritage sites was assessed using GIS.[11]

Research presents the results of a study of absorption and reduction of carbon dioxide emissions with the use of ecosystem services in the nature reserve (reforestation) and the elimination of illegal logging in the state of the newly formed ijevan, located in Tavush region of the Republic of Armenia.[12]

*Resistance*

In general, the fires caused by three major factors

that fuel conditions, weather and culture, including the lack of public awareness of the importance of forest preservation. All three of the above are causing difficult implemented regulations on forest fires.[4]

*Success*

Improvements in the estimation of the risk of forest fires and fire risk zone mapping is essential to reduce the negativethe impact of fires and to facilitate the planning of the protection of forested areas. The success of the methodthe estimated risk of forest fires and fire risk zone mappingsimply and reliably to assess the potential risk of forest fires and map the forest fire zones in a place with little historical data about the fire. This method helps provide reference for decision makers to prioritize areas for conservation of cultural resources and / or culture, and enhance the practical application of fire prevention and suppression.[11]

Meanwhile, the results of studies related to the absorption of $CO_2$ emissions was found that forest ecosystems asylum state ijevan 440.7 metric can absorb carbon and can reduce $CO_2$ emissions each year. And the elimination of illegal logging, the number could increase carbon sequestration. As a result the amount of carbon dioxide in the atmosphere will be reduced 39.07 metric. Research on $CO_2$ reduction with reforestation system and the elimination of illegal logging are found it turns out the value of carbon sequestration forest ecosystem services by lead economic benefits will be surplus.[12-16]

# The Effect of Giving Date Palm Juice on the Duration of the First Stage of Labor in Sele Be Solu Hospital, Sorong City

**Ariani Pongoh[1], Niken Kumala Budi[1], Sri Ayu Dawam[1]**

*[1]Lecturers of Midwifery Department of Poltekkes Kemenkes Sorong,West Papua*

## Abstract

The maternal mortality rate (MMR) in the world in 2017 is 216 per 100.00 live births and 99% of them are due to childbirth problems in Indonesia. One of the causes of maternal mortality in Indonesia is prolonged labor. The labor process requires optimal energy and stamina. One intake of energy/nutrition for childbirth is Date Palm juice, a mixture of 100 grams of dates with ± 200 cc of water blended using a blender. The purpose of this study was to determine the effect of dates palm juice on the duration of the first stage of labor in Sele Be Solu Hospital in Sorong City.

The research design uses Quasy Experiment (quasi-experimental) with Non-equivalent Posttest Only Control Group. Time and place of research 20 May - 15 June 2019 at Sele Be Solu Regional Hospital, Sorong City. A sample of 32 respondents using purposive sampling technique. The independent variable was giving of date palm juice and the dependent variable was the normal labor duration of the first stage of labor. Data collection used observation sheets and partographs. Statistical analysis using Independent T-Test with a significance level of 0.05. After giving date palm juice to the intervention group p-value = 0,000 α = 0.05 was obtained. There is an effect of Date Palm juice to facilitate normal labor duration of the first stage at Sele Be Solu Regional Hospital in Sorong City.

***Keywords:*** *Labor, First Stage, Date Palm Juice*

## Introduction

The labor process requires optimal energy and stamina, but there are still practices that limit food and fluid intake during labor. This is a need that must be fulfilled properly by the mother during the delivery process. Restrictions on food and beverage intake during labor can cause hypoglycemia and dehydration in labor which can affect contractions so that it can inhibit the progress of labor[1].

In dates palm and every 100 grams of dates palm contain 247-93 calories, 7.0-26.1 grams of moisture, 1.7-3.9 grams of protein, 0.1-1.2 grams of fat, 72 carbohydrates , 9-77.6 grams, 2.0-8.5 grams of fiber, calcium 59-103 mg, iron 3.0-13.7 mg, potassium (potassium) 648 mg, vitamin A 15.60 mg, vitamin B1 0.03-0.09 mg, vitamin B2 0.10-0.16 mg, niacin (vitamin B or becomplex) 1.4-2.2 mg, tryptophan (oxytocin) 10-17 mg, phosphorus 72 mg.[2]

Dates contain oleic and linoleic which contribute to the provision of prostaglandins which function to strengthen and stretch the muscles of the uterus. Additionally, dates affect oxytocin receptors and make the uterine muscles respond better to oxytocin, resulting in much more effective uterine contractions[3]. Giving nutrition during labor must be absorbed by the body quickly and practically, one of the alternatives that can be used is to provide date palm juice. Giving date palm juice is one of the natural, non-invasive, effective, economical and safe methods for maternity mothers because date palm juice can be quickly absorbed by the body after consumption.

The labor process requires optimal energy and stamina. This is a need that must be fulfilled properly by the mother during the birth process, one of the intakes of energy and nutrition to expedite the delivery process, namely date palm juice. Date palm juice contains carbohydrates high enough to be useful for adding and storing maternal energy in labor. Dates palm affect the

oxytocin receptors and make the uterine muscles respond better to oxytocin, resulting in much more effective uterine contractions. Therefore, the date palm is very good to be used as a date juice (Cut Mutiah Journal of the Midwifery Study Program at the Langsa Poltekes Aceh, 2017 and Ayu S. Kinanti).

Based on the background above, the authors are interested in researching" The Effect of Giving Date Palm Juice on the Duration of the First Stage of Labor in Sele Be Solu Hospital, Sorong City".

## Materials and Method

The research design used was the Quasy Experiment (quasi-experimental) with the Non-equivalent Posttest Only Control Group Design approach. This research was conducted at Sele Be Solu District Hospital in Sorong City, Sorong City.

In this study there are two variables, including date palm juice as the independent variable and the normal labor duration of the first stage which is the dependent variable.

The population in this study were first-time mothers in the Sele Be Solu District Hospital in Sorong City. The total number of respondents in the first stage of maternity in the Sele Be Solu Regional Hospital in Sorong City was obtained from the period June 1 - December 31, 2018 totaling 550 people. And the period January - February 2019 numbered 139 people with an average per month there were 70 normal maternity mothers.

The sample in this study was 32 first-stage mothers in labor who had inclusion criteria as follows: The mothers who enter the active phase of the first stage of labor and those who were willing to be respondents. Exclusion criteria included Mothers with high risk and complication labor.

After that the mothers who were in the process of the first stage were asked for approval to get some information and biodata of the mother. Before consuming palm juice, researchers first explained the SOP of making palm juice, then each respondent was given 200 cc of palm juice to be spent in the first stage of the process and after that the researcher observed the respondents in the first stage of the process. Labor is said to be normal if the duration of the first stage of labor for primigravida is 12-14 hours and for Multigravida 6-8 hours. Labor is said to be abnormal if the length of the first stage of labor for primigravida > 14 hours and in Multigravida> 8 hours.

## Results

**a) Frequency Distribution Based on Parity.**

**Table 1. Frequency Distribution Based on Maternity Parity in Sele Be Solu Regional Hospital in Sorong City.**

| Group | Parity | Frequency (Σ) | Percentage (%) |
|---|---|---|---|
| Controls | Primi | 5 | 16 |
| | Multi | 11 | 34 |
| intervention | Primi | 2 | 6 |
| | Multi | 14 | 44 |
| Amount | | 32 | 100 |

Based on table 1 above shows that parity in the control group for primipara has the lowest frequency of 5 mothers (16%), for multipara has the highest frequency of 11 mothers (34%). Whereas parity in the intervention group for primipara had the lowest frequency of 2 mothers (6%), for multiparas having the highest frequency of 14 mothers (44%).

b) **Results of Measurement of the Normal Labor Duration in the Control Group without giving date palm juice.**

**Table 2. The First Stage Maternity Mother in Sele Be Solu District Hospital in Sorong City in the Control Group without giving date palm juice.**

| TABULATION OF CONTROL GROUPS | | | | |
|---|---|---|---|---|
| **Normal Labor Duration** | **Primi** | **Multi** | **Frequency (Σ)** | **Percentage (%)** |
| Normal | 3 | 6 | 9 | 56 |
| Abnormal | 2 | 5 | 7 | 44 |
| Amount | 5 | 11 | 16 | 100 |

Table 2 shows the results that research respondents with primipara experienced normal labor duration by 3 respondents with a percentage (56%) and research respondents with primipara experienced abnormal labor duration by 2 respondents with the percentage (44%) while the research respondents with multipara experienced normal labor duration by 6 respondents with a percentage (56%) while the research respondents with multipara experienced abnormal labor duration by 5 respondents with a percentage (44%).

**c) Results of Measurement of the Normal Labor Duration of Labor in the Intervention Group by giving Kurma Juice.**

**Table 3 The First Stage of labor at Sele Be Solu District Hospital in Sorong City in the Intervention Group by giving Kurma Juice.**

| TABULATION OF INTERVENTION GROUP | | | | |
|---|---|---|---|---|
| **Normal Labor Duration** | **Primi** | **Multi** | **Frequency (Σ)** | **Percentage (%)** |
| Normal | 0 | 12 | 12 | 75 |
| Abnormal | 2 | 2 | 4 | 25 |
| Amount | 2 | 14 | 16 | 100 |

Table 3 shows the results that respondents with primipara experienced a smooth delivery process by 0 respondents with a percentage (75%) and research respondents with primipara experienced by not going smoothly by 2 respondents with the percentage (25%) while the research respondents with multipara experienced a normal labor duration process by 12 respondents with a percentage (75%) while the research respondents with multipara experienced abnormal labor duration process by 2 respondents with a percentage (25%).

**d) Normality Test The Effect of Giving Date Palm Juice to facilitate normal duration of the First Stage of Labor in the Control and Intervention Groups.**

**Table 4 Normality Test Effect of Giving Date Palm Juice to facilitate normal duration of the First Stage of Labor in the Control and Intervention Groups.**

| **Tests of Normality** | | | | | | |
|---|---|---|---|---|---|---|
| | **Kolmogorov-Smirnova** | | | **Shapiro-Wilk** | | |
| | Statistic | Df | Sig. | Statistic | Df | Sig. |
| Kel | .338 | 32 | .200 | .638 | 32 | .853 |
| a. Lilliefors Significance Correction | | | | | | |

The Kolmogorov-Smirnov test value obtained in the SPSS application, from

(a) Test the normality of data on the frequency of giving date juice to facilitate normal duration of the first stage of labor, the results of testing in the control group were found to be significant (p) 0,000> 0.05, so the data can be stated as normally distributed.

(b) Test the normality of data on the frequency of giving date juice to facilitate normal duration of the first stage of labor, the results of testing in the intervention group, the test results obtained a significant value (p) 0,000> 0.05 then the data can be declared normally distributed.

**e) Test the effect of homogeneity on giving palm date juice to facilitate normal duration of the first stage of labor.**

Before the hypothesis test is performed the homogeneity test is done using the Anova test. The results can be seen in table 5.

**Table 5 Test the effect of homogeneity on giving palm date juice to facilitate normal duration of the first stage of labor.**

| **ANOVA** | | | | | |
|---|---|---|---|---|---|
| **Results of Observation of the Smooth Delivery** | | | | | |
| | Sum of Squares | Df | Mean Square | F | Sig. |
| Between Groups | 4,500 | 1 | 4,500 | ,460 | ,503 |
| Within Groups | 293,500 | 30 | 9,783 | | |
| Total | 298,000 | 31 | | | |

The Anova Test value obtained in the SPSS application, the test results obtained a significant value (p) 0.503> 0.05, the data can be said to be homogeneous.

f) Independent T-test The effect of giving date juice to facilitate normal duration of the first stage of labor.

The results of the Independent T-test The effect of giving date juice to facilitate normal duration of the first stage of labor can be seen in the following table.

**Table 6 Independent T-test The Effects of giving palm juice to facilitate normal duration of the first stage of labor.**

| Variable | Mean | P = Value |
|---|---|---|
| Control Group | 10,483 | 0.000 |
| Intervention Group | 7.875 | 0.000 |

Based on the results of the Independent T-test test explains that the effect of giving date juice to facilitate normal duration of the first stage of labor in the control group and the intervention group has the same significant value (p-value) that is 0,000 <0.05.

## Discussion

The normal labor duration in mothers given Date juice is caused by it can affect the oxytocin receptors and accelerate the emergence of uterine contractions more easily to push the fetal head into the pelvic floor and shorten the duration of the latent phase of the first stage of labor[4]. From the research conducted there is a normal labor duration in primigravida and multigravida mothers.

Identification of the normal duration frequency of the first stage of labor from special data, it was found that the mother gave birth in the control group (who were not given date juice). For a duration scale in the first stage of labor in primipara experienced normal labor duration of 3 people (56%), while for multipara experienced normal labor duration of 6 people (56%). And for abnormal duration scale in the first stage of labor in primipara as many as 2 people (44%), while for multipara experiencing abnormal duration in labor as many as 5 people (44%).

Dates also contain hormones that help the uterus stretch for the birth of a baby. Dates affect the oxytocin receptors, stimulating the uterine muscles to respond more comfortably to oxytocin. Dates also affect the hormones progesterone and estrogen which are effective in preparing the uterus and cervical ripening[5].

Parity also affects the process of accelerating labor. Mothers with primipara parity status, of course, require a longer time in the labor process, so it is necessary to provide dates juice to stimulate the acceleration of labor[6]. However, due to time constraints and patient availability, most of the research respondents at Sele Be Solu Hospital were in the Multipara parity with a percentage of 78%. Regardless of parity status, every pregnant woman has a varying duration of labor, due to various factors, so it does not rule out the possibility of a pregnant woman with multipara parity status also requiring the provision of date palm juice to stimulate the delivery of labor and minimize risk[7-10].

The control group of mothers (who were not given date juice) experienced an abnormal duration of labor due to lack of uterine rate and systole (heart contraction when blood is pumped into the arteries). Maternal women need the hormone oxytocin during labor[11-13]. The hormone oxytocin is a hormone that is produced in the hypothalamus and is transported through the axoplasmic flow to the posterior pituitary which, if given the right stimulation, this hormone will be released into the blood. Based on the physiological effect of accelerating labor by stimulating contraction of the uterine smooth muscle, the hormone is named Oxytocin.

This study is consistent with previous research conducted by Sabrina Dwi Prihartini[14] in the Independent Practice of Midwives Mrs. Umi Salamah that there is an influence on giving of date palm juice to facilitate normal duration of of the first stage of labor. Another study conducted by Suroso Paryono in 2016 South Klaten Health Center with the title "The Effect of Consumption of Sari Palm Dates at the End of Pregnancy on the Progress of First Stage of Labor and the Number of Bleeding during Labor in Primipara in the Work Area of the South Klaten Health Center ", the result is that there is an effect on giving of date palm juice to facilitate normal duration of the first stage of labor.

## Conclusions

There is an effect on giving of date palm juice to facilitate normal duration of the first stage of labor in the Sele Be Solu District Hospital in Sorong City (P-Value 0,000 <0.05).

Suggestions for this research, pregnant women are advised to consider consuming palm juice for facilitating normal duration of the first stage of labor. For midwives, it is expected to provide counseling about the benefits of date palm juice on the normal duration of labor and should continue to be done following the patient's condition with a good approach before, because date palm juice does not affect the fetus or mother.

For researchers, to further deepen this study by trying to control several factors that can affect on giving of date palm juice to facilitate normal duration of labor and conduct laboratory tests so that the results obtained are more accurate, and prioritize pregnant women with primipara parity status as inclusion criteria.

## Abstract

Efforts so that a person's nutritional needs can be obtained optimally is by holding a food that is managed by applying various scientific disciplines. This study aims to analyze the food delivery system and the level of satisfaction of students in Tebuireng Islamic Boarding School in Jombang, East Java. This research was observational with a cross-sectional study design. Samples taken are students who live and or boarding at Tebuireng Islamic Boarding School in Jombang, East Java, with a total of 303 people from the class 2 population. Samples were taken using total sampling. Data collection is done by providing an identity questionnaire, satisfaction test form sheets and interviews with foodservice parties. The results showed that the food delivery system at Tebuireng Islamic Boarding School in Jombang in East Java was already good in management, service, and workflow but there were still shortages, such as the proportion of students and catering service staff that was not appropriate, there was no calculation of individual student needs, and food handlers hygiene knowledge still needs to be improved. The level of satisfaction of students to the overall menu of students with a thin nutritional status of 76.36% with the category "Satisfied"; students with normal nutritional status of 67.79% with the category "Dissatisfied"; and students with fat nutritional status of 64.49% with the category "Dissatisfied". Training regarding sanitation and hygiene is good and right during the process of providing food and training on how to process various kinds of menus from one food item.

## Introduction

The nutritional and health status of mothers and children as a determinant of the quality of human resources is increasingly evident by the evidence that the nutritional and maternal health status in pre-pregnancy, during pregnancy, and during breastfeeding is a very critical period. The thousand-day period, which is 270 days during pregnancy and 730 days in the baby's first life, is sensitive because the effects on the baby at this time will be permanent and cannot be corrected. The impact is not only on physical growth but also on mental development and intelligence, which in adulthood can be seen from the physical size that is not optimal and the quality of work that is not competitive resulting in low economic productivity[1]

Inadequate nutrition can potentially inhibit sexual growth and maturation, although this may be the result of chronic malnutrition in infancy and childhood. And can place them at high risk of chronic diseases (risk of type 2 diabetes, hypertension, dyslipidemia, and carotid-arterial atherosclerosis) especially if combined with adverse lifestyle others. Deficiency or excess nutrients will be manifested in the form of growth that deviates from the standard pattern[2-4].

To maintain the quality of the food served, the food served must be evaluated one of the ways is to calculate the acceptability of consumer food. Food acceptance is the percentage of food consumed from the total amount provided[5-6]. This acceptance is influenced by several factors including the appearance of food when served and the taste of food. This study aims to analyze the food delivery system and the level of satisfaction of students in Tebuireng Islamic Boarding School in Jombang, East Java.

## Materials and Method

### Population and Sample

The population in this study is the food delivery unit in Tebuireng Islamic Boarding School in Jombang, East Java and all students in the Tebuireng Islamic Boarding School in Jombang, East Java. The students referred to in this study are students living and or boarding at Tebuireng Islamic Boarding School in Jombang, East Java. Sampling is done by total sampling from the target population. The target population is class II, junior high school, Islamic junior high schools, high school, and Islamic high school as many as 521 people. The sample used was a total sampling of 303 people.

### Data Collection

Data collection was obtained by conducting direct interviews with food service managers and respondents by referring to the questionnaire that was available that contained questions and statements to explore information about the variables to be analyzed which are closely related to the food delivery system and satisfaction.

### Data Analysis

Data analysis using IBM SPSS Statistics 21. Univariate analysis was carried out to get a general picture by describing each variable used in the study by looking at the description of the frequency distribution in tabular form. Bivariate analysis was performed using chi-square to see individual characteristics of the level of satisfaction.

## Results

The food management unit in the Islamic boarding school in the making of the menu does not see the habits of the students and employees (Table 1), menus are made based on a predetermined expenditure budget, for example like there is a fried chili sauce menu of tempeh not all students have the habit of consuming tofu and tempeh because of students not only from Jombang Regency but from various regions in Java and some even from outside Java.

Based on table 3, the respondents who were mostly aged between 12-15 years were in the normal nutritional status of 74.8%; most respondents aged between 16-18 years were at normal nutritional status that is 83.5%.

**Table 4. Distribution of Santri Satisfaction of the Entire Menu at Tebuireng Islamic Boarding School in Jombang, East Java**

| **Overall Quality Food Menu** | **Nutritional Status** | | |
|---|---|---|---|
| | Thin | Normal | Fat |
| Score (%) | 76,36 | 67,79 | 64,49 |
| Category | Satisfied | Not Satisfied | Not Satisfied |

Table 4 shows the level of satisfaction of students with the overall menu of students with nutritional status of 76.36% under the category of "Satisfied"; students with normal nutritional status of 67.79% with the category "Dissatisfied"; and students with fat nutritional status of 64.49% with the category "Dissatisfied".

## Discussion

Employees also need to get adequate nutrition attention so that employee performance is expected to be optimal. According to Marotz[7], nutritional needs are several nutrients needed by individuals to be able to live healthy and maintain their body condition. Adequacy of nutrition is the amount of each nutrient needed by individuals to live a healthy life. The nutritional adequacy of each person/individual varies according to age, sex, and level of activity.

According to Nurdiani[8], in the procurement of foodstuffs, there is a food procurement planning and market survey aimed at obtaining standardized foodstuff specifications according to size, type, size to maintain good quality foodstuffs. The market survey aims to find out the price of materials by specifications in the market as a basis for budget planning.

According to Kwon et al[9], the reception of foodstuffs in the operation of food is carried out to ensure that food is received in a fresh and safe condition so that foodstuffs can be moved to the right place by the characteristics of these foodstuffs. It is known that the food operation unit already has a dry food storage area and has been separated between dry food ingredients and wet or fresh food items. This is by the statement of Bartono & Ruffino[10], which states that the food ingredients are stored according to the appropriate types and conditions.

In preparing food ingredients must pay attention to the principle of maintaining and preventing loss of nutrients lost cooked, weeding, and washing food ingredients then cut them according to recipe instructions, carry out preparation techniques and mix herbs according to recipe instructions, prepare food ingredients and seasonings as little as possible with cooking.

In food processing, hygiene behavior is very much needed, including using the attributes of the headcover, mask, and gloves to avoid contamination of food. According to Damayanthi et al[11], high levels of bacterial and microbial contamination of cutlery and food served openly. Therefore it is necessary to increase hygiene behavior for food handlers. One way to do hygienic behavior for food handlers is to wash hands before doing food processing activities. But food handlers must know good hygiene behavior. This is due to avoid contamination of food[12].

Based on the results of menu analysis using CD Menu software, it is obtained the nutritional value of the menu per day in the menu cycle. The menu with the most energy is on the 4th-day menu with the amount of energy of 2597.8 kcal, while the least energy is the menu on the 3rd day which is 2111.3 kcal. Research conducted by Carrier[13] proves that menu cycles, modification of recipes, serving and packaging as well as ways of food distribution are significantly related to the incidence of malnutrition because it reduces food intake

Customer satisfaction can be achieved if consumers feel all their needs are met and get good customer service. The results of this study are also consistent with the results of Mandasari & Tama's[14] research, which states that staff behavior including service friendliness is the most influential attribute on customer satisfaction.

African American adolescents have low consumption of vegetables and fruits, and they consume too much fried food and soft drinks: 55.1% consume twice or more fried foods every day and 19.5% four times or more daily day; 70.3% consumed soft drinks twice or more every day and 22.0% four times or more every day on average[15.]

## Conclusions

The food delivery system at Tebuireng Islamic Boarding School in Jombang in East Java is good in management but the knowledge of food handlers' hygiene needs to be improved. In organizing food, it should consider aspects that can improve consumer appetite, namely variations in processing techniques, taste, flavor, color, size, shape of the dish cut, portions, and appearance of the presentation and training on how to process various kinds of menus from one food ingredient.

## Abstract

The study aimed to investigate the 6-11 months old infants' macronutrients intake on mothers obtaining moringa leaves and iron supplements.

**Method:**This experimental study complemented by kohort study was done in Jeneponto District in 2018 in which the samples were 6-11 months old infant. The research subject was 308 pregnant mothers categorized into 3 groups consisting of group which obtained moringa leaves powder (MLP, n= 103), group which obtained moringa leaves extract (MLE, n=94) and group which obtained irons/folate (IFA, n=111). The data obtained were then analyzed using one way Anova and Kruskall Wallis to test the difference.

**Results:** The research found that different carbohydrate intake was found to be in the $10^{th}$ and $11^{th}$ month, while in the 7th, 8th and 9th month, there was no different carbohydrate intake between the three intervention groups ($p>0.005$). Furthermore, based on the statistical test, different protein intake ($p <0.05$) was also found in $10^{th}$ and $11^{th}$ month, while in $7^{th}$, $8^{th}$ and $9^{th}$, there was no different protein intake between the three groups($\rho>0.05$). Meanwhile, regarding the fat intake, there was no difference in such between the three intervention groups in 7 to $10^{th}$ month ($\rho<0.05$), while in the $11^{th}$ group, there was different fat intake ($\rho>0.05$).

**Conclusion***:* Different carbohydrate and protein intake was found in the 10th and 11th month, while different fat intake was found in the 11th month only between the three intervention groups. As they get older, there was increased macronutrient intake on MLP and MLE groups, however such thing does not happen in IFA group since there was decreased intake in the 11th month which did not meet the need. Thus, it is suggested that future researcher will give supplement intervention on 6-11 months old baby.

## Introduction

Complementary food is solid and semi-solid food containing nutrition and energy accompanying breast milk or formula milk to be given to infant which usually introduced to the baby at the range of 4-6 months old[1]. Optimal complementary food is one of the components to improve infants' nutritional status and health in their first 1000 days starting during the pregnancy until the second year of the infant[2–4].Malnutrition causes the mortality of 3.1 million children annually[5], thus baby and infant food directly determines the nutritional status of childre.

The high malnutrition during childhood is caused by inadequate food intake. There was only 55% of less than 6 months old infant who were breastfeed exclusively and only 7% of 6-8 months old infant who were feed as recommended by WHO. This indicates that there was high stunting prevalence at the age of 3 months old. High quality diet starting from the age of 6 months should be done in order to decrease the stunting rate at the second year[6].

Decreased prevalence occurred during solid, semi-solid and soft food feeding between the educated mothers on 6-8 months old infant (67% in 2003 into 57% in 2013); minimal food diversity (33% in 2003 into 24% in 2013) and minimum acceptable diet (13% in 2003 into 8% in 2013)[7].

Infants at the age of 6-12 months old have lower decreased stunting rate than children at the age of 36-47 months old[8]. A research project that was performed in India found that stunting was mostly found in 36-47 months old children than 48-59 months old children. This is due to the bad weaning and complementary feeding which contribute to the children's energy and protein intake inadequately.

High protein complementary food is related linearly to the growth and body weight of the infants who are kept breastfeed but does not add the adiposity[1]. Circadian distribution of energy consumption can affect the adipose tissue and body weight of 12 months old infant. Bigger adipose tissue increases overweight risk on children who were feed at night more than during the day[9,10]

Malnutrition on 6-8 months old infant is indicated by the lack of iron, zinc, and niacin, while malnutrition on 9-11 months old infant in indicated by inadequate complementary food so that it is suggested to add meat, fish, chicken and egg (MFPE) on the infants' complementary food[11]. The objective of this research is to investigate the difference in 6-11 months old infants' macronutrient intake on mothers obtaining moringa leaves and irons supplements.

## Materials and Method

Experimental research continued by cohort study was done by choosing 6-11 months old infants as the sample. This research was done in Jeneponto District in 2018 collecting 308 pregnant mothers as the research subject. The subjects were then grouped into three consisting of mothers who obtained moringa leaves powder (MLP, n=103), mothers who obtained moringa leaves extract (MLE, n=94) and mothers who obtained irons/folate (IFA, n =111). The inclusion criteria to choose the pregnant mothers were those who were at the second trimester and one month after giving birth, have given birth for ≤3 times, have single fetus, willing to consume capsule for 4 months and did not consume other multivitamin and mineral during the research. The research variable was breastfeeding on 6-11 months old infant. The mothers and children characteristics were found using questionnaire and analyzed using one wayAnova and Kruskall Walli. This research has obtained approval from the Ethical Committee of the Faculty of Medicine of Universitas Hasanuddin number 1071909130.

## Results

**Table 1. Distribution Based on Parents' Characteristics**

| Variable | MLP (n=103) | | MLE (n= 94) | | IFA (n=111) | | TOTAL (N=308) | | ρ value |

| Complementary Food | | | | | | | | | 0.498 |
| <6 months | 24 | 23.3 | 27 | 28.7 | 24 | 21.6 | 76 | 24.7 | |
| >=6 months | 79 | 76.7 | 67 | 71.3 | 87 | 78.4 | 232 | 75.3 | |
| Parity | | | | | | | | | |
| 1 | 28 | 27.2 | 28 | 29.8 | 40 | 36.0 | 96 | 31.2 | 0.355 |
| >1 | 75 | 72.8 | 66 | 70.2 | 71 | 64.0 | 212 | 68.8 | |

Table 2 above gives information that most of the infants were male by 167 infants (54.2%), their birth weight was mostly 295 infants(95.8%), while the birth length was mostly ≥ 48 cm by 264 infants (85.7%). Most of them were still breastfeed by 250 infants (81.2%), given complementary food during ≥ 6 months old by 232 (75.3%), and most parity was> 1 which is by 212 infants (68.8%).

**Macronutrient Intake**

**Table3. Mean Carbohydrate Intake for Infant on the Three Intervention Groups**

| Carbohydrate (gram) | Mean Intake | | | ρ-value |
|---|---|---|---|---|
| | MLP | MLE | IFA | |
| 7th month | 28.519±27.83 | 28.17±21.68 | 25.87±21.91 | 0.600 b |
| 8th month | 30.27±23.09 | 38.96±24.48 | 32.79±22.54 | 0.113 a |
| 9th month | 38.90±28.99 | 45.32±24.27 | 40.63±26.91 | 0.434 a |
| 10th month | 35.31±22.27 | 49.12±20.37 | 45.28±25.01 | 0.002 b |
| 11th month | 40.65±25.21 | 57.02±27.00 | 43.56±24.48 | 0.001 b |

It shows that between the three intervention groups, there was no different carbohydrate intake on the 7$^{th}$, 8$^{th}$, and 9$^{th}$ month (ρ>0.05), while on the 10$^{th}$ and 11$^{th}$ month, there was different carbohydrate intake(ρ<0.05). On MLP and MLE groups, as the infants got older, the carbohydrate intake also increased but not IFA group since there was decreased intake on the 11$^{th}$ month.

**Table4. Mean Protein Intake for Infant on the Three Intervention Groups**

| Protein (gram) | Mean Intake | | | ρ-value |
|---|---|---|---|---|
| | MLP | MLE | IFA | |
| 7th month | 5.38±5.90 | 5.37±4.41 | 4.80±3.85 | 0.354 b |
| 8th month | 5.34±3.44 | 6.63±5.00 | 6.27±4.20 | 0.387 b |
| 9th month | 6.94±4.99 | 7.32±4.13 | 6.83±3.91 | 0.621 b |
| 10th month | 7.94±5.65 | 9.81±4.88 | 9.39±5.29 | 0.026 b |
| 11th month | 7.61±5.03 | 12.61±7.74 | 8.37±5.87 | 0.000 a |

Table 4 presents the result of statistical result showing that among the three groups, there was no different protein intake on the 7$^{th}$, 8$^{th}$, and 9$^{th}$ month (ρ>0.05), while on the 10$^{th}$ and 11$^{th}$ month, there was different protein intake (ρ<0.05). On MLP and MLE groups, as the infants got older, the protein intake also increased but not on the IFA group since there was decreased intake on the 11$^{th}$ month.

**Table5. Mean Fat Intake for Infant on the Three Intervention Groups**

| Fat (gram) | Mean Intake | | | ρ-value |
|---|---|---|---|---|
| | MLP | MLE | IFA | |

| 8th month | 4.37±6.53 | 5.04±6.20 | 4.62±4.64 | 0.401 [b] |
| 9th month | 5.39±7.27 | 5.38±6.12 | 4.80±5.35 | 0.917 [b] |
| 10th month | 6.29±6.27 | 7.34±5.59 | 6.88±6.19 | 0.298 [b] |
| 11th month | 5.55±4.87 | 8.84±6.66 | 6.23±6.36 | 0.004 [a] |

Table5 shows that fat intake on the 7th, 8th, 9thand 10th month were not different among the three intervention groups (ρ<0.05), while on the 11th month, there was different fat intake between the groups (ρ>0.05). On MLP and MLE groups, as the infants got older, the fat intake also increased but not on the IFA group since there was decreased intake on the 11th month.

## Discussion

Among the three groups studied, the carbohydrate intake by the infants were not different significantly on the 7th, 8th and 9th month, but it showed significant difference on the 10th and 11th month. On MLP and MLE groups, as the infants got older, the carbohydrate intake also increased but not on the IFA group since there was decreased intake on the 11th month, and the amount of intake on MLE group was more than the other two intervention groups. However, the amount has not reached the standard of 7-11 months old infants' need which is 82 g/h without breast milk. Meanwhile, if it was complementing breast milk of 7.0 g/h added by the highest content in the research which is 57.02 g/h.

Protein is an important nutrient composition of complementary food. It is the main source of amino acid. Adequate protein food intake is very important in protecting the cell function and integrity to ensure normal health and growth. Furthermore, the lack of protein and low energy intake can cause malnutrition of protein-energy (PE) which is the most common malnutrition form in the world[12]

Regarding the protein intake, there was no significant difference found either on the 7th, 8th and 9th month, instead it was found on the 10th and 11th month. Infants' protein need increases as they get older proven by the research result that on MLP and MLE groups but not on IFA group due to decreased intake on the 11th month.

The amount of protein (gram/day) needed to adequate the infants' nutrition need both from the breast milk and complementary food is 9.1 g for 6-8 months old infant, 9.6 g for 9-11 months old[13] and 18 g/h according to Regulation of Ministry of Health. Breast milk provides significant protein need for the infant. If the average breast milk assumed, then the amount of protein needed from the complementary food is 1.9 g/day on 6-8 months old (21%), 4.0 g/day on 9-11 months old (42%), and 6.2 g/day (57%) on 12-23 months old[14]. Based on this research, the amount of protein intake consumed by the infants other than the breast milk protein on the three intervention groups at the age of 7-8 and 9-11 months old was ≥ 4.8 g/dayand ≥ 6.8 g/day which means that the protein intake was above the standard suggested.

Fat provides essential fat acid, facilitates the absorbance of vitamin dissolved in fat as well as improves energy solid food pattern and sensory quality thus it is important for the infant and children diet. Breast milk is usually has more fat than the complementary food. Therefore, total fat intake usually decreases as the older of breast milk contribution on the decrease of total food

energy.

Among the three intervention groups, there was no significant difference found in fat intake during the 7th, 8th, 9th and 10th month. However, there was significant difference on the 11th month. On MLP and MLE groups, the amount of infants' fat intake increases as the infants got older, but it did not happen on IFA group and the amount of intake on MLE group is more than the other two intervention groups. However, the amount is way below the standard and such thing does not affect some infants due to the breastfeeding.

Even though there is debate regarding the optimal amount of fat in infants and children food, the range of 30-45% of total energy is suggested[15]. The percentage of energy from the fat in complementary food needed to reach 30-45% energy from fat in total diet depends on the breast milk intake and fat level of breast (15). Infants in developing countries usually consume breast milk with normal fat concentration (38 g/L). When developing the diet guideline to provide adequate fat for complementary food, the potential effect of the fat added needs to be considered (such as oil added by porridge) on the nutrition of the food. For example, the addition of one teaspoon of vegetable oil to 100 g typical corn peppers used in West Africa can increase the energy density from 0.28 to 0.73 kkal/g, but it will decrease the protein density from 8.9% to 3.3% from the energy and irons density from 0.5 to 0.2 mg/100 kkal.

## Conclusion

Different carbohydrate and protein intake was found in the 10th and 11th month, while different fat intake was found in the 11th month only between the three intervention groups. On MLP and MLE groups, the older they get, the more increase the macronutrient intake. However, it does not happen on IFA group because there was decreased intake on the 11th month but it did not adequately fulfill the need so the future researcher needs to give supplement intervention on 6-11 months old infants.

# The Effect of *Moringa Oleifera* on the Life Outcome of Pregnant and Breastfreeding Mothers: Literature Review

**[1,2] Nur Ulmy Mahmud, Tahir Abdullah[3], Arsunan, A.A[3], Burhanuddin Bahar[3], Veni Hadju, Muhammad Syafar[3]**

*[1] Postgraduate School Students, Faculty of Public Health, Universitas Hasanuddin, Indonesia, [2] Lecturer of Faculty of Public Health, Universitas Muslim Indonesia, [3]Lecturer of Faculty of Public Health, Universitas Hasanuddin, Indonesia*

## Abstract

**Background:** As an extraordinary plant, moringa oleifera is nutritios plant which is also a source of medicine having content different from other common plants. Moringa also contains all elements of essential amino acids. Moringa is believed to have potential to decrease malnutrition, hunger, increase breast milk volume as well as prevent and heal various diseases due to its nutritious content. **Objective:** This literature study aims to obtain input regarding the effect of *moringa oleifera* on the life outcome of the pregnant and breastfeeding mothers in Indonesia. **Method:** The literature review was conducted through Google scholar and electronic database of PubMed, Clinical Key and Springer. The keywords of Moringa oleifera, pregnancy, galactogogue, breastfeeding, nutrition, health and diseases were used to search original research or literature review on both open access English national and international journal. As many as 24 articles published in 2009 to 2019 were reviewed and synthesized using unsystematic narrative review, obtaining suitable 26 articles and unsuitable 14 articles. **Results:** This research found that moringa oleifera is good for pregnant and breast feeding mothers. **Conclusion:** As one of alternative plants, *Moringa oleifera* is believed to have potential in decreasing malnutrition, hunger, preventing BBLR, increasing breast milk volume and quality, increasing HB level and preventing anaemia which commonly happens among the pregnant mothers.

***Keywords:*** *Moringa oleifera, pregnant mothers, breastfeeding mothers*

## Introduction

Children's growth and development is significantly determined during the pregnancy period which is a critical phase. Nutrition is really important during the pregnancy period as it supports the fetus growth and development. Study proved that mothers with poor nutrition status causes disturbed fetus growth, gives birth to baby with low birth weight and causes malnutrition between generations[1]

Giving exclusive breastfeeding for 6 months is one form to improve nutrition in infant, Education lactation can improve knowledge, attitudes and behavior of mother to give breastfeeding up to 6 months, several determinant factors of exclusive breastfeeding in 0-6 months infants were giving colostrum, mother's work, family income, mother's education, and mother's knowledge about the benefits of exclusive breastfeeding. Iron deficiency in early life can cause brain development disorders and other developmental effects. Iron is very important for brain development, anemia causes metabolic energy deficiency and memory function[2-4].

Nutrition has primary role in mothers' and children's health. Poor mothers' nutritional status is related to adverse birth effect. However, there is complex relationship between the mothers' nutrition and the effect of the birth since it is affected by many biological, socio-economical and demographical factors in different population. Nutrition intervention is a way to improve the birth and quality of life as well as decrease the mortality, pain and health from understanding the correlation between mothers' nutrition and effect of birth. The intervention can be developed through understanding the correlation between mothers' nutrition and the effect of birth[1].

*Moringa leaves* also contains all elements of essential amino acids. These various nutrition is an extraordinary source from plant. Meanwhile six tablespoons of *Moringa leaves* powder can met the daily needs of calcium and iron of pregnant and breastfeeding mothers, can reduce the incidence of morbidity in infants 0-5 months in the district[5-8]. This research aimed to perform literature review in order to obtain input regarding the effect of *Moringa oleifera* on the life outcome of pregnant and breastfeeding mothers in Indonesia.

## Materials and Method

The design of this research was qualitative research through literature review. This research was conducted in Desember 2019 on various research results. This literature review was done through Google scholar, and electronic database of PubMed, Clinical Key and Springer with keywords of *Moringa oleifera*, pregnancy, *galactogogue*, breastfeeding, nutrition, health and diseases to find out the original research or the review of literature review on both open access English national and international journal. As many as 24 articles were reviewed and synthesized using unsystematic narrative review, obtaining suitable 26 articles and unsuitable 14 articles.

**Table 1. Document eligibility criteria**

| CRITERIA | ACTION | DESCRIPTOR |
|---|---|---|
| Publication date | Inclusion | 2009-2019 |
| Region | Inclusion | Indonesia |
| | | India |
| | | Bangladesh |
| | | Nigeria |
| Setting intervention | Inclusion | Pregnant mothers<br>Breastfeeding mothers |
| | Exclusion | Experimental animal |
| Language | Inclusion | Bahasa Indonesia |
| | | English |

## Results

**Literature review result can be seen on Table 2**

**Table 2. Comparison of moringa oleifera for each literature**

| No | Authors | Intervention Setting | Study Design | Tool type | Report outcome |
|---|---|---|---|---|---|
| 1 | (9) | Pregnant mothers | Randomized, double-blind, controlled trials | Questionnaire, intervention | The provision of Moringa leaves extract to pregnant mother who were also informal workers can decrease the stress and improve the nutritional status but cannot decrease the DNA damage. |
| 2 | (10) | Breastfeeding mothers | literature explained | Literature | Moringa oleifera can prevent anemia on pregnant mothers. Study on moringa extract proved that government and community should utilize this local food to prevent anemia and harmful pregnancy |
| 3 | (11) | Pregnant mothers | Randomized Double Blind, Posttest controlled | Questionnaire, intervention | Provision of Moringa leaves extract to prevent anemia and DNA damage due to oxidative stress on pregnant mothers, as well as prevent BBLR |
| 4 | (12) | Pregnant mothers | double blind, randomized control trial study, pretest-posttest controlled | Questionnaire, intervention | Moringa oleifera leaves extract significantly increase the hemoglobin level on pregnant, prevent ferritin serum to decrease up to 50%. Further research needs to be conducted to ensure the validity of Moringa leaves extract dose. |
| 5 | (13) | Pregnant and breastfeeding mothers | Comprehensive study | Questionnaire, intervention | Moringa oleifera leaves powder can increase mothers' Hb level, but cannot increase the mothers' weight |
| 6 | (5) | Pregnant mothers | Quasi experimental research of one group pretest - posttest design | Questionnaire, intervention | Moringa leaves powder can increase pregnant mothers' Hb level who has anemia |
| 7 | (14) | Pregnant mothers | Randomized, double-blind, placebo-controlled study | Questionnaire, intervention | Moringa leaves extract can increase iron deficiency anemia on women |
| 8 | (15) | Breastfeeding mothers | randomized controlled double-blind design | Questionnaire, intervention | The provision of Moringa extract and flour can improve breast milk volume in which the improvement of breast milk was higher on group who obtained Moringa leaves extract compared to the group who obtain moringa leaves flour. However, it did not affect the quality of breast milk (iron, vitamin C and vitamin E) |
| 9 | (16) | Pregnant and breastfeeding mothers | non-randomized group pre-post test | Questionnaire, intervention | Provision of honey and Moringa leaves extract on pregnant mothers who were passive smoker can decrease oxidative stress and DNA damage and prevent low birth weight. |

After reviewing the 14 articles, it was known that among the articles, several of them commonly explains that *Moringa oleifera* is able to increase Hb level on pregnant mothers while the other several articles explain the other benefits of *Moringa oleifera* for having potential to decrease malnutrition, hunger, prevent DNA damage due to stress on pregnant mothers, prevent the occurrence of anemia on pregnant mothers, prevent low birth weight and increase the breast milk volume. However, one of the articles explain the consuming *Moringa oleifera* cannot increase the weight of pregnant mothers and does not affect the breast milk quality.

## Discussion

1. Moringa oleifera

*Moringa oleifera* Lam (synonym: *Moringa pterygosperma* Gaertner) or commonly known as *kelor* is the most popular species of Moringacae genus species. *Moringa oleifera* grows in the form of three and has long live (*perenial*) with height of 7-12 meters. It has woody stems (lignosus), upright, and having thin skin, dirty white colour and rough surface. It also has simpodial branching directing uprightly or tilted and tend to grow in line and extendedly. It can grow both in lowland and highland up to height of ± 1000 m above the sea level, planted frequently as boundary or fence on house yard or field[22].

Fuglie LJ 1999 conducted research resulting that *Moringa* leaves actually contain vitamin A, vitamin C, Vitamin B, calcium, potassium, iron and protein in high amount which is easily consumed and assimilated by human body. In addition, *Moringa* also known to contain more than 40 anti-oxidant[22].

### *2. Moringa Oleifera* Can Increase Breast Milk

Breastfeeding mothers need nutrition more than during her pregnancy. During breastfeeding, she needs extra energy to heal her health condition after giving birth, daily activities such as forming the breast milk. In the first month after giving birth, ASI production is commonly abundant so that it comes out a lot and sucked by the baby, thus the mothers will become hungry and thirsty faster. In order that the amount of calories is balanced with the needs, then adequate nutrition is also needed because the energy will be reprocessed for forming the breast milk. During breastfeeding, mothers produce about 800-1000cc of breast milk[23].

Research on herbs or food which can increase the breast milk production has not been done numerously. Previous research often used animal as the research subject. However, several food and herbs have long been believed to be able to increase the breast milk production. *Moringa* leaves increases the lactation effect proven by higher increase on mothers' serum prolactin level. Prolactin is the most important hormone in lactation initiation. *Galactagogues* is a concoction to increase the volume of breast milk and making the milk flow smoothly. *Moringa* leaves powder is effective *galactagogues* to increase the volume of breast milk and accelerate it [22,24-26].

### The effect of *Moringa oleifera* provision on pregnant mothers

Pregnant period is critical phase determining the children's growth and development. Good pregnant outcome is really expected so that it will creates healthy, smart and productive human resource. Research in India proves that mother with malnutrition status causes disruption on fetus growth and cause the mother to give birth to baby with low birth weight[25,26].

*Moringa oleifera* has long been used to overcome the malnutrition issue on children, pregnant mothers and breastfeeding mothers. Furthermore, micro nutritional compound in *moringa* leaves can be used as alternative supplement for pregnant mothers to prevent anaemia and low birth weight. The prevention of anaemia on mothers can decrease the occurrence of complication during the pregnancy and body weight[6] .

### 3. The effect of *Moringa oleifera* provision on breastfeeding mothers

Breast milk also contains protection compound that can prevent the baby from infectious disease. Providing breast milk also gives extraordinary emotional effect which can affect the inner connection between the mothers and the baby, as well as affect the psychological development of the baby. The provision of exclusive breast milk can optimize the growth of the baby. Factors affecting the provision of breast milk are the mothers who are supported well by the family and lactation education which can increase the mothers' knowledge, attitude and behavior to give exclusive breast milk until 6 months[3,26-29].

**Previous research done by Zakaria in 2016 in Maros District on 70 breastfeeding mothers 6 weeks after giving birth shows that the provision of *Moringa* leaves extract and powder can increase the breast milk volume, however, the increase on group obtaining the extract was higher that the group obtaining the powder, but it did not affect the breast milk quality (iron, vitamin C and vitamin E)[15].**

## Conclusion

*Moringa oleifera* is one of alternative plants believed to have potential to decrease malnutrition, hunger, prevent low birth weight, increase pregnant mothers' hb level, prevent DNA damage due to stress and prevent the occurrence of anaemia on pregnant mothers.

## Abstract

In health services, the drug can save lives and improve health quality. So the provision of essential medicines is mandatory and requires government support at all levels, both central, provincial and Regency/city. The existence of such support can be activities, budgets and commitments. The purpose of this research is to know the system of drug planning in the technical implementation Unit of the Regional Office of Medicine management in Ambon City Health office. This type of research is a qualitative study. Data collection is done through in-depth interviews, observation and document study. Information collected from 6 people who are involved in the management of drugs in the technical implementation Unit of the Regional Office of the Department of Medicine of the city Health office in Ambon. The results showed that drug planning uses a special team with the calculation of drug needs using method of consumption. The emptiness and excess medication are still common due to the change in public health centers affecting the drug prescribing patterns. Therefore, it needs a good coordination between the planning team in the technical implementation Unit of the regional office of the District Health Care office in Ambon City with a doctor at the Public health center in the area to be obedient in writing prescriptions according to the medication that has been ordered.

***Keywords**: Planning, medicine, Kota Ambon, Unit of the Regional Office of the Department of Medicine*

## Introduction

In Indonesian, in 2018 there are 89.69% of pharmacy installation of District/city that has been conducting management of drug and vaccine management as per standard. Such use has fulfilled the target of 2018, which is 75%. It is known that most of the provinces have fulfilled the target of 75% which is 30 provinces and there are 18 provinces that have reached a target of 100%. There are 4 provinces that have not yet reached the target of the Renstra 2018 is Bengkulu Province (70.00%), Maluku (45.45%), West Papua (38.46%) and DKI Jakarta (0.00%). In particular, DKI Jakarta province from 6 installation of Pharmacy district/city does not directly conduct drug and vaccine management as per standard but management and distribution is carried out directly on the District pharmacy installation through the Fund of State Budget income and expenditure[1]. The availability and quality of the drug in the regional technical implementation Unit of the Center for Drug Management of the city Health Department in Ambon is very influential in the service of providing medicine to people who are sick or who need without any changes in the quality of the drug

Based on the results of the study of documents obtained the type of drug item expired in 2016 as much as 141 type of drug with the number of drugs including the type of paracetamol tablets 500 mg as much as 158,525. In the year 2017 the type of drug is as many as 206 types of drugs with the most numerous drugs including the type of Vitamin B complex tab as much as 391,566. The

**Correspondence Author:**
**Jakobis Lewier**
E-mail: lewier.yapie@gmail.com

year 2018 as many as 121 types of drugs are expired and the most widely included types of Thiamine (Vitamin B1) tablets 50 mg as much as 767,483. Based on the problems found, researchers want to know the planning of drug Logistics in the Unit of the Center for Drug Management of the city Health Office in Ambon.

## Materials and Method

The type of research used is this research is a type of qualitative study. Data collection is done through in-depth interviews, observation and document study. Information collected from 6 people who are involved in the management of drugs in the technical implementation Unit of the regional Health Care office of the Ambon City Department of Medicine. To ensure the diversity of data is used triagulation technique

## Results

This research was conducted in the technical implementation Unit of the Regional Medical Management Hall in Ambon City Health office in January to February 2020. This research is a qualitative study intended to determine the management of drug management in the regional technical implementation Unit of the district Medical Management center in Ambon. The study used in-depth interview techniques, document study and observations. The variables are researched namely the process of drug planning. The informant involved in the research is the head of pharmaceutical installation, pharmacist of pharmaceutical installation and drug warehouse management.

**1. Planning**

**A. Special team of drug planning**

The purpose of the drug planning is to establish the type and amount of medicine and health supplies appropriate according to the needs of basic health care. In connection with the above, it is absolutely necessary coordination and alignment in the planning of procurement of medicines and health supplies, so that the establishment of a drug planning team is a necessity in order to improve the efficiency and effectiveness of the use of funds through coordination, integration and synchronization between agencies related to drug problems in every district/city[2].

Based on the results of interviews with the informant in the technical implementation Unit of the District Medicine Hall management Ambon City about the presence of a special team in the drug planning obtained the following information:

"So in accordance with the decree made from the head of the city health Office in Ambon There is a name of the drug planning team, this drug planning team involves cross-program, in this case starting from the regional technical implementation Unit of the drug management hall itself then from its pharmacy section then from the holders of programs that use the drug in this case nutrition Program, KIA, P2p and the health center (HK, 48 years old)"

"The planning team was there and all staff of the regional technical implementing Unit drug management hall is involved for planning". (BE,52 years)

"Well all that in the pharmacy installation district here anyway, the head of the pharmacy installation district, functional pharmacist and pharmaceutical power. Everyone here must be involved, you need in the data what each section will answer about the need for the head of the hall anyway ". (JG,49 years)

B. Compilation of drug use

From the results of interviews with informant in the technical Implementation unit of the District Health Care office in Ambon City about the compilation of drug use obtained the following information:

*"Usually for our planning average usage of a year from the use of January to December we share with 12 and we can the results of planning a month and added also with a buffer Stocknya for 8 months". (BE,52 years)*

"The medicine is based on Dong have the data inevitably going in planning the next year there is a public health center planning, but the planning was like I said that, do not run away from what the Formularium of public health centers that are in the adoption of the national Formularium, continue based on their usage. So stay he saw that last year he evolved or he was reduced or no it was later in view of their request. Keep that request is certainly attributed to Katong have funds from DAK Kan. They want to ask how much is well certainly in adjusting to the budget DAK given ". (JG,49 years)

**C. Calculation of drug needs**

From the results of interviews with informant in the regional technical implementation Unit of the district Medical Management center in Ambon on the calculation of drug needs obtained the following information:

"This method of consumption is this Pak Yapi's for example in a year from January to December we will see for example one of paracetamol drugs, paracetamol used by public health centers A to Z how total is used in a year means that the consumption pattern for paracetamol in a year ago. It became the basis of the policy to plan the following year and then we add the buffer stock of how, usually still closer to reality compared with other methods such as morbidity method is designed based on the objectives that want to be achieved sometimes the goal that you want to achieve this could also be somewhat sidetracked, the target is a thousand we provide a thousand when in fact only reaches five (HK 48 years)

"Mortality eg or can be with the method of use, so usually used that method of mortality" (BE,52 years).

"The Consumptive method is based on the use of the field." (VH,40 years)

The results of interviews with the informant regarding the calculation of the drug needs known that the calculation of drug needs in the Regional technical Service Unit of the district health Care office in Ambon is using the method of consumption is by looking at the data usage of the drug in the previous year and not using morbidity method because it can be very far from the estimate.

D. Constraints in the preparation of drug planning

From the results of interviews with an informant in the regional technical implementation Unit of the district health Care Office in Ambon, the treatment of drug planning obtained the following information:

"Constraints inevitably exist. Mr. Yapi is sure to know a lot of obstacles in planning something because we plan it would want everything planned is approaching reality but in reality there are shifts. Related to the drug, we plan to use the method of consumption but in the service E the right to prescribe the doctor in the E if the prescribing pattern is alternated then it will affect also the consumption pattern of the drug and the prescribing pattern strongly influenced by the individual physician. We know that doctors centered on community health is relatively alternated, sometimes this doctor sometimes doctors that prescribing patterns will change for example last year antihypertensive which tends to be widely used is the captopril but so change the doctor's prescription pattern can change il become ambrodipin which was used to be in useless this year is used more means that the stock will be stocked out in this year while the captopril that was used many years is reduced so that the stock accumulates that sometimes become one of the obstacles in planning ". (HK 48 years)

"It's the best thing if people's health centers often switch to the doctor so that it affects the prescribing patterns that make the drug stock for certain medications that do not go well". (BE,52 years).

"If there is no one who does not understand E calculation for future planning it may be because the medication item too much ya kan usually it is right per drug item so error in calculating". (VH,40 years)

Based on the interview with the informant regarding the obstacles faced in the process of planning the drug in the regional technical implementation Unit of the district health Care office in Ambon City is known that the obstacles faced is the occurrence of the change of doctor in the Public health center so the drug prescribing also change and different from the previous year that causes stagnant and stock out drugs.

From the results of a document is known that the SOP Center for Drug Management in the city Health Department in Ambon for the treatment of drug planning is as follows:

A. To intensiize the letter of planning drug and BMHP needs from Public health center, the field of KESGA and P2P should be done according to the order of acceptance of the letter and stored in the file itself. Otherwise, the letter may be lost so that the drug planning does not meet the needs.

B. Implement the calculation of drug needs and BMHP planning based on the planning of Public health center and the field of family health and P2P DKK and

the availability of drugs in POAKPK hall and public health centers should be done carefully, carefully and accurately. Otherwise, the results of the drug planning calculations do not match what should be.

C. Research and study of proposals for drug planning and BMHP should be researched carefully and accurately. Otherwise, the results of the drug planning calculations do not match what should be.

D. Submission of proposed letter of calculation of drug and BMHP needs to be timely and targeted. Otherwise, it will inhibit the procurement process of the drug and BMHP.

E. Filing of proposed letter of calculation of drug needs and BMHP should conform to the standard archive. If not, it will be easily damaged and difficult to find/lost

## Discussion

Planning needs is an activity to determine the number and period of procurement of pharmaceutical preparations, medical devices, and medically consumables in accordance with the results of election activities to ensure the fulfillment of criteria is appropriate, precise quantity, timely and efficient. Planning is done to avoid the vacancy of the drug using the accountable methods and the foundations of predetermined planning among others consumption, epidemiology, combination of consumption methods and epidemiology and adjusted to the available budget[3].

### A. Special drug planning

The drug planning team is a team that is specially formed to develop the need for drug procurement and is one of the supporting factors to achieve smoothness and accuracy in drug planning. In-depth interviews conducted in the regional Technical services Unit of the district health Care office in Ambon City obtained information that there is a special team formed for the planning of the drug in accordance with the decree issued by the head of the city health office in Ambon.

The drug planning team involves a related cross-sector consisting of the head of the regional Technical Services Unit, the pharmaceutical personnel and the responsible for the program and from the Public Health Center itself. Involvement of various sectors in the planning of the drug is expected that the data needed for further planning can be submitted by each responsible by considering the state of field so that it is able to produce the planning that suits the needs of each part.

Based on the results of a thorough interview with the informant in the Regional technical Service Unit of the district health Care office in Ambon City can be concluded that there is a special team in the planning of drug needs. The planning team consists of a cross-sector that is the head of the regional Technical Services Unit in the Center for Drug Management, pharmaceutical personnel, and responsible programs and from public health centers.

This research is different from the research conducted by Prisanti that shows the results that in RISA Asiyiyah Klaten has not formed a special team to do planning and procurement of pharmaceutical preparations, all procurement is still done by the head of pharmaceutical installation. In the management of the drug, planning strategies include several processes that create an integrated drug planning team involving related elements, building a shared commitment to achieve a goal in an organization[5].

As for the research in line is research conducted in Pharmacy installation RSUD Andi Makkasau City Parepare which has a special team for drug planning. The team is formed from each unit to prepare the necessary drug planning in pharmacy installation of Andi Makkasau City Parepare[6].

### B. Compilation of drug use

The compilation of drug usage serves to determine the monthly usage of each type of drug in Health Service Unit/Health Center for a year and as comparative data for optimum stock. The results of an interview in the regional Technical Services Unit of the district health Care office in Ambon City has obtained information that the compilation of drug use is seen based on the use in the field whether it is increased or decreased use of the drug during the year

The calculations for the compilation of the drug are conducted based on usage data in a year then will be shared with twelve months added with the drug booking

waiting time which sometimes does not correspond to the plan. From the average usage of a year, you get planning results for the month to be added with a buffer stock for eight months. The result is in accordance with Permenkes No. 74 the year 2016 where it is said that the installation of Pharmacy district/city will compile and analyze the need for pharmacy preparations in the working area, adjust to the available budget and take into account the vacancy time of the drug, buffer stock, and avoid the excess stock[7].

**C. Calculation of drug needs**

Calculation of drug needs is done to determine the needs of the drug to be appropriately reviewed by type, quantity, or time. The blanks or excess types of certain medications can occur when calculations are only based on theoretical. Therefore, determining the need of medicine is a tough challenge that is always faced by pharmacists and pharmaceutical personnel who work both at PKD level and in UPOPPK Regency/city.

Calculation of drug needs in the regional technical Services Unit of the Center for Drug Management of the city Health Office uses methods of consumption by looking at data usage in a year. It was then made the basis for planning policy determination for the following year, also added from the stock buffer. Using the method of consumption makes planning closer to reality compared to other methods that can be far from the estimate that can result in the occurrence of excess or lack of drug stock.

This research in line with the research conducted in the Health office of Southeast Minahasa District showed that the determination of the number of drugs needed is done by consumption and buffer stock, i.e. the average use of years x 18 months. Determination of the amount of drug needs done in planning the needs of the public medicine is assessed as not yet appropriate with the data required to perform the calculation of the contemplation in public medicine management guidelines and health supplies[8].

Other research in line is done in pharmaceutical installation in hospital Porsea where based on the results of interviews on the informant related to the calculation of the number of drug needs is using the method of consumption based on the analysis of drug consumption data of the previous year. In calculating the approximate needs of the drug has not been in accordance with the steps present in the method of consumption due to leadtimes data and buffer stock is not used in this calculation. This is different from the research in the technical service Unit of the district administration of drug management in Ambon City, which takes into account the data buffer stock. It can be assumed that the public hospital pharmacy installation party Porsea assumed that the understanding of the consumption method was purely seen from the drug usage in the previous year[9].

**D. Drug planning constraints**

Problems in the planning of drugs can lead to discrepancies between the calculation of the drug with the realization of drug use. Based on the results of in-depth interviews with the informant known that the constraints of drug planning in the Regional technical Service Unit of the Center for Drug Management of the city Health Department in Ambon is often the change of doctor in Public Health Center and the error of calculating the drug due to the

Changes in the doctor affect the occurrence of consumption patterns and drug prescribing patterns, so even though it has been planned based on consumption methods but still occurs some shifts in drug use. Different prescribing patterns can occur in drugs that have the same function as for example for antihypertensive in the previous year tend to use a totopril drug but with the change of prescribing pattern doctors can turn into ambrodipin. Changes in the prescribing pattern may cause stock out in previously underused medications and excess stock for the drug often used over the previous year's period.

Research conducted in RSUP Prof. Dr. R. D. Kandou Manado showed the results that HNI drug procurement planning often have problems in terms of use of consumption method or usage data period ago. This is due to user behaviour in drug use. Given that planning is done by looking at the previous period usage data, then there is often a difference between the previous period usage data with the recipe writing pattern from the user in this case the doctor. Thus there is a gap between the HNI medications that have been provided with the medications used by the patient[10].

Other research in line was conducted in the pharmacy installation of the hospital Porsea where in the planning for the provision of pharmaceutical drugs and supplies had been in the drug vacancy. This can be caused by various things, namely the impact of the drug prescribed by doctors outside the national formulary and the impact of the electronic procurement system (e-catalogue). In this process stock in the distributor is sometimes empty so the ordered medication is not directly available and there are some types of drugs that are rarely used so that the excess drug occurs. Drug planning sometimes has constraints and obstacles so the goal of planning the drug is not achieved or in other words the drug is not available by number, type or not available on time[9].

## Conclusion

The study concluded that the drug planning uses a special team with the calculation of drug needs using the method of consumption. The vacancy and excess drug is still often due to the change of doctor in the Public health center that affects the drug prescribing patterns. Therefore, it needs a good coordination between the planning team at the regional technical implementation Unit of the district health Care office in Ambon City with a doctor at the Public health center in the area to be obedient in writing recipes according to the medicines that have been ordered.

## Abstract

Human Development, including education and health, is one of the three pillars that are indicators in the development concept of Sustainabale Development Goals (SDGs). State nutrition status of Indonesia from year to year shows improvements although still faced with various challenges that are quite severe. The purpose of this research is to analyze the influence of individual characteristics (age, gender and education) on the performance of nutrition Program in the Community Health center of Ambon. This type of research is quantitative research with the design of Cross Sectional Study. The population in this study is all the energy Center public Health that works in 22 public health centres as much as 54 people. Sampling techniques in a total sampling way. The results showed that there were no age and gender relations with the performance of the nutrition Program in the Community Health center of Ambon with the value P = 0138 and 0519. However, there is an education relationship with the implementation of nutrition Program in the Public health center of Ambon City with the value P = 0.004. Therefore, the Public health center can apply for a nutritional officer to get a scholarship or provide facilities and to resupply the nutritional officers to pursue higher education in order to make nutrition performance more maximal.

***Key Words**: Umur, Jenis Kelamin, Pendidikan, Kinerja, pelaksana gizi, Puskesmas*

## Introduction

State nutrition status of Indonesian from year to year shows improvements although still faced with various challenges that are quite severe. Various indicators that measure nutritional status on life cycle is still not encouraging, this is evidenced by the results of basic health research, child nutrition condition. In the stunting problem of toddlers 30.79% in 2018. Likewise, underweight in children of toddlers is 17.68% at 2018 wasting or skinny children yaitu10, 19% in 2018.[1]

The Community Nutrition Improvement Program is one of the main programs of the Public Health center where one of the key functions is to is to prepare, nurture and sustain that everyone has good nutritional status, can live healthy and productive. This function can be realized if every officer in implementing nutrition program is done in a way that is good and correct according to components that must exist in the nutrition Improvement Program in public health Center. Ambon City Health Office is an integrated service Unit (UPT) of the Government of Ambon which is responsible for organizing government affairs in the field of health in the city of Ambon has 22 public health centers with the number of nutritional implementing personnel as much as 54 people in the Public health center.

Nutritional factors are a major factor in the improvement of human resources (SDM). Low human resources will impede the success of national development. The nutritionist of the Human Resources Health Center who has the ability and/or skills in the health sector appointed to carry out the task of nutrient improvement in the public health center. If there is no nutritional personnel who have graduated education in the field of nutrition in accordance with the legislation, then the implementation of nutritional improvement tasks in the Public health center can be done by the nutritionist who comes from other health workers such as nurses or midwives[2]. The goal in research research is to analyze the influence of individual characteristics (age, gender and education) on the performance of nutrition Program in the Community Health center of Ambon.

## Materials and Method

The type of research used is quantitative research with Cross Sectional Study. The population in this study is all employees who work in public health centers, 22 public health centers with the number of nutritional implementing personnel as much as 54 people. The sampling technique in this study was the total sampling so that the number of samples in this study was 22 public health centers with the number of nutritionist personnel as much as 54 people in the Public health center. Data collection is obtained through interviews using data processing questionnaires conducted in computerised by using SPSS program. Data presented in narrative form, frequency distribution table accompanied by interpretation

## Results

According to table 1, it is known that from 54 respondents, the characteristics of respondents based on the most age group are groups of 31 – 40 years, which are as many as 32 respondents (59.2%). The characteristics of the respondents based on the sex of the most are respondents with a female gender of 50 respondents (92.6%). The characteristics of respondents based on the last education of the most are the respondents with the education Asosiate's Degree which is 36 respondents (66.7%)

**Table 1.: Distribution of respondents based on characteristics of the respondents nutrition Program at Ambon City Health center in 2020**

| **Characteristics** | **Amount (n)** | **Percent (%)** |
|---|---|---|
| a. Age (years) | | |
| 21-30 | 8 | 14.8 |
| 31-40 | 32 | 59.2 |
| 41-50 | 13 | 24.1 |
| 51+ | 1 | 1.9 |
| **Total** | **54** | **100.0** |
| b. Gender | | |
| Male | 4 | 7.4 |
| Girl | 50 | 92.6 |

**The nutrition Program at Ambon City Health Center in 2020**

| The performance | Amount (n) | Percent (%) |
|---|---|---|
| Not good | 19 | 35.2 |
| Good | 35 | 64.8 |
| Total | 54 | 100.0 |

Source: Primary Data, 2020

Table 2 shows that from 54 respondents at the Public health Center in Ambon city based on performance variables, as many as 19 respondents (35.2%) which provides an Ungood performance assessment and as much as 35 respondents (64.8%) That provide a good performance assessment.

Influence of individual characteristics to officer performance

The results of the analysis of the influence of individual characteristics of age, sex and last education of the officer's performance can be seen in table 3

**Tabel 3. Effect of respondents characteristics on the performance of the implementing personnel nutrition Program at Ambon City Public Health Center in 2020**

| Individual Characteristics | Officer Performance | | | | amount | | p |
|---|---|---|---|---|---|---|---|

Source: Primary Data, 2020

Table 3 Products that of 8 respondents included group age 21 – 30 years, as many as 5 respondents (62.5%) With the performance assessment of the officers is not good and as many as 3 respondents (37.5%) With a good personnel performance assessment. From 32 respondents included group age 31 – 40 years, as many as 10 respondents (31.3%) With the performance assessment of the officers is not good and as many as 22 respondents (68.8%) With a good personnel performance assessment. Of the 13 respondents included the age group 41 – 50 years, 3 respondents (23.1%) With the performance assessment of officers not good and as many as 10 respondents (76.9%) With a good personnel performance assessment. While, from 1 respondent included age group > 51 years provide the performance assessment of the officer is not good. Statistical test result of value obtained P = 0.138, because the value of p > α = 0.138 > 0.05 then Ho accepted, this means that there is no statistically meaningful influence the variable age of respondents to the performance of officers of the program domiciled in the Public health center Ambo City.

For gender variables show from 4 respondents with male gender, as many as 2 respondents (50.0%) With the performance assessment of the officers is not good and as many as 2 respondents (50.0%) With a good personnel performance assessment. As for 50 respondents with female gender, 17 respondents (34.0%) With the performance assessment of the officers is not good and as many as 33 respondents (66.0%) With a good personnel performance assessment. The results of the statistical test obtained the value P = 0519, because the value of p > α = 0519 > 0.05 then Ho accepted, this means that there is no statistically meaningful influence on the variable gender of the respondent to the performance of the Implementing Officer nutrition program in the Community Health center of Ambon.

For the level of education of 4 respondents with the education of D1, 1 respondent (25.0%) With the performance assessment of the officers is not good and as many as 3 respondents (75.0%) With a good personnel performance assessment. From 36 respondents with an education of D3, as many as 18 respondents (50.0%) With the performance assessment of officers not good and as many as 18 respondents (50.0%) With a good personnel performance assessment. As for 14 respondents with S1 education, all have a good assessment of the performance of the officer. The statistical test result is obtained P = 0.004 value, because the P value is < α = 0.004 < 0.05 then Ho is rejected, this means that there is a statistically meaningful influence of the respondent education variable to the performance of the Implementing Officer nutrition program in the Community Health center of Ambon..

## Discussion

The characteristics of each person will be influenced by physical fitness and individual mental health concerned, education, accumulated training, and their working experience. Physical fitness makes people capable and resistant to work hard and long. While education and training are part of human investment. The longer the time that one is used for education and training, the higher the ability or competence of doing the job, thus the higher its performance[3].

The productivity of someone in work is influenced by age. Success in doing a job is determined by the age of both physical and non-physical. In general, old Labor has strong physical capacity[4]. The Central Statistic Agency (2016) states that a person's productive age is 15-64 years of potential as a capital in development. Productive age has features like forward-thinking, broad knowledge, and high productivity[5].

Table 3 shows the results of the statistical test obtained the value P = 0138, because the value of p > α = 0138 > 0.05 then Ho accepted, this means that there is no statistically meaningful influence on the variable age of respondents to the performance of the Implementing Officer nutrition program in the Community Health center of Ambon. This research is supported by research[6] which suggests that age is not a variable related to public health care service activities. Whereas Ratnasari[7] in his research found that there is no age influence on the implementation of public health nursing services in public health centers. Robbins[8] said that performance may decline as we age, but older age is offset by the practice.

The gender difference between women and men lies in the body size and power. Men can finish heavy work that women cannot do. Women tend to use feelings or biological factors such as leave when giving birth. Table

9 shows that of 4 respondents with male gender, as many as 2 respondents (50.0%) With the performance assessment of the officers is not good and as many as 2 respondents (50.0%) With a good personnel performance assessment. As for 50 respondents with female gender, 17 respondents (34.0%) With the performance assessment of the officers is not good and as many as 33 respondents (66.0%) With a good personnel performance assessment. The results of the statistical test obtained the value P = 0519, because the value of $p > \alpha = 0519 > 0.05$ then Ho accepted, this means that there is no statistically meaningful influence on the variable gender of the respondent to the performance of the Implementing Officer nutrition program in the Community Health center of Ambon.

Robbins[8] argues that there is no consistent difference in problem solving skills, analytical skills, competitive encouragement, motivation, sociability or learning ability between men and women. But there is a tendency for women who have preschoolers to do work flexibly, part-time, to work at Home Office work. Nevertheless,[9] states that female employees tend to be more diligent, disciplined, thorough and patient.[10] also stated that the average performance of male and female nurses has no distinction. The research conducted by Mahendra (2014) on the influence of education, wages, gender, age and work experience on labor productivity, stating that the level of one's productivity is influenced by gender differences. Male productivity levels are higher than women. The work of women requires skill and less need of heavy exertion[11]. A nutritionist should have skills and experience in the PGRS process in order to carry out their duties properly. It can be supported by a formal education owned by a nutritionist[12].

Table 3 shows the results of the statistical test obtained the value P = 0.004, because the value P is $< \alpha = 0.004 < 0.05$ then Ho is rejected, this means that there is a statistically meaningful influence on the variables of the respondent to the performance of the nutrition program in the Community Health center of Ambon. This study is in line with the research conducted by[11] i.e. the level of education of a workforce is positively influential in productivity. This is because someone with a high education has more knowledge to increase their productivity. These results are not in line with research[13] which indicates that there is no difference between the level of education on health counseling activities. The same is also stated by Tafwidhah in his research that the relationship between education and the level of implementation of public health care activities is not proven.[7] in his research suggests that it does not influence the level of education on the implementation of Perkesmas[13]. The level of education affects a person's mindset. The higher the level of one's education, the better the mindset will be. A good mindset will result in high productivity[14-16]. Kurniawan stated that someone who is aware of the importance of productivity can encourage the workforce to perform productive actions[17].

## Conclusion

This research concluded that there is no age relationship and each sex with the power performance of the nutritional program in the center of the community in the city of Ambon with the value P = 0.138 and 0.519. However, there is an educational relationship of the energy performance of the nutrition program in the center of the community of Ambon city with a value P = 0004. Therefore, the Trust Center of Public Health can apply for a nutritional officer to get a scholarship or provide facilities and to resupply the nutritional officers to pursue higher education in order to make nutrition performance more maximal.

# Analysis of Ability and Willingness to Pay Patients in Psychiatric Clinics (Special hospital case study in Maluku Province)

**Mega Aziza[1], Darmawansyah[2], Indar[2], Muhammad Alwy Arifin[2], Syamsiar S Russeng[3], Rahmatia Yunus[4], Muhammad Al Fajrin[1]**

*[1]Research scholar of Magister Program Department of Health Administration and Policy, Public Health Hasanuddin University, [2]Professor of Department of Health Administration and Policy, Public Health Hasanuddin University, [3]Professor of Department of Occupational Safety and Health, Public Health Hasanuddin University, [4] Lecturer of Faculty of economics and business, Hasanuddin University*

## Abstract

The ability to pay and the willingness to pay is a contributing factor in the utilization of services. The population in this study was a general patient who was educated at a psychiatric clinic in the Special Hospital of Maluku Province, 2019. The samples in this study are common patients who are given services to psychiatric clinics. The number of samples obtained using accidental sampling techniques obtained as much as 48 people. The results showed that patients could pay (Abilitiy to Pay) at psychiatric clinics at a rate of Rp. 80,000 with the ability to pay a maximum of Rp. 175,000 and the ability to pay a minimum of Rp. 40,000 whereas the willingness to pay (willingness to pay) normative patients at the Special Hospital Psychiatric Clinic of Maluku region is Rp. 82,083 with a willingness to pay a maximum normative amount of Rp. 100,000 and a willingness to pay a minimum normative cost of Rp. 75,000. Hospitals can revise tariffs in psychiatric clinics taking into account the level of ability and willingness of the community and set rates that do not exceed the ability to pay the community.

***Keywords:*** *ATP, WTP, psychiatric clinic*

## Introduction

The ability to pay and the willingness to pay is a contributing factor in the utilization of services. The ability to pay can be measured by the calculation approach of family income, family assets, or household expenditure. The willingness to pay can be done in the first two ways of measuring the actual ability to measure the amount of expenses a person has paid for health care and normative ability can be done by asking how many individuals are willing to issue health services[1].

This study chose service at the psychiatric clinic, because this clinic is one of the clinic in the outpatient installation that the most number of visits from other outpatient clinics clinics. In addition, the reason for choosing a psychiatric clinic because the tariff of public services of hospitals specialized in Maluku province based on local regulations No. 13 year 2013, then in the update the Tariff of public service levy according to regional regulations No. 1 year 2019 where this psychiatric clinic tariff has been running for approximately 6 years still with a tariff of Rp 75,000,-(seventy Five thousand rupiahs) for a one-time visit regardless of the type of therapy given because the tariff is not based on the type of therapy. So whatever action is given to the patient then the patient still pays the same magnitude[2].

Based on the above data, it is necessary to analyze the ability and willingness to pay the patient or the community of health services users so that the appropriate costs can be known. By knowing the ability and willingness to pay the community, the hospital can

**Correspondence Author:**
**Mega Aziza**
E-mail: m3g4sdentistry@gmail.com

estimate how much the tariff does not cause harm to the hospital, but not also the Community health services users

## Materials and Method

The type of research used is quantitative research with a descriptive survey to analyse the ability to pay (ability to pay) and willingness to pay (willingness to pay) general patient clinics in the provincial district special Hospital of Maluku. The population in this study is a common patient who gets service to the psychiatric clinic in the regional Special Hospital of Maluku province. The samples in this study were common patients at the clinic for the life of the ministry. The number of samples obtained using accidental sampling technique obtained as much as 48 people. Data collection is obtained through interviews using data processing questionnaires conducted in computerised by using SPSS program. Data presented in narrative form, frequency distribution table accompanied by interpretation.

## Results

According to table 1, there are known food expenditure of respondents at most between Rp. 1.000.000-Rp. 1.500.000, which is as much as 29 respondents or 60.4% and the least amount spent in > Group of Rp. 1.500.000, which is 5 respondents or 10.4%, based on household expenditure for non-food is seen that the respondents at most between Rp. 1.000.000-Rp. 1.500.000, which is 23 respondents or 47.9% and the fewest expenditure on the group of Rp. 500.000-Rp. 1.000.000 is 8 respondents or 16.7%. The amount of cost for non-essential respondents was shown that most respondents were in the category of < Rp. 500,000 as many as 28 respondents or 59.3% and at least in the category of > Rp. 1.000.000 as many as 2 respondents or 4.2%

**Table 1. The distribution of respondents based on expenditure on the psychiatric clinic in the provincial district Special Hospital of Maluku in 2020**

| Expense Category (Rp) | Respondents | |
|---|---|---|
| | Amount (n) | Percentage (%) |
| Food Expenditures | | |
| 500,000 - 1,000,000 | 14 | 29.2 |
| 1,000,000 - 1,500,000 | 29 | 60.4 |
| > 1,500,000 | 5 | 10.4 |
| Non-Food Expenditures | | |
| 500,000 - 1,000,000 | 8 | 16.7 |
| 1,000,000 - 1,500,000 | 23 | 47.9 |
| > 1,500,000 | 17 | 35.4 |
| Non-Essential Expenditures | | |
| <500,000 | 28 | 59.3 |
| 500,001 - 1,000,000 | 18 | 37.5 |
| > 1,000,000 | 2 | 4.2 |

Source: Primary Data, 2020

The calculation of ability to pay respondents to this study is used to calculate the level of the general patient's ability to pay rates in the hospitalisation area of special hospitals in Maluku province by using ATP 5% of household expenditure on food (table 2).

**Table 2. Distribution of ability to pay (ATP 1) respondents based on 5% Non-food expenditure on psychiatric clinics in the provincial Special Hospital of Maluku Province in 2020**

| Category | Paying Ability |
|---|---|
| | 5% Non Food expenses (Rp) |
| Maximum<br>Minimum | 175,000<br>40,000 |
| The mean | 80,000 |

Source : Primary Data, 2020

Based on table 2 indicates that the minimum ability to pay respondents using non-food ATP formula is Rp. 40.000 and maximum non-food is Rp. 175.000. Average ability to pay non-food respondents is Rp. 80.000.

**Table 3. Distribution of willingness to pay (WTP) actual and normative respondents at the psychiatric clinic In Maluku Provincial District special Hospital in 2020**

| Category | Actual Paying Will (Rp) | Willingness to Pay Normative (Rp) |
|---|---|---|
| Maximum<br>Minimum | 150,000<br>75,000 | 100,000<br>75,000 |
| The mean | 79,687 | 82,083 |

Source : Primary Data, 2020

Table 3 shows that the actual WTP respondent indicates that the minimum willingness to pay the actual respondent at the clinic's average soul is Rp. 75.000, and the maximum willingness to pay respondents amounted to Rp. 150,000 with an average of the willingness to pay the actual amount of Rp. 79,687. While the average willingness to pay normative suggests that the minimum willingness to pay a normative respondent in the clinic of the average soul of Rp. 75.000, and the maximum willingness to pay a normative respondent of Rp. 100,000 with an average of the willingness to pay the actual amount of Rp. 82,083,-.

## Discussion

The ability to pay health or be known by Ability to Pay (ATP) is a cost that can be allocated by a person to finance related health services. In this study ATP was calculated according to the 5% formula of total non-food expenditure. The high income is directly proportional to the higher expectations to obtain the service in accordance with the costs incurred to obtain the service. The results of this study are in line with research conducted by Mudayana stating that family income affects the patient's ability to pay for healthcare services that have been given, if the patient's income

is still lacking, they assume they are unable to pay for health services[3].

Expenditure to eat in this research consists of the expenditure of respondents in a month which is the form of grain, tubers, fish, vegetables, nuts, fruits, kitchen spices and other consumption calculated in units of rupiah. The results of this study also showed that the average of the spread for food was in the range of 1 million-1.5 million as few as 29 respondents (60.4%). This is because food expenditure is a basic necessity that must be fulfilled for the continuity of human life.

In this study non-food expenditure, the total of the monthly spending of respondents in the form of expenses for daily necessities such as tuition fees, housing, household purposes, the cost of various goods and services, durable goods, and expenses for taxes and house contracts that are calculated in the rupiah unit. Based on the results of the study, the greatest non-food expenditure is expenditure on electricity, gas and water payments. This is because this expenditure must be issued each month as well as soap and transportation requirements. While the fewest non-food expenditures are expenditure on durable goods such as kitchen appliances, cutlery and mobile phones. This is in line with the research done by Marzuki et al, 2019 which shows the expenditure to eat, greater than the expenditure for non-food and non-essential expenditure.[4]

Non-essential expenditure is a month-long household expenditure covering the expenditure of parties, ceremonies, cigarettes, alcohol, snacks as well as spending on entertainment calculated in the rupiah unit. According to table 1, it is known that most respondents are in the category of < Rp. 500,000, which is 28 respondents or 59.3% and at least in the category of > Rp. 1.000.000 as many as 2 respondents or 4.2%. Non esesnial evasion is generally not large because the implementation is rarely done every month but only once a year. The results of this study in line with the research Istiqamah et al, 2019 showing the largest non-essential expenditure was in Class 3 as much as 41.4%[5]. The research conducted by Hardy which stated that the greater the ability to pay respondents then the higher the class of care selected and vice versa[6].

The ability to pay patients will have an effect on his accessibilities to healthcare services. The lower the ability to pay a person then the lower the access to health services. The ability to pay is also determined by a person's income level. The greater the income level the greater the access to healthcare services.

The ability to pay is calculated using concepts. Based on 5% of total non-food expenditure. In table 2 shows that the largest ATP is in the range of Rp. 175,000 and the smallest of Rp. 40,000 with an average pay capacity of Rp. 80,000. In this research the pay ability used to calculate rational tariff assumptions is based on 5% of non-food expenditure. With the consideration that non-food needs in addition to secondary and tertiary needs, also in non-food components there is an expense that is destructive in health, such as cigarettes. It can generally be noted that this destructive household expenditure is precisely greater than the expenditure on health. This research is in line with the done (Annaafia et al., 2020) at Kaliwates General Hospital Jember district showed the ability to pay higher society than the prevailing tariff[7]. This research is not in line with the Done (Wirajaya, 2019) at Puri Raharja General Hospital Denpasar showed ATP < Rp 1 million for 55% was in class II and III and the smallest of Rp 4,000,001 to Rp 5 million for 1.5% which is in the VIP class[8].

The willingness to pay consists of the willingness to pay actual and the willingness to pay normative. The willingness to pay the actual amount based on the cost of the respondent during the treatment of the psychiatric clinic in one month in the hospital while the willingness to pay normative is the amount that is willing to be paid according to the perception of the respondent about the condition of health care in the psychiatric clinic of the Regional Special Hospital

Willingness to pay respondents are willing to pay health care services at the hospital above the prevailing rates if the services including completeness of facilities and infrastructure can be improved and the improvement of health services is maximised. The willingness or willingness of patients to pay services provided by the hospital, should the hospital should be able to further improve the quality of service the willingness to pay high health services is usually driven by the perception of a person in choosing a class of treatment based on good quality of service. These patients will appreciate the quality of service compared to the price they have to

pay, while the quality of service takes precedence over the opportunity for patients who have a high willingness to pay. Hospital needs to pay attention to their wishes and complaints[9-11].

If compared between the ability and willingness to pay respondents to the current tariff rate, it can be seen that the average maximum ability and maximum willingness to pay patients is equally higher than the current tariff rate. This condition indicates that the ability to pay almost as much as the desire to pay the service. It belongs to the ideal tariff determination zone

## Conclusion

This research concluded that the ability and willingness to pay the society is still high compared to the tariffs prevailing at the psychiatric clinic. Therefore, the hospital can revise the tariff on the psychiatric clinic by considering the level of ability and willingness of the community as well as setting the tariff not exceeding the community's paying ability.

# Factors Corresponded to Health Service Utilization of Chronic Disease Management Program (Prolanis) Patient in Health Center Lateri Ambon City Post-Earthquake

**Ervina Imelda Souhaly[1], Muhammad Alwy Arifin[2], Darmawansyah[2], Amran Razak[2], Anwar Mallongi[3], Syamsuddin Wadi[4], Muh. Yusri Abadi[2]**

*[1]Reserach Scholar of Magister Program Departement of Health Adminitration and Policy, Public Health Hasanuddin University, [2]Associate Professor of Departement of Health Adminitration and Policy, Public Health Hasanuddin University, [3]Professor of Departement of Environmental Health, Public Health Hasanuddin University, [4]Associate Professor of Faculty Economics and Business, Hasanuddin University*

## Abstract

The objective of chronic disease management Program (Prolanis) encourages patient with chronic illness to achieve optimal quality of life and 75% of patient have the "good" results on the specific examination of the disease DM type II and hypertension so as to prevent the onset of disease complications. The purpose of this research is to know the factors related to the utilization of post-earthquake service Prolanis. This type of research is analytic survey research using cross sectional approach design. The population in this study is all prolanis patient who utilize the service in the Public Health center after the earthquake as many as 69 patient. The sampling techniques in this study were the total sampling so that the number of samples in this study of 69 respondents showed that there was no age-old relationship with the utilization of Prolanis services in post-earthquake community health centres (P = 0,271) However, there was a gender relationship (0.000), education (P = 002), and marital status (P = 0,006). Therefore, the Lateri Public Health Center can play an active role and reach out to prolanis patient who utilize the post-earthquake service so that they can maintain and increase the degree of health especially in people with chronic diseases such as hypotensions and diabetes mellitus.

***Keywords**: Prolanis, utilization, post-earthquake, Public health Center*

## Introduction

The Chronic Disease Management Program (Prolanis) is an integrated healthcare system and proactive approach that involves patient, health facilities and BPJS healthcare in order to maintain health care for the optimal patient of BPJS Health with the cost of effective and efficient health services. The target of Prolanis activities are all patient of BPJS health with chronic disease especially Diabetes Mellitus (DM) type II and hypertension. This is carried out by first-rate health facilities (FKTP) both in government FKTP and private FKTP. Prolanis aims to encourage patient with chronic illness to achieve optimal quality of life and 75% of patient have the "good" results on the specific examination of the disease of DM type II and hypertension so as to prevent the onset of disease complications[1]

The number of sufferers of Diabetes mellitus type 2 continues to increase in Indonesia. Based on RISKESDAS 2018 the prevalence of Diabetes mellitus in population aged > 15 years for Indonesia is 2.0%. In addition to diabetes mellitus type, hypertension is also a burden of non-infectious diseases that are harmful because of its effects that can spread to other diseases. The prevalence rate of hypertension based on the measurements in population aged ≥ 18 years in regional health research 2018 increased sharply by 34.1%.[2]

**Correspondence Author:**
E-mail: ranggaamard@gmail.com

Based on secondary data at the Leteri Public Health center obtained by researchers, the number of pronalists patient registered in Leteri Public health centers as many as 134 patient and who utilize prolanis services from January to October 2019 as many as 69 patient per month.[3] in November 2019 until December 2019 there was a decrease in the number of visits in each month as many as 69 patient in 40 patient. The decline in the number of visits occurred in the aftermath of the earthquake that occurred in September 2019 in the city of Ambon caused many people to evacuate so as not to utilize the service of Prolanis in the Lateri Community Health Center. By the time this research aims to determine what factors influence the utilization of the service of Prolanis patient in the health center post earthquake Lateri society

## Materials and Method

The type of research used is an analytical survey using the design of a cross sectional approach. The population in this study is all prolanis patient who utilize the service in the Public Health care center after the earthquake as many as 69 patient. The sampling technique in this study was a total sampling so the number of samples in this study was 69 respondents. Data collection is obtained through a live

## Results

According to table 1, it is revealed that from 69 respondents based on the respondent's age, most of the age group > 60 years as many as 37 respondents (53.7%) And the least number of respondents in the age group of 41-50 years as many as 2 respondents or amounting to (2.9%). According to gender, respondents were the most female groups of 53 people (76.8%) And the fewest number of respondents in males is as much as 16 people (23.2%). Based on the most recent education is the category SMA/equal to 28 people (40.6%) And the least number of respondents were the group did not end the elementary school as much as 2 people (2.9%). Based on the marital status, the most widely married category of 53 people (76.8%) And the fewest number of respondents were not married for 2 people (2.9%)

Table 2 shows that out of the 32 respondents who have grouped adult categories, there are 23 respondents (71.9%) That utilize the Prolanis health services in the Lateri Public Health center well and 9 respondents (28.1%) Who undertakes the use of medical services in the Lateri Public health center while from 37 respondents grouped by elderly there are 31 respondents (83.8%) Who utilize the Prolanis service in the Lateri Public health Center and 6 respondents (16.2%) Who undertakes the Prolanis service at the Public Health center of Post-earthquake. Statistical test results using the chi-square test obtained the value P = 0.271, because the value of p > 0.05 then there is no age group relationship to the utilization of the service patient in the Post Earthquake.

According to category of gender shows that of 16 respondents who have male gender, there are 6 respondents (37.5%) Utilizing the Prolanis Health Care Center in the Lateri Public health Centre and 10 respondents (62.5%) Who undertakes the use of medical services in the Lateri Public health center while 53 female respondents are 47 respondents (90.6%) Who utilize the Prolanis service in the Lateri Public health Center and 6 respondents (9.4%) Who undertakes the service of Prolanis at the Lateri Public Health Center. Statistical test results using the chi-square test obtained the value P = 0.000, because the value of p < 0.05 then there is a gender relation to the utilization of the service of the patient in the post-Earthquake Department center.

Based on the education category shows that out of 6 basic educated respondents, there were 3 respondents (50%) That utilize the Prolanis health services in the Lateri Public Health center well and 3 respondents (50%) Who undertakes the use of medical services in the Lateri Public health center while from 63 further educated respondents there are 51 respondents (81%) Who utilize the Prolanis service in the Lateri Public health Center and 12 respondents (19%) Who undertakes the Prolanis service at Public health centers. Statistical test results using the chi-square test obtained the value P = 0.002, due to the value of p < 0.05 then there is an education level relationship to the utilization of the Ministry of Prolanis patient in the lateri health center of Post Earthquake.

Based on the marital status indicates that of 53 respondents who are married, there are 43 respondents (81.1%) That utilize the Prolanis health services in the Lateri Public Health center well and 10 respondents (18.9%) Who is less utilizing the medical service in the Lateri Public Health Center while the 16 respondents who are not married or divorced/widowed there are 11 respondents (68.8%) Who utilize the Prolanis service in the Lateri Public health Center and 5 respondents (31.2%) Who undertakes the Prolanis service at Public health centers. Statistical test results using the chi-square test obtained the value P = 0.006, due to the value of p < 0.05 then there is a marital status relationship to the utilization of the service of the patient in the post-Earthquake Department center.

## Discussion

**Age relationship with the use of Prolanis patient service**

Based on adult category age, there are 23 respondents (71.9%) That utilize the Prolanis health services in the Lateri Public Health center well and 9 respondents (28.1%) Who undertakes the use of medical services in the Lateri Public health center while from 37 respondents grouped by elderly there are 31 respondents (83.8%) Who utilize the Prolanis service in the Lateri Public health Center and 6 respondents (16.2%) Who undertakes the Prolanis service at the Public Health

center of Post-earthquake. This research is not in line with Jenry et al, 2017 which indicates there is age relationship with the utilization of Public health Center service with value P = 0.004.[4] The research conducted by Kim & Hong stating that the age level does not affect the level of utilization of health care for the elderly with or without chronic illness[5]

**Gender relations with the use of Prolanis patient services**

Gender can influence in decision making to conduct treatment search. 8 This is because women need special health services such as pregnancy health services and specific diseases that require women to utilize health care. Another study mentions that gender does not affect people to be able to use health care services. Both men and women have the same risk utilizing health services[6]. The results of the above studies show that Bivariate was obtained from 69 respondents, consisting of 53 female respondents and 16 male respondents. According to the table above, it can be seen that the utilization of Prolanis in post Earthquake Community Health center is dominated by female gender. One of the factors that make the utilization rate of Prolanis dominated by female types. Statistical test results using chi-square indicate a value of P = 0.00 which means the gender relates significantly to the utilization of the prolanis patient in the Lateri public health centers of post-earthquake. The results of research research of Risman et al (2020) which shows that female gender is more utilizing the Ministry of Prolanis in health services UPT Unpad compared to male gender.[7]

**The establishment of a relationship with Prolanis patient service**

The status of education is closely related to the awareness and knowledge of one, so that the status of education has a significant influence on the utilization of healthcare services. Usually low-educated communities, lacking awareness and good knowledge of the benefits of healthcare services[8]

This research shows the educational variables related to the utilization of Prolanis services in the Public health center post-earthquake leteri with a value of P = 0.001 < 0.05. This is in line with the results of the research of Napirah which shows there is a relationship level of education with the utilization of health care in the working area of community health centers of East Coast Poso District of Poso Regency.[9]

**Marital Status relationship with the use of Prolanis patient service**

Marital Status can improve health for individuals with chronic diseases.[10-12]. The majority of Prolanis patient in the Lateri health center are married. A total of 53 Prolanis patient were married to utilize the Ministry of Prolanis. According to Riaz et All arital status is one of the factors that can control the patient's condition in his chronically-controlled disease management efforts[13-17]. This research is in line with the Syafa'at et al, 2019 indicates there is a influence of marital status (P = 0,015) on the utilization of Prolanis in FKTP Depok[11]. Couples or families can be a figure that can help the disease management process. It is not in accordance with the research which et all (2018) that there is no relationship between the status of married than that is not P = 0738. 5

## Conclusion

The study concluded that there is no age relation to the utilization of Prolanis services in post-earthquake community health centres (P = 0,271) However, there are gender relations (0.000), education (P = 002), and marital status (P = 0,006). Therefore, the Lateri Public health center can play an active role and reach out to Prolanis patient who utilize the post-occurrence service of the earthquake so that it can maintain and improve the degree of health especially in people with chronic diseases such as hypotensions and diabetes mellitus.

### Abstract

Employee performance is paramount in achieving goals. Employees will achieve work when they have the discipline and motivation to perform their job well. The purpose of this research is to analyze the effect of work discipline on the performance of employees of the Tanimbar islands district health office. This research uses a type of quantitative research and cross-sectional design. Data collection is done by observation, questionnaire, and document study. The samples in this study were 61 officers of the Health office of the Tanimbar Islands regency. A sampling of this research used total sampling. The collected data is processed using the Statistical Package for the Social Sciences program. The results showed the value of P = 0,537 means that there is no influence between the work discipline to the performance of employees of the District Health Office of Tanimbar Islands. Therefore, the health office of the Tanimbar Islands District needs to discipline employees through a better surveillance process.

***Keywords**: Work discipline, Performance, Employee, Health office*

### Introduction

Employee performance is paramount in achieving goals. Employees will achieve work when they have the discipline and motivation to perform their job well. It is the duty of a leader to apply working discipline and to motivate his subordinates in order to work in accordance with the intended purpose. Therefore, the leader must know the factors that affect the motivation of employee work so that employees ' performance increases. With high discipline and motivation, employees will perform their best tasks, so that the objectives that want to be achieved according to the plan. If a leader is unable to engage the discipline and motivation of employee work, the employee's performance will be decreased[1].

In achieving the success of an employee performance organization is a determining success in achieving its objectives. Good organizational performance is indispensable for realizing the vision and mission of an organization in the future. To get a performance assessment for employees need to be performed a performance evaluation called by performance assessment or performance appraisal[2].

From the initial survey conducted at the Health office of the Tanimbar Islands, it can be noted that employees ' performance in the Health service department is still less good and affects the quality of work. It can be seen less accuracy in the completion of the instructed work so that the time needed in the completion of the work is getting longer. Another thing that we often find in the administration of the establishment and in other areas of duty is very slow in solving problems that occur in the field, one of which often lose mail on the subject of the letter is much needed to be archived to the service. Based on the explanation of the problem above how important

role of working discipline in improving employee's performance.

## Materials and Method

The type of research used is quantitative research with Cross Sectional Study Draft. The population in this research is the overall employee who works in the Tanimbar Islands Health Office (PNS, CPNS, and PPPK) does not include cleaning service and security as much as 61 people. The sampling technique in this study was used in total sampling where the number of samples was equal to the population. Data collection is obtained through interviews using data processing questionnaires conducted in computerised by using SPSS program. Data presented in narrative form, frequency distribution table accompanied by interpretation.

## Results

The results showed the value of P = 0,537 means that there is no influence between the work discipline to the performance of employees of the District Health Office of Tanimbar Islands. Some results are presented in the tables below:

**Table 1. Distribution of Respondents Based on Characteristics of Respondents Health Office Tanimbar Islands in 2020**

| Characteristics | Amount (n) | Percent (%) |
|---|---|---|
| d. Age (yr) | | |
| 18-30 | 10 | 16.4 |
| 31-50 | 46 | 75.4 |
| > 50 | 5 | 8.2 |
| Total | 61 | 100.0 |
| e. Gender | | |
| Male | 29 | 47.5 |
| Girl | 32 | 52.5 |
| Total | 61 | 100.0 |
| f. Education | | |
| High school | 11 | 18.0 |
| Diploma | 19 | 31.1 |
| Bachelor degree) | 28 | 45.9 |
| Masters (S2) | 3 | 4.9 |
| Total | 61 | 100.0 |
| g. Years of service | | |
| <6 years old | 5 | 8.2 |
| 6-10 years | 18 | 29.5 |
| > 10 | 3 | 62.3 |
| Total | 61 | 100.0 |

Source: Primary Data, 2020

**Table 2: Variable Frequency Distribution of Work Discipline in the District Health Office. Tanimbar Islands in 2020**

| The performance | Amount (n) | Percent (%) |
|---|---|---|
| Not good | 41 | 67.2 |
| Good | 20 | 32.8 |
| Total | 61 | 100.0 |

Source: Primary Data, 2020

Table 2 shows that of the 61 respondents, there were 41 respondents with poor work discipline at 67.2 and 20 respondents with good work discipline at 32.8%.

The effect of work discipline on Employee Performance

The bivariate relationship between work discipline and the performance of the Tanimbar Islands District Health Office employees can be seen in table 3 as follows

**Table 3: The effect of work discipline on the Performance of the District Health Office. Tanimbar Islands in 2020**

| Work Discipline | Employee Performance | | | | amount | | Statistic test |
|---|---|---|---|---|---|---|---|
| | Not good | | Good | | | | |
| | n | % | n | % | n | % | |
| Not good | 32 | 52.5 | 14 | 23.0 | 46 | 75.4 | ***p*= 0.537** |
| Good | 9 | 14.8 | 6 | 9.8 | 15 | 24.6 | |
| **Total** | **41** | **67.2** | **20** | **32.8** | **61** | **100** | |

Source: Primary Data, 2020

Table 3 shows that of the 15 respondents with a good working discipline of 6 respondents who have a good performance (9.8%) and 9 Respondents had poor performance (14.8%). While for poor working discipline amounted to 46 respondents as many as 14 respondents had a good performance (23.0%) And 32 respondents had poor performance (52.5%). Statistical test result by using Chi-square, but the chi-square test requirement is not fulfilled, then the value seen is the value of Fisher's exact value P = 0,537, because the value p > 0.05, then H0 accepted. This indicates that there is no influence between working discipline and employee performance at the Tanimbar Islands Health Office.

## Discussion

One form of measuring the performance of a good employee is to look at the discipline at work time. Time discipline here is interpreted as attitudes or behaviors that demonstrate adherence to working hours that includes the attendance and compliance of officers during working hours, employees perform tasks on time and right. It's supposed to work time discipline is applied based on consciousness to complete each job[3].

The work discipline in this research is the effort to carry out its work activities in earnest (timely, obedient rules, according to the responsibilities given). The results of the analysis in table 3 showed that out of a total of 15 respondents with a good category of working discipline more respondents had less than 9 respondents (14.8%). Meanwhile, from a total of 46 respondents with a less well-categorized working discipline, more respondents had a less than good performance amounting to 32 respondents (52.5%). This is because there are certain points that tend not to be performed properly.

Statistical test result by using Chi-square, but the chi-square test requirement is not fulfilled, then the value seen is the value of Fisher's exact value P = 0,537, because the value p > 0.05, then H0 accepted. This indicates that there is no relationship between working discipline and employee performance at the Tanimbar Islands District Health Office. The less-than-good working discipline reflects the lack of a person's responsibility for the task given to him. It is also evidenced by the many officers stating that they always come on time. Thus it can be concluded that it is about time discipline on the district health Tanimbar less good Research is not in line with the research conducted by Kasim et al., about the relationship of work discipline, leadership, training, and motivation to the performance of administration officers Abepura Papua Hospital in 2015[4]. One of the results of his research is the relationship between working discipline to the performance of the administrative officer of the Government Abepura Papua year 2015. The results of this study were not in line with research Panuluh and Gilang stating that discipline has a significant influence on work productivity[5-10].

This research is also not in line with research Satria and Nio (2019) about the relationship of work discipline with the performance of the employees of PDAM Tirta Jam Gadang Bukittinggi[6]. The working discipline indicator measured in the study is attendance, adherence to employment, adherence to working standards, high level of vigilance, and ethical work indicating a significant positive relationship between working discipline and performance in the employees of PDAM Tirta Jam Gadang, Bukittinggi City. That means the higher the employee's work discipline, the higher the performance of an employee. However, this research is in line with the conducted shows the simultaneous and partial work discipline has no effect on the employee's performance[11-17].

## Conclusion

The study concluded that there was no influence between working discipline and employee performance at the Tanimbar Islands Health Office with the value P = 0,537. District Health Office of Tanimbar Islands need to improve employee discipline through better supervision process.

# Analysis Health Information Systems Quality on the Effectiveness of Public Health Center Officers in Ambon City

**Erwine Senda N Wattimena[1], Amran Razak[2], Sukri Pallutturi[2], Darmawansyah[2] Muhammad Syafar[3], Lalu Muhammad Saleh[4], Suci Rahmadani[2]**

*[1]Research Scholar Magister Program Departement of Health Adminitration and Policy, Public Health Hasanuddin University, [2]Professors, Departement of Health Adminitration and Policy, Public Health Hasanuddin University, [3]Professors of Departement of Health Promotion and Behavior, Public Health Hasanuddin University, [4] Lecturer of Departement Occupational Safety and Health, Public Health Hasanuddin University*

## Abstract

Health information systems play a role in providing data, information and health indicators to support the management process will have an impact on increasing the effectiveness of work. The purpose of this research is to know the quality influence of health information system that is seen from availability, timeliness, and relevance to the effectiveness of employees of public health centers in Ambon City. The type of research used is quantitative with cross sectional study design. The population in this study is all employees of the Ambon City Public Health Center amounting to 586 people, the withdrawal of samples with purposive technique obtained by 50 people. Collection of data through questionnaires. Data is analyzed by chi-square test. The results showed that the health information system of the availability aspect (P = 0.02), timely (P = 0.01) and relevant (P = 0.04) significantly affected the effectiveness of healthcare personnel working in the Public health center in Ambon city. It is hoped that the public health center in Ambon City can improve the existing system so that the information produced is more quality.

***Key Words:*** *Health information System, availability, and health care management.*

## Introduction

Efforts in the implementation of health development are all components of the nation that have been arranged in a system called the National Health System (NHS). Its components consist of seven subsystems, one of them about management, information and health regulations. To ensure the achievement of national development objectives of health system is a manifestation and implementation method of health development that combines various efforts of Indonesian nation in a single step [1].

Health information systems can integrate data collection, reporting, processing and use of information to improve the efficiency and effectiveness of healthcare through good management at all levels of health in the central, provincial, Regency/city or even at the level of technical implementation such as hospitals and public health centers[2].

Public health centers as the lowest health executor have difficulty in reporting, where data between one report from one program with another report from other programs has almost the same data set. On the other hand, the application to make various reports is different, causing overlap in its workmanship, it takes a system of information [3].

In the implementation of generic SIKDA for the Maluku province as many as 26 public health centers and 22 public health centers in Ambon City must develop a computer-based health information system in the hope that the data and information produced can be integrated so that the efficiency and effectiveness of the work increases. Based on data from employees work in the Community Health center in Ambon in 2019 repeated errors, the default standard of the report is not used, the delay of information (report) in the form of data (achievement/target) program needed in the creation of public health center profile. Looking at the background

picture researchers want to know the implementation of regional health Information System application (SIKDA) generic Public health center in Ambon City.

## Materials and Method

This research uses quantitative research methods of cross-sectional study design. The population in this study was all employees of the public health centers in Ambon city, amounting to 586 people. The sample is determined by purposive method. Sample criteria is the employee who served in the Community Health center in Ambon city that has participated in the training of regional Health information system (SIKDA generic) amounting to 50 people. Data collection is obtained through a live interview using a questionnaire.

## Result

Based on table 1 shows that the most recent education of respondents was D III with 22 respondents (44.0%) while the least were D I and D IV, each with 1 respondent (2%). The length of service is the length of time the respondent has been working since he was an employee. Table 1 shows that the length of service for most respondents 1-10 years was 34 respondents (68.0%), while those with a minimum of 21-30 years were 2 respondents (4.0%). Most of the respondents' gender was 43 respondents (86.0%), while men were 7 respondents (14.0%). The highest age group of respondents is 31-40 years with 22 respondents (44.0%), the least is 41-50 years, with 2 respondents (4%).

**Table 1: Frequency Distribution of Characteristics of Respondents in Ambon City community health centers in 2020**

Source: Primary Data, 2020

Table 2 shows that out of 50 respondents the variable Availability of Information and work is effective, as many as 34 respondents (81.0%) information is available and ineffective in their work, as many as 8 respondents (19%). While respondents who stated the unavailability of information but were effective were as many as 3 respondents (37.5%) who stated that no information was available and ineffective as many as 5 respondents (62.6%). Based on the results of hypothesis testing using Chi-Square obtained p-value (0.02) <a (0.05), proving that statistically H0 is rejected, which means there is an influence of the availability of information on the Work Effectiveness of Employees of public health centers in Ambon City in 2020.

Based on the timeliness variable table 2 shows that of the 50 respondents the information variables were timely and effective at work as many as 33 respondents (82.5%) and those whose information was less timely and ineffective were as many as 7 respondents (17.5%). While information that is less timely and effective in their work is 4 respondents (40%) and information that is less timely and ineffective in their work is 6 respondents (60%). Based on the results of hypothesis testing using Chi-Square obtained p-value (0.01) <a (0.05), which means that statistically H0 is rejected, meaning that there is an effect of timely information on the Work Effectiveness of Employees of public health centers in Ambon City in 2020.

Based on the Relevance variable table 2 shows that of the 50 respondents the variables are quite relevant and effective as many as 31 respondents (81.5%) and the less relevant and ineffective that is as many as 7 respondents

(18.5%). While respondents who stated less relevant and effective were 6 respondents (50%) who were less relevant and ineffective as many as 6 respondents (50%). Based on the results of hypothesis testing using Chi-Square obtained p-value (0.04) <a (0.05), which means that statistically, H0 is rejected, which means that there is a Relevant Information effect on the Work Effectiveness of Employees of public health centers in Ambon City in 2020.

## Discussion

**The effect of health information system (HIS) availability towards effectiveness of public health center officers**

Based on the results the study showed that 58% of respondents expressed employee work in the Public health center quite effectively. From these results can be noted that the availability of information is assessed reasonably available by health officers. Where every time needed information can be easily obtained. The results also show that the availability of information has a meaningful influence with the effectiveness of employee performance in the Health center in Ambon city. This suggests that the hypothesis is acceptable. This is accordance with the research by Hariana (2013) who conducted research in 66 hospitals in Yogyakarta, where the results obtained showed that between the availability of information system in the hospital with the value of use of information system for management function in the hospital there is a meaningful relationship. The availability of information systems provides comprehensive support for patient development and service [4].

Report/Data that has been recapitulated directly by the officers from the Public health Center to the health office in the form of hardcopy/photocopy. Data transmission from the Public health center of Ambon to the city health office of Ambon can not be sent online still in the form of hardcopy, sometimes also photocopy ". The results of the research conducted by Wijaya (2011), the format of data transmission in the Public health center Tawang also still manually, the form of print out is already determined from the center, the shipment was not directly sent to the national Data Bank but instead sent to the city health office. But for the management of data already use the computer only for the online system of public health center is still constrained because of the absence of adequate Internet network. Given the importance of computers in the SIK process to procure computers in every public health center in certain areas[5].

**The Effect of the timeliness health information system on the work effectiveness of public health center employees**

the results indicate that timely information was judged to be timely enough by health workers. This may be influenced by reports of patient data reconciliation that is always collected after the completion of service hours. So that the information is always on time and can be used by health workers. The results also showed that timely information has a significant effect on the work effectiveness of employees at the Ambon City community health center. This shows that the hypothesis was accepted. The results of this study are in line with research conducted by Wekesa (2014) who did research in looking at the utilization of health management information systems in Kenya where the results obtained from 196 respondents 126 showed satisfaction with the timeliness of the systems they use. Timeliness refers to the data that is available on time to make the necessary decisions. More than half of community health workers in Kenya report that available data are always timely and they are able to make decisions based on the data they collect [6].

The result was also strengthened by an interview with one of the health officers in the Community Health center in Ambon city, who mentioned that the existing system was able to provide timely information. The reports are also timely because each section has been responsible for each.

**The effect of health information system (HIS) relevance effectiveness of public**

**Health Care Officers**

From the results of the research that has been showed that of the 50 respondents variables are quite relevant and effective, as many as 31 respondents (81.5%) and those that are less relevant and ineffective, as many as 7 respondents (18.5%). From these results it can be seen that the relevant HIS is considered quite relevant by health workers. The results also show that relevant

HIS has a significant influence on the work effectiveness of employees at Ambon City community health centers. This shows that the hypothesis is accepted. According to Nuraida information is considered relevant if the information is related to the needs of decision making. That is, the information received must be relevant to the problem [7].

The results of other research by Lestari also show the same results where the information produced is relevant to the needs of management. The form of information provided to the management must be appropriate, precise and detailed so that it can support the management process in making effective decisions [8]. Similar research was also conducted by Chaulagai et al. To see the quality of information system in Srilangka, which shows that 84% of respondents expressed satisfaction in the information of the relevant aspects of information systems. Relevant information is very useful in the decision making of health care management to set decision [9-17].

## Conclusion

The research concluded that the effectiveness of employees at the Health center in Ambon city is influenced by the availability factor and will be better if the necessary information infrastructure is available. Information or data that required timeliness of its inputs have an influence on the effectiveness of employees of public health centers in Ambon City. The relevance aspect affects both the effectiveness of the employees of the Health center in Ambon city.

# Juvenile Treatment Model according to Juvenile Criminal Justice System in the LPKA (Juvenile Detention Center) Class I, Tanjung Gusta, Medan

**Madiasa Ablisar[1], Marlina[2]**

*[1]The Faculty of Law, University of Sumatera Utara, Medan, Indonesia, [2]The Faculty of Law, University of Sumatera Utara, Medan, Indonesia*

## Abstract

Law No. 11/2012 on the Juvenile Criminal Justice System states that child prisoners in the LPKA (Juvenile Detention Center) are required to participate in the treatment program which consists of personal treatment and independency treatment so that they can come back to their communities well; besides that, they have been prepared with skills. The research problem was how about the treatment model of juveniles who have committed criminal offenses in the LPKA Class 1, Tanjung Gusta, Medan. It is expected that through this research a treatment model of juveniles who have committed criminal offenses in the LPKA can be found in the future. The research used normative and empirical approaches. The data were gathered by conducting interviews with some informants in the Section of Juvenile Treatment of the LPKA Class 1, Tanjung Gusta, Medan, and with the child prisoners. The result of the research showed that personal treatment and independency treatment in the LPKA Class 1, Tanjung Gusta, Medan, were performed with group (classial) and scheduled treatment models. It is recommended that individual treatment model, especially independency treatment be used in the future, and personal treatment should be done by using classial treatment model.

***Keywords:*** *Model, Juvenile Treatment, LPKA, Tanjung Gusta*

## Introduction

Law No. 11/2012 on the Juvenile Criminal Justice states that a juvenile who has committed a criminal offense cannot be incarcerated because putting him in prison will not cope with the conflict. On the other hand, it will affect his mental and psychological condition. It is not impossible that he is is not deterrent and will commit the same crime again. This law is the amendments of the system of punishing juveniles. One of them is the special Juvenile Detention Center which called in Indonesian, LPKA (Juvenile Detention Center). The juveniles, who have committed criminal offenses and become the prisoners at the LPKA, are required to participate in the treatment program which consists of personal treatment and independency treatment.

Article 1, point1of Law No. 12/1995 on Penitentiary states that in a criminal justice system, a Penitentiary, in its activity to develop prisoners based on system, institution, and the treatment method, is the last part of the punishing system in the criminal justice system. Therefore, the essence of penitentiary is the treatment toward prisoners so that they can come back to their communities in good condition. The treatment is done in an integrated way among the patron, the prisoners, and the society to increase the quality of the prisoners so that the prisoners will be aware of their wrong doing, improve their quality of life, and not commit their criminal offenses again.

According to the theory of treatment, the objective of the imprisonment is to change prisoners' behavior/ personality so that they will abandon their bad habit which is contrary to legal norms and other norms and to make them inclined to obey the applicable norms. The theory of treatment is more directed toward prisoners' improvement, not toward their criminal offenses. Basically, it is intended to change their attitude toward the better one, and they do not commit their crime again so that they will be accepted by their communities.[1]

The research conducted by Asri Rima Jiwantari, et.al.[2] states that the activity of treatment for child prisoners involves collaboration with the foundation and LSM (Non-Government Organizations). Because of the lack of budget, the implementation of treatment program cannot be done maximally according to the work plan. Alden Juneidy Simanjuntak[3] in his research points out that treatment for child prisoners has some obstacles, due to the lack of competent experts in handling juvenile problems so that child prisoners cannot be treated seriously.

The result of the research conducted by S.K. Sembiring[4] on the Treatment System of Child Prisoners in the LPKA Class 1,Tanjung Gusta, Medan, states that the number of child prisoners in the LPKA Class 1, Tanjung Gusta, Medan, was fluctuating in the last 3 (three) years. There were 510 of child prisoners in 2017, 500 child prisoners in 2017, and the number increased to 587 in 2018. Even though the treatment system has been done, it is not effective, due to over-capacity, lack of facilities and infrastructure, and the shortage of budget and LPKA personnel.

The research problems were how about the treatment model for child prisoners in the LPKA Class 1, Tanjung Gusta, Medan and how to find a treatment model for child prisoners who have committed criminal offenses in the LPKA Class 1, Tanjung Gusta, Medan, in the future.

## Research Method

The research was conducted in the LPKA Class 1, Tanjung Gusta, Medan. It used both normative and empirical methods.[5] The analysis was on the imposition of Law No.11/2012 on the Juvenile Criminal Justice System. Empirical research was done by conducting qualitative study. The data were gathered by conducting interviews with some informants in the Juvenile Treatment Section and with the child prisoners in the Penitentiary.

## Result And Discussion

1. The Treatment for Juveniles Committing Criminal Offenses in the LPKA

The LPKA Class I, Tanjung Gusta, Medan, is located on Jalan Pemasyarakatan, Kelurahan Tanjung Gusta, Kecamatan Medan Helvetia, Medan. It is situated on the area of 19,800 square meters with the building area of 475.47 square meters. Its facility and infrastructure consist of a two-story building with 60 (sixty) detention rooms. From the data

obtained from the Registration and Classification Sub-Section of LPKA Class I, Tanjung Gusta, Medan, until September, 2019, it had been found that of the 160 child prisoners, 68 of them committed drug abuse, 48 of them were involved in juvenile delinquency included in child protection, 16 of them committed robbery, 15 of them were thieves, and the rest of them committed fraud, embezzlement, and sexual harassment.

The treatment system in the LPKA (Juvenile Detention Center), now based on Law on the Juvenile Criminal Justice System, is based on the *Reglement Gevangenis Reklasering.* It has been amended to the Circle Letter of the Minister of Justice of the Republic of Indonesia No. KP.10.13/3/1 on February 8, 1990 on Penitentiary as a process and to the Decree of the Minister of Justice No M..02.PK.04.10/1990 on the Treatment Pattern for Prisoners or Detainees.

The treatment which is done in the LPKA Class I, Tanjung Gusta, which is in accordance with the Decree of the Minister of Justice No. M..02.PK.04.10/1990 on the Pattern of Prisoner Treatment, consists of personality treatment and independency treatment.

1. Personality treatment

The personality treatment includes awareness of having a religion, being in the frame-

work of a nation and a state, intellectual capacity, having a sense of justice, integrating

oneself with a community, and physical treatment. The detail of them is as follows:

a. The treatment of awareness of having a religion: this treatment is done to strengthen child prisoners' belief by providing understanding for them so that they will be aware of the consequences of their actions, whether they are right or wrong. For child prisoners who are Moslems, the activities are done through *Pesantren*

(Islamic Boarding Schools), *Yasinan* (reciting the Surah in the Koran together) and *tahlilan* (praise to God by repeating His name) together, the Koran murottal studying, Islamic counseling, praying together, followed by religious lectures, collaborating with Yayasan AS-Showah Mari Taqwa Medan, Yayasan Insentif Agama Islam (OPIAI) Medan. For child prisoners who are Christians, the activities are done by collaborating with DGKI (Indonesian Council of Churches), STT Abdi Sabda,and KMK USU, while for the child prisoners who are Buddhists, the activities are done through guidance and counseling by collaborating with Majelis Budhayana Indonesia (MBI), Medan.

b. The Treatment of Being in the Framework of a Nation and a State

The treatment of being in the framework of a nation and a state is done through the child prisoners' participation in flag ceremonies in the national holidays performed with the Special Juvenile Treatment Institution. The child prisoners are also participated in the competition of marches and parades (Boy Scouts) organized by the Medan Municipality.

c. The Treatment of Intellectual Capacity

The treatment of intellectual capacity is highly needed in order to increase child prisoners' knowledge and thinking capacity which are needed to support their positive activities during their detention period. The type of education organized in the LPKA Class I, Tanjung Gusta, Medan, is a non-formal education. It is an equivalency education (Package A, Package B, and Package C), collaborating with the Education Agency and PKBM Puspa Private Education as the organizers of equivalency education. The whole program is carried out by qualified private teachers from PKBM Puspa and by the LPKA personnel.

d. The treatment of the Sense of Justice

The implementation of the treatment of the sense of justice is carried out by making

collaboration with the Law Department Regional Office and HAM (Human Rights)

of North Sumatera and with Legal Aid Institutions.

e. The Treatment of Self-Integration to Community

The treatment of social problems is intended to help child prisoners adapt to the communities and neighborhood well. Therefore, to achieve this goal the child prisoners should continuously be adhered to perform their religious duties and can do social activities by doing community services in cleaning up their block surroundings, assimilation program, either in the inside or in the outside penitentiary.

f. Physical Treatment

The physical treatment is done by doing sport such as gymnastics, soccer, volleyball, badminton, ping-pong, and chess. All sports facilities are provided in the LPKA, and they are carried out in an integrated way, according to the daily activity program.

2. Independency Treatment

The independency treatment is directed toward skills in order that child prisoners can

play their role actively in the society. The types of this treatment are as follows: a) skill intended to support handicraft businesses, b) skill in craftsmanship, c) skill in hairdressers, d) wood craftsmanship, e) sewing, f) welding, and g) training in painting.

Personality treatment and independency treatment in the LPKA Class I, Tanjung Gusta, Medan, are done in an integrated way. Personality treatment is implemented by using the model of classial treatment by conducting lectures, questions and answers, simulation, role-play, or team establishment while independency treatment is implemented and adjusted to the available facilities in the LPKA Class I, Tanjung Gusta. Unfortunately, it lacks of attention to the child prisoners' interest and talent.

2. Treatment Model of Juveniles as Child Prisoners in the LPKA in the Future

Gordon Bazemore, in his writing, *Three Paradigms of Justice*, in Paulus Hadisuprapto,[6] introduces three types or models of juvenile criminal justice: 1) individual treatment model, 2) retributive model, and 3) restorative model. The research conducted by Fanny Tanuwijaya[7] proposes five methods of the treatment for child prisoners: 1) situational treatment, 2) individual treatment, 3) classial treatment, 4) experimental learning,

and 5) auto suggestive.

Individual treatment model and retributive model in the model of juvenile criminal justice has single dimension and its control is oriented to an individual juvenile who commits crime. In this case, it does not involve the interest of the victims and other people. In its practice, individual treatment model uses therapeutic approach. The perpetrator is treated like a sick child whose sickness is being diagnosed. After the diagnosis has been found out, the appropriate therapy is determined according to the type of the sickness. The treatment toward a child prisoner should be in accordance with the cause while the treatment for independency should be adjusted to his interest and talent.

Individual treatment model in the European countries is known as juvenile justice model which considers that juvenile delinquency is not considered or expected in the level of values; it tends to be considered as the dysfunction of socialization. Intervention is an effort to improve a social deviation behavior by imposing a sanction on the personal problems and needs of a juvenile who commits a crime.

Classial treatment is done by providing lectures, questions and answers, simulation, role-play, and team establishment. The group should be active, either individually or in groups. The materials and the methods of treatment should involve the entire group in order to achieve the target. In this model, the patron should be able to motivate the juveniles to understand positive values which exist in the society or in the group as the materials of the treatment.

From the treatment models for juveniles above, it is found that each model has its advantages and disadvantages. Treatment model by using classial model, for example, has its own advantages such as the understanding, interest, and talent of juveniles who commit crime are different one to another so that the treatment, as a whole, cannot be absorbed and favored by the child prisoners. In consequence, the treatment done in the LPKA is merely ceremonial. Individual treatment has disadvantage since its cost and instructors' fee are high, it needs so many personnel who have to have special scientific specification.

Treatment models for child prisoners in the LPKA in the future should use individual treatment, especially in the treatment for independency because every juvenile who commits crime has his own social problem, economic problem, interest, and talent so that independency treatment is more appropriate for him. Besides that, the skills he has mastered during the detention period in the LPKA can be applied in his daily life, whereas personality treatment can be done by using classial treatment.

Individual treatment takes a lot of money in its implementation; however, if it is viewed from its advantages and its long term financing, budgeting for the treatment process of can be more beneficial and economical, compared with the cost spent for child prisoners without adequate treatment process.[8]-15

## Conclusion

Treatment for juveniles who have committed crimes in the LPKA Class I, Tanjung Gusta, Medan is done by using classial treatment, either in personality treatment or in independency treatment. Personality treatment includes treatment in having a religion, being in the framework of a nation and a state, intellectual treatment, having a sense of justice, integrating oneself with a community, and physical treatment. Independency treatment is done by providing skill in craftsmanship, skill in hairdressers, wood craftsmanship, sewing, welding, and training in painting. It is recommended that treatment models for child prisoners in the LPKA in the future be done by using individual treatment for independency treatment while personality treatment should be done by using classial treatment.

*[1]Departemen of Environmental Health Department, Faculty of Public Health, Hasanuddin University, Makassar*

## Abstract

This study aims to determine the factors associated with the presence of Aedes aegypti larvae in endemic and nonendemic areas of DHF in Biringkanaya District. The type of research used was observational with cross sectional design and through direct observation. The population is all houses in the Village of Pai and Kelurahan Daya. Determination of the sample was carried out by proportional simple random sampling method in order to obtain a sample of 100 houses each. Data analysis was carried out was univariate and bivariate with chi square test. The results showed that the related variables were the actions of PSN in endemic areas (p = 0.025), water temperature (p = 0.000), house humidity (p = 0.000), container conditions (p = 0.000) in endemic areas and (p = 0.002) in nonendemic areas. Unrelated variables are knowledge (p = 0.141) in endemic areas and (p = 0.824) in nonendemic areas. The conclusion of this study is that there is a relationship between PSN action, water temperature, house humidity, and container conditions with the presence of larvae in endemic areas, but there is no relationship between respondents' knowledge in the two regions and the actions of PSN in nonendemis areas.

***Keywords:*** *Knowledge, action, humidity, temperature, container conditions*

## Introduction

Dengue hemorrhagic fever (DHF) or Dengue Hemorrhagic Fever (DHF) is no longer a foreign disease heard in the ears of the community, internationally, nationally or locally, which is still a public health problem. This disease is almost found in all parts of the world, especially in tropical and subtropical countries, both as an endemic and epidemic disease.[1] Currently, Indonesia ranks highest for dengue cases in the Asian Nations Association (ASEAN). In 2016 there were 204,171 DHF cases with a total of 1,598 deaths.[2] The number of DHF cases in 2016 increased compared to the number of cases in 2015 which was 129,650 cases. The number of deaths due to DHF in 2016 also increased from 2015 (1,071 deaths). Incidence Rate (IR) or the DBD morbidity rate in 2016 also increased from 2015, which was 50.75 to 78.85 per 100,000 population. However, CFR has decreased from 0.83% in 2015 to 0.78% in 2016.[3-5]

Health behavior also determines the level of success in carrying out an activity such as the implementation of prevention or eradication of a source of disease in order to reduce the occurrence of mosquito larvae density.[6] In the case of DHF, the proper method for preventing DHF is the Eradication of Mosquito Nest (PSN) through 3M Plus (Drain, Cover and Bury) plus larvaside sowing, spreading of fish in water reservoirs and other activities that can prevent or eradicate mosquitoes Aedes aegypti breed.[7]

In addition to the factor of clean living behavior, environmental factors are also very influential, especially the physical environment in this case is the temperature, humidity, and condition of the Water Reservoir (TPA). optimum 25-27 ° C, at temperatures below 10 ° C or above 40 ° C growth will stop.9 From this description, researchers intend to conduct research on factors related to the presence of Aedes aegypti larvae in this case are the characteristics of the physical environment (Temperature, humidity, and the condition of the landfill)

as well as community behavior towards PSN in endemic and nonendemic areas of Makassar City DBD.

## Materials and Method

This research is an observational analytic study with cross sectional study design. This research was conducted in Pai and Biringkanaya sub-districts with a sample of 100 houses in each kelurahan, because the study sample was taken using proportional simple random sampling technique. The data collection process was carried out using a questionnaire to measure the variables of PSN knowledge and actions, an observation sheet to measure air temperature, air humidity, and see the condition of the containers of each house. Data analysis used the Package for Social Science (SPSS) program with the chi-square test and presented in tabular and narrative form.

## Results

1. Relationship Between PSN Knowledge and Larvae

Table 1. Correlation of PSN knowledge with the presence of Aedes aegypti larvae in Endemic Region (Pai Village) and nonendemic area (Daya Village) Biringkanaya District Makassar City

**Table 1 shows that of the 100 respondents in endemic areas (Kelurahan Pai) dominated by respondents who had a lack of knowledge about PSN and there were larvae in their containers as many as 53.7% and respondents who had sufficient knowledge but there were larvae at 63% .**

| Subdistrict | Knowledge | Presence larvae | | | | Total | | p |
|---|---|---|---|---|---|---|---|---|
| | | Present | | Not Present | | | | |
| | | n | % | n | % | n | % | |
| Pai (Endemis) | Lack | 29 | 53,7 | 25 | 46,3 | 54 | 100 | 0,141 |
| | Enough | 17 | 37,0 | 29 | 63,0 | 46 | 100 | |
| Daya (Non Endemis) | Less | 7 | 33,3 | 14 | 66,7 | 21 | 100 | 0,824 |
| | Enough | 22 | 27,8 | 57 | 72,2 | 79 | 100 | |
| | Total | 75 | 37,5 | 125 | 62,5 | 200 | 100 | |

**2. Relationship Between PSN Actions and the Existence of Larvae**

**Table 2. Relationship between PSN actions with the presence of Aedes aegypti larvae in Endemic Areas (Kelurahan Pai) and nonendemic areas (Kelurahan Daya) Biringkanaya District, Makassar City**

| Subdistrict | Action | Presence larvae | | | | Total | | p |
|---|---|---|---|---|---|---|---|---|
| | | Present | | Present | | | | |
| | | n | % | n | % | n | % | |
| Pai (Endemis) | Negative | 34 | 55,7 | 27 | 44,3 | 61 | 100 | 0,025 |
| | Positive | 12 | 30,8 | 27 | 69,2 | 39 | 100 | |
| Daya (Non Endemis) | Negative | 13 | 29,5 | 31 | 70,5 | 44 | 100 | 1,000 |
| | Positive | 16 | 28,6 | 40 | 71,4 | 56 | 100 | |
| | Total | 75 | 36,5 | 125 | 63,5 | 200 | 100 | |

Table 2 shows that out of 100 respondents in endemic areas (Pai Village) were dominated by respondents who had bad actions and there were larvae in their containers at 55.7%. As for the nonendemic area (Kelurahan Daya) of 100 respondents in the area, it was dominated by respondents who had good actions and there were no larvae at 71.4%. Based on the results of the Chi square test found that the value of p = 0.025 for endemic areas and 1,000 for endemic areas.

**3. Relationship between Temperature and the Existence of Larvae**

The temperature measured in this study is the temperature of the water in each container using a mercury thermometer. Temperatures are classified into two categories: potential and non-potential. Potentially categorized if the average water temperature measured is between 23 ° C and 27 ° C and not potential if the average water temperature is <23 ° C or> 27 ° C

**Table 3. Relationship between Water Temperature and the presence of Aedes aegypti larvae in Endemic Region (Pai Village) and Nonendemic Area (Daya Village) Biringkanaya District Makassar City**

| Subdistrict | Category | Subdistrict | | | | Total | | p |
|---|---|---|---|---|---|---|---|---|
| | | Subdistrict | | Subdistrict | | | | |
| | | n | % | n | % | n | % | |
| Pai (Endemis) | Potencial | 39 | 81,3 | 9 | 18,8 | 48 | 100 | 0,000 |
| | Not Potencial | 7 | 13,5 | 45 | 86,5 | 52 | 100 | |
| Daya (Endemis) | Potencial | 23 | 51,1 | 22 | 48,9 | 45 | 100 | 0,000 |
| | Not Potencial | 6 | 10,9 | 49 | 89,1 | 55 | 100 | |
| | Total | 73 | 36,5 | 127 | 63,5 | 200 | 100 | |

Table 3 shows that out of 100 houses in endemic areas (Pai Village) is dominated by houses with no potential water temperature and no larvae in their containers, which is 86.5%. Whereas in nonendemic areas (Kelurahan Daya) out of 100 houses in the area, there are also houses that have no potential water temperature and no larvae, which is 89.1%. Based on the Chi square test results it was found that the value of p = 0,000 for both regions. This indicates that there is a relationship between water temperature and the presence of Aedes aegypti larvae in endemic and nonendemic areas of DHF.

**4. Relationship Between Moisture and the Existence of Larvae**

**Table 4. Relationship between House Humidity and the presence of Aedes aegypti larvae in Endemic Areas (Kelurahan Pai) and Nonendemic Areas (Kelurahan Daya) Biringkanaya District, Makassar City**

| Subdsitrict | Category | Presence larvae | | | | Total | | p |
|---|---|---|---|---|---|---|---|---|
| | | Present | | Present | | | | |
| | | n | % | n | % | n | % | |
| Pai (Endemis) | Potensial | 41 | 59,4 | 28 | 40,6 | 69 | 100 | 0,000 |
| | Not Potensial | 5 | 16,1 | 26 | 83,9 | 31 | 100 | |
| Daya (Non Endemis) | Potensial | 22 | 78,6 | 6 | 21,4 | 28 | 100 | 0,000 |
| | Not Potensial | 7 | 9,7 | 65 | 90,3 | 72 | 100 | |
| | Total | 75 | 36,5 | 125 | 63,5 | 200 | 100 | |

Table 4 shows that out of 100 houses in endemic areas (Pai Village) is dominated by houses that have potential moisture and there are Larvae in their containers, as many as 59.4%. As for nonendemic areas (Kelurahan Daya) out of 100 houses in the area, houses are dominated by potential humidity and no Larvae, which is 90.3%. Based on the results of the Chi square test it was found that the value of p = 0,000 for both regions.

**5. Relationship between Container Conditions and the Presence of Larvae**

**Table 5. Relationship between Container Conditions and the presence of Aedes aegypti larvae in Endemic Areas (Kelurahan Pai) and Nonendemic Areas (Kelurahan Daya) Biringkanaya District, Makassar City**

| Subdistrict | Category | Presence larvae | | | | Total | | p |
|---|---|---|---|---|---|---|---|---|
| | | Present | | Present | | | | |
| | | n | % | n | % | n | % | |
| Pai (Endemis) | Open | 44 | 63,8 | 25 | 36,2 | 69 | 100 | 0,000 |
| | Close | 2 | 6,5 | 29 | 93,5 | 31 | 100 | |
| Daya (Non Endemis) | Open | 25 | 41,0 | 36 | 59,0 | 61 | 100 | 0,002 |
| | Close | 4 | 10,3 | 35 | 89,7 | 39 | 100 | |
| | Total | 75 | 37,5 | 125 | 62,5 | 200 | 100 | |

Table 5 shows that out of 100 houses in endemic areas (Kelurahan Pai) is dominated by houses that have containers in open condition and there are larvae in their containers, which is 63.8%. Whereas in nonendemic areas (Kelurahan Daya) out of 100 houses in the area, dominated by houses that have containers in open condition and no larvae, which is as much as 59.0%.

## Discussion

The presence of Aedes aegypti larvae in an area is an indicator in efforts to control DHF. Monitoring the presence of Aedes aegypti larvae by implementing the Periodic larvae examination (PJB) is very important to assist in conducting an evaluation of threats in each city and so that actions to eradicate mosquitoes can be increased. Analysis of the presence of larvae is carried out by observation using a visual method, which is a survey conducted by seeing the presence or absence of larvae in each place of puddles (containers) without making larvae taking.[10]

For the Knowledge Variable, the results of the study found that of 54 respondents in endemic areas (Pai Village) who had a category of less knowledge about PSN as much as 53.7% in the container contained larvae and 46.3% which did not have larvae. Whereas for respondents who have sufficient knowledge category there are 46 respondents, of whom 37.0% have larvae and 63.0% of houses have no larvae. As for nonendemic areas (Kelurahan Daya) of the 21 respondents who lacked knowledge, 33.3% were positive for larvae and 66.7% for larvae were not found in their containers. Whereas for respondents who have sufficient knowledge category, namely 79 respondents, 27.8% of them have larvae and 72.2% have no larvae. This indicates that although the respondents who have a sufficiently large level of knowledge are 46 respondents (endemic areas) and 79 respondents (nonendemic areas),

there is no relationship between the level of knowledge and the presence of larvae due to the very few houses found by larvae, ie only 17 houses (37%) for endemic areas and 22 houses (27.8%) for nonendemic areas. This can be due to the inconsistency of the level of knowledge with actions which means that although the community does not know the source / place of mosquito breeding and how to eradicate it, 3M or PSN activities are unconsciously always carried out because it is a routine activity in maintaining house cleanliness.

In other words, there is no correlation between the level of knowledge and PSN actions. So, even though housewives have a good level of knowledge or not about the actions of DHF PSN, it is not yet guaranteed that these mothers practice DHF PSN well or vice versa. This is evidenced by the results of in-depth interviews with several respondents, especially those who work as housewives, when they saw the larvae at the water reservoir, they assumed that it was a caterpillar and they immediately cleaned it on the grounds that the water was dirty. But not on the basis of knowledge that the small animal is a larva that will eventually become a mosquito.

Good and Less Knowledge can be influenced by several factors such as information sources and educational factors as well as the environmental sector the more people get information both from the family environment, neighboring environment from health workers and print media will affect one's level of knowledge. Good knowledge is obtained from a good learning process. Thus the cause of the high number of respondents who have unfavorable numbers, one of which is the lack of information that can be received by respondents when getting education. So it can be concluded that respondents who lack knowledge can be improved to be even better, based on observations this could be due to lack community interest to watch, read and listen to matters relating to health services, especially regarding PSN or larva eradication. The results of this study are in line with research conducted by Rochmadina (2018) who also said that there is a relationship between temperature and the presence of Aedes aegypti larvae.[11]

The results of this study are in line with research conducted by Nani (2017) about the relationship of PSN behavior with the existence of Aedes aegypti larvae at Pulang Pisau Port with the results of statistical analysis conducted using Chi square obtained p = 0,000 ($p < \alpha$) meaning that there is a relationship between PSN actions in the presence of Aedes aegypti larva at the Pulang Pisau Port in 2016. These results indicate that endemic and non-endemic areas differ in terms of PSN actions.

In the previous discussion, community knowledge in nonendemic areas was very sufficient in relation to PSN, and that knowledge was actually realized in the form of actions. Community behavior has an influence on the environment because the environment is a land for the development of such behavior. routine and continuous it can prevent the development of Aedes aegypti mosquito larvae and prevent the occurrence of Dengue Hemorrhagic Fever. The temperature of the water in the container is measured using a mercury thermometer. The water temperature measured in each container is then averaged according to the number of containers found in each house and this is classified into two categories: potential and non-potential. Potential categorized if the temperature the average water measured is between 23 ° C to 27 ° C and has no potential if the average water temperature <23 ° C or> 27 ° C. According to the existing theory that, water temperature is one of the factors that can affect the development and survival of Aedes aegypti larvae, the water temperature suitable for the development of Aedes aegypti larvae. One of the environmental parameters that is significantly related to the population density of Aedes aegypti larvae is the water temperature. Water temperature acts as a determinant for larval growth. It was also stated that the growth of mosquitoes would be completely stopped if the temperature is less than 10 ° C or more than 40 ° C. The cause of uniformity in the temperature of water in containers is due to the relatively high ambient temperature at the time of the study because the weather was always hot. The results of this study are in line with research conducted by Asrianti Arifin which also says that there is a relationship between temperature and the presence of Aedes aegypti larvae[10].

The survival of Aedes aegypti the low is more caused by a slow metabolic process due to low temperature and humidity that can result in larval death. Based on this we know that moisture that does not meet the requirements will result in death of larvae, thereby reducing the likelihood of larvae being found. The results of this study

in line with research conducted by Herdianti which also says that there is a relationship between temperature and the presence of Aedes aegypti larvae.[11-12]

## Conclusions

The conclusion of this study is that there is a relationship between PSN actions, water temperature, house humidity, and container conditions with the presence of larvae in endemic areas and yet there is no relationship with respondents' knowledge in the two regions and PSN actions in nonendemic areas.

# Analysis of Cost Sharing on the Satisfaction of NHI Patients Not Contribution Beneficiaries
## (Case Study of Passo Hative Hospital in Ambon City)

**Yoki Stefanus[1], Darmawansyah[2], Muhammad Alwy Arifin [2], Indar[2], Syamsuar Manyullei[3], Ansariadi[4], Dian Saputra Marzuki[2]**

*[1]Magister Program Departement of Health Administration and Policy, Public Health Hasanuddin University, [2] Departement of Health Administration and Policy, Public Health Hasanuddin University, [3]Departement of Environmental Health, Public Health Hasanuddin University, [4]Departement Epidemiology, Public Health Hasanuddin University*

### Abstract

Cost Sharing is a fee payable by the patient participant of the social insurance administration Organization because it gets health services in the hospital which is derived from the reduction in tariffs with the amount of costs incurred by the social insurance administration Organization. Analyse the additional costs that the Passo Hative Hospital has done to patient satisfaction. This type of research is quantitative research by using a cross-sectional design approach. The population in this study is all the patients of the national health care insurance not the recipient of dues \who are being treated at hospitalisation in the Passo Hative Hospital in Ambon City with the last one month visit was 150 patients. The sampling techniques in this study are accidental sampling. The results showed there was an additional cost relationship moving the treatment class to patient satisfaction (P = 0.001). There is a relationship of medical services additional costs to patient satisfaction (P = 0,016) and there is a connection to the additional cost of medication to patient satisfaction (P = 0,000) of the hospital as a service provider of the social insurance administration Organization in order to be more observant to see the cause of the users of the social insurance administration Organization to change the treatment class of the care and fulfill and complement medical services and medicines that are the right of the patient according to the social insurance administration Organization.

***Keywords**: Cost Sharing, Moving classes, medical services, medication, hospital*

### Introduction

Universal health protection or globally known as the term Universal Health Coverage (UHC) aims to provide health care insurance for all residents (health for all). It is necessary to obtain sufficient attention for all stakeholders to ensure better quality of health services and can be achieved in 2030 as a deal for all UN Member States[1].

Strategic purchasing is an activity that includes the provider's relationship to information, such as provider performance or population health needs, aligning funding and revenue to achieve increased efficiency, accountability, service delivery, and equity[2]. The additional cost is the cost of medicines that do not go into the list of the price of the drug, medical services and occupy a treatment class that does not comply with its goals[3].

Outline, the additional costs paid by the participant of the social insurance administration Organization in hospital may be grouped in two, which is Cost Sharing allowed and Cost Sharing not allowed. Cost Sharing are allowed, consisting of a fee due to the grade-up of the care class that is the right (according to presidential decree No. 12/2013 on National Health Insurance Article 24 and PERMENKES RI number 71/2013 on health

**Correspondence Author:**
**Yoki Stefanus**
E-mail: devenstefanus@gmail.com

services on National health insurance) and costs due including health services that are not guaranteed. While the Cost Sharing not allowed, that is all that includes the guaranteed health service[4].

Data social insurance administration Organization in Ambon Branch said from 215 complaints against advanced health facilities received in 2018, 69 cases (32%) cost sharing by the advanced healthcare facilities. While the data of the Case-Mix team of the Passo Hative Hospital, in 2018 there are 12 reports of patient complaints regarding the burden of additional charges. To support the fact above, in research that has been conducted, there were 37 of 200 respondents of NHI patients experiencing cost sharing from healthcare providers.

Although the cost sharing may not be made, this issue persists. This can be due to many factors that are quite complex and intertwined. However, there are cost sharing for the participants of the social insurance administration Organization, especially the additional costs that are not allowed, can be due to three aspects of the cause, namely the participant aspect, the hospital aspect and INA Cbg'S aspect itself[4]. The research aims to analyse the additional costs that the Passo Hative hospital has made against patient satisfaction .

## Materials and Methods

The type of research used is quantitative research with the design of Cross-Sectional studies. The population in this study is all the patients of the national health care insurance not the recipient of dues who are being treated at hospitalisation in the Passo Hative Hospital in Ambon City with the last one month visit was 150 patients. The sampling techniques in this study are accidental sampling. Data collection is obtained through a live interview using a questionnaire.

## Result

According to table 1, it is known that the number of respondents who are more than 30-60 years of age is 51 people (46.8%), while the least respondents are in the category age of > 60 Year 8 people (7.3%). According to gender, the number of male respondents was more than 56 people (51.4%), while female respondents were 53 people (48.6%). Based on NHI class the number of respondents who have the right grade II class is more than 46 people (42.2%), while the right grade NHI respondents are the fewest class I is 24 people (22.0%).

According to table 2, shows that respondents did not charge an cost sharing when moving treatment classes by 87 people (79.8%), while respondents who issued 22 people (20.2%). Based on the cost sharing of medical services showed that respondents did not spend an cost sharing for medical services as much as 99 people (90.8%), while respondents who spent 10 cost sharing (9.2%). Based on the cost sharing of the drug service showed that respondents who did not spend additional costs for the drug service as much as 36 people (33%), while respondents who issued an cost sharing of 73 people (67%). Based on the satisfaction of the patient showed that the respondents were satisfied with the

| There is no | 28 | 25.7 | 8 | 7.3 | 36 | 100 | 0,000 |
| There is | 26 | 239 | 47 | 43.1 | 73 | 100 | |
| Total | 54 | 49.6 | 55 | 40.4 | 109 | 100 | |

Table 3 above can be noted that the number of respondents who do not spend cost sharing when moving treatment room classes or not moving classes of care and feel quite satisfied as much as 50 people (45.9%) And respondents who felt dissatisfied as much as 37 people (33.9%). While respondents who spend cost sharing when moving treatment room classes but still feel satisfied as much as 4 people (3.7%) And respondents who were dissatisfied as much as 18 people (16.5%). Chi Square Statistical test results obtained a value of P = 0.001 or a value of P < 0.05. Thus Ho was rejected and Ha was accepted. This indicates that there is an additional cost incurred by the patient when moving the class of treatment room enough to affect patient satisfaction in the Passo Hative Hospital of Ambon City.

Based on the cost sharing of medical services shows that the number of respondents who did not spend an cost sharing for medical treatment or service and felt quite satisfied as much as 53 people (48.6%) And respondents who felt dissatisfied as much as 46 people (42.2%). While the respondent who issued an cost sharing for medical treatment or service but still satisfied as much as 1 person (0.9%) And respondents who felt less than 9 people (8.3%). Test result Statistics Fisher's Exact Test obtained the value P = 0,016 or the value p < 0.05. Thus Ho was rejected and Ha was accepted. This indicates that there is an cost sharing incurred by the patient when obtaining treatment or other medical services to adequately affect patient satisfaction in the Passo Hative Hospital in Ambon.

Based on the cost sharing of the drug indicates that the number of respondents who did not spend cost sharing for the service or the purchase of the drug and felt enough satisfied as much as 28 people (25.7%) And respondents who felt less than 8 people (7.3%). While respondents who issued cost sharing for the service or the purchase of the drug but remained satisfied as much as 26 people (23.9%) And respondents who felt dissatisfied as much as 47 people (43.1%). Chi Square Statistical test results obtained the value P = 0,000 or the value $p < 0.05$. Thus Ho was rejected and Ha was accepted. This indicates that the presence of cost sharing incurred by the patient for the ministry or purchase of the drug adequately affects patient satisfaction in the Passo Hative Hospital in Ambon City.

## Discussion

**Cost sharing of moving treatment classes to patient satisfaction**

Patients who are up in the treatment class then the cost of a fee is the difference between the requested class fee minus the class fee on his right. Participants may also decide to board the treatment class as a result of a room with full-care class privileges. This could happen when the bed capacity and the need for the existing class are not balanced in a hospital. The number of requests is not always balanced by the availability of appropriate inpatient classrooms.

Customer satisfaction is the level of a person's feelings after comparing the perceived performance (result) compared to his expectations. The measurement of patient satisfaction is much done but difficult to do because of its subjective nature. When the patient decides to board the class, the patient has an expectation of the service and the amount of fees to be paid. When expected expectations do not match the reality, there is dissatisfaction

In the era of national health insurance, the participants can be able to improve the treatment class when hospitalized. Before deciding on choices such as boarding classes, participants also thought about other possibilities such as costly fees, healthcare services and the economic opportunities gained from their choice. The option to move the class can be seen on the number of respondents who moved to the class of 22 people (20.2%). This is relevant to the compulsion of paying. This condition occurs in the state of the inpatient class with full rights. If the treatment class does not meet the expectation and ability of the patient, but the need for health status requires the patient to choose and pay the service[5]. When the patient and his family choose an inpatient class, of course there are various factors that are considered as basic considering benefit and cost. It is in accordance with the theory of rational choice.

**Cost sharing of Medical services to patient satisfaction**

Health care is any effort that is held alone or jointly in an organization to maintain and improve health, prevent and cure diseases and restore the health of individuals, families, groups and communities. The weight or light of hospitalized patients is difficult to predict, so the hospital cannot have patients treated with certain reasons [3]. Due to the heavy weight of disease hospitalized, the heavier the disease suffered by one, the more complex the medical examinations/actions will be performed. This situation poses another consequence of higher cost expenditure. In addition, the light weight of the disease condition provides a different contribution to the amount of unit cost to be spent per day

The results of the study Dassi & Hardi (2019) showed that the participants of social insurance administration Organization so far have more financing assistance in terms of inpatient rates, while drugs and medical actions are still not adequate., because for certain medical action the amount (RP) to be paid by the patient is much greater than that borne by PT. social insurance administration Organization. Cost Sharing costs incurred by the patient in terms of the type of action of RS health officers as much as Rp. 422,000[3]

**Cost sharing of drug services to patient satisfaction**

Drug service is the provision of medicines outside the standard medicine included in the hospital package, which is required for health care in accordance with medical indications and with a ceiling list of drug prices used for participants and their families by the social insurance administration Organization according to the decree of the Minister of Health. As for the medicines included in the ceiling list of drug prices is not a generic

drug, but the medication needed can be administered at a price that meets a specific ceiling list. The selection of drugs conducted by pharmacology and clinical experts, and also conducted analysis of the price aspects of making ceiling list of drug prices which refers to the list of national Essential medicines that have been compiled by the government. This is because the medicines in the list of national Essential medicines are the most needed and absolutely necessary medicines to be held. Some types of drugs that enter the list of national Essential medicines ranging from antibiotics, anti-inflimasi, anti-depressants, antihypertensive, anti-fungal, asthma medication, stomach ulcers to skin medications. The research conducted by Nita et al, 2020 shows the patient satisfaction of the pharmacy ministry in the hospital by 90.9% lower than the pharmacy ministry in the Public health center by 96.6% [6].

Meanwhile, in research conducted by Prastina Prayogi (2018) on the policy study of National Health Insurance Program in Sidoarjo District, stating that with the process that occurred in the implementation of the implementation to several hospitals or health facilities, still shows the service provided has not been fulfilled. There are patients who are denied medication, and there are also additional costs for the drug. It concluded that the lack of response responses between officers on patients, lack of socialization provided by policy organizers and policy executor in terms of information, inspection services and the placement of additional costs to be paid alone[7-12]

## Conclusion

The study concluded that there was an relationship cost sharing moving treatment classes to patient satisfaction (P = 0.001). There is a relationship cost sharing of medical services to patient satisfaction (P = 0,016) and there is a relationship cost sharing of drug service to patient satisfaction (P = 0,000) of Passo Hative hospital as social insurance administration Organization service provider to be more observant to see the cause of social insurance administration Organization users to change treatment class from care class that should be the right, and fulfill and complement medical services and medicines that.

# Estimation of Some Immunological and Biochemical in the Patients with Systemic Lupus Erythematosus in Males and Females in Baghdad

**Dua'a Akram AL-Atabi[1], Bushra F. Hasan[2], Ali H. AL-Hafidh[3]**

*[1]Post graduate/ MSc, [2]Professor, Department of Chemistry, College of Science for Women, University of Baghdad, Iraq, 3 Lecturer/PhD in College of Health And Medical Technology /Baghdad/Iraq*

## Abstract

**Background:** Systemic lupus erythematosus (SLE) is the prototypic multisystem autoimmune disease caused by the mistakenly in the body immune system that attacks healthy tissue in many parts of the body. Autoimmune thyroiditis (AT) is an organic-specific disease associated with production of a variety of antibodies such as antinuclear antibodies, anti-double stranded DNA, anti-Ro antibodies and anti-cardiolipin antibodies.

**Methods:** the study consist of 90 subjects from the both sexes were registered in this study.. The subjects have been divided in to three groups, group one and group two represent the patient groups that include, (30 SLE patients without taking steroid drugs group one (3male-27female) and 30 SLE patients with taking steroid drugs group two (2male-28female) with age range (16-57)years and thirty healthy subjects regards as a control (5male-25female)). Various clinical and laboratory parameters of SLE were measured for each groups. Also thyroid function tests were measured, which included free T3, free T4 and TSH. Antimicrosomal was measured for all groups were estimated by VIDAS method.

**Results:** the results showed thyroid disorders were common (23.33%%) in lupus patients. Hypothyroidism was the commonest (13.33%) abnormality in SLE patients then hyperthyroidism (1.66%). At the same time, the results showed significance decreasing ($p<0.01$) in level of FT3 in (G1 and G2) when compared with the control group. Also, the results showed high significant decrease ($p<0.01$) in level of FT4 in (G2) comparison with both groups (G1) and control group. But, The results showed no significant differences ($P<0.01$) in level of TSH comparison with other studies groups included in the study. Further antiTPO a significant increasing ($p<0.01$) in (G1) comparison with both groups (G2) and control group. Then this study revealed a significance increasing of ESR, hsCRP, anti dsDNA, and ANA in both patients groups rather than control group.

***Keywords:*** *SLE, ESR, hsCRP, ANA, anti dsDNA, FT3, FT4, TSH, antiTPO, VIDAS.*

## Introduction

Autoimmune disorders can be broken down into organ-specific and systemic diseases[(1)]. Autoimmune thyroid disease (AITD) is a well-known, organ-specific autoimmune disorder that is associated with many non-specific autoimmune diseases such as rheumatoid arthritis, Sjögren's syndrome, and SLE[(2)]. AITD represents a group of pathologies characterized by thyroid gland dysfunction due to a loss of immunological tolerance with the presence of cellular and humoral immune response, infiltration of auto-reactive T cells and B cells, production of autoantibodies directed against antigens from the gland and, subsequently, the development of clinical manifestations[(3,4)]. Because it is a group of autoimmune diseases (AD) clustered together,

**Corresponding author:**
**Dua'a Akram AL-Atabi**
duaaakram382@gmail.com

the clinical heterogeneity is diverse and varies among these diseases, it can be classified according to whether a state of hypothyroidism (i.e., Hashimoto's thyroiditis) or hyperthyroidism [i.e., Graves' disease (GD)][5]. These disorders derive from the diverse relationships between environmental and genetic factors[6] and are distinguished by reactivity to auto-thyroid antigens expressed as distinctive autoimmune inflammatory or antireceptor diseases[7,8].

Systemic Lupus Erythematosus (SLE) is characterized by disturbances in the immune response and autoantibody production that lead to the multi-system organ damage and dysfunction [9]. The disease is nine times more often observed in women than in men, especially in women at child-bearing years (15 – 35 years), and is also more common in those of non-European descent[10]. Candidate environmental risk factors include UV light exposure, Epstein–Barr virus (EBV) infection, endogenous retroviral sequences and multiple drugs.

The association of thyroid disorders with systemic lupus erythematosus (SLE) has been confirmed[11]. Disease activity indexes of SLE disease activity have been described by: SLEDAI. The SLEDAI is a global index that was developed in Toronto in 1986 and described in detail by Bombardier and collaborators in 1992 [12]. The SLEDAI appears sensitive to

change in disease activity over time [13]

## Subjects and Methods

The study consisted of 60 patients (30 patients of SLE without taking steroid drugs and 30 patients of SLE with taking steroid drugs) and 30 healthy controls. Their age range was (16-57)years; the sample collected from the Baghdad teaching Hospital/ Medical city Iraq. Blood samples were collected at (8:30am), by taking 5ml of venous blood from each patients and healthy human. Five ml of blood was taken by using (5ml) disposable syringe. Two ml of blood transferred to sodium citrate tubes to measured Erythrocyte Sedimentation Rate (ESR), three ml transferred into gel Tubes allowed to clot at room temperature for 30 minutes, the sample was centrifuged at 2500rpm (rotation per minute) for 5 minutes and the serum removed and deposited at (-20°C) immediately before analyzed the biochemical markers and immunological (FT3, FT4, TSH, anti TPO, and hsCRP) measured by vitek immunodiagnostic assay system (VIDAS). ANA and anti dsDNA measured by enzyme-linked immune sorbent assay (ELISA) based on biotin double antibody sandwich technology.

Exclusion criteria: The patients who are under Chemotherapy, The patients who already has thyrotoxic, and patients with vasculitis disease were excluded from the current study.

## Statistical Analysis

The program Statistical Analysis System- SAS (2012) was used to detect the effect of difference factors in the parameters of the study. The least significant difference – LSD test (Variation Analysis-ANOVA) has been used to make significant comparisons between means. The chi-square method was used to greatly equate the proportion (probability 0.05 and 0.01). Estimation of coefficient of association between parameters of variance in this analysis.

## Results

The mean age of patients in G1 was (31.06 ± 8.92) years while a slightly decrease with the G2 patients (30.23 ± 10.25) years, and the mean age of control group was (30.69 ± 9.54) years with P-Value equal to 0.944.The difference was not significant ($p>0.05$) when compared among the groups as shown in table (1). In the same table, according to the gender distribution of patients, there was a higher incidence in female (90, 93.33 %) than male (10, 6.66%) in G1 and G2 respectively.

**Table (1): The demographic data of patients with systemic lupus erythematosus SLE.**

| **Variables** | **Control N=30** | **SLE without taking steroid drugs G1 N=30** | **SLE with taking steroid drugs G2 N=30** | **P-value** |
|---|---|---|---|---|
| Age (year) (mean± SD) | 30.69 ± 9.54 | 31.06 ± 8.92 | 30.23 ± 10.25 | 0.944NS |
| Gender | | | | |
| Male | 5(16.66%) | 3(10%) | 2(6.66%) | |
| Female | 25(83.33%) | 27(90%) | 28(93.33%) | |

Table (2) shown FT3 values, Mean ± SD of patients groups, G1, G2, and control group were [(4.33 ± 1.19),( 2.90 ± 1.06 ), and (4.97 ± 0.57)] pmol/l with P-Value equal to 0.0001.The difference was high significant decrease ($p<0.01$) in level of FT3 comparison with other studies groups. FT4 [(15.33 ± 3.76),( 11.22 ± 2.55), and (15.29 ± 2.51)] pmol/l with P-Value equal to 0.0001. The results showed a high significant decrease ($p<0.01$) in level of FT4 in G2 compared with both groups G1 and control group. TSH [(3.01 ± 1.77),( 2.38 ± 1.82), and (2.11 ± 1.08)] IU/ml. The results showed no significant differences ($P<0.01$) in level of TSH comparison with other studies groups, and antiTPO [(3.97 ± 2.23),( 2.33 ± 1.96), and (1.44 ± 1.32)]IU/ml. The results showed a significant increased ($p<0.01$) in level of anti-TPO in G1comparison with both groups G2 and control group, respectively.

**Table (2): Thyroid function test values and antiTPO in patients with Systemic lupus erythematosus (SLE).**

| **Laboratory variables** | **(mean ± SD)** | | | |
|---|---|---|---|---|
| | **Control group N= 30** | **SLE without taking steroid drugs G1 (N=30)** | **SLE with taking steroid drugs G2 (N=30)** | **P-value** |
| T3 ( pmol/l ) | 4.97 ± 0.57a | 4.33 ± 1.19b | 2.90±1.06c | 0.0001** |
| T4 ( pmol/l ) | 15.29±2.51a | 15.33 ± 3.76a | 11.22±2.55b | 0.0001** |
| TSH ( IU/ml ) | 2.11 ± 1.08a | 3.01 ± 1.77a | 2.38 ± 1.82a | 0.0919NS |
| Anti-TPO ( IU/ml ) | 1.44 ± 1.32b | 3.97 ± 2.23a | 2.33 ± 1.96b | 0.0001** |
| ** (P<0.01), NS: Non-Significant. | | | | |

The results are shown in the table (3) the distribution of the patients with SLE according to results of the thyroid function test. These subgroups are; hypothyroidism group, 8(13.33%) patients. Hyperthyroidism group, 1(1.66%). Hashimoto's disease (HD) group, 3(5%). Subclinical hypothyroidism group, 2(3.33%).

**Table (3): Results Thyroid function test in subgroups of patients with SLE.**

| Thyroid function subgroups | SLE (N=60) | |
|---|---|---|
| | No. | % |
| Hypothyroidism | 8 | 13.33 |
| Hyperthyroidism | 1 | 1.66 |
| Hashimoto's disease (HD) | 3 | 5 |
| Subclinical hypothyroidism | 2 | 3.33 |

Table (4) shows the results of screening and Inflammation markers in both (G1 and G2 and control) groups. The results showed a high significant increase ($p<0.01$) in level of ESR, hsCRP, ANA, and dsDNA compared with other studies groups.

**Table (4): Comparison between difference groups in screening and Inflammation markers**

| Laboratory variables (mean ± SD) | Control group N=30 | SLE without taking steroid drugs G1 (N=30) | SLE with taking steroid drugs G2 (N=30) | P-value |
|---|---|---|---|---|
| ESR (mm/h) | 8.88 ±0.33b | 32.27±25.53a | 23.80±15.26a | 0.0001** |
| hsCRP (mg/L) | 0.564±0.25c | 3.51 ± 3.50a | 2.17 ± 1.25b | 0.0001** |

## Discussion

The present work was conducted to study the thyroid dysfunction in SLE patients. sixty patients from Iraqi individuals who attended to Baghdad teaching Hospital/ Medical city Iraq known to have SLE were included in the study, their ages ranged between 16 and 57 years and the mean age were (31.06 ± 8.92, and 30.23±10.25)year in G1 and G2 respectively.

Most (91.67%) of the patients are females. As regard sex, SLE is an autoimmune disease affecting primarily women[14]. Our finding is consistent with Franco et al.[15]; they noticed that women were 91.8% and men8.2%. Also, Khanfir et al.[16] showed that women were 90.3% and men were 9.7%, with an average age at SLE onset of approximately 30.66 years. Further, Ong et al.[17] found that females were 94.2% among SLE patients' diagnosed with in age between 15to 74year.

In the current study, we illustrated that the mean values of acute phase reactants were high; ESR at 1st hour and CRP. ESR and CRP become high leveler in the autoimmune disease than malignancy or infection and rheumatoid arthritis SLE patients revealed high ESR and CRP, but ESR increase in infection and lupus, therefore it a non-specific marker for differentiating between the diseases.[18].

The results in this study show SLE patients that taking steroid drugs have more thyroid diseases when compared with the SLE patients without taking steroid drugs due to the effect taking steroid drugs, the glucocorticoid inhibits the enzyme T4 5'-deiodinas, which regulates the extra thyroidal production of T3 from T4[19].

In this study, we reported distribution of the patients with SLE according to their thyroid dysfunction and thyroid function test results, 23.33% of SLE patients had abnormal thyroid function. Our result regarding thyroid dysfunction is agree with Zakeri and Sandooghi[20]; they showed that24.1% prevalence of thyroid disorders. Our result was lower than El-Aziz1 et al[21] they showed that 33.3% prevalence of thyroid disorders.

Our patients in the thyroid dysfunction group were hypothyroidism group, 8(13.33%) patients. Hyperthyroidism group, 1(1.66%). Hashimoto's disease (HD) group, 3(5%). Subclinical hypothyroidism group, 2(3.33%). The occurrence of hypothyroidism is common in SLE, a large body of data has support this[1]. Our results were comparable to El-Aziz1 et al[21]. they observed that in their SLE group; were 10.0% subclincal hypo-thyroidisim, 6.6% biochemical hypothyroidisim, 10.0% euthyroid sick syndrome, 3.3% subclincal hyperthyroidisim, and 3.3% biochemical hyperthyroidisim. Also, Chan et al.[22] noticed that 4.3% of their SLE patients had clinical hypothyroidism. Mader et al.[23] as well, cleared that 11.6% of their SLE patients had clinical hypothyroid compared to 1.9% in the control group. Variable results were reported in many studies; Hypothyroidism and hyperthyroidism prevalence ranged from 3.9% to 39% and 0.0% to 10.9%, respectively. [24,25,26,27].

## Conclusion and Recommendation

Thyroid disorders are common in patients suffering from SLE. The most common form is hypothyrodism. Patients with SLE should be assessed for thyroid disorder by testing for early detection of thyroid abnormalities FT3, FT4, TSH and anti TPO Ab. For supporting and clarifying the association between SLE and thyroid disorders in Iraqi, further studies on a large number of patients are required.

**Acknowledgment** I would like to express my special thanks and also the authors are grateful to to the staff of Baghdad teaching Hospital/ Medical city Iraq especially Dr. Ali Hussein Al-Hafidh for their kindness, generosity help in providing samples.

**Ethical Clearance**: The Research Ethical Committee at scientific research by ethical approval of both MOH and MOHSER in Iraq

**Conflict of Interest**: Non

**Funding**: Self-funding

# Impact of Food Simulants Material on Orthodontic Bond Strength after Application of Caries Infiltrant Resin (In Vitro Study)

**Ahmed Muhsin Yousif AL-Mayali [1], Mohammed Nahidh[2], Hayder A. Kadhim[3], Ali Hadi Fahad[4]**

*[1]Lecturer, Pediatric Dentistry, Orthodontics & Prevention dentistry department, Dentistry College, Kufa University /Iraq, [2]Assist. Prof., Orthodontic department, Dentistry College, University of Baghdad/Iraq, [3]Lecturer, Pediatric dentistry, Orthodontics & Prevention dentistry department, Dentistry College, Kufa University /Iraq, [4]Assist. Prof., Pediatric dentistry, Orthodontics & Prevention dentistry department, Dentistry College, Kufa University /Iraq*

## Abstract

**Objective:** To investigate the effect of using different food simulant materials on the shear bond strength (SBS) of orthodontic bracket after Icon application. **DESIGHN:** Laboratory study. **SETTING:** Pediatric dentistry, Orthodontics & Prevention dentistry department, Dentistry College, Kufa University & department of materials, Technology university.

**Methods:** Metal brackets were bonded to 48 extracted premolars and were randomly arrange for three categories with 16 teeth for each, revealing the storage solutions, which were distilled water, 50% aqueous ethanol (alcoholic food), and corn oil (fatty food). Then each category was split for two subgroups, with 8 teeth describing Icon application, all specimens are immersed in their corresponding food simulants for 30 days. After the completed proposed time, the specimens were debonded by using an Instron apparatus to test the SBS**. Results:** Results showed significantly diminished the bond strength of orthodontic adhesive after holding the specimens for 30 days in the food simulants specially ethanol (highest for 50% ethanol, less for corn oil & least for D.W). Icon categories showed higher SBS rather than non-Icon categories. **Conclusion:** Application of Icon on enamel will increase the bond strength & the food simulating agents especially food and rinses containing ethanol could influence the orthodontic bond strength which causes bond failure so that the clinicians should inform their patients concerning their possible adverse effects and complications.

***Key Words:*** *Orthodontics, Food simulants, bonding strength, Resin Infiltration; Icon, caries infiltrant resin, White spot lesion.*

## Introduction

Orthodontic treatment is mostly accomplishing with fixed orthodontic appliances & establish significantly higher WSL than normal persons, because oral hygiene is more ambitious in patients with numerous-bracket orthodontics than in patient without fixed appliance [(1)]. Pervasiveness of WSLs is relatively huge, affecting more than 25 % of the patients earning orthodontic treatment, capturing at least one new lesion over the treatment [(2)]. Demineralization may occur rapidly, as fast as in period 4 weeks after the placement of brackets [(3)].

More recently, a minimum invasive treatment pathway was introduced, in which the WSL is infiltrated adopting a low-viscosity resin. When tooth surface been carried out by the infiltration resin with demand for an adhesive method like: using orthodontic brackets & when the used infiltration material that not be detached, the question: Is there bonding force between the treated exterior of the tooth and the unity of this material to the used bonding scheme? [(4)]. The aim of this study was to study the effect of using different food simulant materials

on the SBS of orthodontic bracket after utilization of Icon.

## Marerial & Methods

In this our study, we used seventy extracted intact upper first premolars [5]. Forty-eight teeth were elected after being inspected by magnifying lens [6]. The elected teeth must be:

1-Caries free.

2-Free of enamel cracks or restorations.

3-Without developmental anomalies.

Standard edgewise S.S. orthodontic bracket (Ortho Technology, USA) and a light cure composite adhesive (3M, USA) were used in this study.

The food simulants were those approved by the Food and Drug Administration in U.S.A. [7]:

1. Beverages including alcoholic drinks simulated by 50% aqueous ethanol solutions.

2. Fatty food including butter, fatty meats and vegetable oils simulated by corn oil.

3. Water established using distilled water.

The possessed teeth were split into three categories, containing sixteen teeth each, according to the type of storage solution, which are distilled water, 50% aqueous ethanol (alcoholic food), and corn oil (fatty food). Then each category was split for two subgroups with eight teeth for each, according to Icon application.

A two metal plates with L-shape specially made for this purpose, were painted with a thin layer of separating medium (Vaseline) and placed opposite to each other forming a box around the vertically positioned teeth. Then the acrylic (Vertex, Netherlands) was poured till reach the cemento-enamel junction of the teeth [8]. After mounting, the buccal exterior was scrub by a rubber cup & pumice which is free from fluoride for 10 s [9]. The teeth were flush by water for 10 s. and then dry with air. This strategy was set to mimic the 'real life' of clinical condition [10]. Etching by using Phosphoric acid (37%) on the exterior of the crown as long as 30 s. after that rinsed with water, then dried with air till the exterior crown marked as chalky [11].

**BONDING PRECEDURE WITHOUT ICON APPLICATION:**

The 7th generation bond (3M company, USA) was used then orthodontic adhesive was administered to the S.S. brackets [12]. Which was then fixed in the midst third of the buccal exterior, the extra composite was removed by using dental probe [13]. The adhesive composite was curing up to 40 s [14] utilizing LED curing device with a range 450-550 nm.

**BONDING PRECEDURE WITH ICON APPLICATION:**

This done by using (Icon-Dry, DMG, Hamburg, Germany). Apply Etch for 2 min. next washed by water, after that dry with air, Handle Icon-dry 30 sec. and check it by visual inspection, then dry air. Handle Icon-Infiltrant, to 3 min. give away by air then curing for 40 sec. Infiltrant was applied for 1 min. clear away extra infiltrant then curing for 40 sec. The 7th generation bond (3M, USA) was used then orthodontic adhesive (3M, USA) was applied.

Then, all tested categories were sinking in distilled water or to the food simulant according to their category, and preserve it in the incubator at 37ºC for 30 days [15].

After 30 days, they ready for the SBS that was done by an Instron universal machine (Laryee, 50 KN, China), a defined speed was 0.5 mm/min. [16]. The loading fail (Newton) / paltry of bracket (10.90 $mm^2$) to obtain the SBS in MPa. Statistical analysis was implement with applying SPSS software Version 21.

## Results

The SBS (MPa) descriptive statistics and the effectiveness of food simulants material & Icon usage on the SBS were calculated (Table 1).

Anova test was performed to examine the difference between each three types of storage medium; SBS reduction was high (highly significant) for corn oil group & highest (highly significant) for 50% ethanol alcohol group and was the least reduction for D.W. group (Table 2).

Comparison of SBS of adhesive & Descriptive statistics according to the Icon application was calculated. Mean rate of SBS were highest (highly significant) in

Icon category in comparison with the other category without Icon application as displayed in (Table 3).

## Discussion

This study was performed to investigate the response to aqueous foods, alcoholic foods, and fatty foods as represented by dietary simulating liquids (D.W, corn oil & 50% aqueous ethanol) and their effect upon the SBS of orthodontic adhesive bonding material with the presence of caries infiltrant resin (Icon).

The treatment of WSL by using infiltrating instead of or postponing conventional restorative treatment may have a positive impact on good oral health as it helps to increase in life cycle of a tooth [17].

Orthodontic treatment based on a sufficient bond strength of brackets to enamel. To withstand normal orthodontic force, the minimal bonding strength should be between 6 and 8 MPa [18].

This is in vitro methods that simulating oral condition have been designed to mimic the clinical performance. Because the difficulty in vivo of oral environments can be partially be simulated in vitro, so there is no in vitro test can be to mimic the complex processes found in vivo [19]. in vivo evaluation, it is very complicated, time consuming, expensive & the most important issue is the ethical reasons. Thus, Continuous exposure of solution was preferred to hasten the resistant effect of the evaluated material [20]. This may prompt solution to be invasive more into the specimens. Intermittent exposure to a resistant agent will causes low invasion rate because simulant desorption while disclosure. The material may not fully desorb due to the force established by the invasion gradient to continue invasion into the specimens [21]. in clinical conditions the agent may either be absorbed by the adherent detritus at the interfacial margins or generated by decomposition [22]. The distilled water group show the high SBS because it is not very susceptible by chemical breakdown. Lee et al show that when exposure to artificial saliva (90-95% water) for 30 days of engagement will not effect on bond strength [23].

A high significant result in SBS of the specimens immersed in food simulants with 50% aqueous ethanol showed the less in bond strength. This is in agreement with several previous studies [15].

The ethanol has solvent properties as cross linked dimethacrylate resins are virtually insoluble, in spite of that its capable of swelling in good solvents [24]. The ethanol which dispersed into the composite may result in micro-crack in architecture that causes bonding weakness. Ethanol has dissolving feature similar to Bis-GMA and this may farther improve its seepage into the composite leading to farther destruction [25]. The diffusion properties of the ethanol solution in dental composite specimens is much more than that of water [26].

Clinically, intra-oral exposure to ethanol either from alcoholic mouth washes or from drink. Usually, orthodontists prescribe mouth washes for their patients for the whole treatment time to keep high oral hygiene [27].

Apply of peppermint oil to assist in orthodontic bond and resin elimination [28]. The significant maceration of resin can occur after continuous exposure to the oil [29]. The time duration being clinically offensive. The 1-hour liability to the oil may cause decrease in bond strength, However, the oil remarkably loud up of ARI scores, display fewer resin on the enamel exterior, which could helpful in 'clean up' next to bond elimination [15].

According to our result the Icon group show high SBS (high significant). By using infiltration to help for protection against demineralization, the using of resin infiltration with multi adhesive systems used in bonding seems to be feasible, this let us go ahead with fixed orthodontic treatment after using infiltration. moreover, there were seems to be strengthen performance of adhesives bond [30,31].

The Icon is a useful to enhance the SBS of brackets to the enamel exterior [27]. The effect of Icon on the SBS of resin cements that used on sound and demineralized enamel. The Icon elevated the SBS of most resin cements types while decline the possibility of enamel fracture during debonding [32]. The pair of above studies are compatible with our SBS integrity of Icon.

The Icon have a hydrophilic trait that empower their seepage into the tooth exterior which results in a direct connection to this tooth exterior. This will diminish the

effectiveness of O2 and enhance the polymerization, in turn empower the SBS [33]. Even on intact enamel, the using of Icon had supplementary action on SBS, possibly as an action of the excessive moisten properties of the TEGDMA resin [34]. It's clear that the Icon may be used on the tooth exterior which not skeptically hamper the bond betwixt resin composite and enamel exterior. It displayed to be statistically preferable rather than other categories .

| Without ICON | 24 | 8.40 | 1.714 | | | |

## Conclusion

1-According to our result, the storage in food simulants for 30 days (50% aqueous ethanol &corn oil) produced a significant reduction in SBS.

1-The Icon application can be used on enamel exteriors even before bonding orthodontic brackets as improve bonding & used to inhibit demineralization.

3-The use of alcohol containing mouth washes may cause premature debonding of brackets especially at the beginning of treatment. So it can be rational to instruct the patients to fend off alcoholic mouth rinses.

4- The use of alcohol containing mouth washes had advantage by making the debonding easier at the end of orthodontic treatment.

# Antibacterial Activity of Selected Fractions Extract of *Coptis chinensis* Franch Rhizomes

**Reyadh R Al-Rashidi[1], Hisham Al-Shaikhli[2], Rusul A Alsaray[1], Tahrani Munusamy[3], Radhi K. Obaid[4]**

*1 Assist. Lecturer/ Department of Dentistry, Alkut University College, 52001, Wasit, Iraq, [2]Lecturer/ School of Public health and Interdisciplinary Studies, Faculty of health and environmental sciences, Auckland University of Technology, 1142, Auckland, New Zealand, 3 Researcher/ School of Pharmacy, Management and Science University, 40100, Shah Alam, Selangor Darul Ehsan, Malaysia, 4 Prof/ Department of Pharmacy, Alkut University College, 52001, Wasit, Iraq*

## Abstract

The antibacterial activity of different fractions of selected extract of *Coptis chinensis* Franch rhizome was evaluated on gram positive bacteria. Three extracts were tested at concentrations ranging from 1 mg/ml, 10 mg/ml, and 100 mg/ml *in vitro* on three bacterial strains, *Staphylococcus aureus*, *Streptococcus pneumoniae*, and *Bacillus anthracis,* which was done by performing disc diffusion for growth inhibition. The methanol extract at concentrations of 100 mg/ml displayed the most significant zone of inhibition of (22.67 ± 3.055mm), (21.67 ± 3.512 mm), (16.67 ± 1.528 mm) against *Streptococcus pneumoniae*, *Staphylococcus aureus*, and *Bacillus anthracis,* respectively. The TLC separation of the extracts showed that each of them may contains constituents that are phenolic in nature. From the $R_f$ values of the spots found in the various extracts is that the *Coptis chinensis* Franch rhizome contains some other non-phenolic compounds responsible for its effect. The selected methanol extract is then subjected to column chromatography and collected 4 fractions. Out of the four fractions, F2 fraction demonstrates the most significant zone of inhibition of 15.00 ± 1.000 mm, 12.33 ± 1.528 mm and 10.00 ± 2.000 mm against *Streptococcus pneumoniae*, *Staphylococcus aureus*, and *Bacillus anthracis,* respectively.

***Keywords:*** *Coptis chinensis, Fractions, Antibacterial activity, Zone of inhibition*

## Introduction

Infectious diseases have persisted as a major health problem for almost half a century now, and there has been increasing incidence of resistance to currently available antibacterial [1]. There is the need for intensive studies for the possible discovery of new agents with antibacterial potentials [1]. Plants have provided a good source of antimicrobial activity. The primary benefits of using plant-derived medicines are that they are relatively safer than synthetic alternatives, offering profound therapeutic benefits, absence or very few side effects and more affordable treatment [2].

Wide range of medicinal plant parts is used for extract as raw drugs and they possess various medicinal properties. Usually, these plants are rich in a wide variety of secondary metabolites, such as tannins, terpenoids, alkaloids, and flavonoids, which have been found to have antimicrobial properties *in vitro* [3]. An example of traditional Chinese plant that possesses various medicinal properties is *Coptis chinensis* a member of Ranunculaceae family, is widely cultivated and produced in Sichuan, Yunnan, and Hubei. This herb is particularly endemic to the middle and southern regions of China. It comprises three main species, among these species, *Coptis chinensis* Franch is regarded as most widely used with a slight odor, very bitter taste, and contains the highest bioactive alkaloids content [4]. Extract of *Coptis chinensis* Franch has a strong antibacterial activity and is used for

**Corresponding author:**
**Reyadh R Al-Rashidi**
Email: reyadh.radhi@alkutcollege.edu.iq
reyadhalrashidi@gmail.com

treating dysentery, diabetes, cholera, leukemia, and lung cancer. They are usually characterized by the presence of the major alkaloids: berberine, palmatine, coptisine, berberastine, and jatrorrhizine [5]. Additionally, aqueous extract of *Coptis chinensis* Franch containing bioactive alkaloids that have been applied widely in clinics, and recent studies discovered that aqueous *Coptis chinensis* Franch extracts expressed a hepatoprotective effect on carbon tetrachloride-induced acute liver hepatotoxicity in rats [6], and also possessed analgesic effects in a rat model of irritable bowel syndrome [7].

The purpose of this study was to evaluate the antibacterial activity of selected fractions extract prepared from the dried rhizomes of *Coptis chinensis* Franch on gram-positive bacteria, *Staphylococcus aureus, Streptococcus pneumoniae, and Bacillus anthracis*.

## Materials and Methods

### Microbial strains

Three strains of standard bacteria, *Staphylococcus aureus, Streptococcus pneumonia,* and *Bacillus anthracis,* were collected from the Microbiology Laboratory at Management and Science University in Selangor, Malaysia. All the three bacteria were supplied as cultures on Mueller-Hinton Agar (Mast Group Ltd.) plates. Plates were stored in the cold room (2 - 4°C) until the study was started [8].

### Plant material

The rhizome of *Coptis chinensis* Franch has been collected locally from Chinese medicinal botany shop within the area of Klang, Selangor, Malaysia.

A total of 100 grams of *Coptis chinensis* Franch rhizomes were thoroughly cleaned and washed 2–3 times with running tap water and once with sterile distilled water in the lab to avoid dusts and other unwanted materials. These samples were then allowed to dry in the oven for 2 days at 45°C. After drying, the rhizome part of the plant was grounded into fine powders using electrical blender. The grounded powders were then transferred into an airtight container and was utilized for extraction. This is to ensure the extraction to be more effective as smaller particles tend to have large surface area which help them to get in contact with the solvent, thus, ease the extraction of active compound [8].

### Extraction of plant material

The dried *Coptis chinensis* Franch rhizomes are then extracted using Soxhlet extractor. This extraction is performed at room temperature (20°C–25ºC) by using 80% methanol, 70% ethanol and chloroform as solvent in the ratio of solvent:sample =10:1 v/w. 20 grams of dried, grounded powder was extracted in 200 ml of the above mentioned solvent via soxhlet extraction method. The solvents were obtained from the Research Laboratory of Management and Science University in Selangor, Malaysia. The whole extraction process took place for nearly 8 hours. Once the extraction was completed, the obtained extract was first filtered using Whatsman filter papers and the solvent was removed by rotary evaporator under reduced pressure at temperatures below 45ºC in order to obtain a concentrated extract. The remaining thick semisolid extract was scrapped out from the evaporator flask using a spatula. Each different concentrated extract was then transferred into a container and kept in cold room until further use [8].

### Preliminary antibacterial test

Before testing with bacteria, medium for bacterial growth were prepared. The medium was prepared by dissolving 15.2 g of Mueller Hinton Agar in 400 ml of distilled water in a schott bottle. These dissolved medium were autoclaved at 15 lbs. pressure (121°C) for 15 minutes. The sterilized media was mixed well and poured into sterile dish plates, with 15ml per plate while still molten. The plates were set aside for storage or further use.

Pattern of inoculation lines for each bacterium, *Staphylococcus aureus, Streptococcus pneumoniae* and *Bacillus anthracis* were made on the agar. .Then, the impregnated discs containing anti-microbial agent, vancomycin (positive control), the resulting crude extract of different concentration (i.e. 1 mg/ml, 10 mg/ml, 100 mg/ml), and solvent (80% methanol, 70% ethanol and chloroform) as negative control were arranged on the surface of the inoculated plates and incubated at 37°C ± 0.05 for 24 hours. This method is known as preliminary antibacterial evaluation. Extract yielding greater zone of inhibition was used further for fractionation [9].

**Thin layer chromatography**

Thin layer chromatography (TLC) is carried out to isolate the principle components that were present in most effective extracts of plant. In this experiment, ratios of different solvent systems of different polarities are prepared. Selection of solvent is normally done on the basis of increasing polarity [10].

Nine different solvent systems were prepared by adding ethyl acetate and hexane in different ratios. Each of these solvent was prepared for 10 ml and poured into different beakers for 9 beakers. Each beaker was placed with a TLC plate in it, which has been spotted with the selected extract concentration (methanolic crude extract – 100 mg/ml) from preliminary antibacterial test on it via capillary tube. The beakers were then covered with aluminum foil and left for few minutes for the solvent to rise up to the top of the TLC plate. Detection of spots was by spraying plates with ferric chloride, iodine and DPPH, and viewing under UV lamp [11]. The $R_f$ value of spot formed on each TLC plate was then recorded. The solvent with the best $R_f$ value was then selected to be used for column chromatography

**Fractionation of crude extract**

The selected extract, methanol crude extract, 100 mg/ml, was fractioned by filter column chromatography over 300 g of silica gel 60 (S). The column chromatography was eluted with approximately 3.0 L of the solvent hexane, in order of increasing polarity, until a clear extract was obtained at the end of the elution [9]. As soon as the colored compound begins to elute, 4 different fractions of 20 mL were collected at different times. Fractions were stored at 4°C.

Antibacterial test using the agar diffusion method (disc) and diameter of the inhibition zone

The *in vitro* antibacterial activity of the methanol crude extract fractions from *Coptis chinensis* Franch rhizomes are determined by the disc diffusion method. The complete diffusion of samples into the Mueller–Hinton Agar was visually confirmed. Mueller-Hinton Agar medium is sterilized and poured into the plate; the medium is allowed to settle and stored at 4°C. The three bacterial strains, *Staphylococcus aureus, Streptococcus pneumonia,* and *Bacillus anthracis* were cultured overnight at 37°C in Mueller-Hinton Agar. The bacterial colonies were transferred into a sterile loop or cotton swab and mixed well from the fresh agar plate. The suspension was adjusted to achieve a turbidity equivalent to a 0.5 McFarland turbidity standard. This suspension resulted in a suspension containing approximately $1\times10^9$ CFU/mL [7]. 1 mL of inoculum of the bacterial strains ($10^6$ CFU/mL) was poured into petri dishes (90 mm) already filled with Mueller-Hinton Agar. Then, 3 mm wells were used and filled with 20 µL of samples. First one was placed with a positive reference Vancomycin (30 µg/disc) (Oxoid), the second was with a negative control, 80% methanol disc, and the third was with one fraction of methanol crude extract. Three hrs. were required for pre-incubated the Petri dishes at room temperature, allowing the complete diffusion of the samples; then, they were incubated at 37°C for 24 hrs [3]. Three replicates of plates were then examined for the presence of inhibitory zone and the diameter of the zone (mm) formed around the disc was measured.

## Statistical Analysis

Experiments were conducted in triplicates, and the values presented as their mean ± standard deviation. Analysis was done with ANOVA with the significance level at $p<0.05$.

## Results and Discussion

The rhizomes of *Coptis chinensis* Franch were extracted with three different solvent systems, 80% methanol, 70% ethanol and chloroform as a preliminary antibacterial evaluation. Extracts were evaluated at concentrations ranging from 1 mg/ml, 10 mg/ml, and 100 mg/ml *in vitro* against three bacterial strains, *Staphylococcus aureus*, *Streptococcus pneumoniae*, and *Bacillus anthracis*. Zone of inhibition of these different extracts were compared with that of standards antibiotic, Vancomycin, for antibacterial activity. The majority of these different extracts had inhibitory effect at different concentrations (Table 1). Results indicated that methanol extract at concentrations of 100 mg/ml displayed the most significant zone of inhibition of 22.67 ± 3.055 mm, 21.67 ± 3.512 mm and 16.67 ± 1.528 mm against *Streptococcus pneumoniae*, *Staphylococc*

**Table 1. Zone of Inhibition of Different Extracts Concentration on *Staphylococcus aureus, Streptococcus pneumonia* and *Bacillus anthracis.*[a]**

| Bacterial strains | Extract conc. (mg/ml) | Diameter of inhibition zone (mm)b | | |
|---|---|---|---|---|
| | | 80% methanol | 70% Ethanol | Chloroform |
| Staphylococcus aureus | 1<br>10<br>100 | 0.00 ± 0.000<br>13.0 ± 0 3.606<br>21.67 ± 3.512 | 0.00 ± 0.000<br>0.00 ± 0.000<br>11.33 ± 9.815 | 0.00 ± 0.000<br>3.67 ± 4.933<br>16.33 ± 2.517 |
| Streptococcus pneumonia | 1<br>10<br>100 | 0.00 ± 0.000<br>6.67 ± 5.774<br>22.67 ± 3.055 | 2.00 ±3.646<br>10.00 ± 1.000<br>17.33 ± 2.517 | 0.00 ± 0.000<br>8.33 ± 1.155<br>17.33 ± 2.517 |
| Bacillus anthracis | 1<br>10<br>100 | 2.00 ± 3.404<br>12.00 ± 2.646<br>16.76 ± 1.528 | 0.00 ± 0.000<br>6.33 ± 0.577<br>16.00 ± 1.000 | 5.67 ± 0.577<br>6.67 ± 0.577<br>17.33 ± 2.887 |

[a]Values are mean ± SD of three replicates, [b]diameter of inhibition zone (mm) include the disc diameter.

*us aureus*, and *Bacillus anthracis*, respectively. In comparison with standard antibiotic, Vancomycin (30 µg/disc), results showed that there was no significant differences ($p > 0.05$) in the diameter of zone of inhibition. This results indicated that the *Coptis chinensis* Franch rhizome of methanol extract inherits a potential antibacterial property compared to ethanol and chloroform extract.

The thin layer chromatography (TLC) separation of the extracts show that each of them may contains constituents that are phenolic in nature (Tables 2). From the $R_f$ values of the spots found in the various extracts is that the plant contains some other non-phenolic compounds responsible for its effect [11]. Phenolic compounds are also reported to have antioxidant effect [12]. Some non-phenolic compounds have been reported to show antioxidant activity and antimicrobial effect. Therefore it can be inferred that it is the presence of these types of constituents that are responsible for the observed antibacterial activity of this plant. Based on $R_f$ values and number of spots formed, the solvent ratio of 9:1 shows a better result and was used for fractionation via column chromatography.

**Table 2. Retention Factor ($R_f$ ) Values Formed by Different Solvents Ratios**

| Solvent Ratios | Rf Value | | | Color Formed |
|---|---|---|---|---|
| Hexane: Ethyl acetate | 1stSpot | 2ndSpot | 3edSpot | |
| 1:9 | - | - | - | - |
| 2:8 | - | - | - | - |
| 3:7 | - | - | - | - |
| 4:6 | 0.88 | - | - | Yellow |
| 5:5 | 0.30 | - | - | Yellow |
| 6:4 | 0.20 | 0.98 | - | Brown |
| 7:3 | 0.33 | 0.64 | - | Brown |
| 8:2 | 0.50 | 0.68 | - | Brown |
| 9:1 | 0.38 | 0.58 | 0.84 | Brown |

Four fractions, 20 ml each, of *Coptis chinensis* Franch methanol extract were collected. Fractions obtained were in different colors (Table 3), this indicates the existence of various components in the extract. The antibacterial activity of each fractions was determined. To perform a rapid screening study of potential antibacterial activity, a disc diffusion assay was used to evaluate the inhibitory effect. The majority of these different fractions had inhibitory effect against *Staphylococcus aureus, Streptococcus pneumoniae* and *Bacillus anthracis* after incubated for 24 hours. Among all of these fractions, second fraction (F2) demonstrates the greatest inhibition zones as compared to other fractions. Based on the comparison table, F2 displayed inhibition zones of 15.00 ± 1.000mm against *Streptococcus pneumoniae*, followed by 12.33 ± 1.528 mm against *Staphylococcus aureus*, and 10.00 ± 2.000 mm against *Bacillus anthracis.*

**Table 3. Fractions of Methanol Extract of Coptic chinensis Franch Rhizome Formed by Column Chromatography.**

| Methanol Fractions | Volume Collected (ml) | Color Formed | Retention Time (RT) of collection (min.) |
|---|---|---|---|
| F1 | 20 | Yellow | 30 |
| F2 | 20 | Yellow - Orange | 40 |
| F3 | 20 | Orange | 55 |
| F4 | 20 | Dark Orange | 75 |

Based on one-way ANOVA analysis, F2 and F3 are having significantly higher ($p$ <0.001) antibacterial activity than F1 and F4. Within both of these fractions, F2 & F3 are not statistically different ($p$> 0.05), which means that both have almost similar inhibition effect.

Standard antibiotics, Vancomycin (30µg/disc) showed much higher significant difference ($p$ < 0.001) than other fractions on *Staphylococcus aureus, Streptococcus pneumoniae* and *Bacillus anthracis.* This explains that treatment with glycopeptide antibiotics, Vancomycin is more effective and possesses more antibacterial activity compared to these four fractions of *Coptis chinensis* Franch of methanol extracts on gram positive bacteria. Therefore, this clearly proves that the fractions of *Coptis chinensis* Franch rhizome of methanolic extract, particularly F2, inherits a potential antibacterial property against *Staphylococcus aureus, Streptococcus pneumoniae* and *Bacillus anthracis.*

## Conclusion

The finding of the study revealed that all the fractions obtained from *Coptis chinensis* Franch rhizomes of methanol extract did possess antibacterial activity against *Staphylococcus aureus, Streptococcus pneumoniae* and *Bacillus anthracis.* Among these fractions, F2 fraction showed more inhibition against those bacterial strains. Future studies are suggested for identification of the minimum inhibitory concentration (MIC) and phytochemical testing of *Coptis chinensis* Franch rhizome of methanol extract fractions.

# Therapeutic Effect of Chemically Synthesized Silver Nanoparticles on Aphthous Stomatitis in Some Iraqi Patients

**Zahraa Neamah Abbas[1], Nafal NazarBahjat[2]**

*[1]Assistant Lecturer, [2]Lecturer, department of Medical Analysis, College of Health and Medical Technologies, Middle Technical University, Baghdad-Iraq*

## Abstract

Silver nanoparticles (AgNPs) were synthesized by a chemical reduction method. The particles were synthesized using silver nitrate solution with sodium borohydride as the reducer. The resulting colloidal AgNPs were characterized by UV-Visible spectroscopy, and FTIR. Aphthous stomatitis is a common and recurrent painful disease of the oral mucous membrane, classified in to three different aphthous types: minor, major and herpetiform. It may appear due to a variety of causes including: stress, food, hypersensitivities, infection, trauma, drug allergy, nutrition deficiencies (Iron, zinc & vitamin B12) or it could be a symptom of serious disease such as carcinoma. In this study, (75) young Iraqi patients aged (18-24) years divided in to two groups according to their gender (25 male and 50 female) all of them are suffering from major Aphthous ulcers in the mouth. The solution of (10 µg/ml) concentration of silver nanoparticles showed a uniform cycle inhibition around the ulcer growth zone while, increasing of (AgNPs) solution to (20 µg/ml) showed a highly and significant inhibitory effect against isolates from Aphthous stomatitis during the first 24 hours only in both male and female groups. Further studies is needed to investigate the inhibitory mechanism of (AgNPs) against Aphthous stomatitis.

***Keywords:*** *patients; health; therapy; toxicity; Silver NPs; Aphthous*

## Introduction

A great attention has been directed toward the use of new medicinal preparations at nanoscale levels. A huge number of physical, chemical, biological and hybrid methods are available to synthesis different types of nanoparticles (NPs) [(1)]. Silver nanoparticles (AgNPs) of 100 nm dimension or less have unique physical, chemical and biological properties [(2)]. AgNPs are considered one of the most promising anticancer agents, protects against bacterial [(2)], fungal [(3)], and viral infections [(4)].

Aphthous stomatitis is a common and recurrent painful disease of the oral mucous membrane. It is start as small red and simple or grouped papules, classified in to three different aphthous types: minor, major and herpetiform. It may appear due to a variety of causes including: stress, food, hypersensitivities, infection, trauma, drug allergy, nutrition deficiencies (Iron, zinc & vitamin B12) or it could be a symptom of serious disease such as carcinoma [(1)].

Minor aphthus stomatitis usually occurs in crops of 1-5. They are small; usually less than 1cm (5mm) in diameter appears as a white or yellowish center with an inflamed red out edge, roundest, painful & shallow. Common sites are tongue margin &inside the lips &cheeks normally take 7-14 days to heal. While major aphthous stomatitis characterized by large (greater than 1cm in diameter), numerous in crops of 10 or more. It heals slowly & may persist for many weeks. Herpetiform (uncommon) are pinpoint & occur in large crops of up to 100 at a time, usually, heal within a month, often occur in posterior part of mouth (an unusual location for MAU) [(5)].

However, many cases may associate with severe pain and difficulty in eating thus a topical corticosteroid and anesthetic can provide a short-term relief and facilities

**Correspond author:**
**Zahraa Neamah Abbas**
E-mail: zah.gas80@gmail.com

eating [5]. Silver nitrate is often used as a chemical cautery, while carbon dioxide laser can provide pain relief almost instantaneously [1].

Actually, there is no effective medication or treatment for the prevention or even future recurrence. The aim of our study is to synthesize colloidal silver nanoparticles and exert their effects on the recurrent aphthous stomatitis.

## Material and Method

### A) Material

Silver Nitrate ($AgNO_3$), sodium borohydride ($NaBH_4$) merck (Germany), Mueller Hinton Agar was procured from Himedia (India). Sterile distilled water was used throughout the experiments.

B) Chemical synthesis of silver nanoparticles

Oxidation reduction method was used for the synthesis of silver nanoparticles, 0.01 M of sodium borohydride was added drop by drop to 0.001 M of silver nitrate solution under stirring. Color changing is appearing from pale yellow, red and finally to almost black color as shown in figure 1. Centrifuged the resulted aqueous solution at 1500 rpm for 30 minutes and dried at 100 °C [6].

**Figure (1): Synthesized colloidal silver nanoparticle solution**

C) Sample collection

Seventy-five young patients (25 male and 50 female) aged 18-24 years suffering from Aphthous ulcers in the mouth arrived to biology lab, department of Medical Analysis College of Health and Medical Technologies, Middle Technical University, Iraq. Clinical samples were collected by sterile swops for major and severe aphthous stomatitis only, minor aphthous stomatitis and simple cases were excluded.

D) Silver nanoparticles test

A solution of two different concentrations of Silver nanoparticles were tested for their activity against identified aphthous ulcer by the modified Kirby Bauer agar well diffusion method according to the CLSI guidelines (2011) [7]. The preferred concentration 10, 20, µg/ml were prepared and twenty milliliter of nutrient agar medium was poured into sterilized Petri plates. With the help of a sterilized borer, agar wells of 6 mm diameter were prepared. The wells were injected with 10, 20µl of the synthesized silver nanoparticle solution, 20 µl of 1 mM $AgNO_3$ as a negative control. The plates were further incubated at 37 °C for 24 h and were then examined for the presence of zones of inhibition. The inhibition zone was measured and expressed in centimeter scale [6].

## Results and Discussion

A) Fourier transform infrared spectroscopy FTIR

FTIR analyses were carried out using ALPHA FTIR spectrophotometer figure (2). The samples were prepared by using the KBr pellets technique and were analyzed to check the presence of functional groups of the surface chemistry of the reduced (AgNPs). The FTIR spectrums were collected at a spatial resolution of 4 $cm^{-1}$ in the transmission mode, between 4000 and 400 $cm^{-1}$, respectively [8].

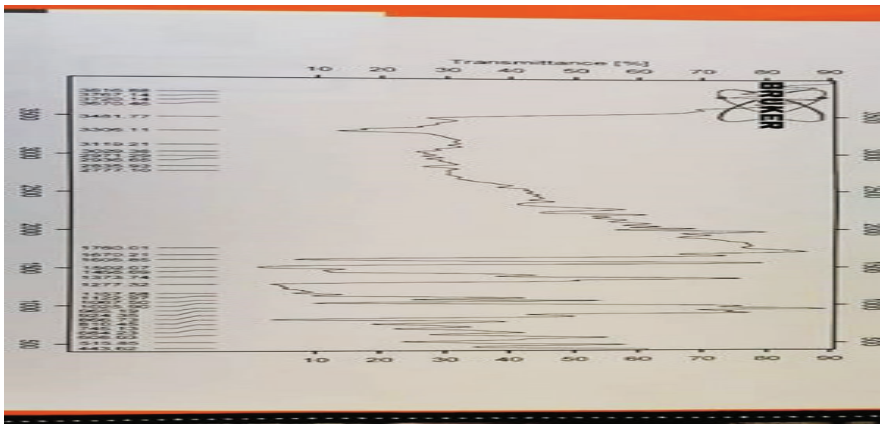

**Figure (2): FTIR spectrum of chemically synthesized silver nanoparticles**

**B) Silver nanoparticles activity**

Recurrent aphthous stomatitis (RAS) commonly known as aphthae or canker sores, have uncertain etiology with causes not fully elucidated [9]. Minor (RAS) are mostly small and below 5 mm in diameter that heal between 4-7 days and usually no treatment is needed, whereas, the severe painful ulcers may be debilitating causing weight loss due to malnutrition.

To our knowledge, there is no published study on the effect of silver nanoparticles in aphthous ulceration. The current study included (75) young Iraqi patients aged 18-24 years divided in to two groups according to their gender (25 male and 50 female) all of them are suffering from major and severe Aphthous ulcers in the mouth. The results showed a decrease in the size of ulcer when the concentration of (AgNPs) solution was (10 µg/ml) figure (3). While, It was found that the increasing concentration of (AgNPs) to (20 µg/ml) resulted in a highly significant decrease in aphthous ulcer size with a measurable zone of inhibition in both groups female and male patients during the first 24 hours figure (4) and table 1.

**Figure (3): Inhibitory effect of silver nanoparticle solution at concentration of (10 µg/ml).**

**Figure (4): Inhibitory effect of silver nanoparticle solution at concentration of (20 µg/ml).**

**Table (1): Average Inhibitory zone level of different concentration of silver nanoparticles against aphthous stomatitis.**

| Gender | (10 µg/ml) AgNPs | (20 µg/ml) AgNPs |
|---|---|---|
| Female | 0.35 ± 0.10 cm | 1.1 ± 0.20 cm |
| Male | 0.45 ± 0.13 cm | 1.4 ± 0.16 cm |

Silver nanoparticles have proven in many recent studies to exert a biological activity at non-cytotoxic concentrations, but the mechanism underlying their inhibitory activity has not been not fully elucidated [(10)]. Nano sized silver particles is unlike other silver precursors like silver oxide and silver nitrate because of their enhanced surface area provides the more toxic effect to the microbes [(6)].

A recent study by (Reidy et al.) [(11)], suggested that the Reactive Oxygen Species (ROS) released by the silver nanoparticles has been preventing the DNA replication, uncontrolled oxidation of proteins, breakdown of membrane function.

The U.S. Environmental Protection Agency has published a reference dose (Rfd), which is for oral silver exposure is 5 µg/ kg daily, with a critical dose estimated at 14 µg/ kg daily for the average person [(1)]. It has been reported that silver nanoparticles (SNPs) are nontoxic to humans and most effective against bacteria, viruses and other eukaryotic microorganisms at low concentrations and without any side effects [(10)].

The limitation faced in our study was the inability to measure the size and shape of silver nanoparticles due to lack of measurement devices and also the high cost.

## Conclusion

Silver nanoparticles (AgNPs) were synthesized using oxidation reduction method, characterization of resulting colloidal AgNPs by FTIR. Aphthous stomatitis is a common and recurrent painful disease of the oral mucous membrane. In this study, silver nanoparticles are showing promising inhibitory effect against Aphthous stomatitis. Moreover, It was found that Silver nanoparticles solution of (20 µg/ml) concentration resulted in a highly significant decrease in the size with a measurable zone of inhibition in both groups female and male patients during the first 24 hours in the cultured samples that isolated from Aphthous stomatitis. Further work is mandatory to investigate the inhibitory mechanism of (AgNPs) against Aphthous stomatitis and also to overcome the lack of measurement devices faced our current study.

# Evaluation of Serum Leptin, Interlukein–6 and some Biochemical Parameters in Iraq obese Adult Patients

**Salwa Gahzi Turki[1], Asmehan Adnan AL- Naqeeb[2], Zahid Jasim Muhammed[1], Wesam Hameed Ahmed[3]**

*[1]Assist Prof., [2]Lecturer, [3]Researcher, Basic Science Department, College of Nursing, University of Baghdad / Iraq*

## Abstract

**Objective:** The current study conducted for evaluating serum level of interleukin-6 and leptin (IL- 6) among Iraqi obese adult people and other biochemical parameters related with obesity. **Methods:** Leptin and IL-6 Levels were assessed in serum samples from 43 Iraqi obese adults and 30 non-obese healthy subjects. **Results:** Significant elevation ($p<0.05$) in $S.Ca^{+}$ levels for obese females as compared to obese males and there is high decrease of significant ($p<0.0001$) in the $S. Ca^{+}$ level for obese male as compared to control male. The liver function enzymes S. GOT S. GPT levels showed significant elevation ($p<0.0001$ and $p<0.01$) in obese female in comparison to their control and a significant elevation appeared at level of cholesterol for both ($p<0.001$ in male) and ($p<0.01$ in female), S LDL $p<0.05$ for obese male and HDL $p<0.0001$ in obese female. Finally, High positive correlation ($p<0.01$) between serum leptin levels for obese subjects and their BMI. Also, IL-6 revealed strong positive correlation ($p<0.01$) with S. TRIG and S. VLDL. Whereas, S.CREAT was positive association at level ($p<0.05$). **Conclusions:** The data revealed effect the obesity in different human body function, liver enzyme, lipid profile and leptin in adult's male in different criteria according to the gender. As well as, the positive correlation between IL-6 with (S. CREAT, S. TRIG and S. VLDL) and leptin with BMI. Increased creatinine related with presence of inflammation or injury to the kidney, which was evidenced by the presence of a positive correlation with IL-6. Obesity effects on lipid profile and liver enzyme and leptin due to the sex hormone differences.

## Introduction

Obesity considered as accumulation of fat in body of human more than needed for the ordinary body functions. Weight gain is a result of accumulation as continue. Obesity had been considered a disease related with behavior, inadequate food intake coupled with relative inactivity. [1]

The body mass index (BMI) is correlated to body fat, and varies with age and sex in children more than it does in adults.[2] There are many risk associated with obesity, metabolic diseases and cardiovascular (CV). [3] Obesity affect on various substance levels produced by adipose tissues i.e. adiponectin, chemokines leptin, factor of tumor necrosis (TNF) and IL-6,.[4] Polypeptide hormone (leptin) is primarily produced and secreted via white adipocyte into the circulation [5]. Correlation as strong exist between mass of body fat and produced and secreted leptin amounts.[6] It is defined as hormone of anti-obesity. Leptin was discovered in 1994[7] as an adipocytokine regulator of body weight, food intake, fat mass, and an important regulator of the immune and neuroendocrine systems. Researchers found a role of crucial in hormonal metabolism and regulation.[8]

Also, adipocytes produced IL-6 an endogenous chemical which is active in inflammation, and in B cell maturation. One-third of total circulating levels are expressed predominantly by adipocytes. Also expressed in macrophages, endothelial cells, skeletal muscle, and fibroblasts.[9] Increase inflammatory mediators, such as C-reactive protein (CRP) and IL-6 in the plasma increases the risk of atherosclerotic complications and acute myocardial infarction.[10] IL-6 is also able to

**Corresponding author:**
**Salwa Gahzi Turki**
E-mail: dr.salwagh@conursing.uobaghdad.edu.iq

influence hormonal balance and some endocrinological abnormalities. It is suggested, that IL-6 may affect the increase of free fatty acids level, and cause lipid abnormalities.[11]

The current study conducted for evaluating serum level of interleukin-6 and leptin (IL- 6) among Iraqi obese adult people and other biochemical parameters related with obesity.

## Patients and Methods

The study was carried out at Alkindy Medical College (Obesity Research and Treatment Unit). During the period January 2017 – July 2017, 43 obese (18 male and 25 female) were referred to the Unit, their age rang 16 – 63 years old. A clinical examination and diagnosis were done for each patient by the consultant medical staff and the biochemical laboratory examination results (FBS, blood urea, serum creatinine, lipid profile, serum GOT, serum GPT, serum calcium and uric acid) were as a routine work. They compared with 30 healthy adults (15 male and 15 female) with approximate age with patients.

### Laboratory methods

Serum isolated from five milliliters vinous blood for each participant. The sera were assessed for IL-6 and leptin by an ELISA kit (Elabscience, USA). The instructions of manufacturer were followed to assess the two variables.

## Statistical Analysis

The results were assessed in a data sheet of SPSS version 20, which was utilized to carry out analysis. The significant differences mean ± SD were assessed by Kruskal-Wallis, Mann-Whitney and Independent-Samples T test and. The correlation between IL-6, leptin and other biochemical parameters were estimated by Person's correlation. A probability **(*P*) value** <0.05 considered as significant.

## Results

Results showed no differences of significant among obese females and males in all parameters except for S. $Ca^{+}$ level which revealed a significant elevation in obese female ($p<0.05$) as compared to the control female Figure 1.

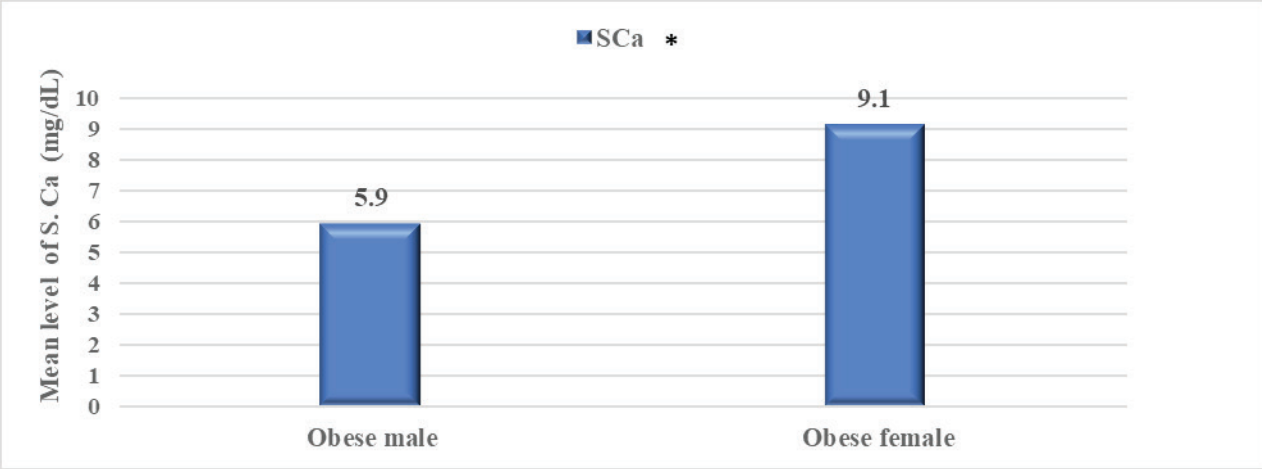

**Figure 1. Serum Calcium (S. Ca) means levels in Obese male *vs*. obese female (*P < 0.05)**

The biochemical parameters involve renal function tests were assessed and there was highly significant decrease ($p<0.0001$) in S. $Ca^{+}$ level for obese male as compared to control male Figure 2A. Whereas no significant differences have been observed in any of these parameters with female studied groups Figure 2B.

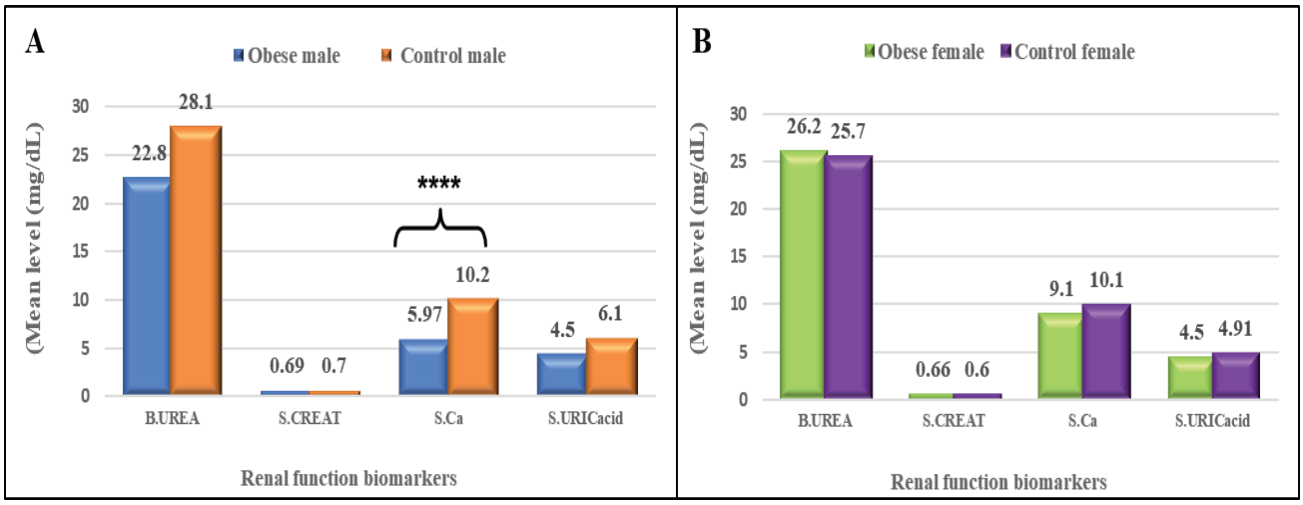

**Figure 2. Renal function biomarker in obese male and female *vs.* their control (****P < 0.0001)**

Lipid profile analysis appeared significantly increase in cholesterol ($p<0.001$ and $p<0.01$) for obese male and female respectively Figure 3. Also, S. LDL elevated significantly in obese male ($p<0.05$) Figure 3A. Whereas, in obese female the significant elevation ($p<0.0001$) was in S. HDL Figure 3B.

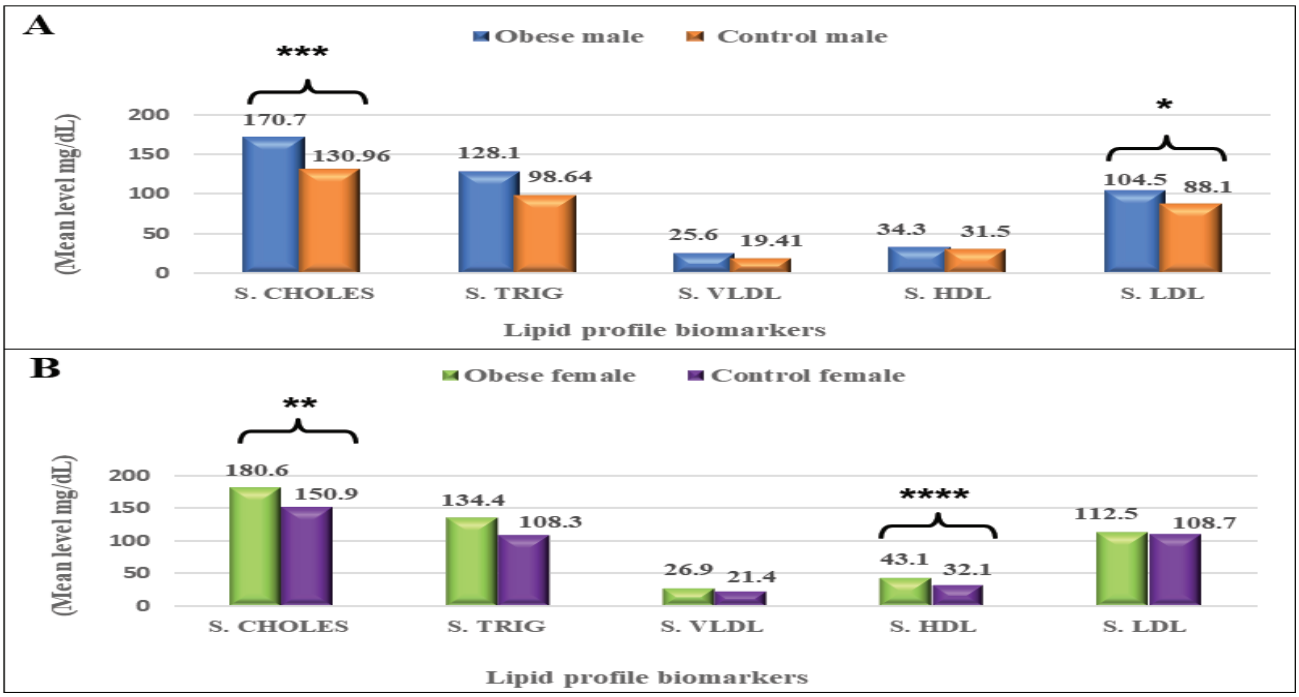

**Figure 3. lipid profile (S. CHOLES., serum cholesterol; S. TRIG serum triglyceride; S. VLDL, serum very low-density lipoproteins; S. HDL, serum high-density lipoproteins; S. LDL, serum low-density lipoproteins) in Obese male and female *vs* their control.( *P < 0.05, **P < 0.01, ***P < 0.001, ****P < 0.0001)**

No differences significant for the two cytokines were observed among obese females and males as compared to their controls, only leptin revealed a significant elevation ($p<0.01$) in obese male as compare to control subjects Figure 4A.

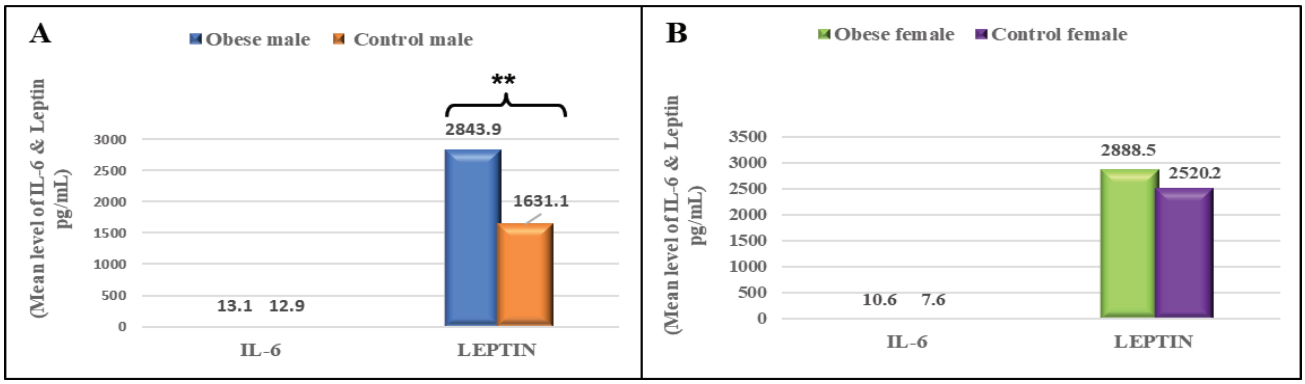

**Figure 4. Leptin and IL-6 in obese females and males *vs* their control (**P < 0.01)**

The IL-6 and Leptin correlation were assessed and the results showed strong positive association p<0.01 between levels of serum IL-6 for obese individuals and (S. TRIG and S. VLDL) and S. CREAT p<0.05. The only positive correlation of Leptin was p<0.01 with BMI.

## Discussion

The present study, showed significant elevation in S. $Ca^{+}$ level in obese females than obese males Figure (1). This is consistent with the study that showed the obesity induces the production of inflammatory cytokines which stimulates bone absorption by osteoclasts that might subsequently lead to a higher serum calcium level in obese people.[12] Another study by.[13] reported that an obesity gene expressed in human adipocytes and the protein produced by this gene stimulates calcium influx and promotes energy storage in human adipocytes by stimulating the expression and activation of fatty acid synthase and inhibiting lipolysis. We also believe that parathyroid hormones (PTH) has effective role in increasing level of calcium in obese people especially females this consistent that PTH of serum is increased abnormally in obese individuals.[14]

In regard to renal functions, no significant differences have been observed between obese subjects and their control except decrease S. $Ca^{+}$ level in obese male as compared to control (Figure 2A). Inverse studies revealed high levels of Ca in blood circulation. The Intracellular calcium which is regulated by calciotropic hormones, which in adipocytes, consequently stimulates high intracellular Ca levels. In adipocytes, Ca high levels cause lipogenesis stimulation and lipolysis inhibition.[12] Others reported that hypercalcemia is associated with vitamin D deficiency in the obese individual.[14] The differences in results may due to the small sample size of obese male.

The increasing in enzyme levels of GOT and GPT were statically significant in obese female but not in obese male when compared with their control Figure 3. Similarly the two enzymes were elevated significantly in obese females having syndrome of polycystic ovary.[15] Inversely, study in Hilla-Iraq population have been indicated no significant differences GOT and GPT in obese and normal individuals.[16], which is consistent with results of obese male Figure 3A.

A significant increment appeared in the level of cholesterol in obese patients for both gender male and in female, S. LDL for obese male as compared to control male Figure 3A and a significant increment appeared in the level of S. HDL for obese female Figure 3B. Other lipid profile parameters ware elevated but statically not significant Figure 3.

The lipids abnormality in obese patients have been diagnosed by[17] including elevated VLDL, non-HDL cholesterol, serum triglyceride, and apolipoprotein B levels. S. TRIG increasing is because of increasing production of hepatic for particles of VLDL and a decline in TRIG rich lipoproteins clearance. Levels of HDL cholesterol are normally low and are linked to the increase in triglycerides of serum. Levels of LDL cholesterol are in range of normal frequently while there is an elevation in small dense LDL.

The different results between genders may depend on the location of the fat tissue in human body, which effect in lipid metabolism. Visceral, subcutaneous, and trunk

(especially upper one) adipose tissue are linked to higher levels of triglycerides and lower ones of HDL cholesterol. In contrast, accumulation fats in subcutaneous tissue is associated with lower triglycerides. The protective effect of leg fat may explain why women and African-Americans have lower triglycerides.[18],[19] Our idea is factors of environmental i.e. activity as physical and factors of dietary influence levels of lipids.[20]

From the results of the present study, level of leptin for obese male appeared highly significant elevated Figure 5A and was non-significant in obese female Figure 4B. In agreement with our results leptin significantly was higher in male and has a significant positive correlation with BMI.[21] Whereas, study in obese men displayed that leptin levels and percentage body fat correlate positively, and obese men therefore have elevated in serum leptin levels.[22] The abnormal accumulation of adipose tissue will cause change and increment in leptin level.[23] Inverse results regarding to the obese women, Study in Pakistan revealed significant increase of leptin in obese female than in obese male. [24] Jenks MZ *et al.* demonstrated that 17β-estradiol increased the abundance of transcript leptin and increase secreted leptin in murine adipocytes.[25] Variation in circulating estradiol concentrations may have an influence on circulating leptin in female subjects.[26] The increased concentration of serum leptin are significantly associated with obesity in postmenopausal women. [27] Hormones of sex are associated significantly along adiposity, and the androgens associations qualitatively vary according to sex. Heterogeneity might help explaining the sex hormones contribution complexity to differences in sex in cardio-obesity.[28]

IL-6 level was statically not significant in our data. Contrary to many studies, augmentation of TNF-α and IL-6 levels is more in obese than in nonobese diabetics patients.[29] Circulating levels of IL-6 and leptin were significantly increased in obese patients than in controls. [30] A significant increment have been observed of IL-6 expression in obese subcutaneous adipose tissue biopsies when compare with lean individual.[31] The controversial results my due to IL-6 secretion is regulated via many pathologic or physiologic factors: cytokines, hormones, diet, stress, hypoxia, physical activity, and others. [32]

Finally, there was highly positive correlation between IL-6, S. TRIG and S. VLDL and the level of IL-6 in obese were similar to healthy controls subjects. Many studies revealed Overproduced IL-6 minimized levels of blood lipid via elevating VLDLR expression in different tissues. They concluded that blockade of IL-6 normalizes levels of reduced lipid due to IL6, but does not influence metabolism of normal lipid.[33]

# Estimation The Scavenging Activities of Ascorbic Acid, Uric Acid, Gallic Acid and GSH to DPPH Radical

**Ali M.A. Al-Kufaishi**

*Al-Furat Al-Awsat Technical University College of Health and Medical Techniques, Department of Medical Laboratory Techniques, Kufa, Iraq*

## Abstract

The "α,α-diphenyl-β-picrylhydrazyl radical **(**DPPH)" method from the estimation methods to determine the antioxidants activity in vitro, through the lowering the absorbance of DPPH with color changing from violet into yellow with increasing the strength of antioxidants activity. So, the results of this study show the uric acid is the strongest scavenging, then ascorbic acid when compared with other compounds used. But the reduced glutathione is the weakest although has acidic hydrogen.

***Keywords:*** *DPPH, scavenging activity, antioxidants, Ascorbic Acid, Uric Acid, Gallic Acid.*

## Introduction

The efficiency of antioxidants (scavenging activity) depends on the ability of free radicals scavengers (FRS) to given hydrogen to the free radicals [1]. The increase in rate and energy promotion for hydrogen ion transition from FRS to free radicals depend on the lowering in energy level for hydrogen bond with FRS. Efficient FRS results free radicals after donating hydrogen but not react rapidly with oxygen to produce superoxide. The efficiency of FRS as well depends on other factors as volatility, pH sensitivity and polarity [2].

In the present study, the antioxidants involve such as vitamin C, uric acid, gallic acid, and reduced glutathione.

**Ascorbic acid (AA):**

One from most powerful FRS [3,4]. It is found in several plants cells types. AA present in the reduced form under physiological conditions (90% of the ascorbate pool) in plants leaves and chloroplasts [5], were the concentration of AA (20 mM) in the cytosol, and (20-200 mM) in the chloroplast stroma [6]. The ability of AA to give the electron by many enzymatic and nonenzymatic reactions, therefore act as main detoxification antioxidants against ROS in the aqueous phase. So, the AA can directly be scavenging for singlet oxygen, superoxide radical, hydroxyl radical and reduced hydrogen peroxide to water by ascorbate peroxidase reaction [7].

AA capable to reduce tocopheroxyl radical into tocopherol that responsible about cell membrane protection. AA performs a number of non-antioxidant roles in the cells. It has been involved in the regulation of cell cycle progression from G1 to S phase, cell division, and cell elongation [8,9].

**Glutathione (GSH):**

"Tripeptide glutathione (□glutamylcysteinylglycine)" is a plentiful compound in the tissues of plants. It is found in all compartments of the cell such as cytosol, mitochondria, and endoplasmic reticulum [10], were GSH has many roles in organisms such as storage for the sulphur, serve as precursors for phytochelatins, act as a detoxifier for xenobiotics via GSH-conjugation [11,12], and maintenance about redox form of the cellular membrane through (GSH-GSSG) system. Also, GSH has the ability to regulate gene expression. And regulation of cell cycle by GSH/GSSG system through -SH group [13,14].

GSH act as antioxidants through the nucleophilic center of –SH residue that responsible for higher reductive potential. So, its scavenger for singlet oxygen,

superoxide radical and hydroxyl radical by non-enzymatic reactions, and with hydrogen peroxide and reducing to water by an enzymatic reaction [15]. GSH has the ability to regenerate others antioxidants such ascorbic acid through the ascorbate-glutathione cycle [16,17].

Uric Acid (UA):

The final product of purine degradation in human and "Great Apes". It is a powerful scavenger for free radical such as singlet oxygen, hydroxyl radicals (.OH), and peroxyl radicals (RO. 2) [18,19]. In blood, stream urate considers from the major antioxidants against oxidative damage, so it is protected RBCs membrane from lipids peroxidation by scavenging oxygen radicals in aqueous media [20]. Uric acid some of the deleterious reactions, such as peroxide production by macrophages or autoxidation of haemoglobin [21].

In contrast, elevated the UA causes a lot of number from the epidemiology of hypertension [22], cardiovascular disease [23], visceral obesity [24], dyslipidemia [25], insulin resistance [26], kidney disease [19].

Gallic Acid (GA):

"GA is a 3,4,5-trihydroxybenzoic acid and its derivatives are widely spread in the plant kingdom and is a large family from secondary polyphenolic metabolites" in plants so it is from natural antioxidants [27]. GA present either methylated gallic acid form such as syringic acid, or in the orgalloyl conjugated form with catechin derivatives as "flanvan-3-ols, or in polygalloyl esters" form with glycerol, quinic acid or glucose [28].

The last two groups from "polyphenols are known as vegetable tannins, which their names derived from its ability to transform animal skins into leather" through the with collagen [29]. GA from the components of tea and some types of GA used as food additives to prevent peroxidation. Also, it is used in many phytomedicines due to its biological and pharmacological activities through the ability to free radicals scavenger [30], inducing apoptosis for the cancer cells [31,32], and inhibiting squalene epoxidase interfering the signal pathways involving calcium [33,34].

**α,α-diphenyl-β-picrylhydrazyl radical (DPPH):**

DPPH is described as relatively stable free radical due to delocalization phenomenon for the unshared electron overall whole molecule, so this radical do not suffer from dimerization as other radicals. The delocalization gives this radical the deep violet color when dissolved in absolute ethanol and absorbed at 517 nm. DPPH used to estimation the antioxidants activity for any sample or free radicals scavenging material [35].

**Material and Methods:**

**Prepared Serial Solutions:**

**Prepared Ascorbic acid solutions:**

This is done by dissolving ascorbic acid in distilled water (D.W.) as the following concentrations: 2.5, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70 mg/dl.

**Prepared GSH solutions:**

This is done by dissolving GSH in distilled water (D.W.) as the following concentrations: 2.5, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70 mg/dl.

**Prepared UA solutions:**

This is done by dissolving UA in distilled water (D.W.) (pH 8.5) as the following concentrations: 2.5, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70 mg/dl.

**Prepared GA solutions:**

This is done by dissolving GA in absolute ethanol as the following concentrations: 2.5, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70 mg/dl.

**DPPH procedure:**

**DPPH preparation:**

Prepared 0.1 mM from DPPH, by dissolving appropriate weight in absolute ethanol.

**Principle of method:**

The principle of this method depends on the reduce the absorbance values of DPPH after addition the sample due to conversion the violet colour into yellow colour depending on the antioxidants activity of the sample.

The colour intensity measured at 517 nm (36) (figure 1).

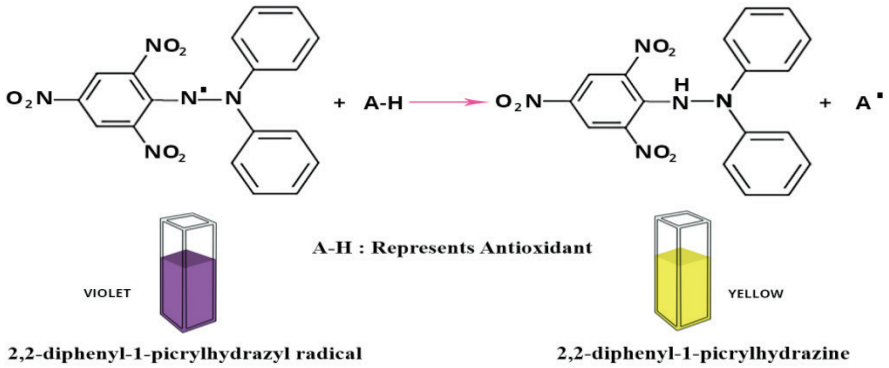

**Fig. 1: Reduction effect of AH to DPPH.**

**Procedure:** The procedure of addition as following:

| Reagent | Sample/µl | Blank/µl |
|---|---|---|
| DPPH | 1000 | 1000 |
| Sample | 100 | ------- |
| D.W. | ------- | 100 |

Incubate for 20 min at 25ºC. In the dark condition, then read the absorbance at 517 nm.

## Results and Discussion

The following results (Table 1) and (Figure 2) the inhibition values of DPPH by the antioxidants compounds. In other words, the absorption values for DPPH after scavenging by ascorbic acids, GSH, UA, and GA.

**Table 1: Absorption values for DPPH after scavenging by UA, GA, GSH, and ascorbic acid.**

| Concentration (mg/dl) of U.A, Gallic acid, GSH, Ascorbic acid | UA | Gallic acid | GSH | Ascorbic acid |
|---|---|---|---|---|
| 2.5 | 0.302 | 0.323 | 0.352 | 0.314 |
| 5 | 0.289 | 0.321 | 0.352 | 0.292 |
| 10 | 0.280 | 0.320 | 0.351 | 0.288 |
| 15 | 0.275 | 0.315 | 0.344 | 0.286 |
| 20 | 0.269 | 0.311 | 0.344 | 0.280 |
| 25 | 0.259 | 0.310 | 0.344 | 0.279 |
| 30 | 0.251 | 0.303 | 0.343 | 0.274 |
| 35 | 0.247 | 0.291 | 0.343 | 0.268 |
| 40 | 0.243 | 0.290 | 0.343 | 0.261 |
| 45 | 0.238 | 0.289 | 0.332 | 0.254 |
| 50 | 0.211 | 0.262 | 0.332 | 0.238 |
| 55 | 0.193 | 0.249 | 0.332 | 0.226 |
| 60 | 0.169 | 0.232 | 0.332 | 0.212 |
| 65 | 0.145 | 0.221 | 0.332 | 0.195 |
| 70 | 0.123 | 0.214 | 0.332 | 0.185 |

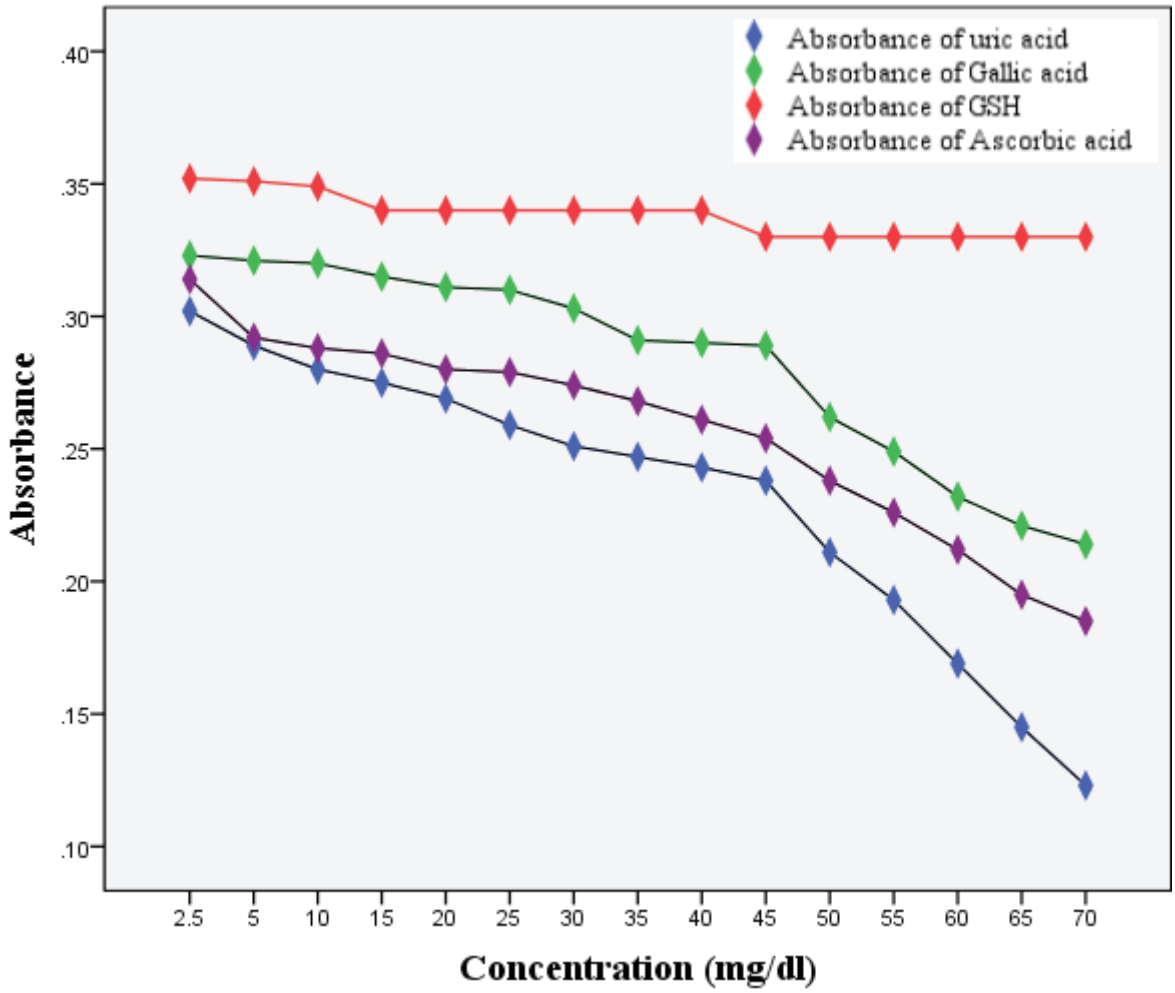

**Fig. 2: Decline in absorption values for DPPH after scavenging by UA, GA, GSH, and ascorbic acid.**

The scavenging effect for UA toward DPPH is more than other antioxidants were used in this study when compared in the same concentrations, may be due to the heterocyclic ring effect that responsible about delocalization and lowering energy of hydrogen bond with the compound (figure 3).

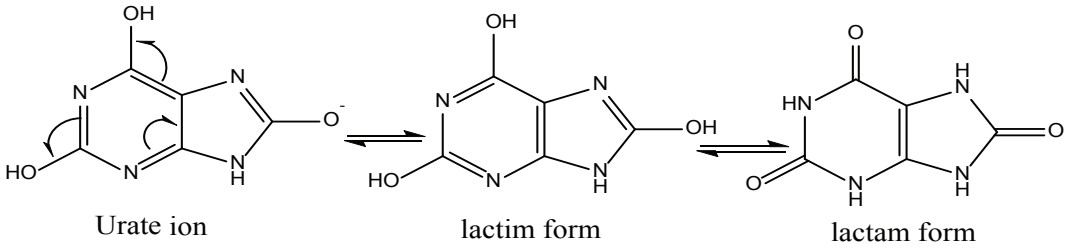

**Fig. 3: Urate tautomerism**

From the results show a slight decrease in the line chart (figure 2) for the GSH value, this means it is the weakest scavenging compared with other compounds used in this study may be due to the energy bond of hydrogen in the thiol group is relatively strongest than other compounds, therefore no change in the color of DPPH. However, the scavenging effect increased with an increase in concentrations of these antioxidants compounds.

Conclusion:

In conclusion, the strongest scavenging in vitro the compounds that have the ability to reduce the DPPH and change its the color from violet into yellow, therefore the scavenging strength follow the sequence UA, AA, and GA, where the GSH is very weakest scavenging to DPPH at the same concentrations.

# Frequency of Aspirin Misuse among Hypertensive Patients in Babylon Province

**Zahraa Fattah Ghani [1], Oday Jasim Alsalihi [2], Mustafa Shakir Mahmood[3]**

*[1]Marjan Medical City/Iraq, [2]College of Medicine - University of Babylon/Iraq, [3]Ministry of Health/Iraq*

## Abstract

**Background:** Hypertension endangering a risk of cardiovascular events and BP reduction will reduce such complications. the role of aspirin in hypertension is debated, however it is advised in primary prevention in case of patient with high risk factors assessed by one of the cardiovascular risk calculator, a state in which the benefit of aspirin outweigh the risk of complications.

**Objectives:** Estimate the prevalence of aspirin misuse in hypertensive patients ,which population at risk and estimate the possible source of this misuse habit.

**Patients and Methods:** A cross sectional study that has been conducted in babil city major hospitals for the period from the 20th of January to 2nnd of May. our study sample included 353 patients all cases were between 35 to 75 years old who attend to internal medicine outpatient clinic , emergency departments and inpatients of the above hospitals . All patient had hypertension being treated with antihypertensive agents and they did not experience any vascular events like CVA, IHD and PVD**.**

**Results:** 30.59% of patient do not use aspirin and 64.31 % of patients use aspirin prescribed by doctors. Most of aspirin use was according to doctor advice( 92.7%). 5.1 a use aspirin by advice from others. Aspirin use was more with increased age group (p value 0.003) and in females( p value is 0.04). No significant differences between educational level, economic status, residency and occupation with the use of aspirin. Regarding aspirin intake by their doctors and score <10 %: women were more than men ,age 40 – 60 years. Mostly were urban, higher education of 50% had positive history of CVD. Patient who need aspirin but they didn't use aspirin, were 66 patients mostly male live in urban area higher education , smoker , most of them had no family history of cardiovascular diseases.

**Conclusion:** Aspirin use requires coordinated interaction between patient and physician with encouraging the importance patient education about aspirin use, side effects and CVD risk and proper evaluation of patients risk factors and stratification using simplified charts accessible in health centers.

***Key words:*** *Aspirin, primary prevention ,hypertension*

## Introduction

The CVD risk associated with hypertension depend on multiple factors including age, gender, in addition to BW ,physical activity, cigarrete smoking, family history of hypertension , high cholesterol level, DM and preexisting vascular disease(1). Assessment of the risk of future CVD is an important step in patients requiring primary protection from any vascular events(2) . However, to determine the role of aspirin's in prevention of CVD, both primarily and secondarily the benefits should be balanced against the complications(3).The net benefit of aspirin in patients with known risk factors is clearly evident(4) . For primary protection ,guidelines vary about whether, and to which groups, aspirin is to be given(5) in that context, physicians should evaluate the risks and benefits of aspirin therapy for those patients free of risk factors (6)

Primary cardiovascular (CV) prevention defined as the use of pharmacological and/or nonpharmacological measures as prophylaxis of atherosclerosis to prevents

MCEs in in the absence of any history or clinical signs of underlying disease. The main outcomes to be measured are MI, stroke, and death from CVD. In addition to other outcomes including hospital admission , intervention of coronary disease, incident angina, all-cause mortality are sometimes added as ancillary end points these are applied to apparently healthy persons[7].

For the calculation of an individual probability to develop CVD all factors that contribute to the risk must be taken into account, including previous CVD events[8]. Many risk calculators are currently available that help in the detection of population at risk of developing CHDs[9].

## Patients and Method

A cross sectional descriptive study was conducted in Babylon city hospitals including al hila teaching hospital, marjan medical city and imam al sadiq teaching hospital. For the period from the 20th of January to 2nnd of May. This study has been done on patients diagnosed by their doctor having high blood pressure and take medication for it.

The data was collected using a preformed questionnaire by which the patient was interviewed after giving appropriate verbal consent .Each patient was interviewed for about 15 minutes

The questionnaire include the following Parts : Patient sosciodemographic characters (age, gender, residency, educational level, economic status, occupation and marital status,the parameters related to 10 years cardiovascular risk score, the protocol of study was approved by ethical committee of Babylon university, college of medicine. Appropriate verbal consent was taken from the patients before the interview. Confidentiality of patients data was approved by replacing names by numbers. To accomplish the study official agreement was taken from Babylon health directorate.

## Results

Table (1) shows the sociodemogrphic distribution of the study sample and the association with the habit of taking aspirin. The association between the age group and the use of aspirin was significant in which p value was 0.003. In which aspirin use was more with increased age group, also the association between gender and use of aspirin was significant when aspirin use was more in females p value is 0.04.

**Table (1): The association between sociodeogrphic characteristics of the patients and aspirin taking.**

| Characteristic | Group | Use Aspirin | Not users | P value |
|---|---|---|---|---|
| Age | up to 40 years | 4 (80.0%) | 1 (20.0%) | 0.003* |
| | 41-60 years | 144 (63.2%) | 84 (36.8%) | |

## Discussion

Hypertension causes cardiovascular and renal. Thus decreasing blood pressure reducing morbidity and mortality. The effect of aspirin on control of BP is still a matter of debate[10]. Regarding the use of aspirin in healthy or apparently healthy people as primary prevention , there are no direct proofs of its efficacy, but in low-risk populations it may be of no benefit or may be risky[7]. In 2016, the (USPSTF) recommendations about aspirin use in primary CVD prevention in has been updated . (11).They adopted a calculator derived (ACC/AHA) for assessment of 10-year risk for first hard atherosclerotic CVD event (non-fatal MI,CHD, death, and fatal or nonfatal stroke)[12].

The study dealt with patients sociodemograhpic characteristics and its association with the habit of aspirin use. The age and the use of aspirin was significantly associated, in which aspirin use was more with increasing age , in those whose ages more than 60 years (120 patients) 97 of them taking aspirin p value 0.003. In a study conducted in Canada that prospectively enrolled 3015 patients without any previous CVS diseases for aspirin use as primary protection , when compared with their counterparts, the study found that , peoples receiving aspirin were older their ages in years was 61.6±8.4 vs. 55.5±8.1 with ($P<0.0001$)[13]

A significant association was also found between gender and use of aspirin in which aspirin use was more in females patients with p value is 0.04. A similar results was found by a study of mendy et al in USA on the aspirin use in primary protection in patients without prior CVS diseases, they found that aspirin use was more in female(45.9% ) than in male(39.1% )[14] .This may because of female in our communities look for and afraid more about their health status. The study found that there was no significant differences between educational level, economic status, residency and occupation with the use of aspirin. P value > 0.05.

The study evaluate the relationship of the effect of the score value of the patients and the indication of aspirin use according to score. From the total number of the patients taking aspirin ,19.2 % of them regarded as a misuse of aspirin , which include 17.6 % whose score is below 10 and their age is more than 40 years, and 1.6 % include patients with age below 40 years that is age not assessed by the score. 80.8 % of patients taking aspirin according to score. These findings were approximately similar to a study done by Vanwormer and his associates was done to find

the relationship between; specific sociodemographic variables, and aspirin use among a representative sample of Wisconsin adults without CVD, and found that the percentage of regular aspirin intake in those without indication to take it was 18% (102 patients from the **563** patients) [15].

This study evaluated the distribution of patient who take aspirin prescribed by their doctors and their risk score was less than 10 %. Women were more than men and age between 40 – 60 years most of them were urban with medium to higher education half, of them had positive family history of cardiovascular diseases. In a study done by Vanwormer and his associates, they concluded that Aspirin intake was less by patients at high CVD risk which may have a cardiac protection effect from regular use of aspirin and excessive use in patients at low CVD risk. (15). These findings may be due to our patients themselves not complying with their following physician instruction or visiting not a specialist medical physicians with limited knowledge about the risk assessment. So to make any decision for aspirin prescription should fellow an individual clinical judgment that balance the benefits of cardio protection and bleeding risk. Patients with a higher CVD risk, have a greater benefit from aspirin. This final judgment to start aspirin therapy continuously should be made by health care personnel's , especially Primary Care Physicians (PCPs) in resource-poor areas, and they must have a knowledge about their role in assessing the benefit and risk of bleeding. [16]

The study show the distribution of patient who take aspirin. which included 5 patients their risk score was less than 10 %, and 4 patient had not included in the score whose age below 40 years. Male were predominant live in urban area, all of them were highly educated employed, also most of them had history their family of CVD, this is may be due to educated people be more aware about cardiovascular diseases. In the study of roth et al, performed in an urban county African –Americans and Hispanic adults where the quality of health care delivery should be high , they found that aspirin intake

was insufficient with high risk patients for CVD and routinely used by many patients at low CVD risk [17].

This study shows the distribution of patient who need aspirin but they didn't use aspirin , they were 66 patients mostly male live in urban area.

higher education , smoker , most of them had no family history of cardiovascular diseases. In a study done by Im et al which was conducted for assessment of the 10-year (CVD) risk and to set for the application of the current requirement on aspirin use for primary protection in Korean participants, and according to 2016 recommendation of (USPSTF), aspirin in their study was indicated in 266 participants (23.6%), but only 44 participants of them (3.9%) were on regular intake of aspirin . Among these who participates in their study, aspirin was prescribed in proper way in 36% of the participants, suggesting that only 6% of the participants were taking aspirin appropriately and 3.3% of them were taking aspirin inappropriately [18]

# Estimation of Antioxidants Activity Through DPPH Inhibition Levels In Patients with Chronic HPV 16 Cervicitis

**Ali M. A. Al-Kufaishi[1], Lamia A. M. Al-Mashhedy[2], Bushra Jaber Al-Rubaie[3]**

*[1]Iraq/Al-Furat Al-Awsat Technical University College of Health and Medical Techniques, Department of Medical Laboratory Techniques, Kufa, Iraq 31003", [2]University of Babylon, College of Science, Chemistry department/ Iraq", [3]University of Babylon, College of Medicine, Gynecology Department/Iraq*

## Abstract

In the present study, the DPPH scavenging activity from the primary methods to estimation the antioxidants activity in the body by an inverse relation between them. So, the levels of DPPH scavenging activity is reduced in the patient with HPV16 genotype chronic cervicitis (G3= 43.01±2.74 in the serum, G3= 9.73±1.53 in the mucus) and without (G2= 47.22±4.50 in the serum, G2= 15.51±1.41 in the mucus)compared with healthy women (G1= 64.79±4.87 in the serum, G1= 21.24±3.62 in the mucus), this is a return to lowering antioxidants in the patients compared with healthy women. The deterioration in the antioxidants levels can cause cancer in the future or delay the response of the medication to inflammation.

***Keywords:*** *DPPH, Antioxidants activity, Chronic cervicitis, HPV, cervical cancer.*

## Introduction

Chronic cervicitis from the widespread diseases in gynecology, caused by delayed treatment or diagnosis [(1,2)]. From the clinical symptoms for this disease include abnormal vaginal discharge, lower genital pain and constant lochia. chronic cervicitis occurs due to infected cervical by a pathogen [(3,4)]. Human papillomavirus (HPV) is a common pathogen that causes chronic cervicitis. The high-risk HPV (HR-HPV) is more than 180 genotypes that cause squamous epithelial hyperplasia because of the DNA of HR-HPV have the ability to synthesis oncoproteins that cause inhibition to tumor suppressor proteins such as "p53 and retinoblastoma protein (pRb)". So, the infected by HR-HPV can lead to "cervical intraepithelial neoplasia" or cervical precancerous lesions [(5,6)].

The chronic infection accompanied by increased free radicals and pro-oxidants, that have harmful effect to biological systems such as lipids, proteins and DNA, that cause ageing, cardiovascular disturbances, diabetes, and cancer [(7)]. While the antioxidants are the compounds, act as free radicals scavenging either by prevention or conversion mechanisms [(8)]. These antioxidants produced internally in living organs or intake by foods [(9)].

α,α-diphenyl-β-picrylhydrazyl (DPPH) is described as a stable free radical due to delocalisation electron overall whole molecule (Figure 1). therefore keep this molecule from dimerization. The DPPH from the mainly methods to evaluation of antioxidants activity for the biological systems [(10)].

## Material and Method

**Study design:**

The study design is a comparative study for healthy, chronic cervicitis patients with positive HPV 16 genotyping, and patients without HPV.

**Sample collection:**

HPV 16/18 genotyping detection by real-time PCR by taken specimens as tissues by cervical scraping and as Pap smear with mucus by the physician in the hospital Imam Sadiq and maternity hospital and children in Babil province, where keeping in (2 ml) from phosphate buffer solution (PBS), in addition to serum for the same persons. The specimens collected depend on the criteria of chronic cervicitis such as age, number of pregnancy or abortion, infection delay, smoking, vaginal bleeding, lower abdominal pain and vaginal pH.

**Sample size calculation:**

The sample size calculated by applying the following equation [11]:

$$n = Z^2 P (1 - P)/d^2$$

Where Z refer to Z-score (equal 1.65), d is the absolute marginal error equal 10%, P is the population (number of women that have cervicitis and undergo to cervical screen equal 8%), therefore the number of samples equal to twenty for each group, but have been taken more than 20 for the chronic cervicitis without HPV 16/18 and healthy control (Table 1). The samples were collected for a period of six months.

**Table 1: Groups classification.**

| Groups | Description | No. of the patients |
|---|---|---|
| G1 | Women with chronic HPV16/18 cervicitis | 20 |
| G2 | Women with chronic cervicitis | 40 |
| G3 | Healthy women | 40 |

**Viral DNA extraction:**

Depended on viral gene-spin DNA extraction kit, can be extracted DNA and prepared to real-time PCR.

**Real-time PCR procedure:**

Have been used Bosphore HPV genotyping kit for real-time PCR to detect HPV 16/18 genotypes [12,13].

**DPPH procedure:**

Principle:

DPPH has violet colour due to this delocalisation when dissolved in ethanol and absorbed at 517 nm. This radical can accept a hydrogen atom from antioxidants to reduce the colour intensity from violet to yellow colour depending on the antioxidants power (Figure 1).

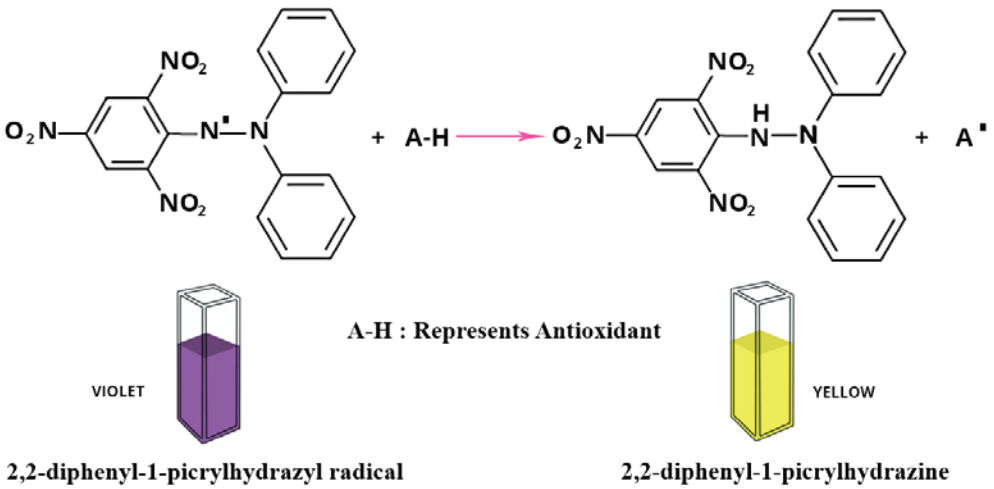

**Fig. 1: DPPH reaction with A-H.**

**Procedure:**

With minor modify prepared the reagent 1 (R1), DPPH (0.1 mM) in absolute ethanol, and control from ascorbic acid (20 mg/dl), then the following steps [14]:

| Reagent | Sample/µl | control/µl | Blank/µl |
|---|---|---|---|
| R1 | 1000 | 1000 | 1000 |
| Serum | 100 | ------- | ------- |
| Control | ------- | 100 | ------- |
| D.W. | ------- | ------- | 100 |

wait for 20 min at 25ºC. within dark condition, read absorbance at 517 nm. The results can be calculated by the f ollowing relation:

## Statistical Analysis

The data were entered into SPSS program version 23 to get on the variables as mean, standard deviation (SD), standard error (S.E), confidence interval and "one-way ANOVA. A p value of ≤ 0.05 was considered to be significant".

## Results and Discussion

The results for the sixty women that undergo to cervical screen represented only twenty from the patients that suffer from the symptoms that related with chronic cervicitis have HPV positive of 16 genotype only according to real-time PCR results as showing from the amplification plot (Figure 2). Where another forty also have chronic cervicitis but due to other causes than HPV 16/18 genotyping.

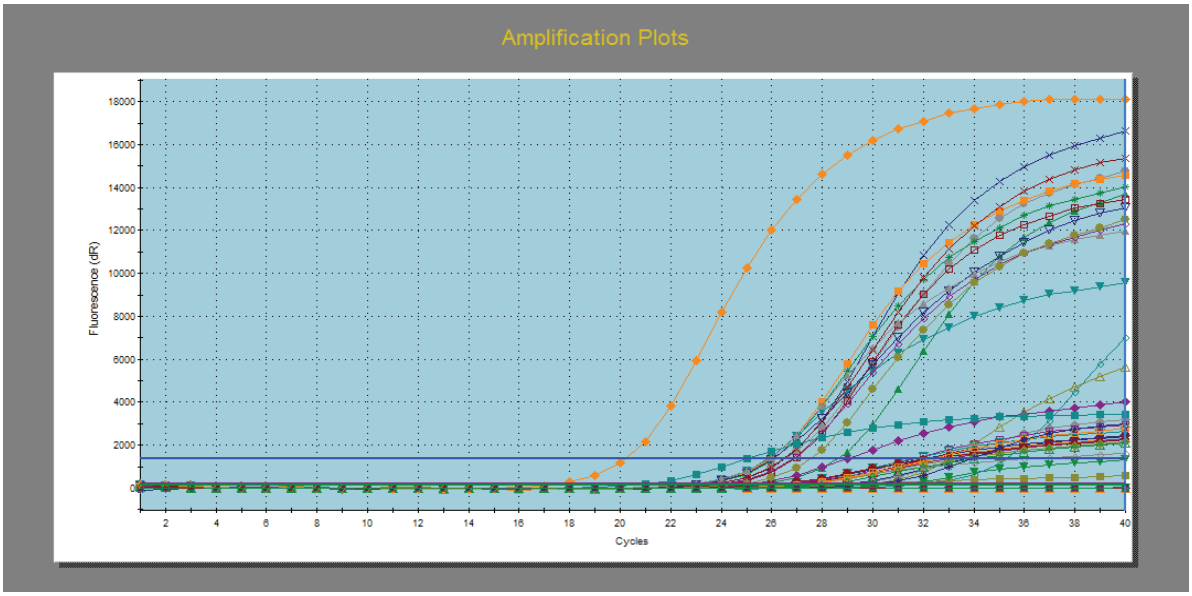

**Fig. 2: Amplification plots of real-time PCR.**

The DPPH results represented in (Table 2), were the results in G3 show the significant decrease in DPPH scavenging compared with G1, and G2 compared with G1, also in G3 compared with G2.

**Table 2: DPPH scavenging activity.**

| Groups | | DPPH scavenging % (Mean ± SD) | S.E | Confidence Interval 95% | | P-Value |

The investigations of this results may be due to the chronic infection in cervix cause increased the number of leukocytes in the location (mucus) of inflammation and this lead to elevated levels of reactive oxygen species (ROS) such as superoxide and hydrogen peroxide to destroy the microorganisms that cause this inflammation such as HPV, bacteria or fungi. Also depletion of antioxidants in the immunity defense process.

Moreover, there are found significant lowering in G3 compared to G2, because of the viral cause desquamation for the epithelial tissues in chronic cervical infection and maybe cause epithelial cells necrosis, then increase electron leakage from the mitochondria and depleted the antioxidants. Therefore, the lowering antioxidants in the body (serum) or cells lead to reduce the ability to scavenging DPPH compared with healthy persons.

## Conclusion

In brief, DPPH scavenging activity from the primary methods to estimation the antioxidants status of the body. In the patients show the lowering in the antioxidants due to inflammation compared with healthy women. The deterioration in the antioxidants levels can cause cancer in the future or delay the response of the medication to inflammation.

# Postoperative Hypothermia in Surgical Patients at Azadi Teaching Hospital

**Anas Amer Mohammad[1], Mehvan Jameel Ahmed[2],**

*[1]F.I.B.M.S anaesthesia & intensive care, ass. Prof. university of Dohok /Iraq, [2]diploma of anaesthesia, Dohok medical director/Iraq.*

## Abstract

**Introduction:** The sensation to cold, shake occurrence and shivering are events that are commonly developed following general anesthesia administration postoperatively. Hypothermia has been considered as the most frequent outcome of surgery underwent by anesthesia. Inadvertent hypothermia has been taken into account as common side effect in the postoperative period immediately and it is related to wide impairments and anomalies of different body organs. Concentration on predictive factors of hypothermia would be important to reduce the incidence rate and correct preventable unnecessary risks for patients in the health settings following surgical operations. The aim of study is to assess the magnitude and associated factors of postoperative hypothermia recovery room in patients underwent general anesthesia. **Methods:** A hospital-based prospective cross-sectional study was conducted on200patients with different age groups of both genders who underwent a scheduled non-cardiac surgery and general anesthesia consecutively during the period between the October 1st and the November1st2016. **Results:** The study revealed that the overall core hypothermia in the study sample was31%. The study showed that the post-operative temperatures decreased statistically significantly in all study patients and separately in adults, children, males, or females P<0.001. The study also revealed that the operation duration(p=0.045)and pre-operative temperature P<0.001were predictors of post-operative hypothermia in study sample. **Conclusions:** The incidence of hypothermia among study sample was not so high. A significant reduction in core body temperature of patients between pre and post-operation times was found. Those patients with longer operation duration, lower room temperature, and lower pre-operative temperature were at more risk of post-operative hypothermia.

***Keywords:*** *core temperature, hypothermia, anesthesia, post-operation.*

## Introduction

The sensation of patients to cold, shake occurrence and shivering are events that are commonly developed following general anesthesia administration postoperatively. Hypothermia has been considered as the most frequent outcome of surgery underwent by anesthesia. A highly evolved characteristics of mammals and birds are called homothermous assist body in regulating and maintaining the internal body temperature close to constant and largely independent on the surrounding environment temperature The patients undergo regional or general anesthetic inducing changes in regulation of body health mechanisms together with exposure to cold in the operating room or environment of dental surgery take part in hypothermia [1].Normothermia or normal body temperature is defined when the core body temperature has the range36.5-37.5±0.5$^0$C. Hypothermia is defined as any core body temperature below1C in "Homothermous". Therefore, a core body temperature less than36$^0$Cis considered as hypothermia [2].The temperature range 32$^0$C-36$^0$C is considered as mild ,28-32$^0$C as moderate, and below28$^0$C as severe hypothermia [3,4].Some impairments resulted from hypothermia are reduction in the release of oxygen to the tissues [5], myocardial contractility, peripheral vasoconstriction [6], mismatch of ventilation-perfusion, blood viscosity increase, and left shift in the

E-mail: dr.anasajam@Yahoo.com

curve of oxyhemoglobin-dissociation [7] Moreover, the hypothermia is responsible for reduction in the function of platelets [8] and decrease in coagulation cascade activation [9] Concentration on predictive factors of hypothermia would be important to reduce the incidence rate and correct preventable unnecessary risks to patients in health settings following surgical operations. Therefore, the normal body temperature will be helpful in the reduction of hospital stay, infection of surgical site, blood transfusions postoperatively, pressure ulcers, disconformity and mortality [2]. The aim of this study is to assess the magnitude and associated factors of postoperative hypothermia at recovery room in patients underwent general anesthesia in Azadi Teaching Hospital.

## Material and Method

Cross-sectional study was conducted in Azadi Teaching Hospital and included 200 patients with different ages groups of both gender who underwent a scheduled non-cardiac surgery and general anesthesia consecutively, a pre-designed questionnaire included name, sex, age, ASA physical status, operation duration, operation room temperature, pre-operative core temperature, post-operative core temperature, and administered intravenous fluids amount in the time of anesthesia. The physical examination was conducted for all patients in order to exclude those patients with fever, sepsis, and ear infection, patients with thermos-regulation abnormalities, and those with hypothyroidism or hyperthyroidism history from the study. In addition, the patients were treated under local anesthesia were not included in the study as well. The core temperature (Tc) of each patient was measured using infrared tympanic membrane thermometer (ThermosScan® Type 6014 Pro 3000 Welch Allyn Medical Products). the tympanic membrane and hypothalamus have the same arterial blood supply arising from the carotid artery, so the membrane directly reflects core temperature [10]. The measurement of tympanic membrane temperature was performed before surgery commencement and on the arrival of the patient at the recovery room. The ear pinna was softly pulled backwards and the thermometer was insulated into the external auditory meatus, turned and directed towards the patient eyes. According to the manufacturer's instructions, the probe of the thermometer remained inside the ear patient for 1 to 2 seconds in that position to hear a beep sound of the device. A second measurement of the tympanic temperature was performed after two minutes to avoid the temperature difference of the device and the researcher error measurement and their average considered as the result. The protocols of the manufacturer were strictly followed during the entire study period [11]. Statistical analysis done by SPSS 23, the independent t-tests, paired t-test, and ANOVA one-way were utilized for the association of continuous and nominal variables, respectively. Table 3.1. The American Society of Anesthesiologists classification of physical status[12]

| **ASA Classification** | **Definition** |
|---|---|
| ASA I | A normal healthy patient |
| ASA II | A patient with mild systemic disease |
| ASA III | A patient with severe systemic disease |
| ASA IV | A patient with severe systemic disease that is a constant threat to life |
| ASA V | A moribund patient who is not expected to survive without the operation |
| ASA VI | A declared brain-dead patient whose organs are being removed for donor purposes |

## Results

The results obtained from the present study showed that the mean age of study sample was 29.86 ± 16.77 year. The percentages of the males and females were so comparable, 49.5% and 50.5%, respectively. More than two-third of the patients (75.5%) were aged 18 years or older and the remaining ones (24.5%) were less than 18 years old, as shown in table 1. The majority of the patients were located in ASA I (66.5%) and ASA II (25.0%). The mean of the operation duration was 50.32 ± 26.83 minutes. The mean of the IV fluid injected into the patients with various operation types was 881.80 ± 526.91 mL. In addition, the mean of pre and post-operation temperatures in the patients under study were 36.61 ± 0.45 $^0$C and 36.14 ± 0.49 $^0$C, respectively.

**Table 1: Baseline charactersictis of study patients**

| **Patients' Characteristics (n=200)** | **Frequency Distribution** | |

| Pre-Operation Temperature0C | 36.61 | 0.45 |
| Post-Operation Temperature0C | 36.14 | 0.49 |

The incidence of post-operation core hypothermia was shown in table 2. The study revealed that the overall core hypothermia in the study sample was 31.0% (mild hypothermia-62 patients). This hypothermia was higher in males (34.3%), adult patients (42.9%), and those with duration of less than 2 hours (31.6%).

The core temperatures measured throughout the study duration in pre-operation and post-operation were compared by means of the statistical analyses as shown in table 3. The study showed that the post-operative temperatures have been decreased, statistically significantly in all the patients under study and separately in adults, children, males, or females (P<0.00001).

**Table 3: Comparison of pre and post-operation temperatures in study patients**

| **Categories** | **Pre-operation Temperature 0C<br>Mean ± S.D. & Range** | **Post-operation Temperature 0C<br>Mean ± S.D. & Range** | **p-value (two-sided)** |

| Paired t-test was performed for statistical analysis. | | | |

The post-operative core temperatures were compared between adults and children, in addition, between males and females and in order to understand to what extent the temperature has been reduced as compared to each other. The study showed a non-significant differences in the post-operative temperatures between adults and children (p=0.059) between males and females (p=0.256) and also between different ASA groups. Table 4.

**Table 4: Comparison of post-operation temperatures between adult and pediatric samples of the study**

## Discussion

The incidence of inadvertent post-operative hypothermia among a Kurdish sample in Iraq was 31.0% with mild severity only also showed a significant reduction in the overall post-operative core temperature, with both genders, and different age categories so lower compared to other studies reported 57.8% hypothermia in 185 adult patients underwent scheduled emergency non-cardiac surgery in ICU admission [13], 44.8% hypothermia in operations of more than two hours [14] and 32% in another study [15], study showed that male patients were more affected by hypothermia (34.3%) compared to females (27.7%) and adults (42.9%) compared to pediatric patients (27.2%). However, the overall differences of hypothermia between males and females (p=0.059) and between adult and pediatric patients (p=0.256) were not statistically significant. This reflects this reality that every person could be at risk of hypothermia. Although the elderly and very younger patients are more at risk of hypothermia [16].

they reported that those with major-plus surgery, longer operation duration and>2 h, intravenous unarmed fluid infusion (>1000 ml) significantly are at risk of core hypothermia similar to study reported that those patients with elevated baseline core temperature prior to anesthesia) and high ambient temperature) are significantly lower at risk of core hypothermia[15], we found there is a positive correlation between the operation duration and post-operative core temperature (r=0.056), but not significantly (p=0.429), possibly due to insufficient sub-sample size as those =>120 min operation duration were only 4 patients which is in agreement with another study [17] the patients with higher ASA physical status were more at risk of hypothermia [2]. In our study we could not find any significant correlation between post-operative hypothermia and different ASA physical status (p=0.404). This may be attributed to small sample size in those with ASA III and ASA IV. According to the guidelines of the National Institute of Health and Clinical Excellence (NICE), it is necessary that in high-risk surgeries, perioperative temperature must be followed rigorously when the oral temperature is below 36ºC. Such patients must be warmed for 20 minutes before surgery commencement with convenient techniques [18]and [19] respectively.

**Conclusions:** The incidence of hypothermia in our study sample was not so high (31.0%) defined as =<36 $^0$C.. A significant reduction in core body temperature of patients between pre and post-operation times was found (P<0.00001). Those patients with longer operation duration, lower room temperature, and lower pre-operative temperature were more at risk of hypothermia.

# Histological and Biometric Study of the Effects of *Fusarium Graminarum* Silver Nanoparticles on the Kidney in Male Albino Mice

**Sahar A. H. AL-Sharqi**

*Assistant Professor / Dep.of Biology,College of Science, Mustansiriyah University, Baghdad/Iraq*

## Abstract

An approach to synthesizing silver nanoparticles(AgNPs)using a Fusarium graminarum fungus was established in the present study.These nanoparticles are identified with the following techniques to confirm the form, size, and other physical properties of the crystal:UV-Visible Spectroscopy(UV-Vis),where the AgNPs showed absorbance at 420 nm, while X-Ray Diffraction (XRD)showed diffraction peaks at(38.05°,4 nm).The experiment consisted of 40 mice divided into two groups, the first group of 20 mice was considered to be the control animals and the other group 20mice was 21day of treatment with a dose of AgNPs(0.1ml/ day).Microscopic examination of the kidney section showed lobulated glomeruli,a large area of hemorrhage, changes in degeneration, and inflammatory cell infiltration. Biometric changes of the renal corpuscle showed no significant difference between the study group,while Bowman's capsule,Proximal,and distal convoluted tubules revealed increased significant differences between the two groups.

***Keywords:****Fusarium graminarum, toxicity,AgNPs, kidney,Image J*

## Introduction

Nanoparticles are defined as very small individual minutes whose dimensions are between 1- 100 nanometers[1], and because of their small size compared to some materials that are more than 100 nanometers in diameter and with a large surface area in relation to their size, different degrees of biological effects, chemical reactions, and highly distinctive properties are not found in the materials.The other, because of its small size, can easily enter the cells of living things[2]. Several previously published studies reported that liver and kidneys were target sites for silver deposition[3],after the entry of silver nanoparticles(AgNPs)into human or animal bodies via several ways including inhalation, ingestion, and the skin[4]. Also, other studies documented that nanosilver had the capacity to induce toxicity and inflammatory response in these tissues[5,6].

The use of eukaryotic organisms such as Fusarium graminarum and other species has attracted considerable potential for producing large-scale metal nanoparticles because the enzymes that are secreted by the fungi are an essential component for the biosynthesis of metal AgNPs due to their excellent properties and specific characteristics.As well as its therapeutic potential for treating a variety of diseases including acquired immunodeficiency syndrome and retinal neovascularization[7].

The aim of the study is to know the effects of AgNPs from the *Fusarium* fungi in the kidney of mice in addition to studying their nanoparticles due to the lack of studies around them.

## Materials and Method

### *Fusarium graminarum* isolation

Isolated from the decayed banana fruit,*Fusarium graminarum* has been maintained by serial cultivation on potato dextrose agar medium,incubated at 28°Cfor 4-5 days,potato dextrose agar was prepared that according to the manufacturer's instructions,39gm Potato dextrose agar should be dissolved in 1000ml distilled water.Sterilized by autoclaving at a pressure of 15 lbs and temperature of 121°C for 15 minutes.It was

cooled to 45-50°C, and subsequently added antibiotic chloramphenicol(250mg/liter)to the sterile Petri dishes.Isolates of *Fusarium graminarum* is cultivated. The potato dextrose broth medium was performed by suspending 24 grams of distilled water in 1000 millilitres. Heat up full to remove the medium.Sterilize at a pressure of 15 lbs and temperature 121°C in 15 min by autoclaving.It was cooled down then added antibiotic chloramphenicol(250mg/liter).This broth was used in the extracellular synthesis of AgNPs for cultivating *Fusarium graminarum*.

**Preparing *Fusarium graminarum* AgNPs**

The 250 ml of *Fusarium graminarum* mycelia was placed in a beaker containing 100 ml of PDB medium and then incubated for 5 days at a temperature of 25±2°C. The mycelia were collected and purification with filter paper(No.42)to get rid of any remaining parts of the mycelia and then re-suspended the mycelia in 100 ml of distilled water incubated at 25°C for 24 hours.After filtering, the mycelia cells were collected and divided into two parts:

- The first part was treated with a 1mM solution of silver nitrate(AgNO3)and incubated at room temperature, which changed color to brown and was considered a positive control.

- The second part without adding AgNO3 to the filter cells,the color has not changed and is considered a negative control.

The AgNO3 can be observed by changing the color of the fungal filtrate.The concentration, size, aggregation state and crystal morphology were measured using the following techniques:

1) Atomic absorption spectroscopy flame (AASF)

The AASFexamines the concentration of the elements in a liquid sample,depending on the energy absorbed from confident light wavelengths.The silver ion concentration identified in the colloidal solution was 2.5µg/ml,where this concentration was considered stock.

2) UV–Visible spectroscopy

Ultraviolet visible spectroscopy(UV-VIS)used to investigate the characteristics of nanomaterials involving aggregation state,concentration,size,and even bio-conjugation when the absorption shapes of nanomaterials are distinguished by passing light through a sample and measuring light transmission through a sample.One milliliter of AgNPs was examined on the spectrophotometer system in the chemistry department of the College of Science at Mustansiriyah University[8].

3) X-Ray diffraction (XRD)

X-ray diffraction is an analytical technique primarily used for determining the crystallite size of AgNPs in solution[9].

4) Atomic force microscopy (AFM)

The AFM characterized biosynthesized nanoparticles.On a glass slide a tinny film of the sample was set by dipping 100µl of the sample on the slide,allow to dry for 5 minutes.The slides were scanned with microscopy by Atomic Force[10].

**Experimental animals**

The study was conducted using 40 male albino mice obtained from the Iraqi Center for Cancer Research and Medical Genetics Mustansiriyah University and their ages ranged between 8-12 weeks and a weight of 20-28 gm.During the experiment, the animals were placed under laboratory conditions of aeration, lighting, and heat.The animals were divided into two groups: the first included 20 mice as a control group, and the second included 20 mice,dosed with 0.1 ml/day for 21 days in *Fusarium* AgNPs at a concentration of 2.5 µg/ml.

**Histological and Biometrical study**

The tissue sections were prepared according to Suvaran *et al*.[11].Kidney samples were fixed with formalin (10%).After, samples were processed, embedded in paraffin waxed, cut into 5µm thick, and stained with hematoxylin-eosin stain.

Barometric measurements were performed to measure the diameters of the renal corpuscle, Bowman's capsule space and proximal and distal convoluted tubules using an Image J program (Sun microsystems,Inc.USA).

## Statistical Analysis

The statistical analysis was carried out with the software SPSS version 25.0(SPSS Inc.,Chicago,

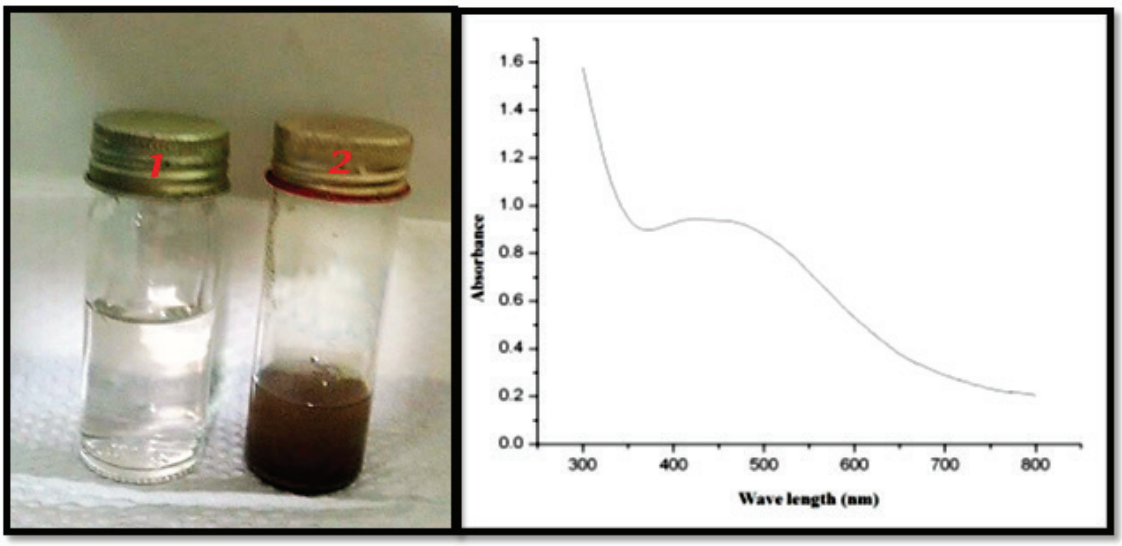
IL,USA).The data were expressed as mean±standard error(SEM).The means analysis was performed by t-test of independent-samples.A statistically significant value of P≤0.05 was found.

## Results and Discussion

### Detection of *Fusarium* AgNPs and UV–Visible spectroscopy

The synthesis of AgNPs by using *Fusarium graminarum* was showed after adding AgNO3 to the filtered cell.The color of the mixture changed from colorless to dark -brown compared with negative control remain colorless,fig.(1a)illustrated the changes in color which indicated the presence of *Fusarium graminarum* AgNPs.These results corresponding with[12],reported the appearance of brown was a clear indicator of the synthesis of AgNPs in the reaction combination.

On the other hand,*Fusarium* AgNPs properties by UV-Visible spectroscopy technique confirms the presence of Fusarium AgNPs by measuring the absorbance of the bio-reduced solution at wavelengths between 300 and 800 nm.Extinction spectrophotometer of UV and visible Vis light (UV-Vis spectrum)confirmation of the presence of Fusarium AgNPs is permitted because of a distinctive Plasmon resonance,which showed a peak absorption at 420 nm, fig.(1b).



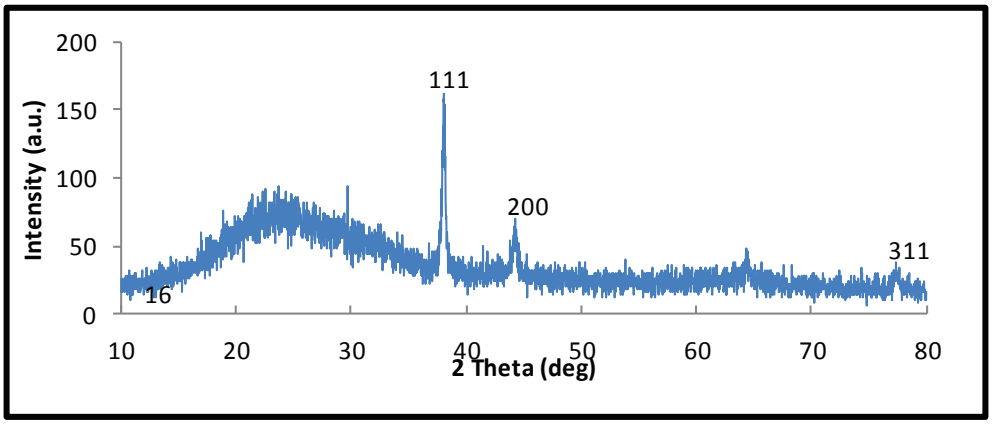
**Figure(1):(a)Synthesis of AgNPs:(1)negative control observed colorless,(2)synthesized *Fusarium graminarum* AgNPs showed brown color.(b)UV-Visible spectroscopy of *Fusarium* AgNPs**

The results corroborate those of previous studies such as Birla *et al*.[13]who showed that the absorption peak is about 420 nm,which is specific to AgNPs. There was one peak refers to the synthesis of spherical nanoparticles, and it is known that there is a very close relationship between the absorption spectra of UV-Vis and the size and shape of AgNPs.Also,Singh *et al*.[14] reported that the production of AgNPs by using endophyte fungus *Fusarium spp*.with maximum surface Plasmon resonance peak at 420 nm.Ingle *et al*.[15] reported that the UV spectrum is allowed to confirm the existence of metal nanoparticles due to distinctive Plasmon resonance.

Fusarium graminarum AgNPs characterized by XRD

The XRD pattern of *Fusarium* AgNPs as revealed in fig.(2),the diffraction peaks at 38.05°, 44.22°,64.32 and77.31°were correspondent to the(111,200,220,311) the faces of the face-centered crystal cube structure,therefore the average crystallite size was 28.225nm.

The results correspond to the results of Shafiq *et al*.[16]who revealed that the XRD diffraction measured in AgNPs resulted in four intense peaks and this further confirms that AgNPs made in extracellular filtration is present in the form of AgNPs.Also,Mahmoud *et al*.[12]reported four distinct diffraction peaks at angles 38.15°,44.18°,64.63°, and 77.50°correspond to(111,200,220 and 311)planes of the face-centered cubic.This further asserts that the AgNPs formed in extracellular filtration is present in the form of AgNPs. Also,similar results have been reported by Gholami *et al*.[17]when extracted nanoparticles from *Fusarium oxysporum*.

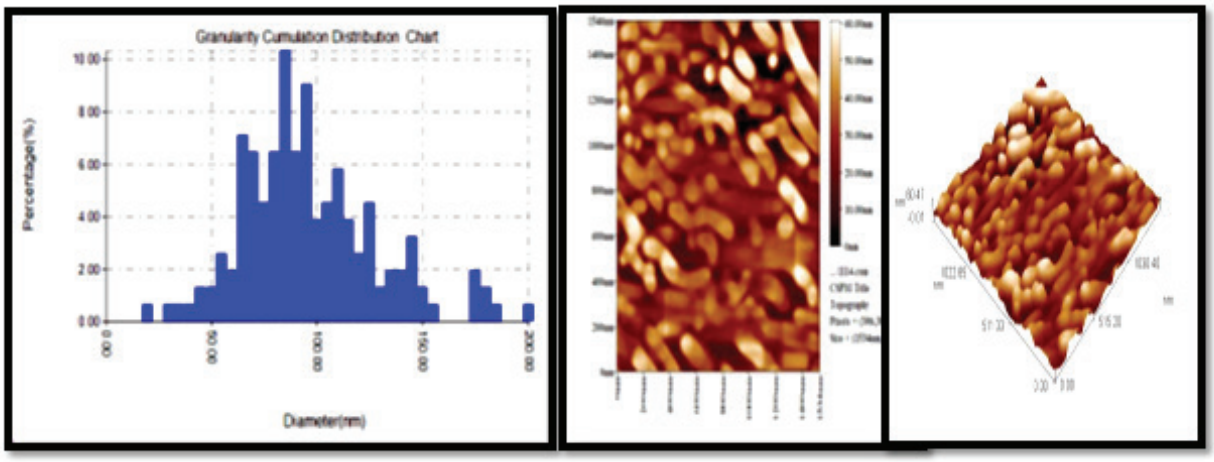


**Figure(2):X-Ray pattern of Fusarium AgNPs**

***Fusarium graminarum* AgNPs characterized byAFM**

Determine of *Fusarium* AgNPs surface morphology and sizes were measured, using the AFM. The images of AFM for *Fusarium* AgNPs in figure(3a)represented particle size distribution, where the average diameter is 94 nm.

While in fig.(3 b, c)showed AFM picture in two dimensions(2D)and three dimensions(3D),it explains structural shape for grains, found that the average roughness is 9.33 nm and Root mean square is 11.6 nm.The AFM is a very good technique for measuring surface morphology and fine structure of nanoparticles[18].The AFM topology is very helpful in revealing the exact size and shape of AgNPs[19].



**Figure(3):(a)Granularity volume distribution of *Fusarium* AgNPs.(b)AFM images of *Fusarium* AgNPs with two dimensions 2D,(c)three dimensions 3D.**

**Histological study of kidney**

Sample of control of kidney tissue demonstrated a normal histological structure of the convoluted tubules and renal corpuscles fig.(4a).In treated mice with *Fusarium* AgNPs after 21 day showed dilation in the collecting tubule fig.(4b),while, dilation in the renal corpuscle with hemorrhage in the interstitial space between the tubules fig.(4c).Also,hydropic degeneration in epithelium cells of the renal tubules with hemorrhage in the interstitial space between the renal tubules fig. (4d).

**Figure(4):Cross section of the *Fusarium* AgNPs effects after 21 day in kidney of mice detected by H&E staining:A.**control group shows normal appearance of the convoluted tubules (black arrows) renal corpuscles (yellow arrows)(X4).**B:**dilation in the collecting tubule(red arrows)(X10),**C:**dilation in the renal corpuscle(yellow arrow)hemorrhage in the interstitial space between the tubules(black arrow) (X10),**D:**hydropic degeneration in epithelium cells of the renal tubules(yellow arrow)(X40).

In the current study,the kidney tissue showed a clear effect, represented by degenerative changes in the epithelial cells lining the renal tubules when treated with *Fusarium* AgNPs after 21day.This may be due to the accumulation of AgNPs in the renal tubules, which may have led to a change in the permeability of the cell wall due to its effect on the entry and exit of ions into the cells of the renal tubules[20,21].Also, may be that most of the AgNPs is caused the renal artery damage which indicates to the detoxifying organ[22]. The toxicity of silver ions has led in a number of studies that release of silver ions (Ag+) from AgNPs could be responsible for toxic responses seen in exposures to AgNPs[23].Although there are not a mechanism of action for toxic histological changes after AgNPs treatment; but previous study hypotheses that silver nanoparticles can disrupts the,Cl- ,H+ and Na+ exchanges at the cell membrane[24].Other researcher proposed that exposure to AgNPs involved genes in inflammation and dissolved Ag implicate oxidative stress,study by Vasanth and Kurian[25]reported collected evidence suggests that the kidney is one of the major organs with reported adverse effects of nanoparticles and the accumulation of NPs in the kidney,leading to nephric inflammation, dysfunction and cell necrosis.Another research by Ma *et al*.[26]found that the AgNPs disrupt the energy metabolism and cause mitochondria and cell membrane damage in the rat kidney,which can lead to nephrotoxicity caused by AgNPs.

**Biometric study of kidney**

Table(1)shows the results of Renal corpuscle,Bowman's capsule,Proximal convoluted tubules, and Distal convoluted tubules diameter respectively in the control group compared with the *Fusarium* AgNPs group.Non-significant different($P<0.05$)is found in Renal corpuscle diameter of *Fusarium* AgNPs group(68.54±1.39µm)compared to that of the control group(70.45±0.66 µm).

Statistically increased significant difference is found in Bowman's capsule diameter between *Fusarium* AgNPs group(15.96±0.34 µm)as compared with the control group (8.04±0.13µm).The expansion of Bowman's capsule may be due to the contraction of the glomeruli of the renal glomeruli or to the destruction of the Bowman's visceral layer[27].Roda *et al*.[28]were evaluated to examine renal responses 28 days after a low AgNPs dose,the AgNPs caused dilatation of the intercapillary and peripheral Bowman's space was showed, as well as with glomerular shrinkage.

On the other hand, increased significant difference is found in Proximal and distal convoluted tubules diameter between *Fusarium* AgNPs group(41.38±0.26,41.66±0.42µm) as compared with the control group(37.82±0.60,37.22±0.33µm)respectively. The appearance of glomerular atrophy and disruption in renal tubules is consistent with Sardari *et al*.[29]which pointed when exposed to AgNPs showed damages in the epithelial lining of renal tubules leading to increased glomerular pressure.Furthermore, study of Meyer[30] revealed that glomerular atrophy might occur to decreased the filtration process in response to damaged tubules,which caused by heavy metals. Another study by Tiwari *et al*.[31]point out that exposed to AgNPs could be affected due to damaged brush border of epithelial lining of Proximal convoluted tubules.

**Table(1): Biomatric changes of renal corpuscle, Bowman's capsule, Proximal and distal convoluted tubules**

| Diameter / µm | Control group n=20 | Fusarium AgNPs group n=20 | P-Value |
|---|---|---|---|
| Renal corpuscle | 70.45±0.66 | 68.54±1.39 | 0.24(NS) |
| Bowman's capsule | 8.04±0.13 | 15.96±0.34* | 0.00 |
| Proximal convoluted tubules | 37.82±0.60 | 41.38±0.26* | 0.00 |
| Distal convoluted tubules | 37.22±0.33 | 41.66±0.42* | 0.00 |
| *signification differences between group(p< 0.05).NS:no signification | | | |

## Conclusion

Our study concluded that because of its ability to enter and translocate within the cell, the size of the AgNPs varies with its toxics effects on the cell and the cell organelles.Therefore,it could be assumed that all nanoparticles are toxic and most likely only free nanoparticles that can penetrate small organelles like mitochondria may trigger adverse health effects. Hence,the AgNPs *Fusarium*.

# Assessment Hormonal Disorders of Women in Oral and Vaginal Changes

**Karama M.T AL-Nuaimy**

*Assist Prof. Department Of Dentistry/ AL-Zahrawi University College/ Karbala, Iraq*

## Abstract

Hormonal deficiencies may contribute to the development of abnormalities of oral and vaginal tissues, such as pain, desquamation, recurrent oral, vaginal ulceration and delayed post-surgical healing .This study was done to determine the differences of cell activity in oral and vaginal mucosa .

A total of 200 females of different age groups were used in this study Oral smears were obtained from the buccal mucosa by scraping the area gently using a wooden tongue depressor while vaginal smears were obtained from the proximal portion of the lateral wall of the vagina using Ayre's spatula by scraping the area gently . In order to find to change in mucosa during different phases of menstrual cycle .

In two groups the present results revealed that vaginal cytological patterns of each group is similar to the oral cytological pattern with some differences .

In conclusion significant correlation between the hormonal fluctuations in woman and the degree of maturation of their oral epithelium was revealed in this study .

***Keywords:*** *Oral discomfort; Vaginal discomfort, clinical aspects; vaginal cytological ; toxicity.*

## Introduction

The oral mucosa member itself is composed of two layers the Lamina propria and the surface epithelium . Abasement membrane separates the Lamine propria from the stratified squamous epithelium [1] while the genital tract in women consists of vagina, uterus, fallopian tubes and ovaries, the vagina is a fibro muscular tube consisting of inner mucosa and other muscular layer which leads from the uterus to the Vulua [2,3] .

The periodic and cyclical shedding of progestasional endometrium accompanied by loss of blood . It occurs approximately 28 days intervals period of cycle normally range from twenty-five to thirty-five days [4,5,6].

Cyclical changes involve the hypothalamus, the pituitary gland, the ovaries, the endometrium and the secondary sex organs [6] .

The oestrogen secreted by the granulosa and cells of the ovarian follicles and subsequently by the same cell from the corpus luteum [6,7] .

The progesterone is an endogenous steroid and sex hormone involved in menstrual cycle – it belongs to a group of steroid hormones [8,9] .

## Material and Method

The correction of samples started from January to December 2019 from 200 women non-pregnant not take contraceptive pills, with regular menstrual cycle the age range between 18-30 years old .

Oral smears were obtained from the buccal mucosa by scraping the area gently using a woodern tongue depressor. While vaginal smears were obtained from the proximal protion of the lateral wall of the vagina using Ayre's spatula by scraping the area gently .

Women are divided into two-group .

**Group I:** Females having a normal and regular menstrual cycle from samples were collected the time period from day 10-18 this time period revealing a predominance of oestrogen influence . Total No. of this group (100) .

**Group II:** Females having a normal and regular menstrual cycle from whom samples were collected on any day during the time period revealing a minimal oestrogen influence and predominant progesterone effect .Total No. of this group (100) .

Each subject required to complete aquestionauire which established name, age, occupation, address, smoking habits, day of menstrual cycle, present medical history, past medical history and hormone therapy .

Then all smears were prepared promptly and fixed immediately because exfoliated cells degenerate rapidly . smears are fixed in 95% ethylalcohol and them stained heamotoxyline and easine method .

Then prepared smears were screened and evaluated for female hormonal effect the karyopyknotic index K.P.I was used for evaluation of oestrogen hormone effect while crowded index Cr.I for progesterone hormone effect .

## Statistical Analysis

The result were presented as mean ± S.D (Standard deviation) for all group .

The result were analyzed by using students t-test and correlation coefficient test with $P < 0.005$ as the limit of significance.

**Table (1) : Age (mean, range) and standard deviations of women groups .**

| Group | Total | Age (years) Mean + S.D | Range |
|---|---|---|---|
| I | 100 | 27.02 + 6.12 | 18 – 30 |
| II | 100 | 24.23 + 6.82 | 18 – 30 |

**Table (2) : Mean and standard deviations of K.P.I and Cr.I. of both oral and vaginal smears of each group of women .**

| Group | V.K.P.I. | O.K.P.I. | V.Cr.I. | O.Cr.I. |
|---|---|---|---|---|
| I | 72.12+10.24 | 61.73+12.02 | 57.21+10.12 | 51.24+10.01 |
| II | 45.21+10.44 | 41.91+10.10 | 78.35+28.72 | 67.32+27.01 |

**Table (3) : The coefficient correlation factors (r), t and probabilities for two group of women .**

| Group I (n=100) | | Group I (n=100) |
|---|---|---|
| V.K.P.I. | r = 0.92 | r = 0.82 |
| | t = 13.82 | t = 19.27 |
| O.K.P.I. | P < 0.001 | P < 0.001 |
| V.Cr.I. | r = 0.92 | r = 0.98 |
| | t = 16.24 | t = 77.28 |
| O.Cr.I. | P < 0.001 | P < 0.001 |

## Result

Oral and vaginal smears were studied on 200 women with normal and regular menstrual cycle, The use of oral and vaginal smears for the assessment of sex hormone activity is a very convent method which offers contain advantages over other techniques . It is cheap, doesn't hurt the patient .

The mean age and standard deviation for each group in shown in table(1).

The mean K.P.I. and Cr.I. of both oral and vaginal smears with their standard deviation for each group is shown in table (2) . The coefficient correlation factors (r), student's t-test and probabilities (p) for each group is show in table (3) .

The vaginal and oral smears presented contain difference .

1) Non based cells found in mouth smears .

2) Most of intermediate oral cells showed purple or deeply stained granules in their cytoplasm .

3) The similar between mouth cells with nuclei and the vaginal smears with nuclei common pykontic .

4) In vaginal smears the white blood cells more and rarely found in the oral smears .

## Discussion

The research for comparing epithelium smears in oral and vaginal at different hormonal changes such as in variant phases of menstrual cycle .

It found the vaginal smears are important in study same change in oral smears which posses contain feature similar with vaginal [10] .

The study of effects oestrogenic and gonadotrophic hormones in females for treatment a menorrhea or other defects . If oestrogenic injected into castrated females the microscopic finding changes in keratin formation [10,11].

The cycle changes of oral mucusa during the course of a normal menstrual cycle of healthy women have been examine by different authors in the last few decades .

The alteration in cells of the oral cavity conciding with changes found in the vaginal smears thus reflecting the hormonal state of the menstrual cycle [10] .

The present study revealed that the oral smears which prepared from women during a predominance of oestrogen presented an increased number of superficial epithelial cells with pyknotic nuclei . The oral smears which prepared from women during a lower amount of oestrogen and a predominance of progesteron presented the presence of an increased number of intermediate epithelial cells, with a significant decrease in the number of superficial cells with pyknotic nuclei, therefore there is typical hormonal changes in buccal smears of the young women that corresponded with the stages of their menstrual cycle .

## Conclusion

In conclusion significant correlation between the hormonal fluctuations in woman and the degree of maturation of their oral epithelium was revealed in this study . The mouth and vaginal epithelium show parallel variants in degree of maturation of this study during menstrual cycle .

The oral smears despite it's technical advantage can not replace the vaginal smears .

# A Difficulty Chart for Estimation of Treatment Duration of Palatally Impacted Canines

**Riyadh A. Ruwiaee[1], Dhuha A. Al-Ali[2], Mushriq F. Abid [3]**

*[1] BDS, MSc/ Post Graduate/ [2] BDS, MSc / post graduate, [3]BDS, MSc, PhD Assist Prof. / Department of Orthodontics/College of Dentistry/University of Baghdad*

## Abstract

Treatment of maxillary impacted canine is a challenging process to dental specialists and orthodontists. The aim of the present study was to assess the duration of orthodontic treatment of palatally impacted canines, using a difficulty chart as an estimate of the prognosis, and relating it to the treatment time and to other factors that might affect the treatment duration. A cross-sectional study was undertaken using a self-administered questionnaire to be completed by orthodontists (82 participants). An index was used as a tool to assess the prognosis and treatment duration. The study found that 48.7% of active orthodontic treatment time for palatally impacted canines was completed in 1.5 to 2 years. The number of active treatment visits per patient was between 16 and 22 (62% of treatment visits). In terms of the treatment performed, 81.7% of cases had space created prior to surgical exposure, and 59.8% had open surgical exposure. Failed to attend visits by the patient accounted for 48.4% and 62.2% did not require repeated surgical exposure. Interestingly, 85% of the cases had 'good' or 'average' prognosis (49% and 36%, respectively). A prognostic chart can provide an estimate for the treatment time to bring a palatally impacted canine into the arch. This information might be valuable for both orthodontists and their patients, to estimate the time of the planned treatment and provide a valid consent form.

***Keywords:*** *Palatally impacted canine; Treatment time; Difficulty chart, Surgical exposure.*

## Intoduction

The maxillary canine plays a major role in the aesthetic and functional aspects of the occlusion and its absence should be avoided wherever possible. [1] This tooth is considered as the most frequently affected tooth with eruption problems, following the third molar, with a reported prevalence of 0.92% to 6.04%. [2,3] Data from previous studies suggests that, 85% of canine impactions occur palatally and 15% buccally, moreover 8% to 10% of canine impactions occur bilaterally. [4]

Several studies have linked canine impaction with multiple etiological factors such as anomalies and absence of lateral incisors, ectopic tooth germ position, the presence of mechanical obstruction, and genetic factors. [5] The treatment of palatally impacted canines is a common challenge faced by dental professionals in daily practice. Different types of treatment modalities have been suggested, including early interceptive or late management, that combines surgical–orthodontic methods. [6,7] Canine extraction and auto-transplantation have been suggested as an alternative way of management. [8,9] Special biomechanics and anchorage are always required during canine traction, such as large cantilever wires with adequate support for the adjacent teeth. [10,11]

The active orthodontic treatment time is defined in relation to either the bonding of a fixed orthodontic appliance or the final realignment of the impacted canine within the dental arch. Published data shows the overall treatment time ranging from 19.6 to 28.8 months, with large individual variations. [12] The number of orthodontic dental visits required to treat ectopic maxillary canines in past studies has varied from 17.7 to

**Corresponding Author:**

39.8 appointments. [12,13]

Any treatment of palatally impacted canine is considered complex. [14] This complexity depends on several factors including the location (palatal, buccal), the angle of impaction, and how close the canine is to the midline. [15] Other factors that might complicate and increase the treatment time include unfavourable impaction, the method of exposure and traction, whether space has been created pre-exposure, the age of the patient, and appointment numbers relating to active orthodontic treatment. [16] Several classifications have been advocated to quantify the severity of canine impaction and to estimate the prognosis, considering how complex the treatment of each case could be. [17,18] According to the Ericson and Kurl classification, an impaction close to the midline is considered complex and requires special biomechanics. [19] Similarly, a horizontally impacted canine (angle of impaction) is more challenging and may compromise the prognosis. [20] Information about orthodontic treatment time and prognosis needs to be given to patients when discussing treatment options in order to obtain valid informed consent.

To our knowledge, no previous study in Iraq has addressed the prognosis and the actual treatment time needed to bring the canine into the dental arch. This study sets out to assess the treatment difficulty and duration of palatally impacted canines, with the help of an index (chart) especially used to estimate the prognosis of treatment.

## Methods

This is a cross-sectional descriptive study designed with the aid of a self-administered questionnaire. The study was conducted in the College of Dentistry (Baghdad University) from April 2019 till October 2019. The study population included orthodontist specialists working at academic institutions, private clinics, and hospitals: all were invited to participate in the study. Overall, a total of 120 surveys were distributed, of which 38 were excluded as they were inappropriately filled in or incomplete; in the end, only 82 questionnaires were eligible for data analysis. The study was approved by a local committee in the Orthodontic Department at the College of Dentistry (Baghdad University).

This survey, in the form of a questionnaire, focused only on patients with palatally impacted canines (unilateral or bilateral) who had received treatment from the orthodontists. For example, one case was selected in which the canine was tracked to its ideal position in the arch using a fixed appliance; this case was chosen by the orthodontist to be one of the best cases that was treated, and the treatment was completed on time. It involved the selection of the prognostic factors and the canine position relating to the treated case, using the parameters from previous studies. [21,22] A chart recommended by the Royal College of Surgeons (RCS Eng) guidelines was given to the orthodontists to estimate treatment difficulty and prognosis [17], as shown in Figure 1. The prognosis considered 'good' was when all four categories were good, 'average' prognosis was considered when only two categories were 'good'. 'Poor' prognosis in all of the categories was considered to be 'poor'.

The questionnaire involved several questions in the form of closed questions, such as the active orthodontic treatment time was specified as the time from the bonding to the debonding of the fixed appliance, and the time needed to realign the canine to correct occlusion (from exposure time to the dental arch) to bring the canine in occlusion. Other details were recorded, including: the total number of active visits, the orthodontic anchorage devices used, the time taken for canine realignment from exposure to correct occlusion, the radiographic assessment, age and gender of the patient, whether the impaction was unilateral or bilateral, the method of exposure and mechanical traction, pre or post exposure space creation, number of failures, and emergency visits and failed to attend visits during the course of the orthodontic treatment (Table 1). The survey was piloted by ten orthodontists to assess the suitability of the questions which were reviewed and adjusted to ensure scientific accuracy. The data was analysed using Microsoft Excel starter 2010 (Microsoft Corporation).

## Results

Data from 82 orthodontists for 82 patients with palatally impacted canines were collected and analysed with a response rate of 68.3%. About two-thirds of the patients were females (65.9%), and the age range of the patients was 12 to 20 years (mean = 14 years old). Unilateral canine impaction accounted for 69.5% of the

cases.

The survey revealed that 49% of active orthodontic treatment for palatally impacted canines was completed in 1.5 to 2 years, with a mean of 21 months (Figure 2A). Sixty-eight percent of the patient's canine realignment (from exposure to the correct occlusion) was achieved in 15 months (range of 12 to 18 months). Sixty-two percent of active treatment visits made by the patients were between 16 to 22, with a mean of 19 visits (Figure 2B).

In 81.7% of the cases, space for the impacted canine was created prior to exposure, and in 59.8% open surgical exposure was performed (Figure 3A). The number of visits failed to attend by the patient during the treatment was 48.8% (less than four visits) (Figure 3B), and 62.2% of the patients did not require additional or repeated surgical exposure (Figure 3C).

Regarding the estimation of treatment difficulty, using the chart provided, four categories were included: incisor overlap, vertical height, and the angulation and position of the apex. The results revealed that 51.3% of cases had a 'good' prognosis, and 34.1% had an 'average' prognosis, while 14.6% of cases had a 'poor' prognosis (Figure 4).

| Age: Gender of patient: |
|---|
| Number of impacted canine<br>A- Unilateral B- Bilateral |
| The space for accommodating the tooth was created<br>A- Pre-exposure B-Post-exposure |
| The method of exposure was<br>A- Open B- Closed |
| Total Duration of active orthodontic treatment was<br>A- Up to 1 year, B- 1–1.5 year, C- 1.5–2 years, D- More than 2 |
| Canine realignment from exposure to correct occlusion<br>A- 6 months B- Less than 1 year C- 1–1.5 year D- More than 1.5 |
| Total number of active visits during orthodontic treatment<br>A- Less than 16 visits, B- Between 16–22 visits, C- More 22 visits |
| The number of failures of surgical exposures<br>A- Less than 2 failures B- 2–4 failures C- More 4 failures D- None |
| The number of visits failed to attend during treatment<br>A- Less than 4 visits, B- 4–8 visits, C- More than 8 visits, D- None |

**Table 1: Questionnaire for data collection.**

| Category | Good Prognosis | Average | Poor |
|---|---|---|---|
| Overlap of incisor | No horizontal overlap | Up to half root width | Complete overlap |
| Vertical height | CEJ – halfway up root | >half <full root length | >full root length |
| Angulation | 0–15° | 16–30° | >30° |
| Position of apex | Above canine position | Above 1st premolar | Above 2nd premolar |

## Discussion

The orthodontic management of palatally impacted canine requires an accurate assessment of the canine location in different dimensions. Accurate localisation helps to surgically expose and retrieve the tooth efficiently and individualise the clinical approach and biomechanics. Both patients and orthodontists need to know the expected treatment duration, which, to a great extent, is affected by the location of the canine. It has previously been observed that the duration of treatment is affected by several factors, including the number of missed appointments, the number of debonded brackets and bands, poor oral hygiene, the number of extracted bicuspid, mandibular plane angle, and age at the start of treatment. [23-25]

Various treatment difficulty indices have been proposed to estimate the severity of impaction. However, this study used a chart that has been recommended by the RCS-Eng guidelines for the management of palatally impacted canines. Four aspects of canine position were assessed, including incisor overlap, vertical height, the

angulation, and the position of the apex. Data from published studies suggest that the treatment duration of palatally impacted canine lasts for an average of 18 to 30 months. [13,26,27] Turning now to the results recorded in the present study, the average active orthodontic treatment time was 21 months, which falls within the range of the studies mentioned previously. The time needed to bring the canine from its location at the time of surgical exposure to the line of the dental arch was about 15 months in the majority of cases (68%).

The average total number of active orthodontic visits was 19 visits which falls within the same range found by other studies (17.7 to 39.8) visits. [22, 28, 29] In response to the prognosis, up to half of the cases (48.7%) had a 'good' prognosis while 36% had 'average' prognosis. This makes a total of 85% of the reported cases who had 'good' and 'average' prognosis. In most of these cases, the treatment time was around 21 months (between 1.5 to 2 years) which might indicate that the chart can be used as a useful tool to estimate the treatment duration. Conversely, other cases within the same categories showed a longer treatment time, which could be related to other factors, including the orthodontist's experience, mechanics, and age of the patients. Another possible explanation for finishing these cases within the expected duration could be attributed to results found in the present study. For example, for 81.7% of cases, the space was created prior to surgical exposure, 62.2% did not have to repeat the surgical exposure, and 48.4% had less than four visits which they failed to attend. Interestingly, these factors were previously emphasised by previous published data as contributing factors adding extra time to bring the impacted tooth into the arch. [15,28-30]

The limitations of the study were that only the best-treated case by each orthodontist was included and it did not involve different types of cases. Additionally, no inferential statistics were made in the present study, which would be more feasible if more cases and different groups were involved.

## Conclusions

On the basis of the results of this study, a rough prediction for the treatment of palatally impacted canine can be made using a difficulty chart. This chart might be helpful in providing information to the patient to estimate the treatment duration. Further studies are required to include other variables to improve the accuracy of the time needed to complete the treatment.

## Abstract

The present study aimed to investigate the histological, enzyme histochemical changes and liver function effects of Maxxthor insecticide on albino rats in liver. The experiment included 20 rat which were divided into four groups, the first group 5 rats were considered the control animals and the others were divided equally into three groups with a dose of 0.01, 0.1and 1 mg / kg of body weight, respectively for a period 40 days. The animals given each 48 hours via oral route Maxxthor by tube dosage after dissolved with distilled water. Microscopic examination of liver showed inflammatory cell aggregation around vessels, congestion and dilation of sinusoids hepatocytes hypertrophy with severs inflammatory cells infiltration, kupffer cells proliferation and hydropic degeneration. Enzyme histochemical study of liver showed weak expression of ALP activity in hepatocyte in low dose, sever expression in middle dose, and mild expression in high dose. There was significantly increase in serum aminotransferases (ALT, AST) and alkaline phosphatase (ALP) level in treated group of rats as compared with control group.

## Introduction

Pesticide is any substance or mixture of substance intended to preventing, destroying or controlling any pest, including vectors of human disease or animal species, unwanted plants or animals that cause damage [(1)]. Pesticides spread within the ecosystem elements due to its extensive and random application, and its resist to physical and chemical breakdown and metabolic degradation [(2)]. Pesticides residues accumulation in the environment components over time lead emergence of several ecological and health setbacks [(3)]. Pyrthroid the important new class of synthetic insecticides of the past three decades are rapidly replacing other insecticides due to low mammalian toxicity and an unusually fast biodegradation [(4)]. Pyrethroid act by enhancing sodium channel activity by shifting activation to more negative membrane potentials as well as slowing channel activation [(5)]. Maxxthor is pesticides belong to pyrethroid insecticides type I. The active ingredient in Maxxthor product is bifenthrin , a second generation of synthetic pyrethroid [(6)]. Maxxthor use against termites and labeled for the long term control of wide range of pests including insect pests, vectors, spiders, ticks, and turf insects [(7)]. The neurotoxicity of Maxxthor depend on the affinity to the voltage sodium channels in insects and mammals, where Maxxthor bind to the sodium channel transiently and stop the closing of the channel permanently, leading to permanently depolarize of the membrane, no further action potential can be generated because the resting potential will not be restored [(8)]. pyrthroid induce oxidative stress as mechanism of their toxic action in the body leading to generation of free radicals and influence the activity of antioxidant enzymes in tissues [(9)]. Our goal was to studied the histological changes, ALP activity expression and alternation in liver enzyme induced by the action of Maxxthor .

## Materials and Method

### Experimental animals and Study Design

The animals examined in this study were mature male Sprague-Dawley albino rats (*Rattus norvegicus* ) with about 8-10 weeks age obtained from biotechnology research center / Al-Nahrian university with an average weight of ( 200-250 gm ) and kept under climate controlled conditions of the animal house with temperature 22-25 $C^{o}$ , good ventilation , regular 12 hours light duration . Rats were randomly divided into four groups five rats for each group and treated as follow: G1 was administrated with 1 ml of normal saline, while G2, G3 and G4 were administrated with1ml of (0.01, 0.1 and 1 mg/kg b.w.) respectively of maxxthor orally once each 48 hours for 40 days.

### Histopathological and Enzyme histochemical study

We began sacrificing the animals at the end of the experiment; Liver was quickly removed. First portion of organ was dissected and fixed in 10 % neutral formalin, dehydrated in ascending grades of alcohol and imbedded in paraffin wax. Paraffin sections (5µm thick) were stained for routine histological study using Hematoxylin and Eosin stain (H&E) [10].

Second portion of organ fixed and dehydrated in a mix of absolute alcohol and cold acetone for different periods and imbedded in paraffin wax. ALP demonstrated in paraffin sections (5µm thick) as described by [11].

### Liver Function

Serum sample was collected for the estimation of liver function (ALT, AST, ALP) by using Linear kit.

## Statistical analysis

The Statistical Analysis System- SAS (2012) program was used to detect the effect of difference groups in study parameters. Least significant difference –LSD test was used to significant compare between means in this study.

## Results and Discussion

Histological effects

Microscopic examination of liver of control rat showed normal structure of the central vein, hepatocytes and blood sinusoids (Figure 1A). Histological changes investigation in sections of liver rat treated with 0.01 mg / kg b.w. of Maxxthor pesticide showed hydropic degeneration in the hepatocytes figure (1B) and dilation in the sinusoids (1C). Aggregation of inflammatory cells near central vein and congestion with dilation of sinusoids were seen in liver section of rat treated with 0.1 mg/kg b.w. of Maxxthor pesticide after 40 days of treatment as shown in figure (2A,B) and proliferation of hepatocyte and hemorrhage with proliferation of kupffer cells figure (2C,D). Hydropic degeneration in hepatocytes with degradation of chromatins cells and aggregation of inflammatory cells figure (3A,B) was in liver of rats treated with 1 mg\kg body weight.

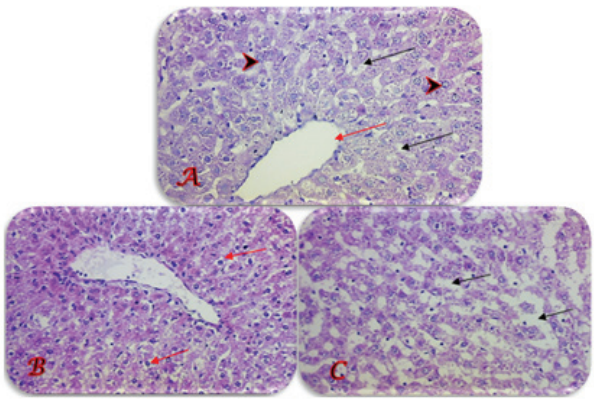

**Figure (1): Crosse section in liver of rat detected by H&E staining A: normal liver of rat showing hepatocytes (head arrows), central vein (red arrow) and sinusoids (black arrows),B: treated rat with 0.01 mg/kg body weight of Maxxthor showing (A): hydropic degeneration in the hepatocytes (red arrows) ,C: dilation in the sinusoids (black arrows) (A,B and C, X10) .**

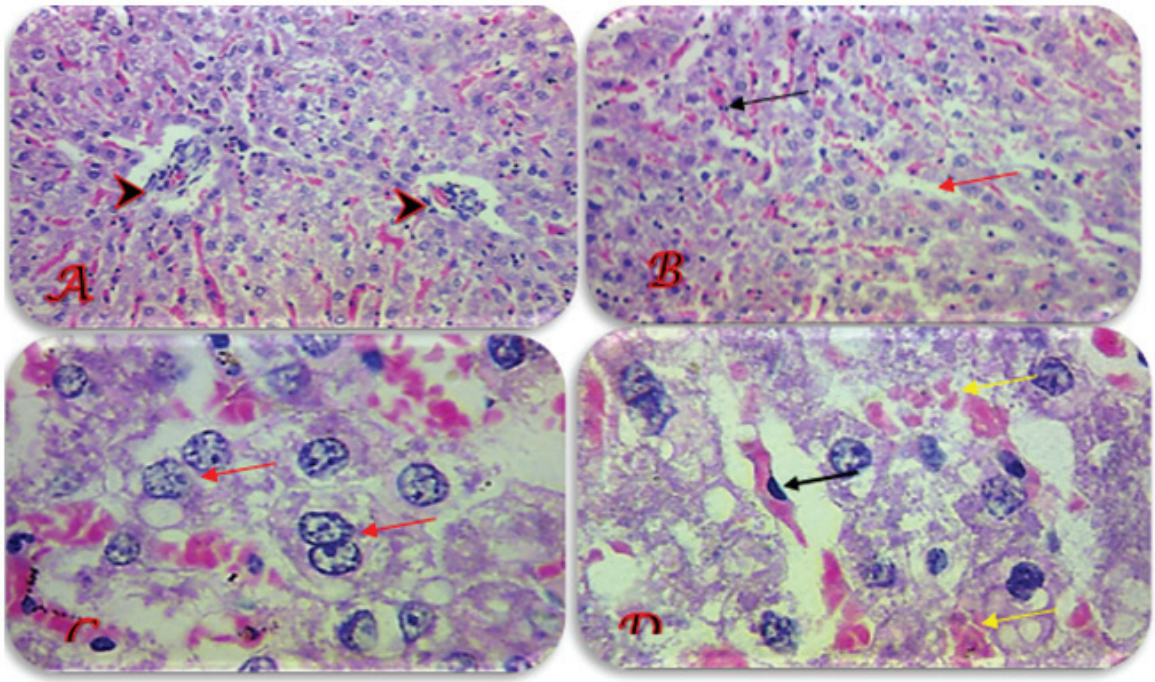

**Figure (2): Cross section in liver of rat treated with 0.1 mg/kg body weight of Maxxthor detected by H&E staining: A. aggregation of inflammatory cells near central vein (head arrows) (X10). B: and congestion (black arrow) with dilation of sinusoids (red arrow) (X10), C: proliferation of hepatocytes (red arrows) (X40), D: hemorrhage (yellow arrows) with proliferation of kupffer cells (black arrow) (X40).**

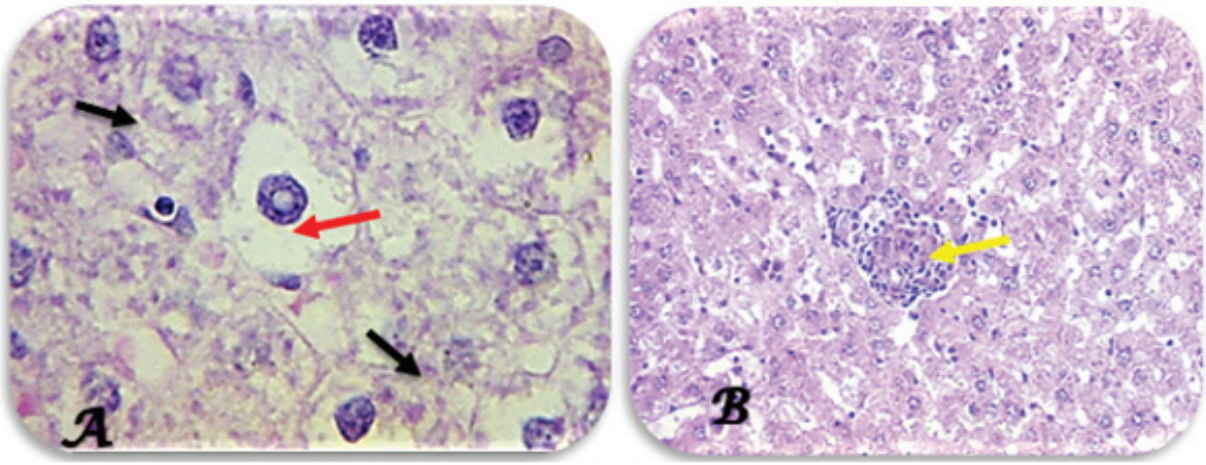

**Figure (3): Crosse section in liver of rats treated with 1 mg/kg body weight of Maxxthor showing A: hydropic degeneration in hepatocytes (red arrows) with degradation of chromatins cells (head arrows) B: showing granuloma consist of aggregation of inflammatory cells (yellow arrow) [H &E (A)X10 & (B) X40].**

This result agreement with [12] who confirmed the damage caused by cypermethrin pesticide in the liver through degeneration of hepatocytes, infiltration of inflammatory cells, necrosis and mitochondrial swelling. Vascular degeneration in the hepatocytes as well as congestion in the central vein and sinusoid in rat liver when treated with deltamethrin was recorded by [13]. These changes in liver tissue could be explained by understanding that bifenthrin is metabolized in the liver by cytochrome P450 through hydrolytic ester cleavage and the oxidative route to produce acid and alcohol moieties [14]. Congestion and hemorrhage could be as a result to increased blood flow to the inflamed area due to toxic substance of the pesticide. Proliferation

and hyperplasia of the hepatocytes indicate the role of pesticide with its toxic effect in causing important change, that may be the first signs of the occurness of cancer. Granuloma from aggregation of inflammatory cells to the toxic effect of the pesticide that cause inflammatory reaction in liver tissue, which resulted in the attraction of neutrophil and mononuclear cells of the site of injury to remove damaged tissue [15]. Intoxication of rats with pesticide led to generation of ROS, the over production of ROS metabolites can creates lethal chain reaction, that involve oxidation and damage to structures which are crucial for integrity of cell and these free radical lead to membrane and macromolecule damage [16 , 17] .

**Enzyme histochemical study**

Cross section in control liver rat showing no expression of ALP activity represented in figure (4A). While treated rat with 0.01 mg\kg b.w. of maxxthor showing weak expression of ALP activity in hepatocyte figure (4B), but figure (4C) show sever expression of ALP activity in hepatocyte and figure (4D) show mild expression of ALP activity in hepatocytes.

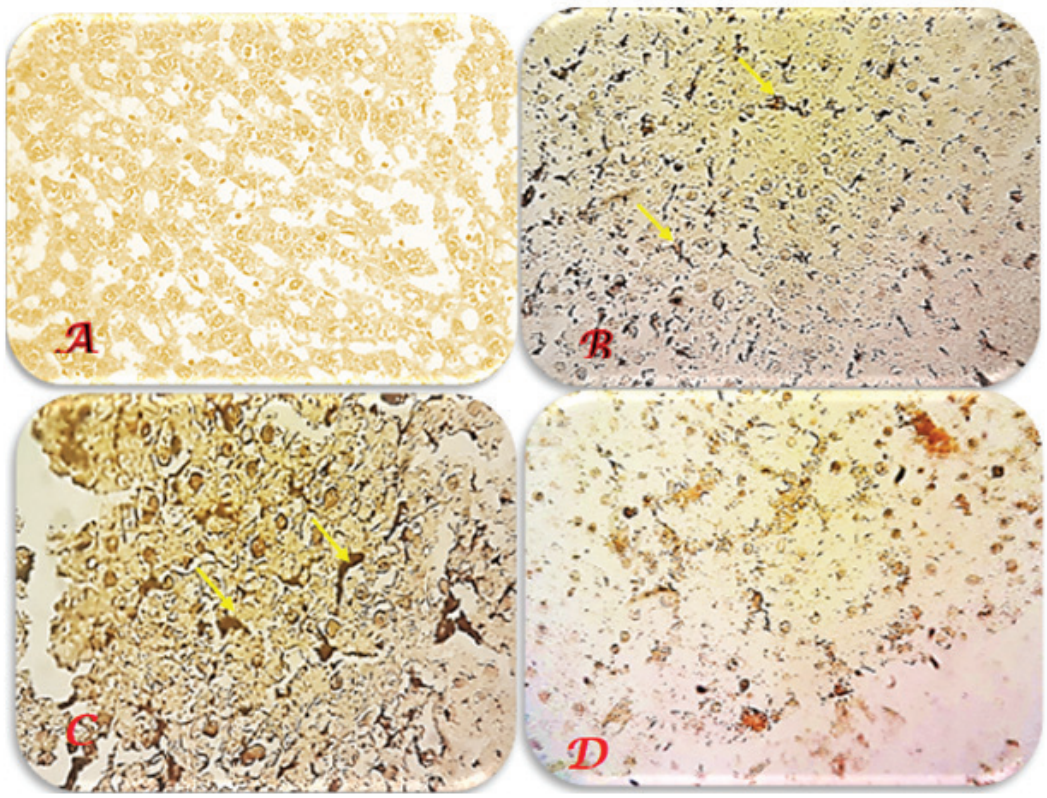

**Figure (4): Cross section in liver of rat detected: A. control group showing no expression of ALP activity (X10).B: treated rat with 0.01 mg/k b.w. Maxxthor showing weak expression of ALP activity in hepatocytes (arrows) (X40)., C: the treated rat with 0.1 mg/k b. w. Maxxthor showing sever expression of ALP activity in hepatocytes (arrows)(X10), D: treated dosage 1 mg/k b.w. Maxxthor showing mild expression of ALP activity in hepatocytes (X10).**

The ALP is eliminated by bile secretion, any increase or accumulation in ALP amount in liver cells indicate a disturbance mechanism of secrtion [18]. Toxic lesion, hepatitis, and congested liver lead to accumulation of ALP in cell, that accumulation indicate a function disturbance of the liver in biobsy or autoptic lived tissue [19]. Increase activity in ALP can be attributed initially to some pathophysiological condation in liver as a result of pesticide intoxication, may be due to damage in membrane permeability of hepatocytes, resulting in leakage of this enzyme, that

mean maxxthor capable of altering normal hepatocytes architecture [20, 21]. Another possibility for the increase in the activity of alkaline phosphatase may be related to the destruction of the hepatic smooth endoplasmic reticulum membrane in the insecticide intoxicated animals [22]. Sublethal concentration of chlorpyrifos to Gambusia fish lead to increase expression of ALP enzyme activity in liver and kidney tissue indicate that pesticide disturpe the chemical constituents of the fish leading to cell damages and finally mortality of the fish [23]. The increment in activity of hepatic ALP activity due to the cellular damages caused by hepatotoxin or a response to overcome toxicity of pesticide [24].

**Liver function study**

Table (1) summarized the results of Maxxthor effect on liver function in rats after 40 days of treated with (0.01,0.1, 1) mg/kg b.w. Maxxthor treatment has highly significant ($p<0.01$) increased in the serum AST, ALT and ALP in all treated groups as compared with control group.

**Table 1: Effect of Maxxthor (0.01, 0.1 and 1 mg/gk. b.wt.) on liver function of rats**

| Group | Mean ± SE | | |
|---|---|---|---|
| | AST U/L | ALT U/L | ALP U/L |
| G1:Control | 56.28 ± 2.14 d | 24.99 ± 0.96 d | 102.81 ± 2.76 d |

| G3: treated with 0. 1 mg/kg/b.wt. of Maxxthor | 92.44 ± 2.40 b | 44.79 ± 2.54 b | 185.65 ± 2.97 b |
| G4: treated with 1 mg/kg/b.wt. of Maxxthor | 146.68 ± 4.56 a | 70.10 ± 3.27 a | 322.46 ± 12.71 a |
| LSD value | 9.147 ** | 6.667 ** | 19.488 ** |

Means having with the different letters in same column differed significantly, ** ($P<0.01$).
AST = Aspartate aminotransferase , ALT = Alanine aminotransferase , ALP = Alkaline phosphtase

This results agreement with Shakoori *et al*. [25] when treated female rabbits' high doses of bifenthrin pesticides within 4 days. Mansour *et al*. [26] study **the revealed that amounts of AST and ALT enzymes were elevated following intoxication of male rats with the insecticides and their mixture**. Exposure to pesticides lead to liver damage and leakage of cytosolic enzymes from hepatocytes and other body organs into blood [27].In fact, transaminase (AST, ALT) are important and critical enzyme in the biological processes. These enzyme are involved in the breakdown of amino acids into α keto-acids and responsible for detoxification process, metabolism and biosynthesis of energetic macromolecules for different essential functions. Increased amount of these enzymes are indices on cellular smashing and loss of functional integrity of cell membranes in the liver [28]. **Mansour and Mossa [29] found that the activities of transaminases were increased in animals after exposure to pesticides.** Increase in ALP activity in serum can be attributed to some pathophysiological changes in liver as a consequence of pesticides intoxication probaplly due to damage in membrane permeability of hepatocytes, resulting in leakage of this enzyme and pesticide can alter normal hepatocellular architecture [30]. Liver enzymes Elevation may also be due to increased gene expression after long term requirement of detoxification of pesticides [31].

## Conclusion

Based on the overall findings from present investigation, it obvious that Maxxthor is toxic to liver following oral treatment of rats at the selected doses. Maxxthor induce pathological changes in the liver tissues and elevated ALP activity in liver tissues. Oral treatment of Maxxthor increased the serum AST, ALT and ALP in male albino rats.

# The Nature of the Il17 Cytokine Response In Rabbits Prime-Boosted With Eschrchia Coli-Pseudomonas Aeruginosa Prototype Bacterin Combinations

**Ibrahim Ms Shnawa[1], Ferial Abd[2]**

*[1]Prof. Department of Biotechnology, College of Biotechnology/ University of Al-Qasim Green/ Qasim, Babylon, IRAQ, [2] Prof. Department of Biology, College of Science/ University of Babylon/ IRAQ*

## Abstract

The prototype E .coli - P. aeruginosa heat killed bacterin balanced and unbalanced bacterin combinations,as well as monotypic E. coli and single P. aeruginosa bacterins were developed. They were prime-boosted rabbits by homologous prime-boost protocols. At the end of the specific immune-priming protocols ,rabbits were bleed, sera saved in 0.5 ml aliquots at -18C till testing due time.IL17 Eliza assay was done on the test and control sera. Single strength balanced combined bacterin combination induced increase in the mean IL17 concentration means as compared to monotypic, double balanced ,un-balanced bcterin combinations and control. The other combinations were showing inhibition in IL17 concentration means than control .The immune interference matched To as: one bacterin enhance the other, and one damp the other. Enhancement of IL17 response single strength combination might be a promise for efficacy of such combination in regulation and protection against natural or experimental infectious challenges .

***Key Words:*** *Bacterin, Combination,enhance ,Immune, interference ,inhibition.*

## Introduction

The T helper 17 cells are subsets of helper T cells with biological immune-cross road functions both at natural[innate] and adaptive[acquired] immune responses towards infections [1 ].IL17 have narrow range of biological activities. It induces IL6,IL8 and granulocyte stimulating factor by bone marrow stromal cells, endothelial cells ,and fibroblasts .But it has no effects on production of IL4,IL6,INFgamma and IL10 by peripheral blood mononuclear cells [2,3].IL17 cytokine has profound role in primary immune responses against infections in one hand [ 4 ].On the other hand IL17 has critical role for the vaccine induced memory immune responses against infectious diseases [ 5 ]

There are some intracellular bacteria require IL17 to derive TH1 cell immunity in the infected host [ 5,6 ].The Th17 cytokine regulate the host immune mechanisms during intracellular bacterial infection is performed through; DC regulation, neutrophil recruitment,TH1 modulation and Treg , balance [6] The human Pseudomonas mucosal infections of lungs induced TH17 ,the Th17 cytokine recognize a protein Pseudomonas sub-unite that has a promising potential as a vaccine candidate for P. aeruginosa infections [7] .The vaccination with bacterin induce Th17 cell responses accompanied by long term memory TH17 cell stable subsets lasting up to post-vaccination state [ 8 ] .The objective of the present work was to report on the nature of IL17 cytokine responses and shed a light on the immune interference of combined E.coli-P. aeruginosa bacterin combinations in a lapin model.

## Materials and Method

### Bacterin Starter Strains:

From a series of patients with urinary tract infections ,a uropathic gram negative isolates were purified and identified by veitic identification system as E.coli and P.aerugnosa .They were grown in broth media and dense

inocula were transferred to brain heart infusion broth tubes then layered by sterile liquid parafine as cryo-protectant and kept at -18C in the refrigerator chest freezer till use for bacterin preparation [9].

**Bacterin Designations**

To make ease description with in the text we adopt abbreviated designations for the developed bacterins, Table 1.

**Table 1 : Abbreviated bacterin designations.**

| Bacterin Type | Description | Desigations |
|---|---|---|
| Organismic heat killed E.coli bacterin | E.coli 1.5x 10 to eight[one x strenght] | BEC |
| Organismic heat Killed P.aeruginosa bacterin | P.aeruginosa 1.5x 10 to eight[one x strength] | BPA |
| Balanced combined one x strength E.coli- P.aeruginosa | E.coli 1.5x10 to 8- P.aeruginosa 1.5 x10 to 8 | X EC-X PA |
| Balanced two x strenght E.coli-P.aeruginosa | E.coli 3x10 to 8-P.aeruginosa 3x10 to 8 | 2XEC- 2XPA |
| Unbalanced oneX strenght E.coli-2X strength P.aeruginosa | E.coli 1.5x 10 to 8-P.aeruginosa 3x10 t0 8 | 1XEC-2XPA |
| Unbalanced two x strength E.coli- one x strength P.aeruginosa. | E.coli 3x10to 8-P.aeruginosa 1.5x10 to 8 | 2XEC-XPA |

**Bacterin preparation;**

A 0.1ml from a fresh 18hrs brain heart infusion broth cultures which constitute the seed lot of the starter bacterin strains were transferred into50 ml sterile brain heart infusion broth in 100ml size conical flasks. Then incubated at 37C in shaker water-bath with 60 shake per minute for 18hrs.Growth harvested into a series of sterile centrifuge tubes of 10 mls size .Tubes were centrifuged at 5000 rpm for 15 minutes. Supernatants were discarded and pellet s were kept. The pellets were reconstituted with sterile saline to the original volumes for triple wash at 5000rpm for 10 minutes. Triple washed pellets were reconstituted with 5 ml sterile saline for each tube. The 5ml bacterin containing tubes were set onto test tube racks and left in water-bath at 60C for one hr. The tube containing suspensions were made in bulks. These bacterin preparations were checked for purity and ratified as one X strength 1.5x10 to eight and two X strength 3x10 to eight bacterin units per/ml. These preparations stands as a prototype bacterins .After adjustment to one and two x strength they were mixed in an equal volumes to form the balanced and unbalanced combinations prior to specific immune priming of rabbits [10]

**Purity**

The final batch to be used prototype single and combined bacterins were checked for sterility in which inocula from each bacterin preprations was quadrate streaked onto nutrient agar plates and incubated for 18hrs at 37C.Presence of any contaminating bacterial growth make preparation as unsuitable for experimentation [11].

**Rabbits**

A group of adult Newzland male rabbits with three to five months old and 1-1.5 body weight were brought to the animal house, College of science, university of

Babylon. These rabbits were checked for the presence of natural serum antibodies for common bacterial pathogens especially those for E,coli and P.aeruginosa .Absence of such serum antibodies make rabbits usable for this study. Rabbits were acclimatized to two weeks in housing conditions. Then categorized into three groups and marked as ; control ,safety and test as in the followings;

Saline control……..5 rabbits

Safety …….7x two rabbits

Test Groups;

BEC……5 rabbits

BPA……..5 rabbits

XEC-PA……5 rabbits

2XEC-PA……..5 rabbits

XEC-2XPA…….5 rabbits

XEC-2XPA……..5 rabbits

Rabbits kept during the housing condition under ad libitum of food and drinks. They were handled and managed following the standard international rules for animal humanity regulations [12] .

Safety;

A volume of 0,1 ml from each of the to be used prototype bacterins was intra-peritone injected in rabbits of safety group. Then followed by follow up for five days to exclude gross and internal organ pathologies for the test and controls [11] .

Homologous Prime-Boost Protocols:

A two ml amounts from each of the prototype pure bacterins were primed into each rabbit of the test groups. One ml was IM injected and second one distributed SC in sub-clavian and pelvic regions in week a part for three weeks followed by one week leave. Then bleed through cardiac puncture rout [13].

Immune Function Tests:

Blood sample collection was done on both of test and control groups by cardiac puncture and saving sera [14] ,leukocyte inhibitory factor [15] ,and agglutination assays as in [16].

Bio-metery:

Means and standard deviations were calculated as in [17] .

## Results

I-Bacterin Development:

The developed monotypic bacterins ,balanced and unbalanced bacterins were found ,pure ,safe, antigenic and immunogenic in rabbits.

II-IL17 cytokine Responses:

i-BEC –IL17 and BPA-IL17 responses,

IL17 mean concentration was 40,12 pg/ml. in BEC primed rabbits. While ,for BPA primed rabbits was 38,48 pg/ml. as compared to normal as 45.49 pg/ml., Table 2

ii- Balanced combination of XEC-XPA-IL17 and 2XEC-2XPA cytokine response;

IL17 cytokine response of rabbits primed with XEC-PA was48.38 pg/ml. While that for 2XEC-2XPA was 38.75 pg/ml. as compared to control rabbit was 45.49 pg/ml.,Table2

iii-Unbalanced Combinations IL17 cytokine responses;

The IL17 in XEC-2XPA and 2XEC-XPA were 37,65 pg/ml and 36.44 accordingly as compared to control 45.45 pg/ml., Table 3.

iv-IL17 cytokine response features,

Both of BEC and BPA monotypic heat killed bacterins priming have shown IL17 inhibition than normal. XEC-XPA has shown enhancement in IL17 concentration means than the mono- typic bacterins and normal controls. The 2xEC-2XPA,XEC_2XPA, and xEC-2XPA combinations were with inhibiting concentration means than normal rabbits cytokine responses, Tables 2 and 3.

**Table 2:Rabbits IL17 cytokine response to balanced combinations**

| **Bacterin type** | **IL17 pg/ml. Mean +-SD** |
|---|---|
| XEC-XPA | 48.38+-3.9 |
| 2XEC-2XPA | 38.75+-4.05 |
| BEC | 40.12+-2.97 |
| BPA | 38.48+-4.5 |
| Control | 45.45+-1.58 |

**Table 3:Rabbits IL17 cytokine responses to unbalanced bacterin combinations**

| Bacterin types | IL17 pg/ml. Mean+-SD |
|---|---|
| XEC-2xPA | 37.65+_3.05 |
| 2X-XPA | 36.94+_11.37 |
| BEC | 40.12+_2.97 |
| BPA | 38.48+_4.5 |
| Control | 45.45+_1.85 |

## Discussion

The cytokine IL17 concentration means in response to monotypic BEC and BPA indicated that these bacterins were inducing IL17 responses but such responses were of lower grade than saline control cytokine response. A finding which may point to an inhibitory insults [18] like presence of weak suppressive antigenic epitope [ 19,20] .The response of rabbits IL17 to two strength balanced and unbalanced bacterins combinations can be attributed to antigenic competition and/ or the antigenic quantity effects [21,22,23,24 ] .Single strength balanced combination has shown increase IL17 concentration than control rabbits which points to an enhancement in the response than the monotypic bacterins and control .Thus ,lapin IL17 cytokine response to monotypic and combination bacterins expresses two forms immune interference as; one damp the other and one enhance the other [25,26,27] .Heat killed whole cell E coli and P.aeruginosa bacterins induce lapin IL17 responses, though such responses were affected by antigenic quantity, antigenic competition, weak suppressive epitope and epitope-epitope enhancement, the immune interference in both positive and negative forms [21-27] .The enhancement was in rationally accepted forms [within the limits for the absence of immunopathology]of immune interference may bears potential benefits for the host contracting such forms of combined infections and might holds a promise for bacterin efficacy in regulation and/or protection against natural or experimental challenges [28-30]

## Conclusion

E.coli-P.aeruginosa combined heat killed bacterins were laboratory scale developed and evaluated in a lapin model. These developed monotypic and combined were inducing IL17 cytokine responses. Such IL17 responses were affected by antigen quantity ,antigen competition , weak suppressive epitope ,epitope-epitope enhancement ,the immune interference in both negative and positive forms.

# Effect of Hearing Impairment on Behavior and Communication of Children in Schools and Special Education Centers in Mosul City

**Hana A. Al-saeed[1] Rabei M. Al-dobooni[2]**

*[1]Post Graduate, Faculty of Nursing/ University of Mosul/Iraq, [2]Assistant Professor, Faculty of Medicine/ University of Mosul/Iraq*

## Abstract

**Objectives:** To identify the effect of hearing impairment on children behavior in daily activities and communication with peers and problems facing teachers of HI children in Iraqi environment. **Methods :** the strength and difficult questionnaire (SDQ) was used to measure the behavioral, and peer problems questionnaire to measure communication disorders of children with HI based on parents and teachers in (209) children (123) HI and (86) normal hearing control group. **Results:** on parent teacher questionnaire significantly higher behavioral problems for HI children compared with control group (p-value **0.043< alpha value 0.05)** and (chi-square 7.321) so increase the emotional problems (p-value 0.035)and peer problems (0.026) of HI children its highly significant found of behavioral problems, so 65% of hearing impaired children had communication problems with others and environment. The teachers facing many problems when deals with HI but the most common one difficult when communicate with them because the limited capabilities available and modern educational methods for teaching the HI children. **Conclusions:** The majority of hearing impaired children have congenital cause for their hearing loss. Behavior problems appear more common in children with hearing loss and communication problems. The vast majority of teachers agree that there are problems facing students with hearing impairment, and these difficulties need to be dealt with the benefit of their children and the community as a whole.

***Keywords:*** *hearing impairment, behavioral, communication, Mosul; children; activity.*

## Introduction

Hearing Impaired category is an important issue that should have taken enough care in one form or another . Hearing loss is a common problem in all ages and represents a. HI directly affects the quality of life and it is most often manifested in communication difficulties.

deviations in emotional and social development[4].

"WHO has documented and continues to document the increase in the proportion of HI people around the world, estimated that in 2030 the number of people with hearing loss will be around 630 million'', and within 2050 the number of injured will be 900 million[10].

**Corresponding author:**
**Rabei M. Al-dobooni**
Rabeialdobooni@yahoo.com

The effect of hearing impairment varies according to variables , type and degree of hearing disability , age at which they occur, and the extent to which hearing devices are used[6].

Hearing loss is categorized as **mild** (20-30 dB hearing level, HL), **moderate** (30-50 dB HL), **moderately severe** (50-70 dB HL), **severe** (75-85 dB. HL), or **profound** (>85 dB) [5].

Recently, the WHO Studies concerned with children had demonstrated that children with hearing loss develop more aggressive behavior[8].

Communication difficulties caused by hearing impairment directly affect the quality of life of affected children. Difficulties in communication can lead to an impairment of emotional and social development. It is well known that good hearing is essential for the

development of speech and language[1].

## Method

### participants

the study was school based populations (HI) children and normal hearing (control group) **(table 1)**. The selected intentional sample (non-probability) consisted (123) students (64 males) and (59 females) ,selected from several special education centers in Mosul, which was confirmed by medical examination as well the severity and cause of hearing loss, were include in this study , and (86) children (male 55.4%) and ( female 44.6%) of the same age group of case samples( 6-12 ) years as control group in order to compare the behavioral and communication problems. So **(50)** teachers in the field of special education were selected to answer the questionnaire prepared by the researcher and evaluated by experts to be suitable for the sample community and for the internal consistency of the questionnaire parts.

**procedure and measure:** After presenting the basic approvals , data were collected by interviewing the hearing impaired students to fill their questionnaire as well as in addition there were several meeting with the teacher to enquire about the child's behavior and to fill the teachers part of the questionnaire. Referral to the student registration data and medical examination when enrolled in the special education classes for the purpose of obtaining the degree of hearing loss and its causes.

### measure of behavioral problems

The present study confirmed the higher behavioral problems for children with HI compared to hearing controls. Children with hearing loss show an elevated level of behavior problems were measured using the Strengths and Difficulties Questionnaire(SDQ)[11].

This is a widely used behavioral screening questionnaire that provides data on children and young people's behaviors, emotions and relationships.

### measure of communications problems

To measure communication problems of (HI) children, the researcher used the "peer relationship questionnaire.

### measures of teachers problems facing them.

To measure the problems facing teachers who deal with the hearing-impaired category, a (12-items) questionnaire was built that obtained acceptable honesty and consistency and evaluation by experts.

## Results

### characteristics of the samples

**Table-1** show that there were no statistically significant differences between control group and experimental group where the value of the chi- square test **(5.000**) and degrees of freedom **(6)** and the significant value (**0.403)** more than p- value (0.05%) which indicates the convergence of the homogeneity of the control sample and the experimental group.

**Table (1) General characteristics of the children with hearing loss (123) and control group (86).**

| | | | Hearing impaired | | Control | | | |
|---|---|---|---|---|---|---|---|---|
| **N** | **Paragraph** | **Var.** | **F (%) (HI)n=123** | **M+S.D (HI)** | **F(%) (NH)n=86** | **M+SD (NH)** | **X2** | **P- value** |

**Table (4)** explain the first four paragraphs(Hearing impaired children group and control group) that include both groups there were no statistically significant differences between the control group and the experimental group where the value of chi-square test (6.000), degrees of freedom (6) and p-value (0.423) was greater than the alpha value (0.05%) ,impairment greatly affects the relationship of students with friends and affects communication with others in the school and the surrounding environment, according to the majority of responses to questionnaire items with a number of 80

responses with a rate of (65%), with a general average of (1.60).

**Table (5) The teachers 'responses regarding the hearing impaired children, the problems and challenges.**

| N. | Paragraph | Responses | | Mean | S.D |
|---|---|---|---|---|---|
| | | Yes | No | | |
| 1 | Are you a graduate of special education | 44% | 56% | 1.44 | 0.051 |
| 2 | Do you have in the center modern means to educate people with hearing impairment | 38% | 62% | 1.38 | 0.490 |
| 3 | Are you talking to them and directing them loudly | 74% | 26% | 1.74 | 0.443 |
| 4 | Do you support setting up courses for teachers to train them in forms of communication with the them? | 86% | 14% | 1.86 | 0.351 |
| 5 | Do you support the presence of a speech specialist in special education centers and schools | 70% | 30% | 1.70 | 0.483 |
| 6 | Do you see progress in the field of special education in the city of Mosul | 40% | 60% | 1.40 | 0.495 |
| 7 | Is your center better from other centers in the city | 52% | 48% | 1.52 | 0.505 |
| 8 | From your point of view as a special education teacher, is it easy to deal with the hard of hearing class | 32% | 68% | 1.32 | 0.471 |
| 9 | Would the results of such studies benefit the hearing impaired group | 60% | 40% | 1.60 | 0.495 |
| 10 | Do you support teaching the hearing impaired sign language | 36% | 64% | 1.36 | 0.485 |
| Weighted average of the survey as a whole | | | 1.54 | | |

**Table (5)** show the opinions of hearing impaired teachers that agree on the presence of problems and challenges facing the hearing impaired in the local environment by 60% and the number of responses exceeding 30 responses, with a general average (1.54) and standard deviation (0.203). Also, the responses of dealing with the hearing impaired category was "not easy" in 68% of the teacher and talking to them loudly and repeatedly causes them stress 74%.

## Discussion

The purpose of the present study is to determine the effect of hearing loss on child behaviors and communication. The questionnaire was filled by parents with **38.2%,** while teachers were **61.8% .** A major problem facing those with hearing impairment is the effect on speech, where the percentage of those who had difficulty speaking and talking was **65.85**%. Another effect of hearing impairment which was shown in the present study is behavior by mean (1.79) and communication by problems that effect (65%) of the studied children. This can have deleterious effect on academic achievement as well as psychological wellbeing.

**level of hearing loss**

The levels of hearing loss were severe to profound by **30.1 _30.7%.(table 2)** Most of them were diagnosed with a disability less than **3**years old, (because this age

the child begins to communicate with others, speak and start talking). These results are consistent with study of [6].The percentage of children with severe hearing loss reached 67%[2].,*Babaroglu* said that aggressiveness varies depending on age and level hearing impairment and children with profound (81 db) hearing impairment show more aggressive behaviors at older ages (10-15 age) compared to normal hearing children.

**Behavioral effect**

**(Table 3)** showed the parents / teachers' opinions on the behavioral questionnaire for the hearing impaired children. **SDQ** contains sub-scale from 5 parts which are problems ***(behavioral, emotional, hyperactivity, peer relationship, social behavior***). Each part of these problems contains 5 points that assess if the child has any of these symptoms or not. In the present study the participants agreed on the presence of emotional symptoms in the behavior of children with hearing impairment with an average of **(1.81)**, and slight increased hyperactivity with an average of **(1.77).** Behavioral problems and aggression with the peers was highest found with average **(1.82),** the first four axes represent the negative behavior in the child's personality. In the **Fifth** part of the questionnaire the participants agreed on the existence of positive personal social behavior with an average (**1.75)** and a standard deviation (0.426).

**communication effect**

**(Table 4)** show that HI affects the relationship of majority students with peers and affects communication (**80)** responses with a general average of (**1.60**). This means that hearing impairment has effects on the relationship and communication with others and the surrounding environment, leading to constriction in social relationships with others and makes children more isolated(65%).The majority of children avoid communicate with peers because mocked him due to he had hearing loss and felt embarrassed about the hearing aids , which makes him avoid the gatherings of children by responding (**62%)** of the whole population sample, and difficulty communication with others when crowded environment rate **65%** .This finding is consistent with a study [3]. which documented communication problems in noisy setting such as family setting room or classrooms.

**Teachers' perspectives and challenges facing them.**

**(Table 5) showed** 65% of the teachers are not graduates of special education and this means that not all teachers have sufficient experience to deal with the hearing impaired group in a correct routs. Seventy four percent of the teachers (74%) need to speak loudly repeatedly which result stress. It was found that the vast majority of teachers support conducting training courses in this field for them in order to deal with the hearing impaired in a correct scientific manner, and the response is **86%,** with mean of 1.36 , they also support the presence of a speech therapist in every center and school, with mean 1.70 and percentage 70%.The teachers do not see progress in the field of special education in the city of Mosul.The majority of teachers do not support teaching the hearing impaired the "sign language»)**64%(**may be explained by the fact that the hearing impaired child who have hearing residue will use the sign language as an easier and faster.

## Conclusions

The majority of hearing impaired children have congenital cause for their hearing loss. Idiopathic cause have next and less common cause is otitis media. Behavior problems appear more common in children with hearing loss,the results of the current study showed an increase in behavioral problems among the hearing impaired and this problems limits their relationship with others. So the results of the study showed the opinions of teachers about centers and schools for the hearing impaired in the city of Mosul.

**Acknowledgment:** I thank the children who participated in this study, the teachers and the parents. And big thanks to the supervisors of *Dr. Rabei M. Aldobooni.*

**Ethical Clearance**: The Research Ethical Committee at scientific research by ethical approval of both MOH and MOHSER in Iraq

**Conflict of Interest:** Non

**Funding**: Self-funding

## Abstract

*Klebsiella pneumoniae* is an opportunistic pathogen causing nosocomial infections with production of biofilm. In the current study, 73 samples were collected from both patient genders of different ages suffering of burn and wound injuries that referred to four hospitals in Baghdad city from Aug. to Nov. 2019. The samples were cultured on MacConkey agar and 60 bacterial isolates were obtained. Primary identification by cultural and microscopic examinations declared that all isolates belong to genus *Klebsiella.* Then the 60 isolates were identified by Vitek 2 system which insured they were belonged to *Klebsiella pneumoniae.* The identified isolates were screened for ability to produce biofilm by Microtiter Plate technique and Congo red agar method. Results showed that only 4 isolates (3 of wounds and 1of burns) were able to form biofilms. Upon such important characteristic, the four isolates were submitted to the *16S rRNA* gene amplification test by using PCR technique and results declared that they are certainly belong to Klebsiella *pneumoniae*. The "National Center for Biotechnology Information (NCBI)" verified and documented that they are new strains of *Klebsiella pneumoniae* to be discovered in this study for the first time and registered them as; KPWIQ25, KPWIQ49, KPWIQ51 and KPBIQ19 strains of *Klebsiella pneumoniae*.

***Keywords**: 16S rRNA, sequences, PCR, Strains, Biofilm, health; pathogen.*

## Introduction

In hospitalized patients, *K. pneumoniae* is a frequent reason of antibacterial-resistant opportunistic infections. Naturally, it is resistant to multiple antimicrobials; serious clinical concerns have stimulated the interest in *K. pneumoniae* research and especially the application of genomics [(1)]. *K. pneumoniae* bacterium is a Gram-negative pathogen that has the capability to form biofilms, Microorganism living in a biofilm sometimes have completely different properties from free-floating (planktonic) microorganism of identical species, as has been shown by completely different approaches [(2)], together with microarray analysis studies representing one of the main causes in hospital infections [(3)]. *K. pneumoniae* is a member of such clinically considerable organisms that have obtained much public health apprehension. It is a significant *Enterobacteriaceae* behold as one of the opportunistic bacteria causing wide series of infections and rendering increasingly recurrent acquisition of antibiotics resistance [(4)]. This microorganism accounts about one-third of whole Gram-negative infections like surgical wound infections, pneumonia, infections to the urinary tract, cystitis, endocarditis in addition to septicemia [(5)].

Among hospitalized individuals, *K. pneumoniae* leads to significant morbidity and mortality universally. The pathogenesis principle mechanism in hospital environments relates biofilms formation, foremost on implanted medical equipment's [(6)]. Biofilm arrangement bears a few stages to make a develop biofilm, which concede essential connection

**Corresponding author**
**Omer N. Abbas**
omarnatheer77@yahoo.com

to the surface, microfilm development, mushroom shape development of biofilm, and discharging motile microscopic organisms inside separation organize [7].

Due to the importance and wide spread of burn and wound infections caused by *K. pneumoniae* and the limitation studies on new strains of this bacterium, the current study was planned for the aim of searching and identification of a new pathogenic strains of *K. pneumoniae* which are able to form biofilms.

## Materials and Methods

Samples collection

A gross of 73 samples were obtained from patients of several ages and both genders suffering from burn and wound injuries who referred to Baghdad Teaching Hospital, Ghazi Al-Hariri Hospital for Surgery Specialist, Specialty Burn Hospital and Al-Kindy Teaching Hospital in Baghdad city from Aug.to Nov. 2019. The samples were taken by sterile disposable cotton swabs and kept in Brain-Heart Infusion broth (Himedia, India) before culturing on MacConkey agar (Mast group, UK) and incubated at 37°C for 24h.

### Isolation and primary identification of bacteria

Colonies from bacterial cultures were described for their morphological properties including shape, size, color, texture…etc. [8]. Then, a touch from a colony was smeared and stained by Gram method to observe cells under the microscope for their Gram reaction, shape, arrangement [9].

### Identification of *K. pneumoniae* isolates by VITEK 2 system

The VITEK 2 (bioMérieux, France) system is a computerized microbiology program using growth-based technology. The suspension of **b**acteria was arranged depending on the recommendations of manufacturers. From overnight pure culture, a sufficient number of colonies were transferred and suspending in sterile saline (3.0 ml) into polystyrene test tube. By using the DensiChek meter, turbidity was regulated to 0.5 McFarland. Later, the same suspension was applied in GN-ID (bioMérieux, France) with VITEK 2 system. Finally, cassette of GN-ID was loaded to the VITEK 2 chamber jointly with the tubes of specimen suspension [10].

### Detection of *Klebsiella pneumoniae* biofilm

### By Microtiter Plate (MtP) method

Microtiter Plate is a quantitative assay used to deduct biofilms through the microplate reader. In the method, each of the bacterial isolates was grown on MacConkey agar (Mast group, UK) at 37°C for 24h. After incubation, part of a grown colony was suspended in physiological solution, then concentration of all isolate suspensions were equilibrated with 0.5 McFarland. A portion (180 µl) of Mueller-Hinton (MH) broth enriched with 1% glucose was put in each of the 96 wells, and then, 20 µl of bacterial suspension was added to it. The microtiter plate was incubated at 37°C for three periods (24, 48 and 72h).

The isolates of which their biofilms formed on the walls of microplate wells were stained with crystal violet for 15 min (Afco, Jordan). Cells not forming biofilms in the wells were discharged by washing twice with phosphate-buffered saline (Euroclone, Italy) and wells were dried at 60°C for 1h. After drying, dye of biofilms that lined the walls of the microplate was resolubilized by of 96% ethanol (ROMIL pure chemistry, UK) and then microplate was spectrophotometrically measured at 570nm by using GloMax Explorer Microplate Reader (Promega Corporation, USA).

The non-inoculated wells containing sterile MH broth augmented with 1% glucose were used as blanks (negative controls). Absorbance values of the blanks were used to detect if isolates form biofilms or not [11].

### By Congo red agar (CRA) method

Congo red agar assay is a qualitative method for screening of biofilm producing microorganisms which depends on colonies color change grown on CRA medium. This medium was prepared by dissolving 0.8g Congo red (Alfa Aesar, USA), 36g sucrose (Oxoid, UK) and 37g Brain-heart infusion (Himedia, India) agar in D.W. then the volume was completed to 1L by D.W. The medium was inoculated the isolate culture and incubated for 24h at 37°C. After incubation, black colonies are considered as biofilm formers while pink ones are non-biofilm producers [11].

**Identification of *K. pneumoniae* by 16S rRNA analysis:** [12]

(All materials of this analysis were from Promega, USA).

**Extraction of bacterial DNA**

The pure colonies were re-suspended completely in 200µl of Buffer CL, and 20µl of Proteinase K solution (20 mg/ml) was added before adding to the cell pellets. The tube was mixed by vortex and incubated first at 56˚C for 30min and second at 70˚C for same time. After incubation, 200µl of Buffer BL was added to the sample and mixed vigorously before incubation at 70˚C for 30 min. After that, 200µl of absolute ethanol was added, and mix thoroughly. All mixtures were transferred to the mini-column, centrifuged for 1 min at 6,000 x g and the collection tube was replaced by a new one. Then, 600µl of Buffer BW was inserted to the mini-column, centrifuged for 1 min at 6,000 x g and the collection tube was replaced with a new one again. A portion of 700µl Buffer TW was centrifuged for 1 min at 6,000 x g. The pass-through was discarded and the mini-column was reinserted back into the collection tube. The mini-column was centrifuged at 13,000 x g, the mini-column was placed into a fresh tube and 100µl Buffer AE was added before incubation for 1 min at room temp. Finally, it was centrifuge at 5,000 rpm for 5min.

**Quantitation of DNA**

Quantus Florometer was used to detect the fineness of isolates for downstream applications. For DNA (1 µl), diluted Quantiflor (199 µl) Dye was prepared. DNA concentration values were inspected after five minutes of incubation within an ordinary room environment.

**Agarose Gel Electrophoresis:**

The presence of amplification was confirmed, agarose gel electrophoresis was adopted after Poly Chain Reaction (PCR) amplification.

**a) Solutions:** DNA ladder marker, 1XTAE buffer, and 10mg/ml Ethidium bromide.

**b) Agarose preparation:** In a beaker, 100 ml of 1X TAE was taken, 1 gm agarose was mixed with the buffer, then all particles of the gel were dissolved by boiling the solution in the Microwave. Then, 1µl of Ethidium Bromide was mixed with the agarose and mixed by the blender. The solution was cooled down to 50 °C

**c) The horizontal agarose gel casting:** After both edges were fixed, agarose solution was flipped into the gel plate with tapes of cellophane and the agarose was solidified at room temperature for 30min. The barrier was gently expelled and the gel arranged in the plate. When the buffer reached 4 mm atop the gel surface, the platter was loaded with 1X TAE-electrophoresis buffer.

**d) Mixture of reaction:** The 25µl mixture of PCR amplification consists of; (12.5 µl Master mix, 2 µl DNA template, 1 µl forward primer, 1 µl reverse primer and 8.5 µl nuclease free water). The protocol of PCR started with initial denaturation at 95°C for 5 min, denaturation at 95°C for 30 sec., annealing at 60 °C for 40 sec., extension 72 °C for 1 min. and final extension at 72 °C for 7min (fig. 1).

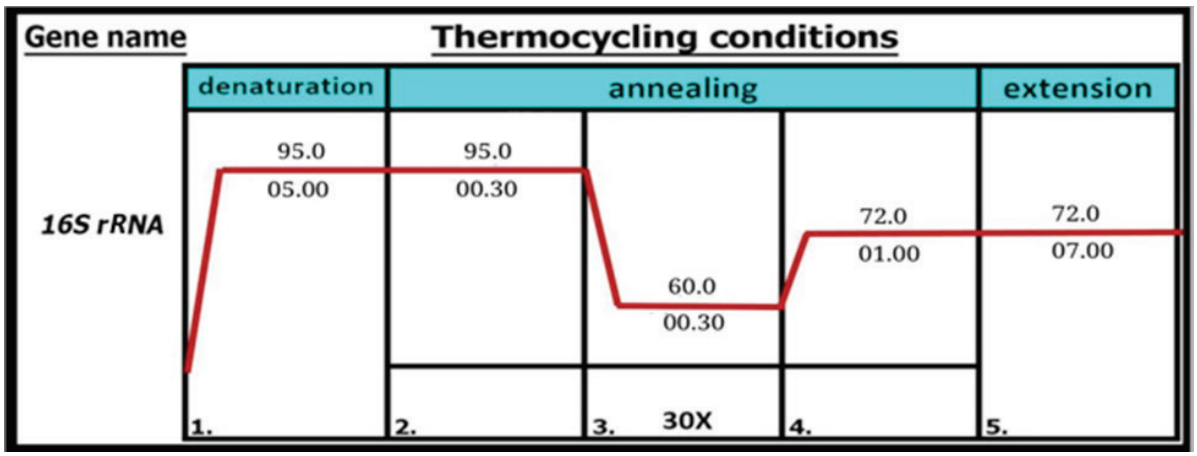

**Figure: (1): Thermocycling conditions diagram of PCR monitor for primer.**

**e) Loading of DNA:** Products of PCR were stacked. For Poly Chain Reaction item, 10µl was padded to well. For 75min electrical power was switched on at 100v/ mAmp. Towards plus Anode poles, DNA moved from Cathode. Investing Gel imaging system stained bands of the Ethidium bromide in gel were visualized.

**Standard Sequencing**

Automated DNA sequences and the product of PCR were sent for Sanger sequencing by Macrogen Corporation/ South Korea using ABI3730XL. The results obtained are shown in table 1. Afterward, it was analyzed depending on genius software and registered by the National Center for Biotechnology Information (NCBI).

**Table (1): Names and sequences of primers.**

| Name of primer | Sequences | Annealing Temp. °C) | Product size bp) | Ref. |
|---|---|---|---|---|
| 27F | 5`-AGAGTTTGATCCTGGCTCAG-3` | 60 | 1500 | (Hashim and AlKhafaji, 2018) |
| 1492R | 5`-TACGGTTACCTTGTTACGACTT-3` | | | |

## Statistical Analysis

Figures were drawn by Graph pad prism version 8 (Graph pad software Inc., La Jolla, CA, USA). Calculations and determination of forming biofilm, means and negative control standard deviation has been done according to [11] by using Microsoft Excel program.

## Results and Discussion

**Isolation and primary identification of bacteria**

From a total of 73 clinical swab samples, 42 were obtained from patients suffering of wound and 31 of burn injuries. After grown on MacConkey agar, 60 bacterial isolates were obtained; 36 (60%) from wounds and 24(40%) from burns. Colonies of the isolates appeared as large, round, mucoid and pink in color; such characteristics are similar to those described by [13] for *Klebsiella* spp. Microscopic examination of the suspected *Klebsiella* isolates revealed that they were Gram-negative short rods according to [9].

**Identification of *K. pneumoniae* by VITEK 2 system:**

By using VITEK 2 system, all the 60 bacterial isolates were identified as *Klebsiella pneumoniae* with a probability of 99%.

**Biofilms produced by *Klebsiella pneumoniae*:**

The results of Microtiter plate (MtP) for biofilm production by *Klebsiella pneumoniae* are shown in fig. (2). After incubation, only 4 isolates, 3 from wounds (symbolled K25, K49 and K51) and 1 from burns (symbolled K19) were able to form biofilms. Among these, K25 isolate was the strongest biofilm producer when its optical density reached 2.67. Adversely, isolate K49 was the weakest biofilm producer with an optical density of only 0.61.

**Figure (2): Optical densities of biofilms produced by *Klebsiella pneumoniae* isolates obtained from wound and burn infections**

**by using Microtiter plate method.**

After that, the Congo red agar assay was applied for qualitative evaluation of pathogenic biofilm. After incubation of *K. pneumoniae* isolates on the medium at 37 °C for 24 h, results illustrated in fig. (3A) showed that only the four biofilm-producing *K. pneumoniae* strains was able to turn color of the medium to black, while others (the non-biofilm producing isolates) were unable to change the red color of medium (fig. 3B). All isolates were let to grow for extended periods of incubation (48 and 72 h) and also found that they were unable to produce biofilms.

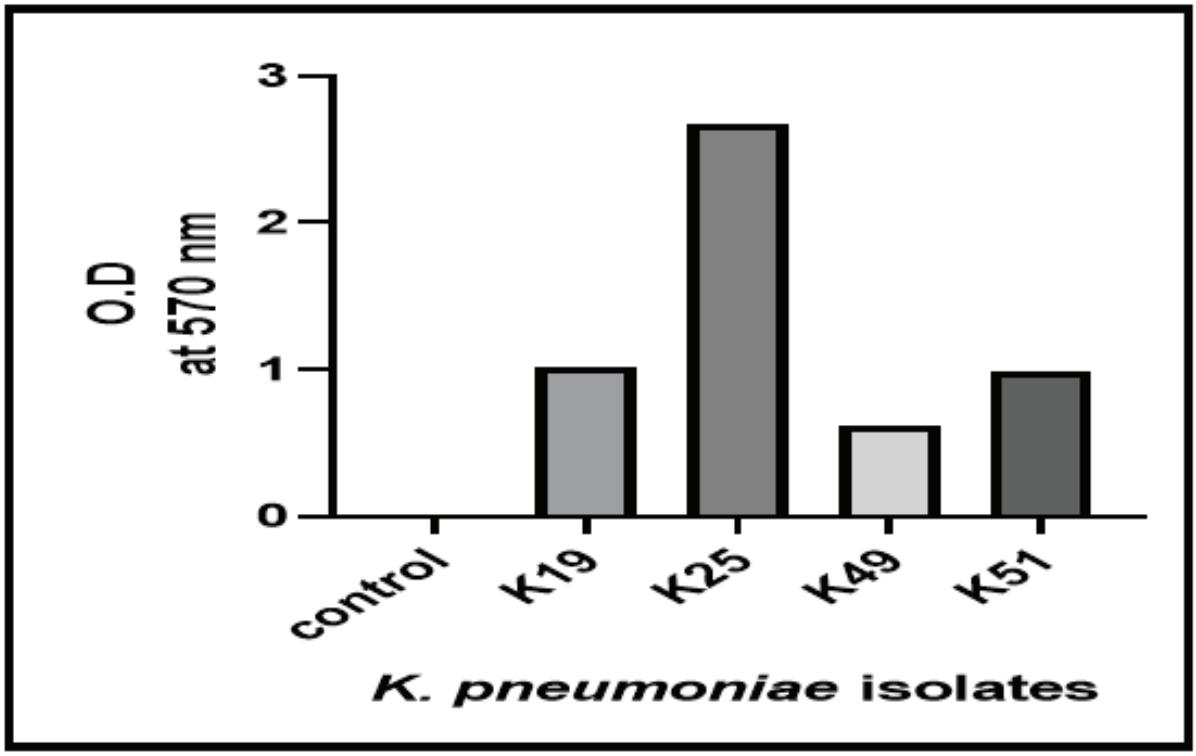

**Figure (3): *Klebsiella pneumoniae* isolates after incubation on Congo red agar at 37 °C for 24 hrs. A: growth of isolate given positive result for biofilm production, and B: growth of non-biofilm producing isolate.**

Results of [14] showed that most of the *Klebsiella* spp isolates collected from numerous clinical centers in Baghdad Province had potency to attach on the smooth surface (glass as well as plastic surfaces) but in various grades and different levels of producing biofilm by using microtiter plate method. However, a trial by [15] found that there is a relationship between color of the colonies and the strength of biofilm foundation; in which dark black reveals heavy biofilm formation, while red colonies declared the absence of biofilm production; they described the Congo red agar as specified method to characterize biofilm-forming bacteria morphologically.

**Identification and registration of new strains of *Klebsiella pneumoniae***

Depending on the 16S rRNA-based molecular identification of clinical isolates and to confirm the identification of *Klebsiella* spp to subspecies level, the amplification of *16S rRNA* gene was conducted by using PCR technique to detect the positive result, 4 new strains of *Klebsiella pneumoniae* namely (KPBIQ19, KPWIQ25, KPWIQ49 and KPWIQ51) were obtained from Iraqi burn and wound patients have been detected and registered in The National Center for Biotechnology Information (NCBI) as written within (table 2).

**Table (2): Gene bank locus registered by the "National Center for Biotechnology Information (NCBI)" based on 16S rRNA molecular identification for the new strains of *Klebsiella pneumoniae* isolated from Iraqi patients suffering burns and wounds.**

| Strain symbol | Gene bank locus | Source of strain |
|---|---|---|
| KPBIQ19 | MT102627 | burn |
| KPWIQ25 | MT102629 | wound |
| KPWIQ49 | MT102630 | wound |
| KPWIQ51 | MT102634 | wound |

In this study the molecular technique were used to confirm the identification of *Klebsiella pneumoniae* strains. where, also [16] performed sequence analysis by using the National Center for Biotechnology Information (NCBI) blast tool and searched in sequences of the Gene Bank database for comparison to identify the *K. pneumoniae* strain (symbolled SRP2), isolated from paper mill waste, Canada.

## Conclusions

After screening all isolates for biofilm production, only four of them were able to form biofilm. The four biofilm producers were discovered for the first time in this study to be new strains of *K. pneumoniae* and nominated by NCBI as KPBIQ19, KPWIQ25, KPWIQ49 and KPWIQ51 *K. pneumoniae* strains.

## Abstract

**Background:** Low- and high- oncogenic risk human papilloma viral infections have been related to the genesis of a variety of human benign and malignant tumors in the oral cavity and nasopharyngeal tissues. High- risk types of human papilloma virus are now well established as major etiologic factors of head and neck cancers, including tonsillar carcinomas. **Objective:** The current prospective case- control study aimed to unravel the frequency of HPV genotype 16/18 DNA detection rates in the adenoctomized tissues from patients with nasopharyngeal tonsillar adenoid hypertrophy. **Materials and Method:** A sixty (60) nasal as well as nasopharyngeal adenotonsillar tissues obtained from patients with adenoid hypertrophy via adenoctomies were enrolled. Forty (40) adenotonsillar tissues were from patients with adenoid hypertrophy, and (20) normal nasal tissue specimens were obtained from pediatric patients following trimming operations of inferior nasal turbinates' with unremarkable pathological changes (as an apparently healthy control group). A recent version of chromogenic in situ hybridization (CISH) method for HPV detection were performed by using specified DNA probes for DNA of high- risk HPV 16/18 genotypes. **Results:** Among nasopharyngeal adenotonsillar tissues group, 15 out of 40 have revealed positive CISH signals for DNA of HPV 16 / 18 genotype, constituting 35% of the total screened adenoid hypertrophied tissues. No positive–CISH reactions were detected in the control nasal tissues. Statistically, the results obtained in this study showed significant difference when compared to the control tissues group. **Conclusions:** The significant rate of such high- oncogenic HPV genotypes detection in those nasopharyngeal adenotonsillar tissues criticizes searching its further importance, as HPV 16/18 genotypes are critically correlated to many pre- neoplastic as well as malignant lesions.

## Introduction

Waldeyer's ring consists of submucosal and subepithelial lymphatic tissues localized in the pharynx and comprises the tubal, pharyngeal, palatine, and lingual tonsils. The pharyngeal tonsils, also known as adenoids, located at the posterior superior nasopharynx [(1)].

**Corresponding author:**
**Shakir H. Mohammed Al-Alwany**
shakir_immuno@yahoo.com

Adenoidal hypertrophy is an increase in adenoids size that might be associated with or without an acute or chronic infection[(2)]. An array of viral agent were recognized in association with the etiology of adenoid hypertrophy, such as herpes simplex virus, Epstein-Barr virus, , cytomegalovirus, adenovirus, coronavirus, coxsackie virus,,human boca virus, para influenza virus, rhinovirus, Parvovirus B19, and novel KI and KU polyomaviruses [(3-6).]

Among over 100 different types of Human papillomavirus (HPV) that are capable of infecting skin or stratified epithelial cells, at least 13 are cancer-causing types deemed 'high-risk'; the most common of

these being HPV 16 and 18 The remaining 'low-risk' types, causing non-cancerous lesions, of which HPV 6 and 11 are most common [7]. During the last 2 decades, an increasing evidence has suggested that human papillomaviruses (HPVs) can also infect the tonsillar epithelium,[3,4] and similar to other mucosal sites, have been associated with malignant transformation of tonsillar epithelia[8-10].

Since the incidence of tonsillar SCC has increased, whereas simultaneously the frequency of smokers has declined, additional risk factors probably exist for this malignancy [11,12]. Previous studies have suggested a substantial proportion of tonsillar SCCs to be associated with oncogenic HPV infections(13). The prevalence of HPV-positive related oropharyngeal SCC has been progressively increased and the tonsils were the most commonly affected sites [14] . Of note, >90% revealed HPV 16 [15] . However, to delineate when tonsillar HPV infection is first acquired as well as how long it remains latent, this goal could be approached by evaluating its prevalence in the pediatric population [7].

To our knowledge, this is the first molecular analysis that shade light on the association rate of HPV 16/18 infection in pediatric patients with tonsillar adenoid hypertrophy in Iraq.

## Material and Method

In this prospective case- control study, sixty nasopharyngeal adeno-tonsillar tissue specimens from patients with adenoid hypertrophy have enrolled that including 40 nasopharyngeal adeno-tonsillar tissues from patients with adenoid hypertrophy and other 20 normal nasal tissues (as an apparently healthy control group since have unremarkable pathological changes). CISH detection of HPV 16\18 DNA, a specified four- (4) µm tissue section was tested by a digoxigenin-labeled, oligonucleotide probe to target this HPV 16\18-DNA, via using specific CISH kit ( purchased from Zyto Vision GmbH. Fischkai, Bremerhaven. Germany).

For the statistical analysis, Chi–square test has used to calculate the statistical significance of the studied parameters, and the SPSS-23 package has been performed to analyze the relationship between the variables, where the p value of less than 0.05 points for a significant relationship between the studied parameters.

## Results

**Distribution of patients with nasopharyngeal adenoid hypertrophy according to their Age:**

In this study, the specimens were collected from patients with nasopharyngeal adenoid hypertrophy whom ages were ranging from 4 to 9 years with a mean of 5.77 ± 3.73 years. The mean age of those apparently healthy individuals (A.H. control) was 6.35 ± 5.66 years and their age ranged from 5- 12 years (Table 1) .

**Table (1): Distribution of studied patients with nasopharyngeal adenoid hypertrophy according to the mean and range of their age**

| Studied groups (Age / Year) | N | Mean | Std. Deviation | Std. Error | Range | | ANOVA test (P-value) |
|---|---|---|---|---|---|---|---|
| | | | | | Minimum | Maximum | |
| Nasopharyngeal Adenoid Hypertrophy | 40 | 5.77 | 3.73 | 1.11 | 4 | 9 | P=0.4 |
| A.H. Control | 20 | 6.35 | 5.66 | 2.14 | 5 | 12 | |
| Total | 60 | | | | | | |

**Gender distribution of the patients with nasopharyngeal adenoid hypertrophy:**

Males **with nasopharyngeal adenoid hypertrophy** was higher (60%: 24) than their female counter parts (40%: 16) .Also, in the control group , the males were higher (60%: 12) than females (40%: 8 ). The statistical analysis showed significant difference (P<0.01) among the studied groups (Table 2).

**Table (2): Distribution of the studied patients with nasopharyngeal adenoid hypertrophy according to their gender.**

| Gender | | | Studied Groups | | Pearson Chi-Square (P-value) |
|---|---|---|---|---|---|
| | | | Apparently Healthy Control | Nasopharyngeal Adenoid Hypertrophy | |
| | Male | N | 12 | 24 | |
| | | % | 60% | 60% | P=0.007 Sign. (P<0.01) |
| | Female | N | 8 | 16 | |

| Total | | N | 20 | 40 | |

**CISH expression of** Human Papilloma Viral types 16\18 DNA **in nasopharyngeal adenoid hypertrophied tissues**

**I-Positive HPV 16\18 DNA- CISH signal scoring**

The nasopharyngeal adenoid hypertrophied tissues have revealed 35% positive signals which represented 14 out of 40 tissues in this group. None of control tissues group presented positive signals for HPV 16\18-CISH test. The low signal scoring was noticed in (15%) whereas (12.5%) and (7.5%) have moderate and high signals scoring, respectively (detailed in Table 3). However, in comparison to the percentage of HPV 16\18-DNA in healthy control group, the differences are statistically highly significant (P value = < 0.0001).

**Table (3): Distribution of signal scores of HPV 16\18-DNA-CISH reactions.**

| HPV 16\18 scores | | Studied groups | | |
|---|---|---|---|---|
| | | A.H. Control | Nasopharyngeal Adenoid Hypertrophy | P-Value |
| Negative | N | 20 | 26 | |
| | % | 100% | 65% | |

**Physical state assessment of HPV-16/18 DNA as an integrated and episomal forms**

Regarding episomal and integrated forms of HPV 16\18-CISH signal detection in adenoid hypertrophy tissues group, the episomal was noticed in (28.6 %) whereas (71.4%) have an integrated phase (Table 5).

**Table 5: Integrated and episomal forms of HPV-16/18**

| HPV 16\18 | Positive (No.) | % |
|---|---|---|
| Episomal | 4 | 28.6 |
| Integrated | 10 | 71.4 |

**V. Spearman's Rho statistical testing of age, gender, and HPV 16\18-CISH to evaluate the studied markers in nasopharyngeal adenotonsillar hypertrophied tissues.**

A strong positive relationship (with highly significant correlation) was found between HPV 16\18 and age of patients with nasopharyngeal adenotonsillar hypertrophy (r = 0.248, P = 0.003). However, there are no significant correlation between adenoid hypertrophy and gender ( and as illustrated in table 6).

**Table 6 .Spearman's Rho statistical testing of age, gender, and HPV 16\18-CISH to evaluate the studied markers in nasopharyngeal adenotonsillar tissues.**

| Spearman's rho | | Age groups (years) | Gender | HPV 16\18 |
|---|---|---|---|---|
| Age groups (years) | r | | 0.050 | |
| | P | | 0.898 | |
| Gender | r | | | 0.186 |
| | P | | | 0.342 |
| HPV16\18 | r | 0.248 | | |
| | P | 0.003* | | |

***Correlation is highly significant (P<0.01).**

## Discussion

While tonsillar and/or adenoidal hypertrophy are prevalent otolaryngology disorders in children, their pathogenesis are largely unknown [(16).] Normal tonsillar tissues have been assessed in only a few studies, where by the end of year 2002, 8.5% (17 of 200) of the tonsillitis samples contained HPV DNA, and out of them 12 samples of HPV 16[(1)] . However, the current rate of HPV infection in the tonsillar and adenoid hypertrophied tissues of the pediatric population remains poorly defined [(7).]

In the current study, 14out of 40 nasopharyngeal adenotonsillar tissues have revealed positive CISH signals for DNA of HPV 16 / 18 genotype, constituting 35% of the total screened group of tissues. The detecting of such important HPV 16/18 genotypes in these adenotonsillar tissues criticizes searching their further importance.

Based on a systematic review of the literature by Wojtera et al, [(7)], the range of prevalence of HPV in pediatric tonsillar tissues was 0 - 21%. However, an interesting parallel in the pathogenesis of HPV infection of the cervix, is that persistent and often asymptomatic HPV infection can lead to intraepithelial neoplasia and the eventual accumulation of mutations, resulting in cancerous invasion and metastasis. A similar cycle may occur with tonsillar HPV infection, emphasizing the importance of early detection of HPV[(17).]

Geographical distribution of HPV infection (in general) as well as HPV-related cervical lesions are alternate possibilities for supporting the notion of such variation in the prevalence of pediatric tonsillar- HPV infection [(18,19).]

In the present study, the CISH results of HPV DNA detection showed 15% low scores and 20% weak signal intensity.

In the present, and as all previous studies, the obtained tissues from tonsillar hypertrophy and chronic tonsillitis cases were the indications for tonsillectomies. The current findings support these authors that such subclinical HPV infections detected in childhood may represent a pre-malignant lesion with a long-term course, and as well as a risk factor for the development of tonsillar cancer in adulthood.

Of value in this respect to note that, up to 2003, a total world literature has reported presence of HPV DNA in 51% of the analyzed tonsillar SCCs via a variety of detection techniques .In addition, the most prevalent HPV type was HPV-16 (84%). Moreover, HPV-33 has been found in only 4.6% whereas HPV types 5, 12, 31, 35, and 59 have been detected in occasional tonsillar carcinomas. However, four studies have enrolled 1941 patients have failed to detect HPV[1].

These contradictable results were suggested to be related to a potential sampling or selection bias since were done on a smaller scale [20,21].

For being RT-qPCR as a gold standard [22], and since the unreliability of conventional PCR (that use broad-spectrum primers for HPV) as well as lack of controls (in some studies), some of the observed high prevalences in majority of the previous studies may be explained [23].

In the present study, the CISH results to analyze the physical state of HPV DNA detection in the tonsillar tissues have showed that 71.4% have an integrated forms while episomal forms constituting 28.6% of the tissues.

Only few studies have systematically analyzed the physical state of HPV in the tonsillar carcinoma(1,24). Interestingly, integration of HPV-18 into the chromosome at 10q24 in tonsillar SCC cases has also been reported [25].

It was also described an episomal forms of HPV-16 as well as integrated or both (the episomal and integrated) forms of HPV 33- positive tonsillar carcinomas[8]. One possible explanation, for being HPV is mostly in the episomal form in tonsillar carcinomas, could be a genetic alteration in the long control region of extra chromosomal HPV, that leads to dysregulation of the viral oncogenes[1].

It was also reported an episomal (but deleted) HPV-16 in tonsillar carcinomas, where the biological implications of such deletions remained obscure [8]. The pathogenesis of HPV- induced tonsillar carcinoma is different from cervical carcinoma, where HPV is mostly in the cervical carcinoma of an integrated form [1]. Whether these pediatric HPV 16 /18 infections are representing a transient and eventually eliminated by the host's immune system, or remains as a latently viral status, or eventually progresses to symptomatic disease, pre-malignancy states and ultimately lead to a malignant lesions is currently unknown and to be determined, too.

# Roles of Brain-Derived Neurotrophic Factor (BDNF) In Developing Jaw

**Noor Natik Raheem[1], Mohammed Faris[2],،Athraa Y. Al-Hijazi[3], Ali I Alqurshi[4]**

*1Oral Hisology, Researcher/ College of Dentistry, Mustansiriyah University, Baghdad, Iraq, 2Oral Physiology, Researcher/ Al-Mustaqbal University College/Dentistry Department, Babylon, Iraq, [3]Oral Histology, Researcher/ Al-Mustaqbal University College/Dentistry Department, Babylon, Iraq, [4]Dentist/ Researcher, Al-Mustaqbal University College/Dentistry Department, Babylon, Iraq*

## Abstract

Brain-derived neurotrophic factor (BDNF) recognized to be involved in differentiation and proliferation of specialized cell such as osteoblast cell and endothelial cell. The study designed to identify the effect of exogenous BDNF on development of jaw and on neural marker expression.

Twenty pregnant rats, ten rats injected (I.M) with 0.1 ml normal saline, other ten injected (I.M) with 0.1 ml of BDNF. Rats were received three doses at intervals (0, 7, 14 day of gestation periods).The developmental jaw of embryos in 16th and 18th intra-uterine life studied for histological and immune-histochemical investigations.

The results Illustrated an enhancement of bone development during proceeding embryonic periods for both study groups .Moreover, the experimental group showed a significant differences in the mean of bone cell count at 18th day in comparison to 16th day IUL, and in comparison to control. Results revealed a positive expression of neuronal marker by proliferating nerve cells with a significant difference in comparison between experimental and control. The study suggests that BDNF may contributed in promoting the differentiation of bone cells and enhancement of bone formation with increasing in expression of neuron marker.

***Key words:*** *Brain derived neurotrophic factor, bone, embryogenesis, osteogenic cell, bone stem cell*

## Introduction

Neurotrophins and their receptors are important molecules that have a role in the development and maintenance of nervous organs and involved in regulating of organogenesis of skeletal tissues[1,2] . Studies have shown that neurotrophins are widely expressed in skeletal tissues, and shared in chondrogenesis, osteoblastogenesis, and osteoclastogenesis[3,4] .They illustrated to be involved in regulating skeletal tissue formation and in healing events[5] .Moreover ,BDNF stimulates and controls growth of new neurons from neural stem cells (neurogenesis)[6,7] and BDNF protein and mRNA have been identified in most neural areas of developing tissues[8,9] .

This study used Brain-derived neurotrophic factor (BDNF) to investigate its potential roles on expression of neural marker in developing bone of prenatal rat jaw.

## Materials and Methodology

Twenty female Albino Wister rats with age range of 4-5 months ,weighted 250-270g have been enrolled in this study and according to ethical approval from the ethical committee of the Al-Mustaqbal University College (license No: 069222) authorized all of the experimental approaches. Rats were first isolated from the rest, for two weeks to exclude any previous pregnancy. After examination and confirmation of non- pregnancy by the resident veterinary doctor, each female paired with a male in a separate cage and checked daily for the presence of vaginal plug. Then

the pregnant rats maintained in the animal department of (National Center of Drug Control and research / Iraq) under control conditions of temperature, drinking and food consumption. All experimental procedures carried out according to the ethical principles of animal experimentation. The pregnant rats divided randomly into 2 groups, each consisting of 10 animals.

Group I (control group) received 0.1 ml normal saline by intramuscular injection

Group II (experimental group) received 0.1 ml BDNF (ab9794)/ Abcam (intramuscular injection).Both groups received three doses at gestation interval periods (0, 7, 14 day).

Five rats from each group sacrificed at 16$^{th}$ and 18$^{th}$ day of gestation date and their embryo heads used for histological and immune-histochemical investigation.

**Histological examination**

Embryo jaw resected, fixed in 10% buffered formalin, dehydrated, and embedded in paraffin wax. Then section (5µm) stained with Hematoxylin and Eosin (H&E). The histological examination done under light microscope by examining four microscopical fields for each slide. Mean readings of counting number of the bone mesenchymal stem *cells* (BMSCs), osteocytes, and osteoblast were calculated and used in statistical analysis.

**Immunohistochemistry investigation on tissue sections**

The Neuronal Marker (ab104224) from Abcam used and according to manufacture data sheets, the preparation and characterization of this monoclonal antibody described. Positive peroxidase staining produces brown color on light microscopy; the percentages of positively stained cells counted at five representative fields (40X). Quantification method for Immuno-response estimated for the positive cell that expressed neuronal Marker and assessed by identifying and scoring 100 cells in five fields, X40 of the examined area. The scoring is (Score 0, none; score 1, <10%; score 2, 10-50%; score 3, 51-80%; score 4, >80% )[10].

**Radiological examination**

All embryo's head radiographed by Plain X-ray before resection with standard dental radiographic film. Voltage(kV)=60, Current(mA)=70, Exposure(s)=0.08.

## Statistical Analysis

The data analyzed by using Statistical methods using SPSS software program (version 19) and including:

A. Descriptive statistics

1. Means 2. Std Dev.3. Std error 4.Min.&Max.

B. One-way ANOVA test with multiple comparisons by (LSD Method).

## Results

**1. Histological and immune-histochemical Findings**

Control group at 16$^{th}$ IUL showed new apposition of thin trabeculae surrounding by proliferating bone stem cells, and at 18$^{th}$ day, histologic section showed bone trabeculae with osteoblast on the surface.

Immuno-histochemical expression of neuronal marker for embryonic bone (control& exp.) at 16$^{th}$ & 18$^{th}$ IUL have showed a positive DAB stain by proliferating neural cells in developing jaw, and recorded score 1 for control and score 2 with intense immune reaction for the experimental.

Experimental group at 16$^{th}$ IUL showed bone trabeculae with osteoblast, and proliferating bone stem cell detected around the trabeculae. At 18$^{th}$ day of gestation period, histological views illustrated well, thick organized trabeculae surrounding by osteoblast and osteocyte cell trapped inside the trabeculae. Figure (1)

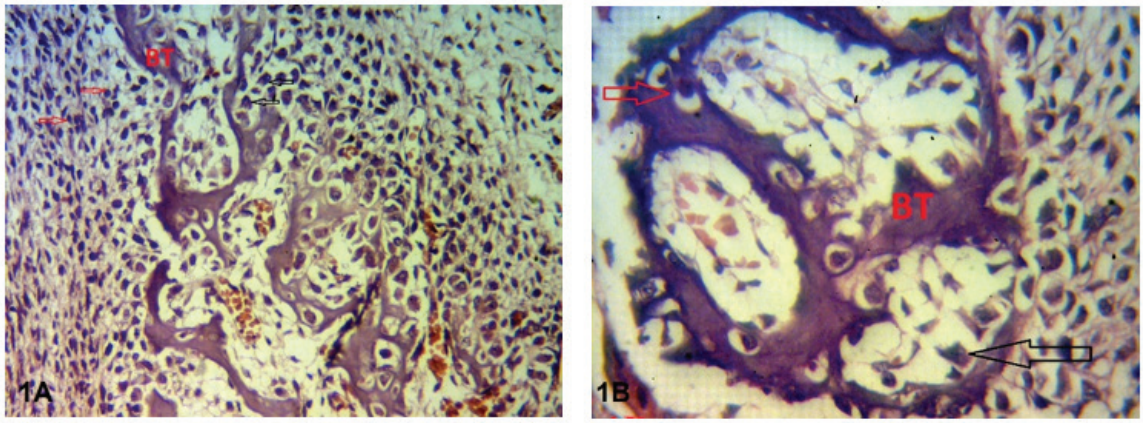

**Figure (1) embryonic bone at 18th IUL for control and experimental groups "1A: Control shows bone trabeculae (BT), bone mesenchymal stem cell.(arrows).H&Ex20 ; 1B: Experimental shows bone trabeculae (BT); osteocyte (red arrow) osteoblast (black arrow) H&Ex40"**

### 2. Radiological results

Radiographic evaluation for the study groups of embryos at 18th IUL illustrated that control group showed faint and streaky radio-opacity in upper and lower jaws, while experimental group has recognized more organized, linear radio-opacity in upper and lower jaws. Figure (2)

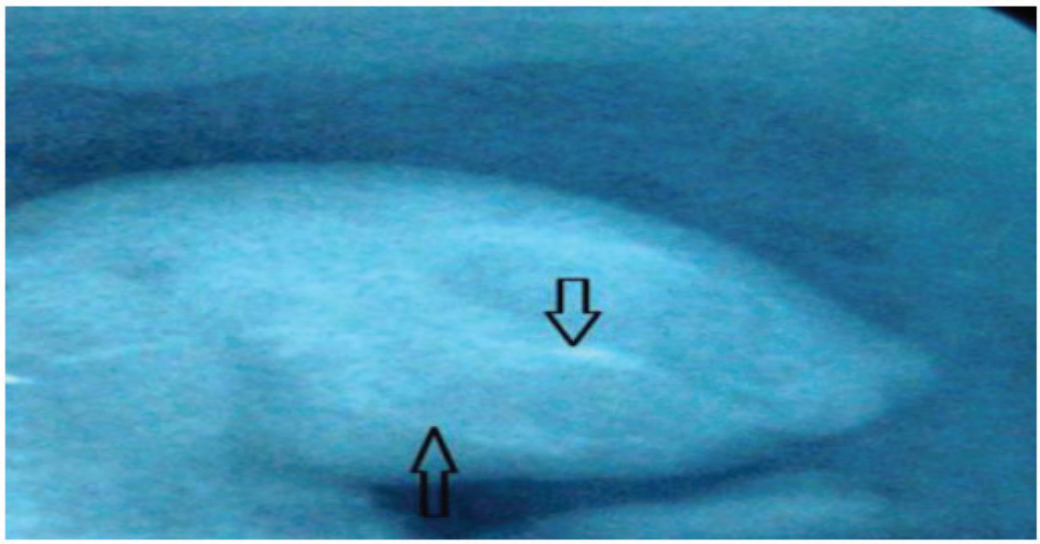

**Figure (2) Linear opaque radio-density represents development of upper and lower jaw (arrows) for Experimental group at 18th IUL**

## Statistical Analysis

Tables (1&2) illustrate the mean of bone cell (osteoblast and osteocyte) with bone mesenchymal stem cells (BMSC) for control and experimental groups at the16th and 18th gestation periods. Multiple comparisons by (LSD Method) of bone cells and BMSC count showed a significant value for the experimental group at the period 18th day in comparison to 16th day IUL, and in comparison to control at 18th day IUL .

Table(3) illustrates mean of neuron cells that expressed positive neuron marker .The results showed a high record in the mean of positive cells in experimental for both periods in comparison to control with a

significant difference value. On other hand, mean of positive cells in experimental group showed to be high at period 16th in comparison to 18th period, moreover, reversed results in control observed.

## Discussion

The study focused on jaw development of rat model and confirmed how the use of brain-derived neurotrophic factor can affect formation and aggravation of bone. However, the effect of BDNF in bone development reconsolidation has been less studied.

A studies found that neurotrophins and their receptors expressed in mouse osteoblastic cell lines[11,12] .The present study shows that using of exogenous BDNF plays a role in development of the jaw as the results confirmed by histological and immune-histochemical investigations and by radiologic examination . The results show that the mean of the number of bone cell (osteoblast and osteocyte) with bone mesenchymal stem cells for experimental group are higher in comparison to control [13,14] .In addition, increment of expression of neuronal marker by the proliferative mesenchymal stem cell and formative bone cell enhanced bone formation [15,16] .

Furthermore, in experimental group, we observed that new bone trabeculae formation started at 16$^{th}$ day proceeding the control group with a coincidence of an increment for expression in neuron marker. At 18$^{th}$ day of gestation period a well, thick organized trabeculae surrounding by osteoblast with presence of osteocyte detected histologically .Moreover, the result confirmed radiologically as the radiographic view showed a linear opaque radio-dense demarcated the jaw.

The results could explained as following: BDNF is a key molecule that controls neuronal differentiation, survival and synaptic formation[17] which helped in differentiation of bone cells, and enhanced neuron expression as revealed in this study.

## Conclusion

Brain-derived neurotrophic factor (BDNF) has neurological and non-neurological effect on bone formation by increasing expression of neuronal marker with increment of the number of bone progenitor cells and bone forming cells.

# Serum and Salivary Immunoglobulins levels in Tobacco Smokers of Baghdad Governorate

**Shatha F. Tariq[1], Raghad N. Shihab[1]**

*[1]Assist. Lec. Department of Medical lab. Techniques, Dijlah University college /Iraq*

## Abstract

It was shown that tobacco smoking was a major environmental factor which altered numerous changes in both antibody and cell mediated immune responses leading to increase the capability of the individual to develop various inflammatory and autoimmune diseases, thus the current study aimed to assess the levels of both serum and salivary Igs in 35 individuals who smoking tobacco and compared them to 35 non-smokers group. Results of this study revealed a slightly but non-significant increased ($p<0.05$) in the serum and salivary levels of IgM in smokers as compared to non-smokers, while the serum and salivary levels of both IgG and IgA shown a significantly decreased ($p\leq0.05$) in smokers as compared to non-smokers group. No positive correlation was found in the serum and salivary Igs levels in smokers. Body mass index (BMI) and smoking index (SI) were calculated for the smokers group, however, no significant differences were found in both serum and salivary Igs levels.

***Keywords:*** *Health, Smoking, Immunoglobulins (IgM, IgG and IgA); toxicity*

## Introduction

Tobacco smoking is one of the worldwide epidemic habits that associated with human beings death and morbidity[1] .Various chronic diseases in the brain, respiratory tract and cardiovascular system are induced because of the antigenic, carcinogenic and mutagenic impacts of the toxic chemical compounds which found in tobacco[2]. The World Health Organization (WHO) expected that in 2030 tobacco smoking will be one of the main causes that lead to the death of about 8 million individuals especially in the developing countries[3]. According to Hussain and Sullivan study in Iraq, about 29-31% males and 3-4% females considered as active smokers[4]. Inhalation of tobacco smoking has many adverse effects on both humeral and cellular immune response, it implicated in the inhibition or the production of many pro-inflammatory and anti-inflammatory cytokines in human body[5]. Many studies confirmed that tobacco smoking has prospective effects on inflammation process and autoimmunity such as Chronic Obstructive Pulmonary Disease (COPD), Rheumatoid Arthritis (RA) and Systemic Lupus Erythematosus (SLE)[6].Immunoglobulins (Igs) are glycoproteins found in serum, tissues and body fluids, synthesized by plasma cells in response to antigenic stimulation[7]. Five classes of Igs have been established which include: IgM: plays an important role in primary immune response, IgG: considers as the main Ig in secondary immune response, IgA: protects the mucosal surfaces from infections, IgE: acts as anti-parasitic and anti-allergenic, IgD: acts as B-cell receptor[8, 9]. Igs that present in saliva play a very important role in oral cavity protection especially salivary IgA which inhibit the entry of infectious microorganisms[10]. The current study aimed to investigate whether there are differences in the serum and salivary Igs levels in tobacco smokers and non-smokers.

## Materials and Method

The present study was carried out on 70 healthy males (with no clinical signs) lived in Bagdad Governorate, 35 individuals were smokers and 35 individuals were non-smokers, their age range from (18-40) years. Body mass index (BMI) was calculated by dividing the body weight (kg) on the square of the body height ($m^2$) in both smokers and non-smokers as the followings:7 smokers and 8 non-smokers had underweight BMI<18.5 kg/$m^2$, 20 smokers and 22 non-smokers had normal BMI (18.5-24.9) kg/$m^2$, 5 smokers and 4 non-smokers had over weight BMI (25- 29.9) kg/$m^2$, while only 3 smokers

and 1 non-smokers had obese BMI >30 kg/$m^2$. Smoking index (SI) for smokers was calculated as the number of cigarettes per day multiplying by the years of smoking as the followings: 30 smokers had mild SI < 200 while only 5 smokers had moderate SI (200-600).Serum samples from both smokers and non-smokers were obtained after centrifugation of blood samples for 5 min. at 3000 rpm, then they were stored at -20C° until use. Unstimulated saliva samples were collected from the study subjects (whom prevented from eating and drinking for nearly 1 hr. prior to donation) after cleaning and rinsing their oral cavity. All saliva samples were centrifuged for 10 min. at 10000 rpm, then the supernatants were stored at -20°C until use. The levels of serum and salivary Igs were measured by using the turbidimetric immunoassay. In order to analyze the data of the current study which were presented as mean ±Standard Error (S.E.), SPSS version 25.0 was used, one way ANOVA test has been dependent to find the differences between means which considered significant when the probability (P) value was ≤ 0.05[11].

## Results

Serum Levels of Igs (IgM, IgG and IgA) in Smokers and Non-Smokers:

Results of the current study revealed that serum level of IgM showed non-significant increase (p>0.05) in smokers as compared to non-smokers, while the serum levels of both IgG and IgA were decreased significantly (p≤0.05) in smokers as compared to non-smokers (Table.1).

**Table.1: Mean Serum Levels of Igs (IgM, IgG and IgA) in the Study Samples.**

Correlation between Serum Igs (IgM, IgG and IgA) in the Study Samples.

In smokers, negative correlation was found between serum IgM and IgG levels, no correlation was found between serum IgM and IgA levels as well as between serum IgG and IgA levels. In addition, no correlation was found among serum Igs in non-smokers (Table.3).

**Table.3: Correlation between Serum Igs levels (IgM, IgG and IgA) in the Study Samples.**

| **Serum Igs levels in Smokers** | | **r** | **p** | **Significance** |
|---|---|---|---|---|
| IgM(mg/dl) | IgG(mg/dl) | -0.01 | 0.956 | Non-significant |

Correlation between Salivary Igs (IgM, IgG and IgA) in the Study Samples.

In smokers, negative correlation was found between salivary IgM and IgG levels as well as between salivary IgM and IgA levels; however no correlation was found between salivary IgG and IgA levels. In addition, in non-smokers negative correlation was found between salivary IgM and IgA levels but no correlation was found between salivary IgM and IgG levels as well as between salivary IgG and IgA levels (Table.4).

**Table.4: Correlation between Salivary Igs levels (IgM, IgG and IgA) in the Study Samples.**

| **Salivary Igs levels in Smokers** | | **r** | **p** | **Significance** |
|---|---|---|---|---|
| IgM(mg/dl) | IgG(mg/dl) | -0.092 | 0.599 | Non-significant |
| | IgA(mg/dl) | -0.197 | 0.256 | Non-significant |
| IgG(mg/dl) | IgM(mg/dl) | -0.092 | 0.599 | Non-significant |
| | IgA(mg/dl) | 0.046 | 0.792 | Non-significant |
| IgA(mg/dl) | IgM(mg/dl) | -0.197 | 0.256 | Non-significant |
| | IgG(mg/dl) | 0.046 | 0.792 | Non-significant |
| Salivary Igs levels in Non-Smokers | | r | p | Significance |

***Cont...*** **Table.4: Correlation between Salivary Igs levels (IgM, IgG and IgA) in the Study Samples.**

| | | | | |
|---|---|---|---|---|
| IgM(mg/dl) | IgG(mg/dl) | 0.124 | 0.478 | Non-significant |
| | IgA(mg/dl) | -0.43 | 0.807 | Non-significant |
| IgG(mg/dl) | IgM(mg/dl) | 0.124 | 0.478 | Non-significant |
| | IgA(mg/dl) | 0.08 | 0.649 | Non-significant |
| IgA(mg/dl) | IgM(mg/dl) | -0.43 | 0.807 | Non-significant |
| | IgG(mg/dl) | 0.08 | 0.649 | Non-significant |

According to the BMI and SI in smokers, no significant differences were found in both serum and salivary Igs levels.

## Discussion

Alteration in the immunological functions for both antibody and cell mediated immunity might be due to the inhalation of tobacco smoke[12, 13] .Several previous studies in other countries authorized that serum levels of Igs were lower in smokers by 10-20% as compared with non-smokers individuals[14].Depending on the results of the current study, non-significant increase in terms of serum IgM was found in smokers which came in agreement with the results of Arinola *et al.*[15] and Gonzalez-Quintela *et al.*[16] who stated that this increased may be attributable to the ability of IgM in neutralizing the harmful toxins found in tobacco smoke by complement activation, conversely, Tarbiah *et al.*[13] reported a significant increased while Olayanju *et al.*[17] reported a significant decreased in the serum IgM in smokers as compared with non-smokers. In addition results of this research showed that both serum IgG and IgA levels were decreased significantly in smokers which were similar to the findings of Tarbiah *et al.* [13] in terms of IgG and Aula and Fikry[18] in terms of IgA level, however, IgG and IgA levels were found to be higher in smokers according to Prajapati and Jyoti study[19].Various investigations have concentrated on the possible mechanisms by which tobacco smoke might alter B-cells (which responsible for the production of Igs after their differentiation into plasma cells) development, functioning and distribution, it was found that tobacco smoke might cause down regulation of murine marrow B220+CD34- pre-B cells and/or B220+CD34+ pro-B cells which they effect on B-cells development[20]. In addition several molecular studies have stated that nicotinic receptors such as α 4 and α7 subunits which have essential roles in B-cells lines show elevated expression after long term exposure to nicotine which suppress B-cells secretions[21].Furthermore, it was found that proliferative ability of T-cells and T-cells dependent antibody responses were decreased in smokers which subsequently suppress B-cells functions and causes reduction in the production of serum Igs[22].Moreover low number and impaired functions of regulatory B-cells in smokers infected by Helicobacter pylori had been improved by Li *et al.*[23].It was found that after smoking cessation the levels of serum IgM and IgG were increased significantly, however the level of IgA remained the same[24].Despite the fact that blood considered as an essential sample for disease diagnosis; saliva reveals the mucosal and systemic expression of many biomarkers in the human body, salivary IgA initiate from the plasma cells found in salivary glands, while salivary IgM and IgG are mainly originate from the serum[25].Regarding the results of the present study, salivary IgM revealed non-significant increase in smokers which analogs with the results of Barton *et al.* [26] but a significant decreased in salivary IgG and IgA which came in agreement with the results of Giuca *et al.*[27].It has been demonstrated that tobacco smoke has an adverse effect on the oral mucosa by altering the amounts of saliva secretions, enzymes and immune functions[28], so the reduction of salivary Igs which have important roles in mucosal defenses may increase the susceptibility of the smokers to develop several oral infections such as chronic periodontitis[29]. Low level of salivary IgA which was found in this paper may be due to the perceived impact of tobacco smoke on the salivary glands or on other immunological cells that responsible for the production of salivary IgA. The absence of positive correlation in the smokers Igs levels in both serum and saliva in this study may be due to the smaller size of the smoking samples, in addition this study included only men because of the low prevalence

of smoking in females.

## Conclusions

According to the data of the current study, tobacco smoking is strongly associated with the suppression of B-cell functions and thus alters the Igs production and levels in both serum and saliva samples of smokers individuals.

# Association of Retinol Binding Protein-4 and Microalbuminuria and Blood Glucose Regulation in Type 2 Diabetic Iraqi Patients

**Thair Lateef[1], Ali Abdulhussain Kasim[2]**

*[1]Post gradsuate/ College of Pharmacy/University of Baghdad/Iraq,*
*[2] PhD/ College of Pharmacy/University of Baghdad/Iraq*

## Abstract

**Retinol binding protein 4 (RBP-4)** has long been known as the carriers for vitamin A, in the plasma it is banded to transthyretin to form too large complex for glomerulus filtration. Discovered as adipokine involved in the pathogenesis of type 2 diabetes induced insulin resistant and linked to obesity. Diabetic nephropathy one of serious microvascular complication that impact large numbers of the patient however, association with RBP-4 is not fully known.

The present study tested this hypothesis by measuring serum RBP4 in samples of Iraqi type 2 diabetic (n=120) with normal albumin excretion (n=57) and microalbuminuria (n=63) of either sex. and Also apparently health subjects (n=30) were involved to serve as control.

Concentrations of the RBP4 were significantly elevated in serum of microalbuminuric diabetic patients as compare with normoalbuminuric patients, ($p=0.000<0.05$). also glycemic index parameters significantly higher (for all $p<0.05$).

In conclusion, the study suggested that serum level of RBP4 are affected by microalbuminuria and the assessment of RBP-4 as controller for insulin resistant in type 2 diabetic in further studies must take into consideration other renal problems.

***Key Words:*** *retinol binding protein 4 (RBP4), type 2 diabetes mellitus, microalbuminuria.*

## Introduction

Diabetes is a set of metabolic defects recognizes mainly by hyperglycemia as a result of impairment in insulin sensitivity and/or secretion. Chronically, long-term hyperglycemia causes damage and dysfunction of multiple organs (kidneys, heart, eyes, nerves and blood vessels) [(1)]. The latest approximations show that there was a global prevalence of 463 million people with diabetes (9.3%) in 2019, which is expected to rise to 700 million (10.9%) by 2045, of whom 90% have type 2 diabetes [(2)].

About one third of diabetic patients will finally have progressive deterioration of renal function. The first clinical sign of renal dysfunction is generally microalbuminuria, which is occasionally reversible in type 2 diabetes, but may progresses to obvious proteinuria and then into chronic kidney disease. Most patients who have microalbuminuria are at greater risk to develop cardiovascular diseases (CVD) [(3)], this can be explained by the hypothesis that widespread vascular damage is resulting from renal albumin leakage, in other words, microalbuminuria seems to reflect a state of vascular dysfunction and is associated with changes in vasomotor tone regulation of peripheral vessels [(4)]. Furthermore, damaged endothelial cells secreted cytokines and growth factor and they accumulate into sub endothelial space of the injured region, this promoting atherogenic changes that makes an individual susceptible to CVD and other organ damage [(5)].

Retinol binding protein (RBP4) is a 21,000 Da protein that belongs to the lipocalin family of proteins; it has long been known as the carriers for retinol. Retinol is bound to apo-RBP4 which is attached to transthyretin

(TTR) to form too large complex (retinol-RBP4-TTR). The latter prevents glomerular filtration of RBP4 [6-8].

After delivery of retinol to target tissue, RBP4 is glomerulofiltered and degraded in the proximal tubules; thus, glomerular filtration rate (GFR) determines RBP4 concentration [9]. the impaired catabolism of the RBP4 complex in the kidneys leads to the accumulation of a truncated variant of RBP4 in plasma of patients with chronic renal failure; indicating the central importance of kidney function in the regulation of plasma RBP4 levels [5].

Ziegelmeier et al has correlated RBP4 to clinical and biochemical measures of renal function, glucose and lipid metabolism and inflammation in patients with a mild to moderate decrease in GFR [10]. In this study, higher levels of RBP4 were recorded in plasma of dialysis patients even though they excrete RBP4 in urine. Moreover, serum creatinine had predicted RBP4 concentrations in the control subjects with a GFR >50 ml/min [10].

In addition to its important function as retinol transporter, RBP4 is linked to obesity-induced insulin resistance and type 2 diabetes [11, 12]. The association of microalbuminuria with insulin resistance has been documented in both type 2 diabetic patients as well as in non-diabetic individuals [13, 14]. Serum RBP4 has also shown to be associated with albumin excretion; the relationship was not fully clarified [15, 16].

In the present study, we aimed to investigate the association of serum RBP4 with microalbuminuria levels and blood glycemic indices, fasting blood glucose (FBG) and glycosylated hemoglobin (HbA1c), in sample of type 2 Iraqi diabetic patients.

## Subjects and Methods

This cross-sectional study was conducted out in Specialized Center of Endocrinology and Diabetes in AL-Nasiriya city, south of Iraq. A total of 150 subjects were enrolled in the study; 120 of whom were an already diagnosed type 2 diabetes mellitus patients according to the American Diabetes Association Criteria [17], of age ≥ 18years and of either sex, with disease duration since diagnosis of at least 1 year. The remaining 30 were apparently healthy individuals to serve as control group.

Pregnant women, patients with end stage renal disease (ESRD) or patient on renal dialysis and patients with hepatic failure were excluded from the study.

Medical and social history were taken for each participant. Venous blood samples were collected after 12 hours of fasting. Ten milliliters blood samples were taken using 10 ml disposable syringes; about 2 ml of the collected blood was transferred to EDTA tube for analysis of glycosylated hemoglobin (HbA1c) by high performance liquid chromatography [18]. While (8 ml) of the blood was transferred to plane tube and centrifuged at (3000 rpm) for 10 minutes to obtain serum, which is used for the measurement of fasting blood glucose (FSG), blood urea (BU) and serum creatinine (S.cr.) by colorimetric assay [19]. The remaining part of serum was divided in Eppendorf tubes and kept frozen at (–20ºC) for the measurement of serum RBP-4 by enzyme-linked immunosorbent assay (ELISA) [20]. Finally, urine sample was collected from each participant for the measurement of microalbuminuria levels (MU) by NycoCard U-Albumin [21].

## Statistical Analysis

The statistical analysis was performed using The statistical package for social science (SPSS), version 25. Data are expressed as mean ± standard error of mean (SEM). Comparison of means of two groups were done by using student t-test. Categorical variables were presented as number and analyzed by the chi-square $\chi^2$- test. Pearson's correlation was used to study the correlation between different parameters and RBP4 Values. $P<0.05$ were considered significant.

## Results

The sociodemographic and clinical charecteristics of the participants are selected. Type 2 diabetic patients and control groups were of comparable age, gender and body mass index (BMI) (P-value >0.05). Fifty two of the diabetic subjects were males, and 68 were females. The mean age of them was (50 ±8) ranging from 33 to 69 year; and mean BMI was (29.3 ±4) kg/m$^2$. Regarding the control group, 13 of the subjects were males and 17 were females. Their mean age was (48.3 ±8.7) ranging from 32 to 65 year, and mean BMI was (27.9 ±4).

Serum RBP4, FBG, HbA1c% and MU levels were significantly higher in the diabetic group as compared with the control group ($P<0.05$). While, there was no significant difference in serum creatinine and blood urea between the diabtic and the control groups.

Diabetic subjects were divided according to urinary albumin excretion into two groups: normoalbuminuric patients with normal urinary albumin excretion (0-18 µg/l), (n=63); and microalbuminuric patients with albumin excretion (> 18 µg/l), (n=57). Sociodemographic and clinical characterizes for each group as choosen. There was no significant difference between the two diabetic groups with regard to gender, BMI, smoking habit and blood urea (P>0.05). Meanwhile, age, disease duration, serum RBP4, FBG, HbA1c and serum creatinine were significantly higher in diabetic patients with microalbuminuria (P<0.05).

Correlation studies of serum RBP4 with the studied variables of the pooled data are shown in Table 1. Serum RBP4 has a positive correlation with BMI, FBG, HbA1c, and microalbuminuria levels (P<0.001), and serum creatinine (P<0.05). While, there was no correlation between serum RBP4 with age, gender and blood urea (P>0.05).

## Discussion

In the present study serum RBP4 levels were significantly higher in the diabetic study group than in the control group. Serum RBP4 levels were positively correlated with the glycemic indices, FBG and HbA1c, of the total study subjects or of the diabetic group. High plasma levels of RBP4 have been reported in many conditions characterized by insulin resistance such as obesity, polycystic ovarian syndrome, and type 2 DM [22, 23]. Moreover, exercise-induced improvement in insulin sensitivity was shown to be associated with a reduction in serum RBP4 levels [15]. In mice, it was found that RBP4 interferes with expression and phosphorylation of insulin receptor substrates in skeletal muscle. While, in the liver, RBP4 induces expression of phosphoenolpyruvate kinase [22]. Therefore, elevated RBP4 levels in humans might participate in impairment of insulin-induced uptake of glucose by skeletal muscles and elevated fasting hepatic glucose production, which are two important characteristics of type 2 DM. Furthermore, RBP4 may negatively affect pancreatic beta cells function [24]. It is worthy to mention that RBP4 gene is located on human chromosome 10q, a locus near regions that reported to be related with hyperinsulinemia or type 2 DM developed early in life in two populations [25].

Serum RBP4 levels were significantly higher in diabetic patients with microalbuminuria than in those with normoalbuminuric, and there was a significant positive correlation between serum RBP4 levels and microalbuminuria levels. Similar findings were reported in other studies [26]. Microalbuminuria represents an early marker of nephropathy developed in diabetic patients[27] , and it is also reported to be associated with insulin resistance in diabetic patients and in non-diabetic subjects [13]. As mentioned earlier, RBP4 (low molecular weight protein) is mainly cleared by the kidney, and its serum levels are determined by the glomerular filtration rate (GFR) and become greatly elevated in end-stage renal disease [5, 9]. However, in case of microalbuminurea; it is unlikely that pobable variation in GFR was responsible for for the raised RBP4 levels in microalbuminuric diabetic patients [28]. So this elevation of plasma free RBP4 has been recognisesd by the liver as a positive-feedback signal from peripheral tissues for the release of the RBP4-retinol complex [29], whereby RBP4 elevates in plasma of type 2 diabetic subjects with miocroalbuminuria.

**In conclusion**, our results revealed that serum RBP4 levels are high in type 2 diabetic patients and may be linked to the early manifistations related to the development of nephropathy, specifically, microalbuminuria. In addition, serum RBP4 correlate positively with the FBG and HbA1c. Larger scale study for the assessment of serum RBP4 levels as predictor of diabetic nephropathy is recommended.

# Assessment of Nurses Knowledge Toward Neonate with Birth Asphyxia at Neonatal Intensive Care Unit in Pediatric Hospitals at Babylon Governorate

**Salim Amir Yousef[1], Abdul Mahdi Abdul Ridah Hasan[2]**

*[1]Post Graduate Student in Pediatric Nursing, Babylon Health Directorate, Iraq, [2]A. Prof. phD in Pediatric Nursing, College of Nursing/ University of Babylon – Iraq*

## Abstract

**Background:** Birth asphyxia is neonates' inability to activate and sustain breathing at conception .. It is also recognized as a condition that arises when blood gas delivery is compromised, contributing to hypoxemia and hypercapnia The combination of hypoxia and ischemia may contribute to a cascade of biochemical changes in the body contributing to neuronal brain loss and brain harm

**Objectives:** In order the aim of study to Identify the demographic characteristic of sample , Identify knowledge of nurses in caring of neonate with birth asphyxia at NICU at pediatric hospitals in Babylon governorate , determine the relationship between nurses knowledge with birth asphyxia at NICU with certain of socio- demographic characteristics of sample Babylon, Iraq.

**Methodology:** A comprehensive research is undertaken to investigate nurses' understanding of Neonate with Birth Asphyxia in the Neonatal Intensive Care Unit at Babylon Governorate Pediatric Hospitals A randomized random sample of (62) nurse is chosen with the usage of the chance sampling method. The research group is spread in the Neonatal Intensive Care Unit at Babylon Governorate Pediatric Hospitals. The data was obtained using a built-in self-report questionnaire and evaluated using the concise statistical analysis method that involves "frequencies & percentages" and the Inferential statistical data analysis methodology used for the Chi-square test.

**Results:** Results of the analysis show that the participants with excellent awareness served (66.1 percent), whereas those with bad information (33.9 percent) reflected nurses in the Neonatal Intensive Care Unit at the Babylon Governorate Pediatric Hospitals. In comparison, the mean age of experienced nurses is 32.73 ± 9.33 while those with bad awareness are 26.05 ± 5.86. Significant linkages exist between Education and awareness engagement, $p = 0.015$.

**Conclusions and recommendations :** Around 66 per cent of nurses have experience of birth asphyxia, the study showed. Despite Born Asphyxia, about half of them have strong and optimistic disposition towards Neonate. Education will be deemed to improve nurses' awareness of Neonate with Birth Asphyxia

***Key words:*** *Knowledge, Nurses, birth asphyxia.*

## Itroduction

Birth asphyxia is neonates' inability to activate and sustain breathing at conception .. It is also recognized as a condition that arises when blood gas delivery is compromised, contributing to hypoxemia and hypercapnia The combination of hypoxia and ischemia may contribute to a cascade of biochemical changes in the body contributing to neuronal brain loss and brain harm **(1).** According to the (World Health Organization; 2007) Birth asphyxia can occur as a result of factors such as premature lungs with inadequate surfactant for proper functioning. Maternal, placental, or fetal triggers can be involved. Complications such as obesity, disease and drug consumption are motherly triggers Placental disorders such as placenta Previa, placental abruption or post-maturity may trigger asphyxia in utero **(2)** The fetal asphyxia triggers include complications with the thread, pregnancy, early delivery and multifetal childbirth.

(Maternal Newborn Foundations) However, if the arterial umbilical cord pH is < 7, the neonate is asphyxiated; the Apgar level is 0-3 for longer than 5 minutes; has cognitive signs such as epilepsy, paralysis or hypertension; and multisystem organ failure like cardiovascular failure;, gastrointestinal, hematological, pulmonary, or renal system [(3)] Relevant risk factors for prenatal asphyxia involve gestational maternal age below 16 or over 35 years. Age 41 years, asthma, prescription substance and alcohol consumption, hypertensive conditions, excessive breakup of the membrane, maternal inflammation, second or third trimester bleeding and > 24 hours' labour [(4)] The clinical form of birth asphyxia is persistent hypoxia, hypercapnia, hypo- perfusion, and metabolic acidosis. Birth asphyxia will be treated if the infant has gasping and insufficient respiration or no breathing at one minute, according to the Regional Neonatology Forum of India. It correlates to 3 minute or less of an Apgar ranking [(5)] All the attendants must also be trained in newborn resuscitation and must have the appropriate equipment ready to resuscitate the newborn infant. Approximately resuscitation equipment is necessary for effective treatment of asphyxia; but, without the use of equipment, asphyxiated babies can be resuscitated. For the event of birth time asphyxia. Newborn mothers should realize the value of interventions which contribute to the prevention of birth asphyxia. Nonetheless, this concern focuses mainly on the treatment of birth asphyxia, which is neonatal resuscitation rather than avoidance.

## Methodology

**Study design:** A comprehensive research is performed at the Neonatal Intensive Care Unit in Pediatric Hospitals, Babylon Governorate Babylon Teaching Hospital for Maternity and Children, and AL-imam Al-sadiq Clinic. Babylon Governorate, Babylon Health Directorate / Iraq.

**Study Sample:** A randomized random selection of (62) nurse is chosen through use of the approach to chance sampling. The research sample is spread in the Maternal and Children's Neonatal Intensive Care Unit in Pediatric Hospitals at Babylon Governorate Babylon Teaching Hospital and AL-imam Al- sadiq Hospital.

**Study Instrument:** Data collection tool which comprises the following:

**Part I**: Socio-demographic profiles of pediatric nurses in the Babel government clinics for newborns with birth asphyxia comprise (9)items and Respiratory structure and roles comprise (6)items.

**Part II**: Issues for evaluating the awareness of newborns with birth asphyxia include (6) items and reasons, and (4) items at risk for congenital asphyxia.

**Part III**: Issues for testing nurses on birth asphyxia include (12) objects, clinical symptoms include (2) objects and medical evaluation include (1) item.

**Data Collection the Methods:** The data were collected using a built-in self-report questionnaire. To get oral consent, the researcher introduced himself to the participants and clarified the intent of the test.

**Statistical analysis:** Data entry and interpretation were conducted using computer program SPSS version 23 (statistical kit for social sciences), categorical variables were presented as concentrations and percentages, continuous variables were presented as (mean ± standard deviation). The same Pearson chi square / Fisher check was carried out to establish the relation between categorical variables, In addition, student t-tests were used to evaluate mean discrepancies between classes. The P value of 0.05 has been considered statistically important

## Results

**Table (1): Nurses their Demographic Characteristics**

| Variable | mean±SD | Range |
|---|---|---|
| Age (year) | 30.47±8.86 | 35(19-54) |
| Gender<br>Male<br>Female<br>Total | <br>38<br>24<br>62 | <br>61.3%<br>38.7%<br>100.0% |

| | | |
|---|---|---|
| Marital status | | |
| Single | 16 | 25.8% |
| Married | 46 | 74.2% |
| Divorce | 0 | 0.0% |
| Widow | 0 | 0.0% |
| Separated | 0 | 0.0% |
| Total | 62 | 100.0% |
| Educational level | | |
| Preparatory nursing | 11 | 17.8% |
| Diploma | 34 | 54.8% |
| Bachelor | 14 | 22.6% |
| Master | 3 | 4.8% |
| Total | 62 | 100.0% |

This table shows that the mean age of nurses in year is 30.47±8.86 ranging from (19-54),two third of whom (61.3%) are male,74.2% of the respondents are married and just over half of them (54.8%) have a diploma.

**table (2): Nurses Knowledge Distribution of mean knowledge of nurse regarding birth asphyxia(n=62)**

| **Variable** | **Mean** | **Frequency** | **Percentage(%)** |
|---|---|---|---|
| Good knowledge | ≥ 17.85 | 41 | 66.1% |
| Poor knowledge | <17.85 | 21 | 33.9% |

This table shows that the participants with good knowledge represented (66.1%),while those with

poor knowledge represented (33.9%). The overall knowledge were estimated by taking the average score of all subscales ,the subscales score were obtained by summing items score and dividing by the total number of items. Good knowledge is participant who scored above or equal mean for knowledge questions.

Poor knowledge is participant who scored below mean for knowledge questions. Finding reveals that the majority of (60.7%) were poor knowledge of nurses at primary health care centers in Babylon Governorate.

**Table( 3): Association between variables related to work and training of nurses and knowledge(n=62)**

| **Study variables** | **Knowledge** | | |
|---|---|---|---|
| | **Good** | **Poor** | **p-value** |
| **Participation in training course** | | | |
| **Yes** | 37(90.2%) | 13(61.9%) | |
| **No** | 4(9.8%) | 8(38.1%) | **0.015*F** |
| **Total** | 41(100.0%) | 21(100.0%) | |
| If yes, type of training (n =50) | | | |
| Theoretical | 9(24.3%) | 3(23.1%) | |
| Practical | 6(16.2%) | 0(0.0%) | 0.402[F] |
| Both | 22(59.5%) | 10(76.9%) | |
| Total | 37(100.0%) | 13(100.0%) | |

***Cont...*** **Table (1): Nurses their Demographic Characteristics**

| | | | |
|---|---|---|---|
| Place of training (n =50)<br>Inside Iraq<br>Outside Iraq<br>Total | 37(100.0%)<br>0(0.0%)<br>37(100.0%) | 12(92.3%)<br>1(7.7%)<br>13(100.0%) | 0.26F |
| Number of times of training (n =50)<br>One time<br>Twice<br>More than twice<br>Total | 10(27.0%)<br>7(18.9%)<br>20(54.1%)<br>37(100.0%) | 2(15.4%)<br>4(30.8%)<br>7(53.8%)<br>13(100.0%) | 0.57F |

***P value ≤ 0.05 was significant , F: Fisher exact test**

Table (3)shows that Fisher exact test was conducted to show an association between variables related to work and training of nurses and knowledge regarding birth asphyxia (good or poor).

There is significant association between participation in training course and knowledge, p value = 0.015.

## Discussion

Part I: Discussion the demographic characteristics

Our results reflect the concise data of the socio-demographic details of the nurses who function in frequency and percentage terms in the neonatal intensive care unit. Of the (62) participants that took part in this research, their age distribution of nurses in the year was 30.47±8.86, varying from (19-54), two-thirds of which (61.3%) were male, (54.8%) had a certificate, (22.6%) had a Bachler, , (4.8%) had a master's degree According to their professional success, most nurses (54.8%) graduated with a nursing certificate, since the credential was deemed to be the highest percentage of staff nurses in a health system regardless of the vast number of establishments graduating with that degree. This statement also came from the pediatric hospitals' neonatal intensive care unit We are largely reliant on nurses who have graduated from nursing and high school while nurses that have graduated from nursing college are assigned to specific units of hospitals and are only in low numbers compared with other patients.

74.2% of respondents are dating and only over half are female as the bulk of these age ranges are dating., especially after the conclusion of the nursing studies and appointments. Where the Iraqi young take advantage of the marriage hand after graduation from the study and the availability of work opportunities. Mean years of clinical practice varied from (1-22) 7.77±4.94. Third (80.6%) took part in educational or academic classes, nearly exclusively inside Iraq (98.0%). 38.0 percent of nurses indicated that the last time they provided infant resuscitation instruction was the previous year, this finding was followed by a survey carried out of Awareness Evaluation, Birth asphyxia treatment mindset and experience at the Federal Medical Center Asaba, Delta State-Nigeria. Their analysis shows that 16 (32%) of the respondents have at least one neonatal resuscitation experience while 3 (6%) have two experience cycles. 3(6%)had less than a year earlier, 7

(14%), 2 (4%) and 5 (10%) had their last schooling from 1-2 years, 3-4 years.. And 12(0) appropriately for 1-5, 6-10, 11-15, 16-20 and 21-30. With regard to experience in neonatal resuscitation, respondents ranked 9.6 (2.9) and 10.1 (2.3) respectively for those with and without experience [6]

**Part II: Discussion the nurses knowledge**

The result indicates that participants with good information identified (66.1 per cent) strong information are participants who ranked at or equivalent mean for questions of knowledge. This finding is followed by a research conducted to determine the efficacy of a formal training system on information regarding neonatal asphyxia control among staff nurses in pediatric allied units in selected hospitals of Punjab According to this report, 24 (80%) respondents had strong information, 2 (6.67%) had great knowledge and 4 (13.33%) had outstanding knowledge in the experimental category and 23 (76.67%) respondents had acceptable knowledge and 7 (23.33%) had less than average knowledge in the control group [7] .

Weak information (33.9 per cent) was reflected. Participants who ranked below mean for information questions are followed by a test performed in Evaluation of Information of Birth Asphyxia in staff nurses employed in the workplace and NICU Results of this research 5 (16.67%) had weak awareness [8] .

**Part III: Discussion the relationship between variables related to work and training of nurses and knowledge**

Findings indicate the connection of information linked to birth asphyxia among nurses and their demographic characteristics. There is a strong correlation between involvement in training and information, p value = 0.015 This finding fits the test findings obtained in a cross-sectional analysis obtained in Nigeria Education. Health care professionals, so they should boost their capacity to provide patient treatment. It will also improve the capacity and their awareness to control birth asphyxia. Just 29.4 percent of nurses have been qualified in the new research. This result was comparable with the result in the analysis in Kenya that only 23% of the test participants provided training [9] .

## Conclusions

In terms of awareness, birth asphyxia was bad awareness among nurses. Nurses years of neonatal intensive care unit practice and preparation programs play an significant part in their expertise. To develop awareness, it requires to hire comprehensive educational courses relevant to birth asphyxia and neonate resuscitation.

# Evaluating the Concentration of Cotinine, Lead and Cadmium in Newborns with Respsiratory Distress Syndrome

**Hiba Hussein Ali [1], Ali Faris Hassan[2], Hayder Hussein Alzubaidi [3]**

*[1]Pharmacist. Department of Toxicology/ Medico Legal Directorate/Iraq, [2]Lec. Dr. Departments of Pharmacology and Toxicology / College of Pharmacy / University of Baghdad/Iraq, [3]F.I.C.M.S Pediatrician, Al-Elwayia Pediatric Teaching Hospital/Iraq*

## Abstract

**Background** Respiratory distress syndrome is one of the most common problems of newborns. Respiratory distress syndrome occurs when there is no enough surfactant in the lungs. Heavy metals are naturally occurring elements that have a high atomic weight and a density at least 5 times greater than that of water. Lead is a heavy metal, it is important environmental toxicant; the toxic effects of lead include many systems in the body like central and peripheral nervous system. Cadmium is heavy metal that exerts toxic effects on the kidney, the skeletal and the respiratory systems, and is classified as a human carcinogen. Nicotine, the main alkaloid of tobacco. It is readily absorbed from tobacco smoke, and its concentration rises over 6-8 hours during the day in regular smokers. About 70 to 80% of nicotine is metabolized to cotinine. **Methods** The study was carried out for 50 newborns divided in two groups: *Group 1*: 25 newborns with respiratory distress syndrome. Group 2: 25 newborns without respiratory distress syndrome. **Results** According to Demographic characteristics there are no significant differences when compered the age, gender, duration of pregnancy and the age of the mothers of newborns with respiratory distress syndrome and normal newborns *($p<0.05$)*. the whole blood lead and serum cotinine concentration in newborns with respiratory distress syndrome was significantly higher compering with normal newborns (*$p<0.05$*). The whole blood cadmium concentration in newborns with respiratory distress syndrome was not significantly different comparing with normal newborns *($p<0.05$)*. **Conclusions** Newborns with respiratory distress syndrome have high serum level of cotinine and whole blood lead when compared to healthy newborns.

***Keywords:*** *Cadmium, cotinine, Heavy metals, Lead, Nicotine, Respiratory distress syndrome*

## Introduction

Respiratory distress syndrome (RDS), or hyaline membrane disease, is one of the most common problems of newborns. It can cause newborns to need extra oxygen and help to breathe [(1)]. Respiratory distress syndrome occurs when there is no enough surfactant in the lung. When there is not enough surfactant, the tiny alveoli collapse with each breath. As the alveoli collapse, damaged cells collect in the airways and further affect breathing ability. As the newborn's lung function decreases, less oxygen is taken in and more carbon dioxide accumulates in the blood. Signs and symptoms of RDS include**:** cyanosis, flaring of the nostrils, tachypnea, grunting sounds with breathing, chest retractions [(2)]. RDS is usually diagnosed by chest X-rays of the lungs, blood gas tests and Echocardiography. [(3)] The multiple uses of heavy metals in industry, domestically, agriculturally, medically and technologically have led to their wide distribution in the environment [(4)]. Lead is a naturally occurring, present in small amounts in the earth's crust [(5)]. Exposure to lead and lead chemicals can occur through ingestion, inhalation and dermal contact, most human exposure to lead occurs through ingestion and inhalation [(6)]. Lead metal causes toxicity in living cells by ionic mechanism and that of oxidative stress. Antioxidants, e.g. glutathione, present in the cell protect it from free radicals such as $H_2O_2$. Under the influence of lead, however, the level of the ROS increases and

**Corresponding Author**
**Hiba Hussein Ali**
hussein.hiba@ymail.com

the level of antioxidants decreases [7]. Cadmium (Cd) is a toxic heavy metal and the components of tobacco, together with water and food contamination, represent the main sources of non- occupational exposure in the general population. Cd enters the human body mainly after inhalation of environmental tobacco smoke and also via gastrointestinal absorption [8]. Continuous exposure to low levels of Cd may result in bioaccumulation and can cause a variety of adverse health effects on human beings, among which kidney function, lung diseases, and disturbed calcium metabolism and bone effects are the most prominent, depending upon the level and duration of exposure [9].Cadmium increases the activity of some hydrolytic enzymes such as peroxidase that lead to intensifying the respiration of the cells and depletion of the cells nutrients during this process that leads to the acceleration of senescence [10].

Nicotine, the main alkaloid of tobacco, is responsible for its addictive effect. About 70 to 80% of nicotine is metabolized to cotinine [11]. As the primary metabolite of nicotine, cotinine has been widely used as a specific biomarker of tobacco exposure because its half-life in the body (12-20 hours) is longer than that of nicotine (3-4 hours) [12].

## Subjects and Methods

### Research setting

A cross sectional study of 50 newborn babies divided as follows:

1- **Group 1**: 25 newborns with respiratory distress syndrome (RDS). The newborns within this group were taken from Al-Elwayia Pediatric Teaching Hospital.

**2- Group 2:** 25 newborns without respiratory distress syndrome (RDS). The newborns within this group were taken from welfare pediatric Teaching Hospital- Medical city

The newborns were taken from both sexes, at the age range from 24 hours to one week. This study was conducted from the 1st of March to the 30th of July 2019

### Blood sampling:

Approximately (3 ml) of venous blood was taken from each newborn, which divided into three tubes:

- The first tube (2 ml) whole blood is collected into EDTA tube for the measurement of blood levels of Pb and Cd by atomic absorption.

- The second tube (0.5ml) is collected in a gel tube from which immediately the serum was separated by centrifugation for the measurement of the concentration of cotinine by cotinine Elisa kit.

### Biochemical assay

Frozen serum was allowed to thaw at room temperature; assessment of inorganic elements (Pb) was performed by flame atomic absorption spectrophotometry (FAAS) [13], while (Cd) was performed by graphite furnace atomic absorption spectrophotometry (GFAAS) [14].

## Statistical Analysis

All the results were expressed as mean± standard deviation (SD). The data were analyzed by utilizing a computerized statistical package for the social sciences SPSS program. Unpaired Student t-test was performed for each group pair includes a comparison between two groups (P-values < 0.05) were considered to be statistically significant [15]. A chi-square test was used to assess the statistical significance in distribution between different discrete variables [16].

### Ethical Consideration

All administrative and Ethical approvals were taken from the parents, the administrative team of the hospital including the managing director, the head of the departments and collage of pharmacy- University of Baghdad.

## Results

### Demographic Characteristics

In table (1), according to the age of newborns, there is no significant difference in the age of RDS newborns when compare to the normal newborns *(p>0.05)*, the same finding was seen with the age of mothers in which there is no significant difference in age of mothers of RDS newborns when compared to the age of mothers of normal newborns *(p>0.05)*. The gender of RDS newborns was 18(72%) as a males and 7(28%) as females meanwhile the gender of normal newborns 15(60%) as males and 10(40%) as females. Regarding the duration of pregnancy, the duration of pregnancy of RDS newborns was not significantly differs from the duration of pregnancy of normal newborns *(p>0.05)*.

According to the residency of newborns, the residency of RDS newborns and normal newborns were significantly different *(p<0.05)*, The residency of RDS newborns was 20(80%) live in urban area and 5(20%) live in rural area meanwhile residency of normal newborns was 11(44%) live in urban area and 14(56%) live in rural area.

According to the smoking status of newborns mothers, there are significant differences when comparing the smoking status of the mothers of RDS newborns and normal newborns *(p<0.05)*. The smoking status of RDS newborns mothers was found 0(0%) for non-smoking mothers, 23(92%) for passive smoking mothers and 2(8%) for smoker mothers meanwhile the smoking status of normal newborns mothers was found 13(52%) for non-smoking mothers, 7(28%) for passive smoking mothers and 5(20%) for smoker mothers.

According to the types of delivery of newborns, there are significant differences when comparing the types of delivery of RDS newborns and normal newborns *(p<0.05)*. The types of delivery of RDS newborns was found 9(36%) for a normal delivery and 16(64%) for caesarian delivery meanwhile the types of delivery of normal newborns was found 20(80%) for a normal delivery and 5(20%) for caesarian delivery.

**Table (1): Demographic characteristics of study groups**

| | | **RDS Newborns** | **Control Newborns** | ***P-Value*** |
|---|---|---|---|---|
| **Age of newborns (days)** | | 2.92±1.29 | 3.04±1.24 | 0.7378 |
| Gender of newborns | males | 18(72%) | 15(60%) | 0.3740 |
| | females | 7(28%) | 10(40%) | |
| Age of the mothers (years) | | 25.76±6.78 | 26.44±5.75 | 0.70415 |
| Duration of pregnancy (weeks) | | 39.52±1.38 | 39.48±1.87 | 0.93203 |
| Residency | Urban | 20(80%) | 11(44%) | 0.00873 |
| | Rural | 5(20%) | 14(56%) | |
| Smoking status | Non-smoking | 0(0%) | 13(52%) | $1.1*10^{-5}$ |
| | Passive smoking | 23(92%) | 7(28%) | |
| | Smokers | 2(8%) | 5(20%) | |
| Type of delivery | Normal | 9(36%) | 20(80%) | $8.4*10^{-7}$ |
| | Caesarian | 16(64%) | 5(20%) | |

Clinical Signs and Symptoms for RDS Newborns

In the table (2), the average duration of residency of RDS newborns in the hospital was (2.72±1.2 days), the average heart rate was (159.19±1.77 beats/mints) and the average respiratory rate was (77.56±3.25 breath/mints).

According to bell shape thorax, the number of RDS newborns with bell shape thorax was 13(52%). According to grunting baby, number of RDS newborns with grunting was 9(36%). regarding to subcostal retraction, number of RDS newborns with subcostal retraction was 24(96%). Cyanosis was important sign for detecting the severity of RDS, number of RDS newborns with cyanosis was 12(48%).

The severity of RDS was categorized into three levels (mild-moderate - sever), newborns with mild RDS was 10(40%), and with moderate RDS was 7 (28%) and with sever RDS was 8 (32%).

**Table (2). Clinical Signs and Symptoms for RDS Newborns**

| | | **Clinical Sign and Symptoms for RDS Newborns** | **Normal value** |
|---|---|---|---|
| Duration of residency in hospital (days) | | 2.72±1.2 | |
| Heart rate (beats/mint) | | 159.19±1.77 | 120-160 (beats/min) |
| Respiratory rate (breaths/mint) | | 77.56±3.25 | 30-60 (breaths/mint) |
| Bell shape thorax | Positive | 13(52%) | |
| | Negative | 12(48%) | |
| Grunting baby | Positive | 9(36%) | |
| | Negative | 16(64%) | |
| Subcostal retraction | Positive | 24(96%) | |
| | Negative | 1(4%) | |
| Cyanosis | Positive | 12(48%) | |
| | Negative | 13(52%) | |
| RDS severity | Mild | 10(40%) | |
| | Moderate | 7(28%) | |
| | Sever | 8(32%) | |

Whole blood Lead and Cadmium concentration

In the table (3), according to whole blood lead concentration, the whole blood lead concentration in newborns with RDS was significantly higher when compared to the whole blood lead concentration in the normal newborns (*p<0.05*). Both groups of a newborns have a blood lead concentration higher than normal value (Normal levels in newborn: < 10 µg/dL) [17]. according to the whole blood cadmium concentration, whole blood cadmium concentration in newborns with RDS was not significantly differs when compared to the whole blood cadmium concentration in the normal newborns *(p<0.05)*. Both groups of a newborns have a blood cadmium concentration higher than normal value

(Normal blood cadmium is <0.005 µg/mL) [17].

**Table (3) Whole blood Lead Concentration**

| | RDS Newborns | Normal Newborns | P-value |
|---|---|---|---|
| whole blood lead concentration (µg/dl) | 16.36±3.1 | 13.02±2.87 | 0.0002411 |
| whole blood cadmium concentration (µg/dl) | 0.175±0.04 | 0.165±0.03 | 0.411070 |

Serum Cotinine Concentration

In the table (4), according to serum cotinine concentration, serum cotinine concentration in newborns with RDS was significantly higher when compared to serum cotinine concentration in the normal newborns *(p<0.05)*. Both groups of a newborns have serum cotinine concentration higher than normal value (normal value of cotinine less than or equal to 10 ng/mL) [18].

**Table (4). Serum Cotinine concentration**

| | RDS Newborns | Normal Newborns | P-value |
|---|---|---|---|
| Serum cotinine concentration (ng/dl) | 93.16±5.16 | 65.86±6.83 | 7.28*10-21 |

## Discussion

Respiratory distress syndrome (RDS) is a complex disease and several factors may contribute to its etiology. The incidence of RDS decreases with advancing gestational age, from about 60–80% in babies born at 26–28 weeks, to about 15–30% in those born at 32–36 weeks [19]. According to the table (1), male newborns with RDS were higher than the female newborns with RDS despite there were no significant differences between the sex when compare the healthy newborns and RDS newborns. This finding completely agrees with another previous study which found that male newborns are more likely than female newborns to develop RDS at ratio male-to-female ratio (1.3:1) [20]. These differences are thought to be partly due to androgenic actions on type II pneumocytes delaying the production of mature surfactant [21]. According to a table (1) the number of newborns with RDS who have a smoking mother or passive smoking higher than healthy newborns, this finding is compatible with previous studies which found that the cigarette smoking during pregnancy is associated with a decrease in the risk of RDS in very preterm babies [22]. In the present study, the newborns in both groups were at full term of gestation and it seems that the smoking of cigarettes loss its protective effect against RDS. According to a table (1) the number of newborns with RDS delivered by caesarian was higher than healthy newborns who delivered in a normal delivery. This finding completely matched with another previous study in which they found that at any given gestational age the incidence of RDS is greater for infants born by cesarean section, especially without established labor, than for those born by normal delivery [23]. In table (3), the concentration of lead in newborns with RDS was significantly differs comparing to healthy newborns. Lead is a well-known human reproductive toxin. For centuries, lead exposure has been linked to adverse outcomes in pregnant women and newborns [24]. There is no previous study that links between RDS and blood lead concentration but there is a previous study for children showed that children with asthma

were more likely to have 5-fold higher blood lead level (>10 mg/dL) than those without asthma . In table (4), the concentration of cadmium in newborns with RDS is not significantly differs comparing to healthy newborns. Short-term exposure to inhalation of cadmium can cause severe damages to the lungs and respiratory irritation while its ingestion in higher doses can cause stomach irritation resulting in vomiting and diarrhea. Long-term exposure to cadmium leads to its deposition in the bones and lungs. As such, cadmium exposure can cause bone and lung damage .

# Synergistic Effect of Some Natural Substances in Combination with Antibiotics on MDR *Klebsiella* isolates

**Mohammed Shaker Mahmoud Alani[1], Laith Musleh Najeeb Al Nuaimi[2]**

*[1]Bacteriologist/ Al-Amiriya General Hospital / Ministry of Health / Al-Anbar/ Iraq, [2]Assist prof./Department of Biology/ College of Science / University of Anbar Al-Anbar /Iraq*

## Abstract

This study included the collection of 210 samples of Mid-stream urine samples of the patients who were confirmed to be infected with UTI by conducting a general urine examination and the patients of AL-Amriya General Hospital, Ramadi Teaching Hospital and Fallujah Teaching Hospital for the period between 2017 and January 2018. The results of the diagnosis showed a seven isolations of 17.5% of the total of 40 bacterial isolates. These isolations were diagnosed in aerobic conditions according to the microscopic examination and Culture characteristics on blood agar base and MacConkey agar as well as the biochemical tests, Diagnosis was confirmed using the modern diagnostic system VITEK2.

The synergistic activity of the natural substances used (sesame oil, olive oil, and royal Jelly) was studied against *Klebsiella* isolates by interfering with some of the antibiotics by disk diffusion method (Gentamicin, Amikacin, Ceftriaxone, Trimethoprim-Sulfamethoxazol, Nitrofurantoin, Amoxicillin/Clavulanic acid, Ciprofloxacin), and the synergic efficacy of natural materials was studied by adding 10 ul of sterile pasteurized natural substance directly to the antibiotic disk separately. The results showed increased efficacy of some antibiotics, especially Ciprofloxacin, Ceftriaxone and Amoxicillin/Clavulanic acid. so it can be concluded that sesame oil and royal Jelly have synergistic effectiveness in increasing the effectiveness of some antibiotics against *Klebsiella*.

***Key Words:*** *Klebsiella spp., Natural substance, Antibiotic resistance, Synergism*

## Introduction

The genus *Klebsiella spp* belongs to the enterobacteriaceae. This species includes several types: *K.pneumonia*, which affects all sites of the human body, especially the respiratory tract and urinary tract. The type *K.ozaenea*, affects the nose, as well as the respiratory tract and the urinary tract and blood and for the type (*K.rhinoscleromatis*) it affects the nose, and (*K.oxytoca*) It is similar to the first type in its ability to infect all sites of the human body[(1)].

These bacteria cause many diseases for both human and animal such as pneumonia, urinary tract infection, soft tissue inflammation, sepsis, meningitis, diarrhea [(2)].

**Corresponding author:**
**Mohammed Shaker Mahmoud Alani**
mhammed_shaker2003@yahoo.co.uk

The development of bacterial resistance to antibiotics, as well as the emergence of new strains of the most important factors causing the disease, as it constitutes a major concern for society and also for public health [(3)].

The study of plant extracts is important to demonstrate the mechanics of their work and effectiveness, as well as their toxic effect. World Health Organization (WHO) has approved the use of medicinal plants to treat various diseases[(4)]. WHO has shown that 80% of the world's population (mostly developing countries) still rely on conventional medicine for the treatment of common diseases[(5)].The most important components of most vegetable oils are: Carvacrol, Eugenol, Linalool, Thymol. These compounds have been shown to have a wide spectrum of antimicrobial activity, some of which inhibit the growth of bacteria and some is lethal according to the concentration used. Sesame oil is one of the most important oils used because it contains fatty

acids (saturated and unsaturated). Unsaturated fatty acids reduce oxidation. In addition, oil contains flavonoids (Sesamol, Sesamolin, Sesamin), which have anti-oxidant properties,which contributes to keeping sesame oil in its natural properties for a long time without oxidation, and it also stimulates the work of vitamin E[6].

Research has shown that olive oil has an important effectiveness as phenolic olive oil compounds have antimicrobial properties, especially phenol compounds (oleuropein, hydroxytyrosol, tyrosol), which have been shown to have strong antimicrobial activity against several bacterial strains responsible for intestinal inflammation, respiratory tract infections and urinary tract infections[7,8]. Antimicrobial activity against foodborne pathogens such as *Staphylococcus aureus* and *Salmonella enteritidis* has been demonstrated in the laboratory when use high concentrations of oleuropein[9,10] have been used. In addition, oleuropein and hydroxytyrosial have antimicrobial effects against pathogenic bacteria and viruses[11,12].

On the other hand, some studies have shown that royal jelly has an anti-bacterial effect higher than the rest of bee products. The most sensitive organisms recorded are *S. aureus*, followed by *E. coli*[13]. Recently, royalisin, a powerful antimicrobial protein in royal jelly, has demonstrated the selective growth inhibition against gram-positive bacteria (*Lactobacilus helveticus*, *Clostridium*, *Corynebacterium*, *Leucnostoc*, *Stafilococcus*, *Streptococcus*), with effective concentrations less than 1μm[14]. Propolis and albumin in royal jelly have a role in inhibiting bacterial growth. Propolis also has a synergistic effect with antibiotics in the treatment of infections and also reduces resistance of antibacterial walls to bacterial cells[15].

## Materials and Methods

### Collection of samples

Urine samples were collected according to method[16], in special and sterile container, who have been found to have UTI through primary examination, which includes see of Pus cells and RBCs In the urine under microscope , to confirm the infection of the urinary tract, and then transferred directly to the laboratory under refrigerated conditions for the purpose of culture and diagnosis for the period between October 2017 to January 2018.

### Isolation and diagnosis of *Klebsiella* spp.

### Diagnosis by simple methods

Bacterial isolates were identified based on both culture characterize, microscopic examination, and biochemical tests, and based on what Goldman and Lorence[17].

- Culture characteristic and microscopic examination

the shape of the colonies on the different culture media , size, height, shape of edges, color, and ability to ferment some of the sugars were observed and made smears for gram stain and examined under a light microscope to observe the shape and arrangement of bacterial cells and also their response to the gram stain.

- Biochemical tests

These tests were conducted according to the way they were[18] and also[19].

### Diagnosis in modern methods

The diagnosis was confirmed using the VITEK2 diagnostic kit was used to further confirm the diagnosis of isolates for the species level[20].

### Antibiotic sensitivity test

The efficacy of antibiotics (Gentamicin, Amikacin, Ceftriaxone, Trimethoprim-Sulfamethoxazol, Nitrofurantoin, Amoxicillin/Clavulanic acid, Ciprofloxacin) was tested against bacteria by following the disc diffusion method, depending on the method [21], then the bacteria were considered resistant if the inhibition diameter reached as indicated by the indicator In the standard specifications mentioned in (CLSI 2013).

### Testing of Interference between Natural and Antimicrobial Materials

The interference test between the antibiotics under study with the natural substances (sesame oil, royal Jelly and olive oil) was performed for bacterial isolates, depending on the method [21], and then put 10μl of sterile sesame oil in pasteurization, and then incubated the dishes at a temperature of 37°C for a period of 18-24 hours and the diameter of the inhibition zone of the antibiotic with sesame oil was measured. and the same treatment was repeated with olive oil as well as royal jelly separately.

### The Statistical analysis

The statistical analysis of the statistical package of

social sciences-Version-22 (SPSS).

## Results

The results showed the isolation and diagnosis of *Klebsiella spp*. With a rate of (17.5%) of the number of isolates by 7 isolates, which are Gram negative bacteria, the *Klebsiella spp*. isolates were distinguished Which was isolated by the fact that its colonies are large in size and with mucosal shape due to they contain capsule, They are pink on the MacConkey medium for their ability to ferment the lactose sugar and are non-moving bacteria, positive for the Urease and Catalase tests as well as for the vogas- Proskauer, , And for the test of the indol, methyl red and the oxidase, they are negative and non produce hydrogen sulfide.

*Klebsiella* isolates showed resistance to (Ciprofloxacin, Trimethoprim-Sulfamethoxazole, Amoxicillin / Clavulanic acid, Ceftriaxone) were 100% and the resistance ratio of ( Gentamicin, Amikacin and Nitrofurantion ) was 85.7% for each antibiotics.

The results of the statistical analysis showed significant differences at the level of probability ($P \leq 0.05$). The results showed that the overlap of natural substances (sesame oil, olive oil, royal Jelly) with the antibiotics under study has a special role in increasing the sensitivity of antibiotics.

The results of the interaction of the antibiotics with the natural substances used showed significant differences in all antibiotics discs. The results of the Ciprofloxacin interaction showed significant differences, especially the increase in synergy with the royal Jelly. The rate of inhibitory diameter of the antibiotic disc was increased after its synergy with the royal Jelly compared to the standard of (4 mm) to 7.28 mm. Ciprofloxacin with both sesame oil and olive oil was increased for inhibition compared with the standard (5.14 mm and 4.85 mm) respectively, From 6.14 mm to 9.1 4 mm) compared to standard when synergistic with royal Jelly, as shown in the table 1.

**Table 1: interaction of the antibiotics with the natural substances**

| P value | Synergistic antibiotic with natural substances | | | Control ( antibiotic only ) | Antibiotics |
|---|---|---|---|---|---|
| | Royal Jelly | Olive oil | Sesame oil | | |
| 0.002* | 7.28 | 4.85 | 5.14 | 4 | Ciprofloxacin |
| 0.029* | 12.14 | 13 | 12.57 | 12.57 | Amikacin |
| 0.043* | 9.14 | 8 | 6 | 6.14 | Augmentin |
| 0.006* | 2 | 2.71 | 2.85 | 1.71 | Trimethoprim-Sulfamethoxazole |
| 0.006 | 11.42 | 14.42 | 13.57 | 13.42 | Nitrofurantion |
| 0.000* | 5.85 | 4.57 | 3.14 | 3.71 | Ceftriaxone |
| 0.006* | 10.28 | 10.57 | 10.42 | 10.28 | Gentamicin |

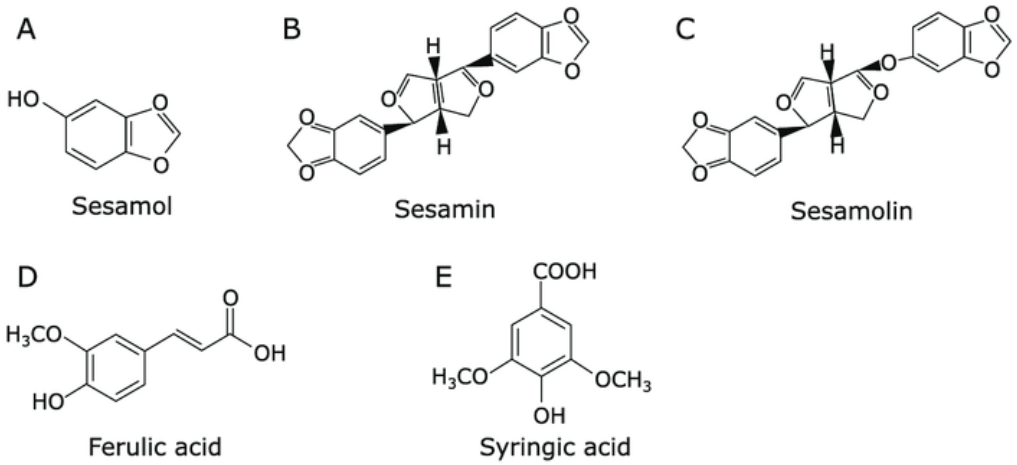
* Significant difference at a level below (0.05)

The results showed that there is a significant difference in the sensitivity of the isolates to the antibiotics alone, on the one hand, and the change of sensitivity in the use of antibiotics with natural substances on the other, due to the synergistic act between the natural substances and antibiotic.

The results of this study agree with what he found[22], which showed that the synergistic action affects the resistant and sensitive bacteria. The synergistic effect has a significant impact on the resistant and sensitive species and in percentages that may vary depending on the species. The synergy of natural substances and antibiotics reduces antibiotic resistance and also cooperates with antibiotics in the killing of bacteria [23] as confirmed in their study.

The results of the present study are consistent with what is found [24] in increasing the sensitivity of bacterial isolates to antibiotics mixed with honey, indicating the synergistic action between them.

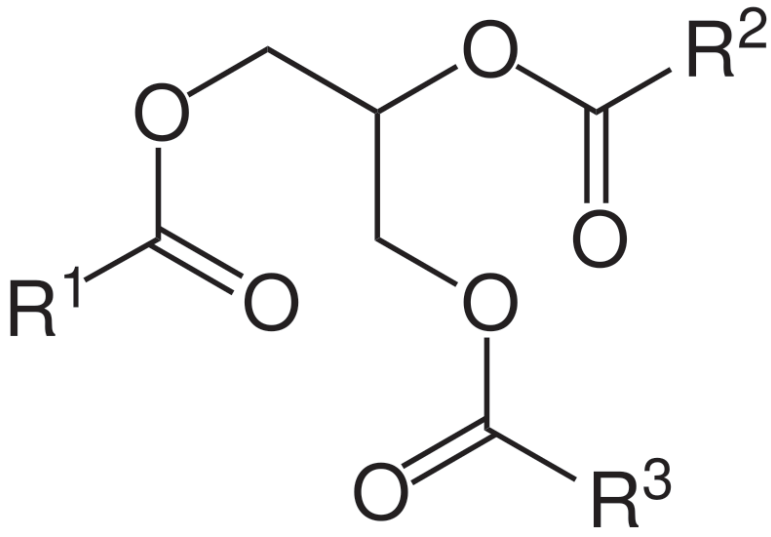
And the current study is consistent with[25] what found sesame oil shows different therapeutic characters , which indicates its antibacterial properties on Enterobacteriaceae .



Sesame oil contains phenolic groups capable of binding or depositing water soluble proteins. This disrupts the cell function and causes the cell to stop functioning by inhibiting enzymes, destroying the plasma membrane[26].

It can be said that the use of this extract will be a natural substance that provides the body with important compounds as well as the inhibitory effect of pathogenic Klebsiella bacteria when used by patients and this was the main purpose of using this extract against bacteria[27].

Our results are in concordance with those reported by[28] and[29], who observed higher activity in olive oils . The authors attributed this activity of olive oil to the phenolic compounds; the dialdehidic form of decarboxymethyl oleuropein and ligstroside aglycons, hydroxytyrosol, and tyro-sol were the phenolic compounds.



Phenolic products consisting of polyphenol, flavonoids, and tannic acid have been reported to have satisfactory antibacterial activity against food-borne pathogens[30].

Khan[31] has shown that many phytochemicals have an inhibitory effect on a wide range of microorganisms that have been used as drugs such as alkaloids, soapins, flavonoids and polyphenols.

The mechanism of action of these compounds is not clear, but there are studies indicating that these compounds enter the cell and interfere with the process of cellular metabolism, while other studies indicated that phenols (Carvacrol and Eugenol), Disturb the cell membrane and thus reach the effective site in the Enzyme[32].

Fatty acids and monoglycerides found in olives have been found to have a wide range of killer activity of microbes against bacteria and yeasts[33].

As indicated by[34], who indicated in his results that the inhibitory effect is most likely associated to lipid-containing molecules present in ether soluble fraction of royal jelly. The weaker antibacterial activity in ether-non-soluble fraction of royal jelly may be attributed to royalisin which is a portion of the ether-non-soluble fraction of royal jelly[35].

Studies on raw royal jelly have shown that because of its antimicrobial properties it can inhibit the growth of several types of microbes, including MRSA. In addition, the synergistic effect of mixing royal jelly with other products, such as honey, significantly improves antibacterial activity against dangerous pathogens such as *Staph. aureus*,*P. aeruginosa* [36,37].

## Conclusions

Natural substances under study have a significant effect on increasing the effectiveness of antibiotics against *Klebsiella* spp. Royal jelly is most effective in increasing the efficacy of antibiotics, especially the antibiotic Ciprofloxacin.

# Assessing the Response of a Sample of Iraqi Asthmatic Patients to Different Medication Regimens

**Ali L. Jasim[1], Eman S. Saleh[2], Mustafa N. Abd Ali[3]**

*[1]Lecturer, Department of Clinical Pharmacy, College of Pharmacy, University of Baghdad, Baghdad, Iraq, [2]Assistant Professor, Department of Clinical Laboratory Science, College of Pharmacy, University of Baghdad, Baghdad, Iraq, [3]Assistant Professor, Department of Medicine, Baghdad College of Medicine, University of Baghdad, Baghdad, Iraq*

## Abstract

Asthma is a chronic inflammatory disease of respiratory airways characterized by distinctive history of respiratory symptoms due to variable airflow obstruction which reverses either spontaneously or in response to certain medications. Acetylcholine is a parasympathetic neurotransmitter which plays fundamental roles in the development of persistent asthma. Treatment guidelines recommend using medium doses of inhaled corticosteroids in addition to another controller bronchodilator instead of using high doses inhaled steroid alone for treatment of moderate to severe persistent asthma. The inhaled long acting muscarinic antagonist, tiotropium, was approved recently to control unresponsive asthma to inhaled corticosteroid with or without a long acting β-2 agonist. The aim of this study was to assess and compare the responses of a sample of Iraqi asthmatic patients to three different medication regimens.

***Key words:*** *Persistent asthma, Medication regimens, Tiotropium*

## Introduction

Asthma is a disease characterized by chronic inflammation of respiratory airways causing the distinctive history of variable respiratory symptoms which include wheezing, shortness of breath (SOB), cough and chest tightness due to variable airflow obstruction which reverses either spontaneously or in response to certain medications [(1)].

Acetylcholine (ACh) is a parasympathetic neurotransmitter and plays principle roles in the development of chronic or persistent asthma via multiple types of muscarinic receptors resulting in enhancement of inflammatory mechanism, mucus hypersecretion, bronchial lumen narrowing and remodeling of respiratory airways [(2)].

Two important terms are used in the assessment of asthma; the first being severity which is concerned with describing disease process and is used primarily when initiating treatment, whereas the term control is a dynamic tool concerned with describing the response of patients to therapy depending on the efficacies of the prescribed therapeutic agents [(3)].

The level of asthma control during the previous four weeks can be assessed by asthma control test (ACT) questionnaire which involves five questions with answering score ranges from one which means worst control to five which means best control [(4)]. A change of three points in the total score of ACT is considered minimal clinically important difference (MCID) [(5)]. Pulmonary function test (PFT) maneuver is a valuable non invasive procedure for measuring airway caliber of both large and small airways [(6)].

Inhaled corticosteroids (ICS.s) are the cornerstone anti-inflammatory medication indicated alone or in combination with other controllers for controlling all severities of persistent asthma. Treatment guidelines recommend using medium doses of ICS in addition to another controller bronchodilator instead of using high doses of ICS monotherapy for long term control of moderate to severe persistent asthma [(7)]; long acting β-2 agonists (LABAs), formoterol and salmeterol, are the first line bronchodilator indicated for this purpose, but reduced responsiveness due to tachyphylaxis limits their prolonged use [(8)].

The recent addition to the list of maintenance treatment of persistent asthma is the inhaled long acting muscarinic antagonist (LAMA), tiotropium, which was approved to control unresponsive asthma to ICS with or without a LABA [9]. The aim of this study was to assess and compare the responses of a sample of Iraqi asthmatic patients who reside in Baghdad, Capital of Iraq, to three different medication regimens.

## Patients and Methods

### Patients

This study was designed as a prospective interventional open label randomized clinical study to evaluate the clinical efficacies of three medication regimens assigned for Iraqi patients with persistent asthma. The study was conducted in 2 sites located in Baghdad, Capital of Iraq, fromSeptember-2018 till June-2019. These sites were the respiratory clinic of Dowaly Private Hospital and AL-Zahra Center of Asthma and Allergy.

The inclusion criteria were: age between 18 and 70 years, current status of poorly controlled or uncontrolled moderate - severe persistent asthma according to diagnosis of the specialist physician, baseline forced expiratory volume in one second (FEV1) of 40-80 % of predicted values and patient being nonsmoker or previous smoker of less than 10 pack years who stopped before at least a year.

Meanwhile, patients should devoid of the following exclusion criteria: pregnancy or lactation for female patients, concurrent serious respiratory or cardiac disease, use of any maintenance asthma controllers within 4 weeks of enrollment visit and respiratory tract infection or use of systemic corticosteroids within the previous 4 weeks of the baseline visit.

Patients were allocated randomly to one of three groups according to the type of treatment regimen being studied:

**First group:** Combination of budesonide 160 µg and formoterol 9 µg **(Bud/For)** per inhalation of dry powder inhaler (DPI): dose was two inhalations every 12 hours

**Second group:** composed of budesonide 200 µg per inhalation of DPI and oral modified release aminophylline 225 mg tablets **(Bud/Ami)**: dose of budesonide was two inhalations every 12 hours, while dose of aminophylline tablets was a single tablet every 12 hours after meals.

**Third group:** composed of budesonide 200 µg per inhalation of DPI and tiotropium capsule containing 18 µg of dry powder intended for oral inhalation **(Bud/Tio)**: dose of budesonide was two inhalations every 12 hours, while that of tiotropium was a single capsule inhaled at evening

All patients were allowed to continue their use of salbutamol metered dose inhaler (MDI) when needed for reliving the acute attacks of asthma symptoms.

## Method

The duration of current study was 8 weeks and involved 3 visits: baseline or enrollment visit, first follow up visit 4 weeks after the baseline one and second follow up visit after additional 4 weeks.

Pulmonary function test procedure was performed and ACT values were recorded in each visit. Patients were instructed to perform PFT under the supervision of a well-trained technician for three times and the device recorded the best result automatically.

## Statistical Analysis

Discrete variables were presented using their numbers and percentages, whereas continuous variables were presented using their means ± standard deviation (SD). Discrete variables were analyzed using Chi square test or Fisher-Freeman-Halton exact test.

Trend ANOVA was applied to analyze the differences of means within each studied group over three visits (baseline, first follow up and second follow up visits) using the means of values measured in each visit, while One way ANOVA was used to test the differences among the groups using the means of values in the baseline visit and then means of changes of values (increment or decrement) produced during the first and second four weeks of study.. Thereafter, if the general comparison showed significant differences, post Hoc Tukey test was applied to test the significance difference between each pair of means.

Statistical Package for Social Sciences (SPSS) version 23.0.0 (Chicago, IL), GraphPad Prism version 8.0.0 for Windows, GraphPad Software, San Diego, California USA, software package was applied to conduct the statistical analysis. The level of difference

was chosen to be significant when p value was less than 0.05

## Results

This study recruited 78 patients. Fourteen patients terminated the treatment regimens prematurely due to different causes with subsequent exclusion of their data, while those who completed it were 64 patients; 21 patients in the first and second group and 22 patients in the third group. Socio-demographic data of patients were matched across the studied group; patients were older than 40 years in the first group. The first and second groups showed slight male predominance. Patients in all groups were overweight and their BMI values were between 25 and 30 kg/m$^2$. Nearly two thirds of patients were urban and one third was rural. About 70% of patients were nonsmokers and the majority of them were unemployed. Educational status showed higher ratio of secondary level.

The FEV1 values were increased after initiating study in all groups; medication regimens caused significant increases of measured FEV1 values in first follow up visit compared to baseline one. Both first and third groups developed further significant increase of FEV1 values measured in the second follow up visit in comparison with first follow up values (p<0.001), unlike the second group which showed a non-significant decrease of FEV1 values in second follow up visit compared to first follow up one (p=1.0) as presented in table-1

**Table-1: Effects of medication regimens on FEV1**

| **Group** | **First group (Bud/For)** | **Second group (Bud/Ami)** | **Third group (Bud/Tio)** | **p-value** |
|---|---|---|---|---|
| Number of patients | 21 | 21 | 22 | - |
| FEV1 (Liters) | | | | |
| Baseline | 1.6±0.3 | 2.0±0.5 | 2.1±0.6 | <0.01a |
| First follow up (After 4 weeks) | 1.9±0.3 * | 2.4±0.6 * | 2.6±0.6 * | <0.001a |
| Second follow up (After 8 weeks) | 2.2±0.3 *,¥ | 2.3±0.4 * | 2.9±0.7 *, ¥ | <0.001a |
| p-value | <0.001b | <0.001b | <0.001b | |

FEV1: Forced expiratory volume in one second
a: One way ANOVA

b: Trend ANOVA (repeated measure ANOVA)
*: significant difference compared to baseline values
¥: significant difference compared to first follow up values

Between groups analysis according to extent of FEV1 improvement revealed that third group developed significantly the largest improvement compared to other two groups during the first four weeks of study (p<0.001), while no significant difference was noted between first and second groups (p=0.71), as shown in figure-1

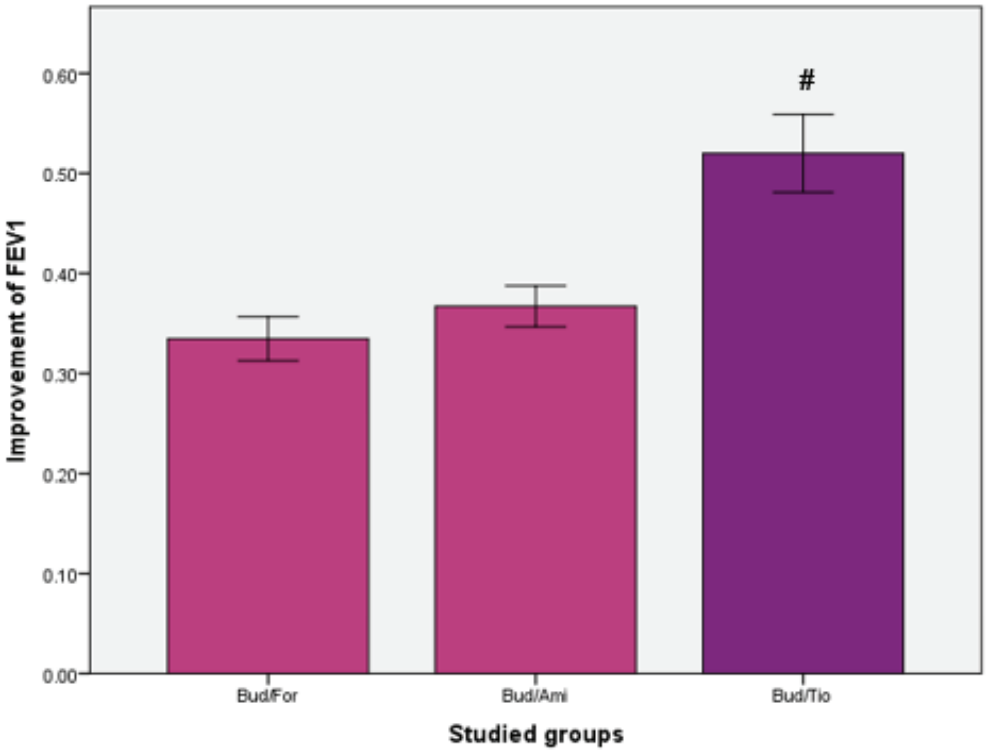

**Figure-1: Extent of FEV1 improvement during the first four weeks of study**

#: significant difference compared to other groups

The magnitude of FEV1 improvement during the second four weeks of study produced in first and third groups was significantly better than that produced in second group ($p<0.001$), while it was not significantly different between first and third groups ($p=0.93$) as shown in figure-2.

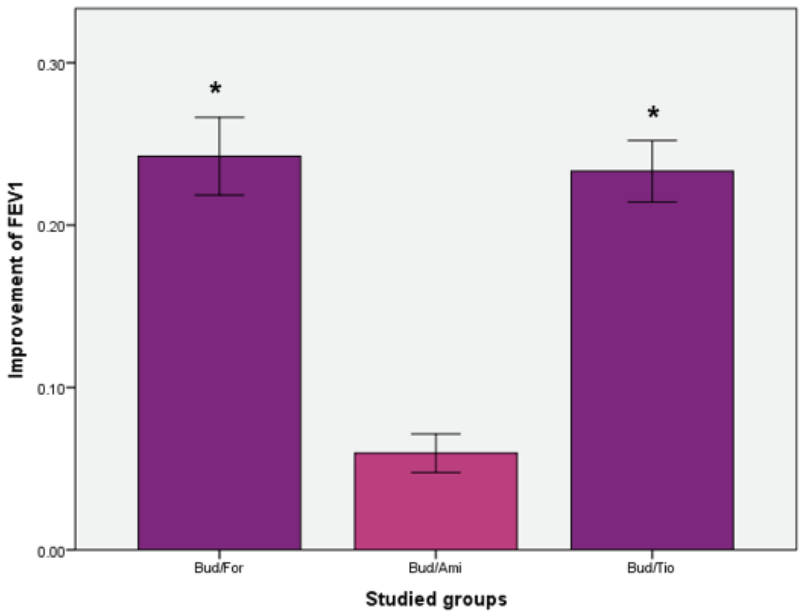

**Figure-2: Extent of FEV1 improvement during the second four weeks of study**

*: significant difference compared to second group

In all groups, treatment regimens caused significant improvement of ACT scores after 4 weeks of administration compared to pretreatment values (p<0.001). Studied groups continued the improvement and developed significant higher scores of ACT in the second follow up visit in comparison with first follow up scores (p<0.001) as illustrated in table-2.

**Table-2: Effects of medication regimens on ACT scores**

| **Group** | **First group (Bud/For)** | **Second group (Bud/Ami)** | **Third group (Bud/Tio)** | **p-value** |
|---|---|---|---|---|
| Number of patients | 21 | 21 | 22 | - |
| ACT scores | | | | |
| Baseline | 11.5±2.0 | 11.1±2.2 | 10.8±1.5 | 0.433 a |
| First follow up (after 4 weeks) | 17.0±1.3 * | 16.6±2.0 * | 17.4±1.1 * | 0.011 a |
| Second follow up (after 8 weeks) | 21.0±1.4 *, ¥ | 18.5±2.5 *, ¥ | 21.3±1.9 *, ¥ | <0.001 a |

## Discussion

The doses of budesonide inhaler used in studied groups of the present study were chosen to be equivalent in the medium range of 640-800 µg per day [10]. Therefore, the differences in clinical efficacies among the studied groups may be attributed to the second controlling medication which was combined with inhaled budesonide in each group, while the clinical efficacies within each group after initiating medication regimens in comparison with pretreatment status may be attributed to both components of studied regimens.

The FEV1 is a very important parameter for assessing the response of respiratory airways to bronchodilator medications indicated for long term maintenance of asthma [11] and it is obvious that the principle mechanism of action of the second medication combined with budesonide in each group of this study was bronchodilation

Zhang *et al*, noted that after 8 weeks of adding either tiotropium or LABA to asthmatic patients inadequately controlled on corticosteroid inhaler alone produced significant increment of FEV1 compared to pretreatment values. They also noted that despite the non-significant difference between these two controllers, tiotropium produced higher FEV1 increment (0.73±0.31) than LABA (0.68±0.26) [12]. This finding highlights the primary role of parasympathetic transmission in affecting asthma through its effects especially on airway patency despite the abundance of β-2 receptors in respiratory airways.

The results of the current study were consistent with those observed by Adachi *et al*, who conducted a double blind randomized study to assess the clinical outcomes of two treatment regimens; the first was ICS/salmeterol combination and the second was ICS plus prolonged release oral theophylline for 8 weeks in adult Japanese patients having persistent asthma. The ICS/salmeterol group showed continuous progressive increment of FEV1 at 4 and 8 weeks, while the ICS/theophylline group showed initial improvement of FEV1 during the first 4 weeks followed by decrement to baseline values during

the second 4 weeks. At the 8th week, the FEV1 change of the salmeterol group was significantly higher than the FEV1 change of theophylline group [13]. This finding supports the fact that locally administered medications by inhalation route produced more powerful effects on airways diameter than systemically administered ones.

In agreement with this study, Zhang *et al*, found that after 8 weeks of allocation to the studied treatment combinations, the ICS/tiotropium significantly improved the ACT scores from 14.4±2.41 (uncontrolled status) at baseline visit to 23.3±2.92 (controlled status). Similarly, ICS/salmeterol regimen significantly increased the pretreatment ACT scores of 12.6±2.2 (also uncontrolled) to reach 22.1±2.46 (controlled status). The magnitude of ACT improvement was not significantly different between these two medication regimens [12].

Wang *et al*, assessed the clinical outcomes of oral theophylline (400 mg daily) administered with fluticasone aerosol (500 µg daily) versus combined salmeterol and fluticasone (100/500 µg daily) in patients with moderate to severe persistent asthma for 12 weeks. Before treatment, the ACT scores were 17.09±3.837 and 16.24±3.936 in the theophylline/ICS and LABA/ICS respectively. Both medication regimens produced significant improvement of ACT scores after weeks of regular administration compared to baseline scores (20.39±3.43, 19.81±4.37 in the theophylline/ICS and LABA/ICS respectively). The changes in ACT scores brought about by these two regimens were not significantly different between them [14].

**Limitations of study**

1- The design of study did not involve blinding or enrollment of placebo group

2- The study recruited small sample size and was conducted at only two center in Baghdad

3- Duration of study was relatively short which did not allow for assessing the effects of treatment regimens on rate of asthma exacerbation as well as long term safety profile

**Conclusions and recommendation**

1. All studied group caused significant improvements in FEV1 and ACT scores in comparison with baseline values.

2. Patients who received inhaled tiotropium/ICS were associated with the best significant improvement of study parameters followed by those treated with inhaled formoterol/ICS and finally the group allocated to oral long acting aminophylline tablets/ICS developed the least extents of improvement

# Experimental Study of Prepared Killed Vaccine For *S. Aureus* in Local Rabbits

**Mohammad Hamid Kareem[1], Rafid Khalid Ali [1], Shireen Jameel Khaleel [2], Mustafa Salah Hasan[1], Eman Naji Saleh[3]**

*[1]College of Veterinary Med., University of Fallujah, Iraq, [2]College of Veterinary Med., University of Basra, Iraq, [3]College of Education for Women, University of Anbar, Iraq*

## Abstract

This study was performed to estimate the *S. aureus* prepared killed vaccine in rabbits. The isolate of *S. aureus* that used in the present study were obtained from the college of veterinary medicine, University of Fallujah which were confirmed by using gram stain and other biochemical tests. A total of 30 local rabbits were used in this study, these were divided into 3 groups, each group contain 10 rabbits, the group 1 used as control negative, group 2 given 1 ml antigen contained 20 mg according to the pilot study that performed, group 3 serve as control positive. At day 21 post-immunization, a skin test was done, at the day 28 post first immunization, the rabbits of group 2 and 3 were challenged intra peritoneal with (1ml) of bacterial suspension containing $1\times10^8$ cfu/ml of viable virulent *S. aureus*. At day 33 post immunization, the rabbits were sacrificed then postmortem examination was carried out to all sacrificed rabbits, pieces from internal organs (liver, spleen and kidney).

The results showed that all animals in G2 showed positive reaction after 24 and 48 hrs. for skin test, the result of bacterial isolation after challenge with virulent *Staphylococcus aureus* showed the isolation of heavy bacterial isolation in control positive group from different organs of body, while immunized groups showed significant decrease in bacterial isolation as compared with control positive. The result of histopathological study of G2 showed PMNs infiltration in liver, spleen and kidney, with vacuolar degeneration of epithelial lining the renal tubule, also, the spleen showed hemorrhage, congestion of red pulp.

In conclusion, the killed vaccine that prepared showed a higher effectively when given to the rabbits; furthermore in our conclusion some bacteria were spread from the site of inoculation toward internal organs and during the course of the experiment, activated macrophages engulfed and destroyed most of them.

***Key words:*** *killed, S. aureus, ra*bbits.

## Introduction

It is a major pathogen in both community-acquired and nosocomial infections [(1)]. Many studies have reviewed the clinical infection of Staphylococcus infection which considered to be the 2nd most public cause of wound infection after *E. coli* .The wide spread use of antibiotics has led to result in multiple resistance strains [(2)].

**Corresponding author:**
**Mustafa Salah Hasan**
drmustafasalah7@gmail.com

*Staphylococcus aureus* is regarded as a main pathogen for humans as well as animals importance due to the rise in antibiotic resistance being a highly adaptable organism, it has the ability to create infections in a wide-ranging in most body positions. The type of infections which caused by this species were to be frequently acute and pyogenic, if untreated may transmit to the adjacent deeper tissues or organs, may result in spread or deep-seated infections which are life threatening [(3)].

The important of this strain was due to multiple drug resistance as reported by [(4)].

Different type of *S. aureus* antigens were used previously as a vaccine but these Ags produced partial protection [5], however, Increasing of *S. aureus* resistance to the latest line of drugs, which is vancomycin may places of interest for seeking a new as well as novel antibiotics [6].

To this time the vaccine for *S. aureus* till unavailable to encourages the active immunity against infections from result from this bacteria [7].

A study designed to investigate the clumping factor as well as FnBPA for *S. aureus* as a vaccine, the authors showed a highly immunogenicity of the vaccine with a significant protection in mice [8].

A vaccine was developed which would offer protection against a wide-ranging of *S. aureus* strains and possibly other gram +ve bacteria. The use of peptidoglycan was studied, because it is the structure which has been exposed to play a main part in the opsonic recognition of Staphylococcal and also has a huge ability to activate both the classical as well as the alternative pathways for human complements [9].

The aim of current study was to estimate the *S. aureus* prepared killed vaccine in rabbits.

## Materials and Method

**Strain of *S. aureus*:**

The isolate of *S. aureus* used in this study were obtained from the college of veterinary medicine, university of Fallujah. This strain was ensured by using many tests including gram stain as well as the biochemical tests according to [10].

**Preparation of killed antigen:**

*Staphylococcus aureus* cultured on brain heart infusion agar, then incubated at 37 °C for 24 hrs., the harvesting was done by using PBS 7.2, then centrifuged at 3000 rpm for thirty minutes then washed for 3 times with sterilized PBS, and the precipitate was re-suspended by using PBS. This suspension were heated till boiling and then cultured on agar to ensure that the bacteria killed and preserved till used.

**Laboratory animals:**

Thirty (30) local breed healthy rabbits male and female were used in the present study. They were fed on pellet and green grass ad libitum. They were reared for two weeks for adaptation, these were divided into two groups:

G1: this include 10 rabbits were used as control negative.

G2: this include 10 rabbits and used as treated group which given 1 ml antigen contained 20 mg according to the pilot study that performed.

G3: this include 10 rabbits which serve as control positive

At day 21 post-immunization, a skin test was done according to [11]. At day 28 post first immunization, the rabbits of groups 2 and 3 were challenged intra peritoneal with (1ml) of bacterial suspension containing $1\times10^8$ cfu/ml of viable virulent *S.aureus* [12].

**Histological examination:**

At day 33 post immunization, the rabbits were sacrificed then postmortem examination was carried out to all sacrificed rabbits, 1 cm pieces from the internal organs (liver, spleen & kidney) were taken for bacterial isolation on Nutrient, blood, mannitol salt agars and other pieces were fixed in 10% formalin at (72)hrs. for histological examination which is done according to [13].

**Statistical analysis:**

This is done by using SPSS software according to [14].

## Results and Discussion

All animal in G2 showed a positive reaction after 24 and 48 hours of skin test, this positive reaction represented by presence of a circular erythema and increasing skin thickness against used Ag, the control groups give negative reaction (erythema & thickness) (Table 1).

**Table (1) Mean values of skin test in immunized Group (G2)**

| Animal No. | Erythema Diameter (cm) | | Skin Thickness( mm) | |
|---|---|---|---|---|
| | 24 hrs | 48hrs | 24hrs | 48hrs |
| 1 | 2.3 | 1.3 | 9.2 | 5.1 |
| 2 | 2.4 | 1.2 | 8.3 | 4.4 |
| 3 | 1.7 | 0.9 | 7.1 | 4.7 |
| 4 | 2.4 | 1.8 | 9.8 | 3.8 |
| 5 | 2.0 | 1.5 | 8.4 | 5.4 |
| 6 | 2.3 | 1.3 | 8.7 | 4.2 |
| 7 | 2.1 | 1.1 | 7.9 | 5.1 |
| 8 | 1.8 | 0.9 | 6.8 | 3.4 |
| 9 | 1.8 | 1.0 | 7.0 | 4.6 |
| 10 | 2.6 | 1.4 | 10.2 | 5.9 |
| Mean ± SE | 2.2±0.14 a | 1.4±0.26 a | 8.1±0.55 b | 5.40±0.22 c |

In the skin test, remaining macrophages in the skin epidermis collect the supernatant $Ag_s$ that pass from the skin and carrying into the local lymph nodes, where T-cells are activated by Ags and rapidly differentiate to Th-1 cells, which produce various cytokines and chemokine's like IL8, so that macrophages and other cells are activated and attracted to the site of skin test [15].

All rabbits in G2 gave different reaction this is due to the different degrees of immune response the same results were recorded by [16]. In general positive reaction of all Ags refer the ability of smooth strains to give immune response higher than rough strains due to their consisting of O-side chain [17].

The result of bacterial isolation after challenge with virulent *Staphylococcus aureus* showed the isolation of heavy bacterial isolation in control positive group from different organs of body, while immunized groups showed significant decrease in bacterial isolation as compared with control positive (Table 2).

**Table (2) Bacterial isolation from the internal organs of groups animals infected with virulent *S.aureus* at day 33 showed number of colonies in 1gm from each organs**.

| **Group of animal** | **Spleen** | **Liver** | **Heart** | **Kidney** |
|---|---|---|---|---|
| G3 | 42 | 49 | 23 | 26 |
| G1 | 0 | 0 | 0 | 0 |
| G2 | 1 | 1 | 0 | 0 |

O'Riordan and Lee [18] explained that the phagocytic response of PMNs is the body's first line of defense against invasion by *S.aureus* and critical determinant in the outcome of staphylococcal infections.

These findings indicated that some bacteria were spread from the site of inoculation toward internal organs and during the course of the experiment, activated macrophages engulfed and destroyed most of them. This evidence was consent with several previous studies that explained the opsonization of *S.aureus* is critical for

uptake and killing of bacteria by professional phagocytic cells, complement and Abs, are the principle serum opsonin and had been shown to play an important role in opsonophagocytic killing to *S.aureus* [19].

The result of histopathological study of G2 showed few number of leucocytic infiltration and small amount of fibrin deposition in the liver (Fig. 1), there's also PMNs infiltration with vacuolar degeneration of epithelial lining the renal tubule (Fig. 2). The spleen showed hemorrhage, congestion of red pulp as well as neutrophilic infiltration (Fig. 3).

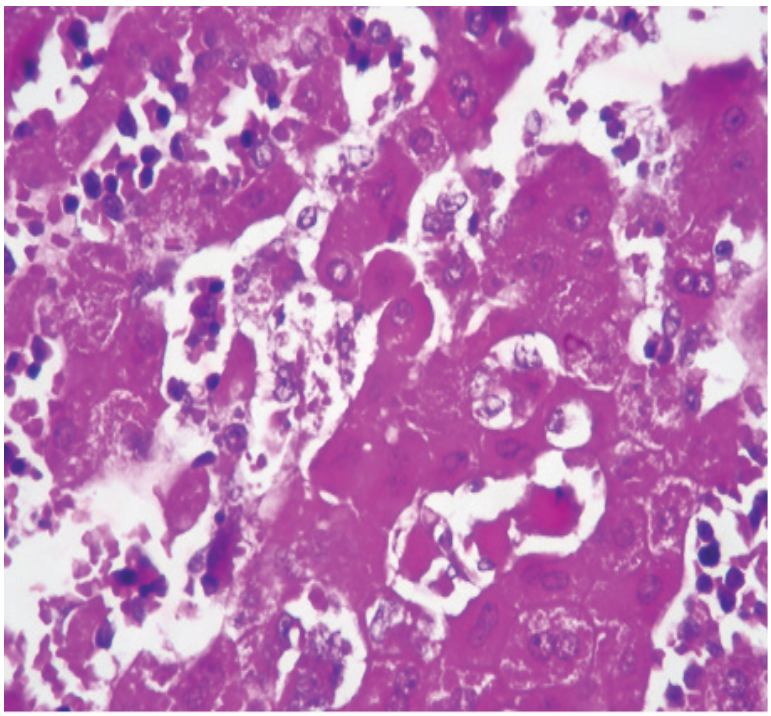

**Figure (1). Histological section in the liver of immunize group with killed *S. aureus* Ag showed few number of PMN leucocyte infiltration (H&E stain X40) .**

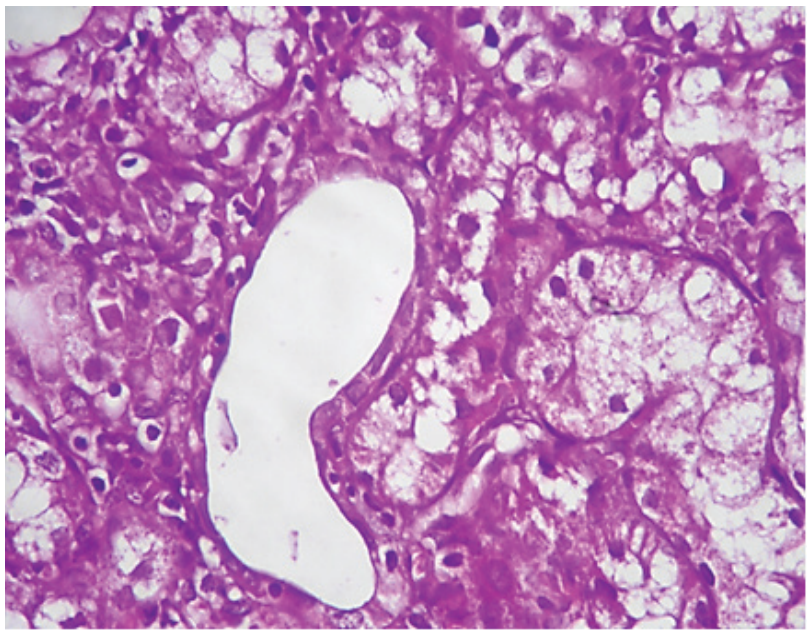

**Figure (2). Histological section in the kidney of immunize group with killed *S. aureus* Ag showed neutrophilic infiltration and vacuolar degeneration of epithelia lining of renal tubules (H&E stain X40).**

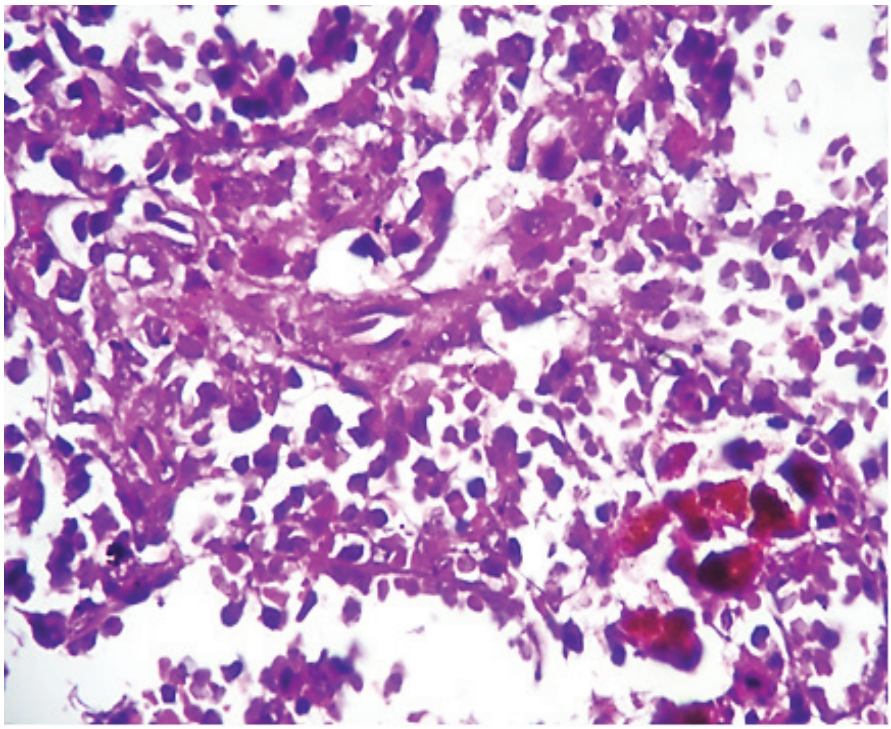

**Figure (3). Histological section in the spleen of immunize group with killed** *S. aureus* **Ag showed hemorrhage and congestion of red pulp and neutrophilic infiltration. (H&E stain X40) .**

The liver was the most affected organ, spleen, kidney, this is may be due to the nature of the function of the liver which mention nutritional metabolic balance in the body and this include all nutrient material and the liver considered to be the important filter which play potential role in elimination of toxins, body waste protected, metabolic substance and other foreign materials including pathogens more over the liver is major organ depended in portal circulation. These mean that all hard substance cross through the liver tissue [(20)].

The present neutrophils infiltration in organs of tissue included in this study the higher proportion of this infiltration in group 2 may related to the active production of TNF-α which proximal mediator of neutrophils chemo tactic factor [(21)] and related also to the fact that is the neutrophil represent essential cells for host define [(22)], neutrophil also can produce pro inflammatory mediators such as IL-12 [(23)].

In conclusion, the killed vaccine that prepared showed a higher effectively when given to the rabbits; furthermore in our conclusion some bacteria were spread from the site of inoculation toward internal organs and during the course of the experiment, activated macrophages engulfed and destroyed most of them.

# Evaluation of Serum Leptin Level in Correlation with CRP in a Sample of Iraqi Patients with Inflammatory Bowel Disease at Gastroenterology and Hepatology Teaching Hospital

**Ali S. Musa Al Shammaa[1], Ghaith Sael Mohammed Ali[2] Haitham Kaddouri Hussein[3]**

*[1]Lecturer, College of Medicine, Al-Nahraine University/Iraq, [2]Lecturer, College of Medicine, Al-Nahraine University/Iraq, [3]Consultant/ Department of General Surgery, Khadymia Teaching hospital/Iraq*

## Abstract

**Introduction:** adipocytokines display avital role in inflammation and metabolism, body metabolism changes in inflammatory bowel disease (IBD) and chronic inflammation conceder the pathognomonic of this disease, s. leptin and C-Reactive protein (CRP( in patients with active disease either Crohn disease or ulcerative colitis. The aim of this descriptive study is to evaluate the serum leptin and CRP level in a sample of Iraqi patients with IBD of variable disease activity index. **METHOD:** serum concentration of leptin was studied in 79 patients diagnosed as IBD [41 patients diagnosed as Crohn's disease (CD) and in 38 patients diagnosed as ulcerative colitis (UC)]. The diagnosis based on colonoscopy, CT, MRI, US and histopathological examination of mucosa. Serum leptin and CRP was measured by an indirect ELISA. Leptin level was compared with CRP and correlated with disease activity. **RESULTS:** data showed that out of 38 patients diagnosed as UC, 10 (26.3%) were in remission, 22 (57.9%) were in moderate activity, and 6 (15.8%) have severely active disease. On the other hand, out of 41 patients diagnosed as CD, 17 (41.5%) were in remission state, 20 (48.8 %) have moderate active disease, and 4 (9.8%) have severely active form. Serum leptin in the UC group was significantly associated with disease activity in an inverse pattern ($p$ = 0.045), while no significant association between action index in patients with Crohn disease and leptin level P-value = 0.77. While CPR level have significant association with ulcerative colitis patients P-value = 0.017 and with Crohn disease P-value = 0.043.Comparing both CRP and leptin level showed significant association with UC as an overall effect and those in decrease only (P-value = 0.047, 0.029 correspondingly), while this association was only significant as an overall effect for CD group P-value = 0.043. **conclusion:** a significant association between disease activity in UC and CD with serum CRP. Comparing both CRP and leptin level showed that there is an overall significant association with both UC and CD, but not useful for defining their activity index.

***Keys words:*** *serum leptin, CRP, Iraqi patients, inflammatory bowel disease, Hepatology Teaching Hospital.*

## Introduction

Inflammatory bowel disease (IBD) can divided into two types Crohn's disease and ulcerative colitis, it define as chronic immune disease inflammatory in nature of gut, incidence of it very universally [(1)]. Unclear pathophysiological mechanism but with many studies they recommends a multifactorial causes [(2)], some studies connected it with nature of food consumption, high energy loss and decrease absorption of food and minerals [(3)]. CD with features of weight loss and loss of appetite during acute stages of inflammation [(4-7)]. Traditionally, management of IBD was mainly depended on the presenting symptoms such as abdominal pain, bowel habits, and general well-being. Symptomatic treatment, however, may not improve long-term results or slow disease progression[(8)]. CRP used as substitute indicators of endoscopic IBD action, it conceders one of many plasma proteins that have significant action in serious stage of inflammatory action [(9)], it created in the hepatocytes and also extra-hepatic also been established [(10,11)]. CRP half-life is 19 hours and the level of it decrease quickly when acute phase end, so conceder vital sign of inflammation [(12)]. CRP action

independent in physiological and pathological situations so CRP produced by liver conceder a single agent so it is important factor to diagnosis and screen CD patients [12]. Leptin from the Greek word leptos, meaning 'thin' was first proposed in 1953 that it could be a marker of fat tissue regulation[13], later Zhang et al isolated the leptin hormone in 1994 [14]. It have important function to food intake rule, energy spending, and body weight, its receptors are expressed in a variety of tissues [15]. Leptin is considered a multi-task hormone [16], as well as an important regulator of inflammation [17]. Some of its immunological tasks includes increasing the synthetic activity and chemotaxis of macrophages and monocytes, induces the proliferation, activation and maturation of natural killer cells. Besides, leptin has non immunological tasks like regulation of food intake and digestion, regulation of metabolism, and angiogenesis [17,18]. **So the aim is** to assess the serum leptin level in association with CRP in a sample of Iraqi patients with IBD of variable disease activity index referred to The Gastroenterology & Hepatology Teaching Hospital/ Baghdad.

## Methods

Out of 88 patients diagnosed with IBD, referred to the GIT and Hepatology Hospital/Medical City at Baghdad from December, 2015 to October, 2016, 79 patients who fulfill the inclusion criteria were involved in this study, 38 with ulcerative colitis, and 41 diagnosed as a Crohn's disease. Exclusion criteria: **(**Patients diagnosed with diseases that may affect the serum leptin level such as liver cirrhosis, emaciated patients, malignant diseases or patients on chemotherapy or radiotherapy [18]**,** Diabetes mellitus on insulin therapy as insulin use may increase leptin level [19]**,** Obese patients (BMI more than 30) [18]**,** Lack of participant agreement and patients who did total colectomy). All patients were interviewed, clinical history, and proper examination was done. The diagnosis based on colonoscopy, CT, MRI, US and histopathological examination of mucosa. Patients with UC were separated into three clusters conferring to their disease action and by referring to ulcerative colitis disease activity score (UCDA Index) [20]: (remission and mild disease: UCDA Index ≤ 4, moderate disease: UCDA Index 4-10, severe disease: UCDA Index > 10). Regarding CD, assessment of action of disease by use (CDAI) Crohn's Disease Activity Index [21]. Patients were categorized into three collections: remission and mild disease < 220 points, moderate 220- 450, severe > 450. Fasting serum leptin were collected from subjects at morning. Centrifuged of blood for 10 mins and then accumulate and serum tasters were directly cold at – 48 c. Various methods for the estimation of body fat are available such as calculation of body mass index (weight (kg) divided by the square of height (m)) (BMI). So, the reference range of serum leptin differ from patient to other depending on the BMI, gender, and age group, for this reason patients divided (according to their leptin level) into three groups: (high leptin level, normal leptin level and low leptin level). Statistical analysis: t-test, for variances between the mean of 2 groups ( normal distribution), Mann W. test for variances between the mean of 2 groups ( skewed distribution), more than 2 group used K. W. test (skewed distribution). Binary logistic regression analysis used to calculate the odd ratio (OR). All data analysed by SPSS 22, P- value consider significant when less than 0.05.

## Results

Patients with UC had significantly higher BMI compared to CD, gender also had significantly difference between UC and CD, in which female to male ratio was 1.9:1 in UC and 0.64:1 in CD, serum leptin was significantly higher in UC compared to CD.

There was no significant difference in the distribution of disease activity index and type of IBD as illustrated in table 1. In UC disease activity index significantly associated with serum leptin, in which as the disease activity increase serum leptin decrease (inverse association), while in CD no such association was observed as illustrated in table 1. In patients with UC patients with remission had significantly lower serum CRP compared to both disease activity (moderate, severe) and in patients they had CD patients with remission had significantly lower CRP value compared to moderate and severe disease activity as illustrated in table 1.

P- value < 0.05 ( significant).

Significant association between leptin and CRP in individual with UC, in subset analysis in which we divide UC into 3 groups (remission, moderate and severe disease activity), only in the patients with remission there was significant direct linear relationship between CRP and leptin, while in the other group no relationship was observed as illustrated fig. (1, 2).

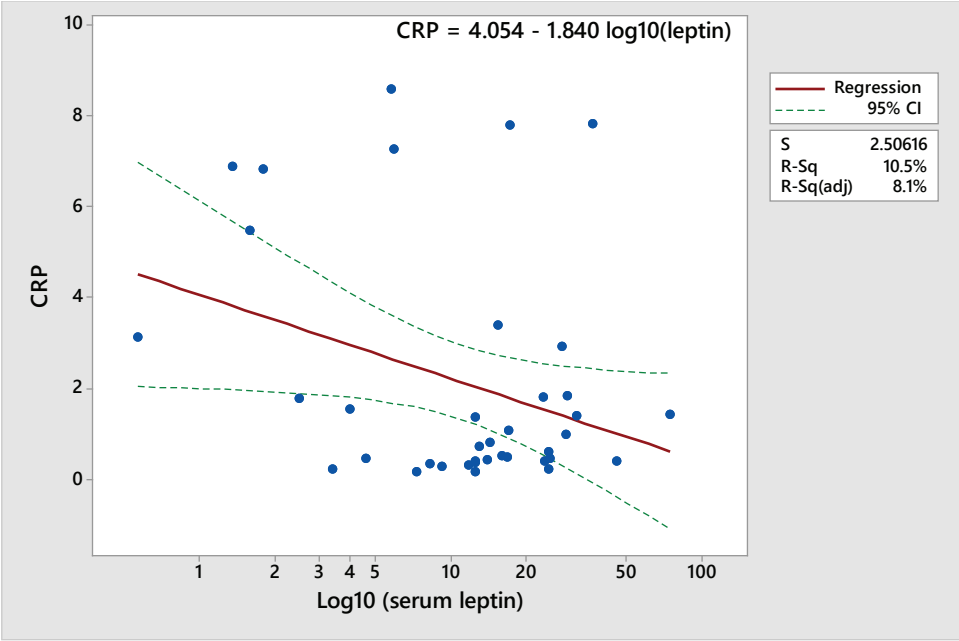

**Figure 1: correlation between CRP and leptin in patients with UC (serum leptin was transformed using logarithmic scale)**

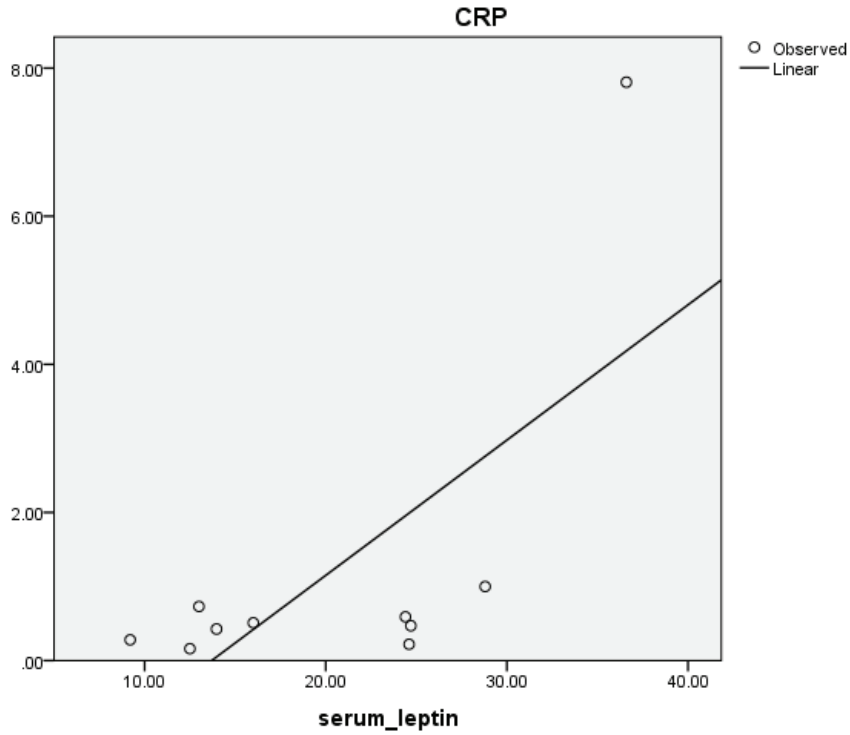

**Figure 2: correlation between CRP and leptin in UC for patients with remission**

Overall there was significant (direct) logistic relationship between CRP and serum leptin (see figure 3), in each of the subgroups (remission, moderate and severe), no significant association between CRP and leptin in patients with CD.

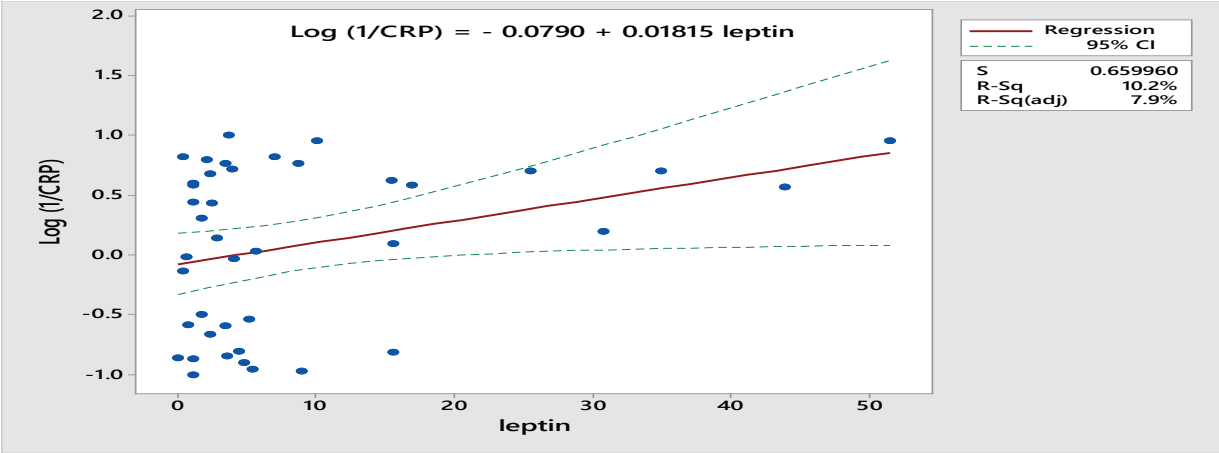

**Figure 3: correlation between CRP and leptin in patients with CD (serum leptin was transformed using logistic scale).**

## Discussion

Causes of IBD is blurred most studies showed the disease developed as genetic basis or due to immune response to food allergens and bacteria that casing agitated intestine [22]. The average age of patients they had IBD was 30 years old. UC can occur at any age, although diagnosis before the age of five years or after 75 years is uncommon. The peak incidence of UC occurs in the second and third decades of life [23]. Another studies show the median age was 30 years also [24]. Data reveled that there is a significant variance between patients with UC and CD by fact of gender, in which female to male ratio was 0.64:1 in CD and 1.9:1 in UC. many studies showed that female with less risk to have Crohn's disease, so female to male ratio was 1:3, 1:1. Our data reveled that patients with UC had significantly higher BMI compared to CD, this might be illustrated by the reduced dietary intake and malabsorption which was more severe in patients with CD. According to a large Chinese research done by Jie Dong et al [25] in which 1442 patients diagnosed with IBD were involved, results showed that CD patients had significantly lower BMI compared to controls (95% CI-2.77 to -1.00, P< 0.001), while no obvious difference was observed in UC patients. Our data reveled that serum leptin level was significantly upper in those patients with UC likened with CD patients, this may be due to the higher number of female patients with UC, since females have higher fat mass than males, which might the cause of this significant increase in leptin level. In patients with UC patients with remission had significantly lower serum CRP compared to both moderate and severe disease activity and in patients with CD with remission had significantly lower CRP value compared to moderate and severe disease activity, many past studies showed that CD had higher CRP level than UC patient, and high level of IL-6 [26]. In our study, results showed that the relationship between disease activity and leptin level in UC group was an inverse relationship, in which when the activity of the disease increase, serum leptin level decrease, On the other hand, there was no significant relationship between leptin level and CD activity index, Studies assessing serum leptin levels in IBD activity showed controversial results [27]. In a study by Karmiris et al [18], serum leptin levels ( s. leptin level in UC 10.6±2.0 ng/mL and in CD was 12.5±2.6 ng/mL) were significantly decreased in UC patients compared to CD patients these results were nearly comparable with our study's results. In our study we compared the level of serum leptin with that of CRP in both UC and CD. Significant association between leptin and CRP in individual with UC. Results showed that only in the patients with remission there was significant direct linear relationship between CRP and leptin, while in the other group no relationship was observed [22]. , there was significant (direct) logistic relationship between CRP and serum leptin, while in each of the subgroups (remission, moderate and severe) there was no significant relationship observed between CRP and leptin. there was non-significant relationship, while there was a significant one when we add CRP parameter. This means that the effect of CRP was stronger than that of serum leptin in CD patients. On the other hand the effect of leptin may be become more obvious when after adding the CRP effect as another variable, up to the date this study was established, we did not find other previous studies comparing the level of both serum leptin with that of CRP, so this study is an original one.

## Conclusion

There is a significant correlation between disease activity in UC and CD with serum CRP. Comparing both CRP and leptin level showed that there is an overall significant association with both UC and CD, but not useful for defining their activity index.

# Influence of Quality of Nursing Work Life on Nurses' Turnover Intention: the Mediating Effect of Organizational Commitment

**Hyoungshim Choi[1], Insook Kim[2], Yeongyi Yim[3], Seonae Won[4]**

*[1]Assistant Professor, Department of Nursing, Hansei University, Gyeonggi-do, Republic of Korea; [2]Emeritus Professor , College of Nursing, Yonsei University, Seoul, Republic of Korea; [3]Director, Department of Health Service Innovation, Korea Industry Development Institute, Chungcheongbuk-do, Republic of Korea, [4]Assistant Professor, School of Nursing, Taegu Science University, Daegu, Republic of Korea*

## Abstract

The top priority of this study was to identify how nurses' organizational commitment (OC) serves as a mediating factor between Quality of Nursing Work Life (QNWL) and turnover intention (TI) among Korean nurses. Three hundred thirteen registered nurses working in hospitals participated in this study. Mediating effect analysis was conducted to identify the relationship between QNWL, OC, and TI. The results revealed significant correlations between variables. OC showed a perfect mediating effect in the relationship between QNWL and TI. The results suggest that nurses' QNWL has a significant influence on the TI, which is mediated via OC.

***Keywords:*** *Nurses, turnover intention, Quality of life*

## Introduction

With a continuous increase of the aging population and the number of chronic illnesses every year, hospitals are trying to provide specialized and patient-oriented medical services.[1] Frequent changes in the medical environment can be a burden to nurses, reducing job satisfaction and increasing the turnover intention, with most countries suffering from a nurse shortage.[2–4] A lack of skilled nursing staff due to high nurse turnover rates leads to overtime work and higher patient-to-nurse ratios, as many patients to be cared for increases. In turn, the quality of medical services is reduced and efforts made on quality improvement and workforce development programs, such as training for new nurses, result in increased health service costs.[5]

The turnover intention is a response to job dissatisfaction and refers to the intention to move from one's current job to a new one; it is a variable that explains the actual turnover behavior.[6] To manage turnover intention, it is necessary to systematically grasp factors that affect the turnover intention from various perspectives.[7] Age, position, education level, marital status, working status, career, and salary are factors affecting the turnover intention.[8] Situational variables include QNWL, OC, job satisfaction, and job stress.[9]

QNWL is a very important factor for employees. In recent years, hospital administrators have been trying to identify and improve the indicators that affect the QNWL in order to prevent the loss of competent nurses. QNWL refers to harmony of work and personal life, including elements required by nurses in order to work satisfactorily in their workplace; therefore, it can be viewed as a reliable and valuable concept that can be used to measure the QNWL of nurses and identify changes that need to be implemented to increase the productivity of the organization.[12] In general, QNWL was found to affect nurses' job satisfaction and turnover intention.[13] QNWL and turnover intention have been reported to be negatively correlated,[3,9,10] while QNWL

and OC have been reported to be positively correlated.[14]

OC is closely related to how strongly the members trust and agree with the goals and values of the organization, how willing they are to do their best while at the organization, and how earnestly they wish to remain as staff members.[15] It has been identified as the most influential factor regarding nurses' turnover intention,[16] and a major attitude variable for nursing staff with a positive influence on organizational effectiveness.[17]

QNWL and OC influence each other, as do OC and the turnover intention. An intermediating effect of emotional OC on the relationship between the QNWL and the turnover intention was found for university professors and other employees.[18,19] However, no studies have explored the possible intermediating effect of OC on the relationship between QNWL and the turnover intention among nurses. Therefore, this study aimed to identify how nurses' OC serves as a mediator between the QNWL and the turnover intention.

## Material and Method

### Study design and sample

This was a descriptive study aiming to analyze the relationship between QNWL, OC, and the turnover intention and to confirm how nurses' OC serves as an intermediary between the QNWL and the turnover intention.

Three hundred and thirteen general nurses in Seoul and Gyeonggi Province for more than one year participated in this study. Nurses working in general institutions are usually not satisfied with their job during their first year[20]; thus, nurses with less than 12 months of experience were excluded from this study owing to differences in job satisfaction due to length of service.[20]

### Ethical Considerations

This study was approved by the Institutional Ethics Committee of Y University (IRB No. 2014-0061-1). Participants were requested to sign an informed consent form before taking part in the survey.

### Measures

Quality of nursing work life

The Korean version of the QNWL tool[21] based on Brooks'[11] QNWL tool was used in this study. This measure has 36 items in four sub-domains. The higher the score, the higher the QNWL.[21] The internal consistency of the original tool[11] was .37–.88, while the Cronbach's α of the QNWL-K[21] was .69–.93.

### Organizational commitment

To measure nurses' OC, this study adopted a tool designed by Mowday et al.[15] and translated by Kim.[22] This tool includes 15 items. Higher scores reflect higher OC. The reliability of the original instrument measured with Cronbach's α was .82 to .93, and .89 in the study by Kim.[22] Cronbach's α in this study was .82.

### Turnover Intention

We used a modified tool by Park[23] to measure nurses' turnover intention by adding four questions from the tool used by Lawler.[6] Lower scores reflect lower turnover intention. Cronbach's α was .88 in the study by Park,[23] and .85 in the present study.

## Data Analysis

Data were collected over one month from May 1 through 30, 2015. In the final analysis, 313 questionnaires were used.

SPSS 24.0 program was used to analyze the data. T-tests and ANOVA were performed to analyze the differences in variables by nurses' characteristics, and Scheffé's test was performed for post-hoc comparisons. Pearson's correlation coefficient was used to analyze the relationship between QNWL, OC, and turnover intention. Finally, we examined the mediating effect of OC using the procedure of Baron and Kenny,[24] and verified the significance of the mediation effect with the Sobel test.

## Results and Discussions

### Descriptive statistics

The QNWL of nurses showed a significant difference according to the following general characteristics: marital status ($t = 2.50$, $p = .013$), hospital type ($t = 5.43$, $p = .005$). OC showed significance for age ($F = 10.87$, $p < .001$), education level ($F = 10.30$, $p < .001$). Turnover Intention showed significant differences for marital

status ($t$ = -3.88, $p$ < .001), age ($F$ = 10.47, $p$ < .001), total clinical career ($F$ = 2.96, $p$ < .033). (Table 1).

**Correlations between variables**

Significant positive correlations between QNWL and OC ($r$ = .63, $p$ < .001), and between QNWL and nurses' turnover intention ($r$ = -.43, $p$ < .001) were found. (Table 2)

In order to determine the intermediating influence of OC on the relationship between QNWL and turnover intention, the three-step analysis procedure developed by Baron and Kenny[24] was used (Table 3). The Sobel test showed that OC had served as a significant mediator in the relationship between QNWL and the turnover intention ($Z$ = -8.07, $p$ < .001; Figure 1).

## Discussion

The average score of turnover intention was 3.4 out of 4.00. This is relatively high compared to the turnover intention score of 2.96 found among nurses in small-sized hospitals obtained using the same tool by Hwang and Kang.[7] The general characteristics that showed a difference in turnover intention were age, marital status, children, and clinical career. Turnover intention was higher for those aged below 29, single, without children, and with clinical experience between 3–5 years and a higher salary. These results were supported by a previous study.[25] Nurses with clinical careers of 3–5 years tend to perceive their work as repetitive rather than experiencing

increased confidence. Therefore, differentiated policies and efforts are needed to lower the turnover intention among nurses.

In this study, there were statistically significant correlations between QNWL, OC, and the turnover intention. QNWL and OC showed a very strong positive correlation. Additionally, QNWL and the turnover intention were negatively correlated, as previously noted.[9,27] OC and the turnover intention showed a strong negative correlation, which adds to the body of literature suggesting that OC is the strongest correlated factor among those negatively correlated with the turnover intention.[7]

Our results showed that OC functioned as a significant mediator between QNWL and the turnover intention. This implies that OC is a critical factor in the relationship between QNWL and the turnover intention. OC can be increased by increasing QNWL, and the turnover intention can be decreased by increasing OC. In addition to the demonstrated mediating effects of OC in relation to nurses' perceptions of work environment and turnover intention.[1] This study confirmed the full mediating effect of OC between QNWL and the turnover intention. Therefore, hospital administrators need to understand the relationships between these variables in order to reduce nurses' turnover rates. Career development courses are needed to improve the relationship between multidisciplinary teams working together in hospitals, and customized welfare system should be strengthened in order to increase QNWL. Furthermore, employee management strategies that reflect the existing hospital system should be developed to enhance the overall QNWL, toward the aim of fostering a healthy work/life balance for nurses.[19,27]

This study has several significant implications. First, we confirmed the degree of QNWL of Korean nurses, which is an important concept for enhancing organizational productivity through the harmonization of work and personal life. Second, by analyzing the intermediating influence of OC in the relationship between QNWL and turnover intention, which is closely related to the quality and cost of medical services, we deepened our understanding of the turnover intention and provided basic data for the development of interventions. Third, by using the QNWL-K based on Brooks'[11] QNWL tool, which is widely used in Asian countries comparisons of the same items are made possible. However, since this study was conducted with nurses working in hospitals in Seoul and its metropolitan area, there is a limitation to the generalizability of the results.

## Conclusion

The findings of this study revealed that QNWL and OC were positively correlated, whereas OC and turnover intention were negatively correlated. OC was also found to fully mediate the relationship between QNWL and the turnover intention. Therefore, policies and organizational efforts to raise QNWL should be developed to increase OC.

Since this study examined the relationship between QNWL, OC, and the turnover intention, we propose further empirical studies to identify the factors affecting QNWL, which will be useful for the development of intervention programs for improving it. Additionally, we propose a follow-up study to identify QNWL levels and influential factors for nurses working in various fields as well as hospitals.

# The Role of Aspiration and Thyroxine Suppression Therapy in Management of Benign Thyroid Nodules

**Jalil Ibrahim Awaid alrubaye[1]; Hussein Ali Abed Ahmad [2]; Salah Mahdi Tager[3]**

*[1]MBCHB, FICMS) Department of Surgery/Al -Zahra Hosp Al-Kut; [2]Assist prof. Wassit Medical Collage M. B. Ch. B- F.I.C.M.S ; [3] Consulltant General Surgeon(MBCHB.CABS)*

## Abstract

A prospective study on 142 patients presenting with (benign euthyroid nodule) , after diagnostic work-up included a clinical evaluation, thyroid function tests, ultrasonography, thyroid scintigraphy and fine needle aspiration cytology. Based on the investigations, patients were managed with aspiration andthyroxine suppression therapy for sex month . Patients were divided into four groups according to their response of treatment ,group( 1) complete shrinkage response ,group( 2) reduction in size ,group (3) no response but same size and group (4) enlarge in size non responders'.Of the 142 patients17 (12 %) were male, and 125 (88 %) were female. The age rangein 99 (69.7%) patients were between 21 and 50 years and forty three patients were above 50 years of age. We divided our result into four groups,group( 1) complete shrinkage response29 patients' (20.5%),group( 2) reduction in size 45 patients' (31.8%),group (3) no response but same size38 patients' (26.7%) and group (4) enlarge in size non responders30 patients'(21% )Thyroxine suppressive treatment were effective in shrinking about one fifth of thyroid nodules. Similarly, there was reduction in size in about one third of nodule.From 17 male 6 patients (35 %) achieve complete response ,while only23 female patients (18 %) achieve complete response, and from17 male patients 5 (29 %) achievereduction in size,while only 40 female patients (32 %) achieve reduction in size. Young age less than fifty achieve good response than older patients(63.6%).Single aspiration needed in26 patients(18.3%) while multiple aspiration needed in 116 patients(81.7%).

***Key words :*** *Aspiration, Thyroid Nodules , thyroxine suppression treatment.*

## Introduction

Medical management of benign thyroid nodules may deter the requirement for medical procedure and morbidity related to it. Thyroxine inhibition treatment is being used in the medicinal management of euthyroid benign nodules [1 2]. Nodular thyroid infection still one of the common endocrine troubles. The majority thyroid nodules are benevolent hyperplastic injury however 5 to 20% of thyroid nodules are genuine neoplasm [3]. The predominance of thyroid nodules differs impressively relying upon an assortment of elements that incorporate iodine consumption inside a given populace, age, sex, diet, drug and natural radiation presentation.

The age-related is increment the nodularity and thyroid volume. Little thyroid nodule are ordinarily found in patients with a simultaneous history of Hashimoto's Thyroiditis[4]. The significance of dealing with a thyroid nodule in the early separation among benign and harmful nudule, since the way to deal with treatment in the two is thoroughly different. The viability of thyroxine concealment treatment in benign euthyroid nodule brings about the justification of medical procedure in such patients.

Most investigations have demonstrated that a little of thyroid nodule relapse in patients treatment with thyroid hormone. Nonetheless, the suppressive treatment appears to intervene with goitrogenesis in numerous patients, and recent hypothesis proposes that it could diminish the danger of thyroid oncogenesis[5].

Inhibition of thyroid-stimulation hormone(TSH) discharge in ordinary subjects by the giving of thyroid hormone brings about thyroid decay [6],even though the pathogenesis of thyroid nodule and irregular nontoxic multinodular goiters is ineffectively comprehended, TSH is dared to be essential if not adequate and, along these lines, inhibition of TSH secretion may be relied upon to bring about a diminishing in nodule or goiter size or possibly avert further augmentation.

The significance of TSH in goiter production changes with the reason for the goiter. For instance, in patients with iodine inadequacy or autoimmune disease (Hashimoto's), an elevated in TSH secretion is the dominating reason for goiter. Conversely, the majority patients with thyroid nodule or irregular nontoxic multinodular goiters have typical serum TSH levels, especially persons with nontoxic multinodular goiters, the thyroid expansion is most likely caused by many factors (include TSH) that work after some time on thyroid follicular cells that have special manufactured and growth possibilities. The effect is spread and presently multinodular thyroid augmentation; a few nodule inevitably become independent [7]and others may experience cystic deterioration. Since the thyroid hormone is assumed to decrease goiter size by diminishing TSH emission, inhibition treatment would be relied upon to be ineffectual in patients in whom plasma TSH levels were previously subnormal because of autonomous thyroid hormone creation [8]

## Patients and Methods

The research was carried out in AL-Zahra teaching hospital from May 2011 until May 2015, on 142 patients presenting with (benign euthyroid nodule) , after diagnostic work-up included a medicalevaluation by history information, write of present symptoms with their period, a systemic assessment and local assessment of the thyroid enlargement and the neck . The quantitative determination of plasma triiodothyronine(T3) and plasma thyroxine(T4) was carried out by radioimmunoassay(RIA), (normal values of T3: 0.72-2.2 ηg/ml, T4: 5.6-13.6 μg/ml). Serum TSH was measured by the immunoradiometric assay (IRMA), (normal range 0.3–6.5 μIU/ml). Fine Needle Aspiration Cytology( FNAC) was performed as therapeutic and diagnostic, result were write as thyroid cyst. According to the earlymedical, biochemical assessment, FNAC and thyroid examine. The subsequentsubjects were excluded from this study: Goiter hypothyroidism, hyperthyroidism, pre-pubertal and pubertal, distribute nodular goiter and suspicious FNAC result.

All included patients after aspiration given thyroxine suppression at a dose of 50–100 μg every day. TSH was reserved in the littletypical range for 6 months. subjects were followed up every month to observe the size of the nodules by medical palpation and ultra-sonography also repeated aspiration was performed for those with persistent nodule. Patients were divided into four groups according to their response of treatment group(1) complete shrinkage response ,group(2) reduction in size ,group (3) no response but same size and group (4) enlarge in size non responders' .Operation was performed in states where the nodule did not retreatfollowing6 months of thyroxininhibition.

## Findings

Of the 142 patients17 (12 %) were male, and 125 (88 %) were female. The median age was 37 years Ninety nine (69.7%) patients were between 21 and 50 years and forty three(30.3%) patients were above 50 years of age. We divided our result into four groups, group( 1) complete shrinkage response 29 patients'(20.5%),group( 2) reduction in size 45 patients' (31.8%),group (3) no response but same size38 patients' (26.7%) and group (4) enlarge in size nonresponders30 patients'(21% ) Thyroxin suppressive treatment were effective in shrinking about one fifth of thyroid nodules. Similarly, there was reduction in size in about one third of nodule. From 17 male 6 patients (35 %) achieve complete response ,while only23 female patients (18 %) achieve complete response, and from17 male patients 5 (29 %) achieve reduction in size, while only 40 female patients (32 %) achieve reduction in size. From 99 Young age patients(less than fifty years) 63 patients(63.6%) achieve good response either complete response 25 patients(25.2%) or reduction in size 38 patients(38.3%),while from 43 older patients11 patients(25.6%) achieve good response either complete response 4 patients(9.3%) or reduction in size 7 patients(16.2%). The common side effect areweight loss 7 patients(4.9%) , insomnia4 patients(2.8%) and palpitation 16 patients (11.2%) but all patients tolerate these side effectby reduction the dose.Single aspiration needed in6 patients(4.2%) while multiple aspiration needed in 136 patients(95.8%. Group 3 and 4( 68 patients 47.8%), there was no response in spite of aspiration and thyroxin suppressionunderwent subtotal thyroidectomy.

## Discussion

The American Association of Clinical Endocrinologists(AACE) does not containthyroxininhibition in its advice for running of benign euthyroid nodule[8]and restricts its use to patients with FNAC negative thyroid nodules not from iodinepoorregion, youthfulpersons with little goiter and nodules with no confirmation of practical autonomy. It additionalconditions that thyroxine inhibitionmust be avoided in big goiter, clinically doubtfulinjury or those with insufficient cytologic example, in postmenopausal females or persons with osteoporosis and cardiovascular disease. However, thyroid hormone treatment for nodular goiter, for superficial reasons or to avoid investigative and healingoperation surgery, results in reasonable to totalweakening of the nodule[9].Zygmunt, reports that in the early stage hyperplasic goiter may regress if thyroxine is given at a dose of 0.15- 0.2mg daily for a few months [10].

Thyroxine inhibitiontreatment with aspiration is an suitablesubstitute as long as the person is followed-up cautiously at 3-month period because fluid may be re accumulated[11].It is set in dosageenough to inhibit the TSH value to 0.1–0.5 µU/ml for 6 months; additionalextendedtreatment is kept for persons in whom a reduce in nodule size is recognized on USG. following 12 months, the dosage of thyroxine is reduced to preserve the plasmalevel of TSH in the little normal value. information also propose that thyroxine inhibition for benign nodules does not decisively result in decline of nodules, while a littleexamination of inhibition may be sensible in special patients[12].A study by La Rosa [13]has shown a 35% reduction in the size of the colloid and regenerative nodules. In our study, we achieve shrinkage in about one-fifth of thyroid nodules(20.5%),. Similarly, there was a reduction in size in about one-third of nodule(31.8%) at a response rate of 52,3%. In our study 17 patients (12 %) were male, and 125 (88 %) were female, Figure (1). These because that every kinds of simple goiter are extrafrequent in women than menas a result of the found of estrogen receptors in thyroid tissues[10].

The age range in 99 patients (69.7%) were between 21 and 50 years and 43 patients (30.3%) were more than 50 years of age Figure (3). In a review article, Mazzaferri [14]reports an elevated in the occurrence of thyroid nodules with age and a occurrence of 5% in persons at 50 years present by physical palpation. The ultrasonography (USG noticeoccurrence is far elevated, approximately 55%)[15]. Among the response groups, From 17 male 6 patients (35 %) achieve complete response ,while only23 female patients (18 %) achieve complete response,

and from17 male patients 5 (29 %) achieve reduction in size, while only 40 female patients (32 %) achieve reduction in size Figure (2). From 99 Young age patients (less than fifty years) 63 patients(63.6%) achieve good response either complete response 25 patients(25.2%) or reduction in size 38 patients(38.3%), while from 43 older patients11 patients(25.6%) achieve good response either complete response 4 patients(9.3%) or reduction in size 7 patients(16.2%) Figure (4). We conclude that the younger age group of our patients due to the iodine deficiency which endemic in our country and most of our patients were fertile women.

We achieve good responses in the male group because of the absence of the estrogen receptor in thyroid tissue that not competent with thyroxine therapy[10]. Aspiration and FNAC have good sensitivity and a specificity in the exclusion of suspicious nodules[16],but single aspiration was needed in 6 patients(4.2%) while multiple aspirations needed in 136 patients(95.8%) Figure(5) these mean that aspiration was not significant than thyroxine and fluid may re-accumulate without thyroxine and benefit only in FNAC stay the basis of helping to identify suspicious nodule. In our study, no response but the same size in 38 patients' (26.7%) and enlarge in size in 30 persons (21% ), despiterecurring aspiration and thyroxine inhibition. The response speed of 52.3% to aspiration and thyroxine inhibition in the current study was more than that in other studies, wherever it is write to level from 17% [15] to 35%. [13] .The cause could be a larger number of younger persons(63.6%) presented less than 50 years of age). The common side effect is weight loss 7 patients(4.9%), insomnia 4 patients(2.8%) and palpitation 16 patients (11.2%) Figure (6) but all patients tolerate these side effects by reducing the dose.

## Conclusion

Aspiration and thyroxine suppressive treatment were effective in shrinking thyroid nodule. Male patients achieve good response than female patients. The response is better in younger patients.

# Assessment of Risk Factors of Lung Cancer Patients in Babylon Governorate ,Iraq

**Ali Abdullah Jasim[1], Basim Hussein Bahir [2]**

*[1]Master Student, Master Of Community Health Technology, College of Health and Medical Technology Baghdad.[2] PhD Community Medicine , Department of Community Health , College of Health and Medical Technology Baghdad, Middle Technical University, Iraq*

## Abstract

**Background:** Lung cancer is one of the most common and serious types of cancer. Cigarette smoking is the main cause of lung cancer.The aims of this study was therefore to assess the risk factors of lung cancer patients in Babylon governorate including tobacco smoking , family history, and occupational exposures, measurement of radon gas in the bed room of patients with lung cancer. **Patients and Methods:** A case – control study was conducted in Babylon oncology center , Murjan medical city during the period from 8th of may to 2nd of september 2019. This center received all lung cancer patients in Babylon governorate. **Results:** The study showed that 43.3% of cases were in the age groups 60- 69 years**.** Males constitute 69.5 % of cases, seventy one percentage of cases were residing in a rural area. Smoking is the main risk factors of lung cancer in 75.8% , the risk of lung cancer in current smoker is three times more than that of non smoker .Those who had a family history of lung cancer constitute 8.3% ,of them 3.9% were first degree and 4.4% were second degree ,there was a significant association between lung cancer patients and first degree family history with lung cancer .Those who had a family history of other cancer was 23.6 % .The risk factors include radon exposure, asbestose, beryllium ,cadmium and diesel exposure were significant associated with lung cancer . The radon value in (77) patients of lung cancer were within exceptable limit.**Conclusion :** This study revealed that males, age group 60 and above, rural area and smoking is the main risk factors of lung cancer in Babylon city.There is highly significant association between smoking habits and lung cancer cases p-value<0.05.

***Key words:*** *Risk factors , Lung cancer, Radon exposure, Smoking in lung cancer.*

## Introduction

Lung cancer is the most common cause of cancer death in men and the second in women after breast cancer [1] .There are two main types of lung cancer small-cell lung carcinoma(SCLC) and non-small-cell lung carcinoma(NSCLC).The most common symptoms are coughing(including coughing up blood),weight loss, shortness of breath, and chest pains[2].

The risk factors of lung cancer is a multifactorial ,that is many factors work together to cause lung cancer. Globally, risk factors of developing lung cancer include smoking ,exposure to radon gas, asbestos, radioactive ores such as uranium, inhaled chemicals or minerals like, beryllium,cadmium,chromium compounds,diesel exhaust, air pollution.Family history of lung cancer increases its risk. The debilitated patients with compromised immune system and elderly over the age of 65 years are more prone to the disease [3]. In the USA in 2019 there were about 228,150 new cases of lung cancer 116,440 in men and 111,710 in women , and 142,670 deaths from lung cancer 76,650 in men and 66,020 in women[4]. Each year, more people die of lungcancer than of colon, breast, and prostate cancers combined[4]. The problem of tobacco smoking in Iraq associated with the social and cultural environment, which encourages smoking and influence an individual's attitude toward cigarette smoking [5]. Tobacco smoking is responsible for the majority of lung cancer cases, cigarette smoking is the cause of approximately 90% of lung cancer deaths [6]. Another study reported that lung cancer killed approximately1,590,000 persons in2012[7].The primary

risk factor for lung cancer development and the leading cause of preventable death [8].

## Patients and Methods

Babylon governorate located in the middle of Iraq is about 100 , kilometers south Baghdad city and has an area of 5,119 Square Kilometers, and population of 1.931.700 people in 2014.

A case – control study was conducted on patients attended Murjan medical city , Babylon oncology center throughout the period from 8th of may to 2nd of september 2019 .

**Sampling :** convenient sample that including all a available patients .

Case: was diagnosed by specialist and referred to the center .

Controls: were age and sex matched .

First degree of family history is defined as a family member who shares about 50% of their genes with a particular individual in a family , first degree relatives include parents, offspring and siblings[9] .Second degree defined as someone who shares 25% of persons genes, it includes uncles, aunts, nephews, nieces, grandparents, grandchildren, half- siblings, and double cousins[10]. Current smokers: is ever smokers who are still smoking at the time of the interview[11].Its including Number of cigarettes smoking per day , and age at beginning of cigarette smoking in years and duration of smoking , number of cigarettes smoking per day [11] .

**Data collection technique :**

Data for lung cancer patients risk factors were collected by direct observation using a structured questionnaire after reviewing previous studies.The questionnaire consists of demographic characteristics of patients, risk factors include(smoking, radon ,family history, first degree of family history is defined as a family member who shares about 50% of their genes with a particular individual in a family , first degree relatives include parents, offspring and siblings [9] .Second degree defined as someone who shares 25% of persons genes, it includes uncles,aunts,nephews, nieces, grandparents, grandchildren, half- siblings, and double cousins[10] .

**Measurement of radon :** Radon gas was measured in bed rooms of patients, in cooperation with Babylon environment directorate by using alphaguard professional radon monitor ,a modern device used to examine radiation and especially to measure the value of radon gas, normal value of radon is 100Bq/$M^3$ according to( WHO)[12].

## Statistical Method

Data were presented in simple measures of frequency, percentage , mean, standard deviation, and range(minimum- maximum values).The significance of difference of different means (quantitative data) , and odd ratio, confidence interval around odd ratio [13] .

**Statistical analysis :**

Data analysis was carried out by using the Statistical Package for Social Science (SPSS/ version 25). **Finding:** A total of 203 cases were include in the study :

**Table 1 : Family history of cancer among cases and controls.**

| Variables | | (Cases) | | Controls | | OR | 95% C.I | P-value |
|---|---|---|---|---|---|---|---|---|
| | | No. | % | No. | % | | | |
| Family History of Lung Cancer | First degree | 8 | 3.9 | - | - | 8.69 | 0.08-70.03 | _ |
| | Second degree | 9 | 4.4 | 1 | 0.5 | 9.77 | 1.23-77.89 | 0.009 |

***Cont...*** **Table 1 : Family history of cancer among cases and controls.**

***** Others include those who were works in brick factories ,spray pesticide and chemicals , exposure to agricultural chemical wastes, individuals that presence in area of asphalt plant and generators worker.

Table 3: Showed that (22.7 % , 13.3% , 12.3 % and 5.4 % ) were exposed to (beryllium ,diesel exhaust ,asbestose and cadmium) respectively , and the association were significant .

Figure 1:This figure showed the radon value in (77) patients of lung cancer. All values of radon were within exceptable limit .The duration of exposure 21.2±6 range (5 - 32 ) P.value 0.0001.

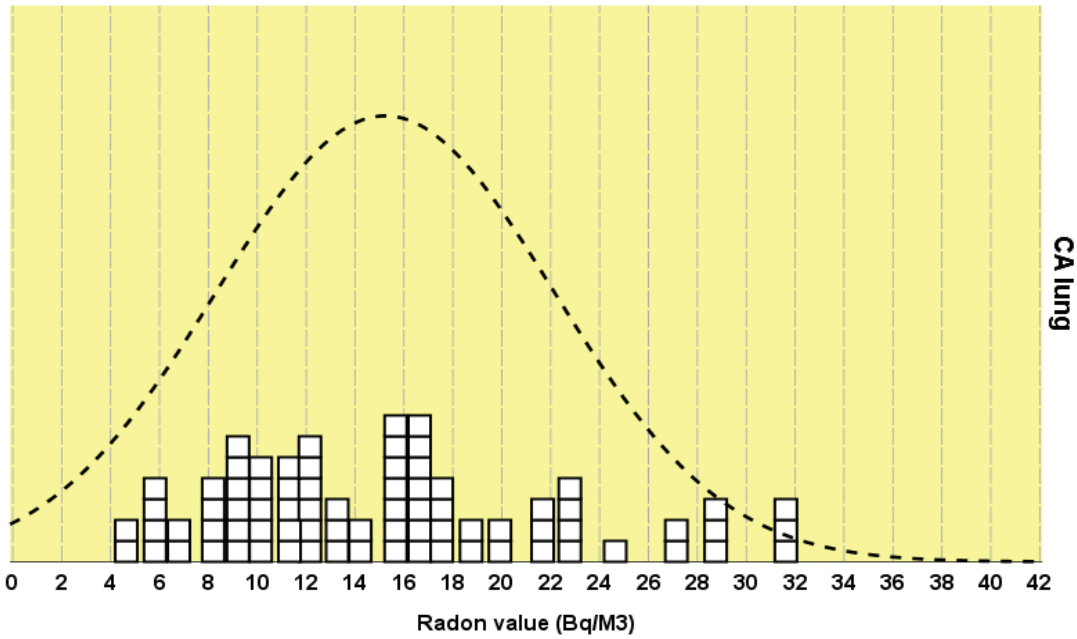

**Figure 1 : Distribution of radon value of lung cancer patients .**

## Discussion

Regarding the age , the results of this study demonstrated highest percentage ( 43.3%) of cases in age group (60 – 69 )years.

Higher percentage of males 69.5 % had lung cancer. This study agrreed with others studies that showed: increase risk of lung cancer in smoking persons more than non-smokers, and in male more than females and in the age groups (50 years and above) [14,15] . This may be due to higher percentage of smoking in males , passive smoking , type of occupational exposure and other risk factors are more in the males than in the females.This study demonstrated the risk of lung cancer in the current smoker were three times more than non smokers, which was supported by other studies, that indicated that cigarette smoking plays an important risk factor in the occurrence of lung cancer [16].The current study revealed that 71.4% of cases were living in rural area, which agreed with the study of Stamm *et al.,*2007, which found that lung cancer was more in rural area than in urban area .[17]

This showed that the 22.7 % , 13.3% , and 12.3 %, there was a significant between lung cancer and exposed to beryllium , diesel exhaust and asbestose . The results agreed with others studies . These studies found that occupational exposure including radon exposure, and asbestos, beryllium, cadmium, chromium, diesel exhaust are constitutes a leading risk factors for lung cancer according to the type of occupation[18,19] .There was a significant association between lung cancer patients and first degree family history lung cancer .Lung cancer patients had 8.7 times more family history of first degree patients with lung cancer. That was in agreement with a study that found brothers, sisters, and children of people who have had lung cancer may have a slightly higher risk of lung cancer themselves, especially if the relative was diagnosed at a younger age. It's not clear how much of this risk might be due to shared genes among family members. [20].

There were many limitations for this study . Firstly : The sample was convenient which included all available cases at the time of the study ,so we not able to include all cases .

Secondly : Measurement of radon was done for (77) patients only , which not reflect the total exposure for all patients . This because there was only one radon gas measurement device available in the directorate of environment of Babylon , and the far distance between houses of patients .

## Conclusion

This study revealed that males, age group 60 and above, rural area and smoking is the main risk factors of lung cancer in Babylon city .There is highly significant association between smoking habits and lung cancer cases p-value<0.05.

## Abstract

In this research,lactide was synthesized by ring opening polymerization then reacted with amino acid to obtain drug polymer,poly (ester-amide)by condensation polymerization at 90C˚with mixture DMF&dioxane(1:1),then the biodegradable polymers substituted by some hydroxyl drug units such as 3-hydroxy pyridine .The action of polymeric drugs depends on hydrolytic & cleavage of the drug moiety from the polymer,this give advantage of late & sustained release of drug over long time with decrease of side effects .The new polymers wich has bioactive group's moiety were measured physical properties and characterized by FTIR & UV spectroscopy and TG thermogram.

***Keywords:-*** *lactide ; aminoacid ; biodegradable ; polymeric drugs*

## Introduction

Human health is threatened by autoimmune,neurodegenerative,metabolic and cancer disease ,just to mention a few,which are difficult to treat with systemically ,delivered drugs[(1)] .Conventional pharmacotherapy involves the use of drugs whose absorption and therefore bioavailability dependes on many factors , such as solubility , molecular weight , number of bonds per hydrogen atom of the molecule ,and chemical stability , all of wich can hinder the achievement of therapeutic response [(2,3)].

Research is being conducted into new formulations that ensure a greater pharmacological response , which in turn would lead to lower doses and therefore the minimization of side effects .Thus , it is necessary to improve the bioavailability of drugs .Bioavailability is affected by several factors ,including the physical and chemical characteristics of the drug [(4)],the dose and concentration , the frequency of dosing , and the administration route.

Therefore ,research into drug delivery systems seeks to improve the pharmacological activityof drugs by enhancing pharmacokinetics (absorption,distribution,metabolism and excretion) and also by amending pharmacodynamics ptoperties , such as the mechanism of action , pharmacological response , and affinity to the site of action[(5)]

Hence , the main function of polymeric carriers is to transport drugs to the site of action .Drugs are protected from interacting with other molecules which could caise a change in the chemical structure of the active ingredient causing it to loose its pharmaceutical action [(6,7)].Moreover , polymeric carriers avoid the intreraction of the drug with macromolecules .

In the case of biodegradable polymers , another option to consider in their design is the chemical structure of the polymer (degree of hydrophobicity , covalent bonds between monomers ,etc.),sincs the speed and degradation condition , and therefore , the rate and site of drug release,can be modulated depending on the chemical structure of the polymer used[(8)].

If the polymer is not biodegradable , the drug can be covalently attached to the polymeric structure by a linker which can be degrade d under different conditions such as in an acidic medium or by different enzymes[(9)] .On the other hand , targets can be bound covalently to the surface which will help the directionality of the vector to the site of action.

Lactide is iactone cyclic di-ester.,Tow molecules of lactic acid can be dehydrated to lactide,a cyclic lactone avarity of catalysts can polymerize lactide to either[10] heterocic or syndiotacticpolylactide[11].

Lactide is one of the most promising biodegradable polymers (biopolymers).The basic aim of prodrug designs to eliminate undesirable drug properties,such as low solubility in water or lipid membrane,low target selectivity,chemical instability [12],undesirable taste,irraitation or pain after local administration,pre systemic metabolism and toxicity .

## Materials & Methods

Glycine,arginine,3-Hydroxy pyridine ,ether,zincpowder,NaOH,dioxane, and lactic acid were purchased fromAldric,Dimethylformamide was purchased from Merck.

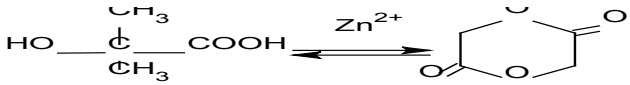
FTIR spectra were reached by (4000-900)$cm^{-1}$ on shimatau spectrometer using KBr pellet .

Ultra violet spectra were recorded using Shimadzu (UV-Vis)-160 , TGA and DTG were performed using CINTRAS-UV[13].

**Synthesis of L-lactide (P1):-**

The synthesis of l-lactide was carried out according to the procedure that was reported by Bendix with some modification including the use of Zn as catalyst.

Lactic acid (88gm,0.97mole)and zinc powder (0.44gm,0.0146mol.) were added to 100 ml round bottom flask containing magnetic stirrer and the mixture was stirred for 15 minutes,then the reaction was placed in a sand bath at 130C˚and the temperature raised to about 200C˚with continuous stirring under vacuum pressure for four hr.Theflsk content was left to cool down to room temperature with a continuous stirring until colorless viscous material was formed,chloroform (100ml)was added to the reaction flask,and then the content of the flask transferred to a separate funnel,washed by (45ml) of NaOHsolution.The organic layer was received and the solvent removed under reduce pressure [14,15],a light yellow viscous was collected with yield 70% and softening point 270C˚.



**Poly condensation of some amino acids with poly lactide(P2,P3) :-**

(1 mole,1.19gm) of prepared lactide was dissolved in (5ml) mixture of dioxane and DMF (1mole,2gm)of amino acid such as glycine was added ,the mixture was heated to 90C˚for 1 hr .The brown product was washed with ether and was dried at 50 C˚in vacuum oven, rigid product .

Modification of prepared polymers with heterocyclic compound(P4,P5).

(1.7gm,0.014mole)of 3-hydroxy pyridine was dissolved in( 1ml)DMF and (10ml)dioxane,the (2gm,0.014mole)of preparing polymers (P2,P3) which dissolved in (1ml)DMF and (10ml)dioxanewas added with stirring in flask equipped with condenser , then reflexed 3hr.The solvent was evaporated under vacuum,the substituted polymers were washed by ether for several times and dried,physical properties .

## Finding

Recently ,studies on biodegradable polymers has increased in importance due to wide range of biomedicine applications an addition to packaging and agriculture applications .(lactide importance) in the present study lactate polymers which have biological activities was prepared studied .

FTIR spectrum of lactide(P1) shows the absorption of (C=O)ester in( 1724)$cm^{-1}$, the absorption of (C-O) was appeared at (1207)$cm^{-1}$,finally,the absorption of (C-H)aliphatic was appeared at (2943)$cm^{-1}$,(2887)$cm^{-1}$, figure 1.

FTIR specrum of (P4) shows absorption of bands at (3377)$cm^{-1}$due to (OH) group of remaining carboxylic acid ,(1732)$cm^{-1}$due to (C=O)este,(1300)$cm^{-1}$(C-O) estere ,(1651)$cm^{-1}$due to (C=O)amide ,(3522)$cm^{-1}$due to (NH)and at last , figure shows absorption bnnds of (C-H) aliphatic at (2026)$cm^{-1}$,(2856)cm,$^{-1}$figure2.

FTIR specrum of (P5)shows absorption bands at (3308) $cm^{-1}$due to (OH) group of remaining carboxylic acid ,(1734)$cm^{-1}$due to (C=O)ester ,(1307)$cm^{-1}$ due to

(C-O)ester ,(1647)$cm^{-1}$due to (C=O)amide ,(3290)$cm^{-1}$due to (NH)and at last ,we can see also absorption bands at (2928),(2870)$cm^{-1}$due to(C-H) aliphatic, figure3.

ultraviolet spectrum of (P5) shows an absorption band at (280)nm,figure4.

The thermal stability of the prepared polymer(P1) was investigated by thermogravimetric analysis (TGA).This technique is based on measuring the weight loss as a function of time at constant temperature and a function of tempreture at constant rate of heating . In the present study, the thermal stability of the prepared polymer was tested by measuring the sample weight as a function of temperature Figure5. The thermal measurement gave valuable information about thermal stability of the prepared compound in four steps of weight loss-temperature .This high thermal resistance indicated the high molecular weight of the prepared polymers with high interaction between hydrogen bonding through the polymer chain.

The weight loss of P2,P3 were measured as a function of temperature which gave valuable information about the thermal stability of the P2,P3 polymers as shown in, figure6.

# Correlated of Some Parameters of Placenta and Umbilical Cord with the Newborn Baby

**Saif Kamel Mohammed[1]; Saad Ahmed Al-Rawi[1]; Samira Abdul Hussein Abdullah[1] ; Nihad Khalawe Tektook[2]**

*[1]Department of anatomy and histolgy,College of Medicine,Tikrit University; [2]Middle Technical University/Collage of Medical &Health Technology, Medical laboratory Techniques Dep - Iraq*

## Abstract

**Background** :umbilical cord is a fetomaternal tubular organ; it has been described as "dairy of intrauterine life"; this remarkable organ responsible for living of the bay for about 266 days, Where the source of food and oxygen from the mother to the fetus as well as the disposal of waste. **Patients and methods :**209 umbilical cord and their placentae were studied thoroughly and the mothers ages were 15 -< 45 years old .The length and diameter of the umbilical cord, Wharton's jelly ,placental weight and umbilical cord insertion were measured .The babies weights were measured and their gender were assigned. **Results**: current study showed the umbilical cord parameters (length and diameter) have no correlation to mothers' age groups only in the length and diameter means there were Simple drop in group 1(15_19 year old) and the diameter group 7 (>45 year old ).The umbilical cord knots percentage was normal in comparison to other studies. The study of Wharton's jelly were correlated with baby's weight was significant, whenever baby weight increases the Wharton's jelly increase. And when the Wharton's jelly Correlate with placenta weight in gm. There was significant correlation.

***Keywords :*** *placenta; umbilical cord; newborn baby.*

## Introduction

Plenty of inventions have been made by human beings beside mind and inspiration had made high influence, but the most remarkable development of all is a human being; how human come to be. In particular, the development of a new human life heavily depends on umbilical cord and placenta, an organ whose anatomy and histology ensure the nourishment of a developing baby [(1).]

The umbilical cord is thin, long tube-like structure that is needed to form a connection between the fetus and the placenta in the mother's uterus. To provide sufficient and effective circulation of the blood to the growing fetus, the umbilical cord has one vein which carries oxygenated rich blood and two arteries which carry deoxygenated blood. These three blood vessels coil around in a helical Configuration to form the umbilical cord or the umbilical cord is a helical and tubular blood conduit connecting the fetus to the placenta [(1).]

Umbilical cord achieves its final form of development by the 12$^{th}$ week of gestation and normally contains two arteries and a single vein; all embedded in Wharton's jelly (Figure 1) [(2).]

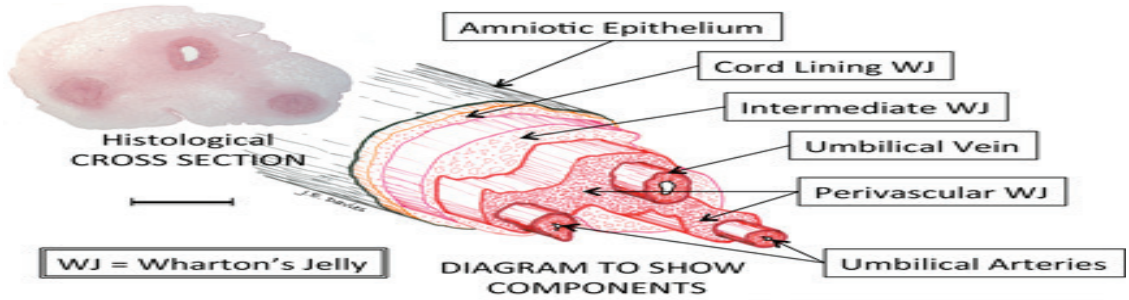

**Figure 1: Diagram of umbilical cord at term**

At term the umbilical cord has an average length of 43–94.5 cm (3). The umbilical cord arteries and vein are unlike their counterparts in the remainder of the foetal body as the umbilical cord vein transports oxygenated blood to the fetal heart, while the two arteries return oxygen-depleted blood to the placenta[3].

Umbilical cord is physiologically and genetically part of the fetus and (in humans) normally contains two arteries (the umbilical arteries) and one vein (the umbilical vein), buried within Wharton's jelly. The umbilical vein supplies the fetus with oxygenated, nutrient-rich blood from the placenta. Conversely, the fetal heart pumps low oxygen containing blood, nutrient-depleted blood through the umbilical arteries back to the placenta[4].

The aim of the study is to find umbilical cord parameters (length and diameter) by using gross anatomical study and calculate the Wharton's jelly in umbilical cord and find the knot of umbilical cord.

## Materials and Method

During the period from March 2018 till Jun 2019, more than 209 placentas with its umbilical cord were collected from deferent labor room after vaginal delivery or theaters room after Caesarean section in Gynecology and Obstetrics department from various provinces like Kirkuk and salah-aldin, samples have been studied anatomically. 120 placenta and umbilical cord were collected from the delivery room in Bejei hospital these examined anatomically , and 89 placenta and umbilical cord were collected from delivery room in Kirkuk teaching hospital these were examined anatomically .

Regarding the mothers ages they were divided into 7 age groups (Group 1 – Group 7 ) with 5 years interval , starting from 15 - > 45 years old , and number of placenta and umbilical cord collected according to the mother's age groups.

**Anatomical study of the placenta and their Umbilical cords**

Regarding the placenta and umbilical cord after delivery and their separation from the babies, they were placed on a towel, cleaned and then studies anatomical gross by tape measure and the data were mentioned in and according to a questioner paper done for each mother.

In the beginning the placenta were weighted and baby's weighing device present in the delivery room , so the placenta and baby's weights in grams were measured by the same weighing device .

Regarding the umbilical cord , the type of their insertion to the placenta were mentioned ,then their lengths were calculated in which after delivery of the baby the umbilical cord is clamped at two sits one near the baby and other near the mother then cut to handle the baby and taken for further management , waiting for the delivery of the placenta from the mother which occurs about 10 min later and sometime up to 30min , so the length of the umbilical cord was measured with flexible rubber length gauge and the summation of three measurements , one from the placenta to the clamped site , the other from the baby to the other clamped site and the last between the two clamping sits by the tape measure.

The umbilical cord diameters were measured in centimeters by the Vernier.The umbilical cord knots were calculated regardless their type whether true or false knots.

**Measuring method of Wharton's jelly:**

This study Included 54 women who visited the Tikrit Teaching Hospitals maternity department and Kirkuk Teaching Hospital's maternity department and pregnancy at 37–42 weeks of gestation. Gender, gravity, parity, weight gained during pregnancy and gestational age verified by the last cycle of menstruation or first trimester ultrasound were reported for each subject or EDD. The umbilical cord with three intact vessel structures was collected after delivery of the vaginal or cesarean section and after proper separation of the placenta.

Was cut 5 centimeter from the umbilical cord is cut by a Sharpe scalpel approximately 30 cm from the attachment of the umbilical cord to the placenta. Place the specimen in a normal saline solution, then clear the blood vessels from blood and measure the sample by sensitive balance with tolerance to 0.01 g. In individual containers, cord parts are incubated in 10% formaldehyde for 10 minutes.

The section of the cord was weighed again after removal and drying Smoothly isolated the cord vessels and membranes from the jelly of the Wharton's and the weight of the Wharton's Jelly was obtained using a scalpel. The volume of the Wharton's jelly was measured by calculated the amount of water displaced in a volume measurement jar when the Wharton's jelly was placed. Wharton's jelly density [Wharton's jelly (g)/water (mL)] was calculated.

## Findings

The umbilical cord is appeared flexible, tube-like structure that has a spongy appearance, smooth, surrounded in a jelly-like substance, color yellowish-green. Conduit between the fetus and the placenta.

(Usually the umbilical cord lining membraneextension of the amniotic membrane covering the placenta. The umbilical cord lining membrane comprises two layers: the amniotic (or epithelial) layer and the sub-amniotic (or mesenchymal) layerand inside of umbilical cord gelatinous fluid called Wharton's jelly. It comprises two arteries (the umbilical arteries) and one vein (the umbilical vein).Figure 2

**Figure(2): Umbilical cord**

The following parameters were inspected and measured in the umbilical cords shown in (Table1 ).According to the mothers age groups ,there were no differences in umbilical cord length means only in the length and diameter means there were Simple drop in group 1(15_19 year old) and diameter in group 7 (>45 year old ) as shown in ( Table 2) .

**Table (1) parameters of umbilical cord**

| parameter | frequency | Minimum | Maximum | Mean | Std. Deviation |
|---|---|---|---|---|---|
| Cord length | 209 | 43.00 | 94.50 | 63.49 | 7.00 |
| Cord diameter | 209 | 0.3 | 2.50 | 1.31 | .46 |

**Table (2) Mean of cord length and cord diameter by mean age group.**

| Age group | frequency | Cord length | | Cord diameter | |
|---|---|---|---|---|---|
| | | Mean | Std. Deviation | Mean | Std. Deviation |
| 14-19 | 44 | 62.84 | 6.59 | 1.18 | 0.44 |
| 20-24 | 42 | 63.44 | 6.36 | 1.38 | 0.40 |
| 25-29 | 43 | 63.83 | 6.63 | 1.37 | 0.49 |
| 30-34 | 39 | 64.53 | 7.89 | 1.37 | 0.51 |
| 35-39 | 21 | 64.33 | 7.37 | 1.35 | 0.45 |
| 40-44 | 12 | 63.08 | 8.39 | 1.39 | 0.38 |
| 45- | 8 | 64.25 | 8.34 | 1.33 | 1.33 |

The following the result emerged after part of the umbilical cord was taken (5 cm) ,Mean of Wharton's jelly weight in gm. 4.92±0.84g ,and mean volume 3.53±0.87ml .The mean Wharton's jelly density 1.45±0.98 gm./ml( table 3).

**Table (3) values of Wharton's jelly at 5 cm weight, volume and density.**

| Item | Mean±SD | maximum | Minimum |
|---|---|---|---|
| Wharton's jelly weight in gram | 4.92±0.84 | 6.21 | 3.35 |
| Wharton's jelly volume in ml. | 3.53±0.87 | 5.41 | 1.80 |
| Wharton's jelly density in gm/ml | 1.45±0.98 | 2.46 | 0.98 |

The mean Wharton's jelly weight in gm. were Correlated with mean babies weight there was significant correlation, whenever baby weight increases the Wharton's jelly increase ,also The mean of Wharton's jelly in gm. were Correlated with Mean of placenta weight in gm. There was significant correlation ( Table 4).

**Table (4) Correlation between means Wharton's jelly weight and mean of baby weight and Mean of placenta weight**

| Mean of baby weight | Mean of Wharton's jelly weight in gm. | Correlation | p.value |
|---|---|---|---|
| 3.22±.51 | 4.92±0.84 | 0.895** | S. |
| 640.72±51403 | 4.92±0.84 | 0.290 | S. |

S: Significant

## Discussion

In this research the umbilical cord parameter was studied anatomically (length and diameter) in this study the mean length of umbilical cord was 63.49 and in a range 43-94 cm, while the mean diameter was 1.31 cm. and in a range 0.3-3.50cm.in its diameter; these values and range studied and provide by shipp *et al.,* [5] weeks [6] , Krakowiak *et al.,* [7].

In this work , there was no correlation of the mean umbilical cord length with mother age groups while the diameter means there were decreases in group 1(15_19 year old) and group 7 (>45 year old ) .

The umbilical cord knots were present in about 5.3 %, this disagrees with the percentage in European countries were the percentage is about 1% only which was studies by Karina *et al.,* [8]. The Wharton's jelly was calculate in 54 women in 5 cm. the men Wharton's jelly weight 4.92±0.84 gm. in the range 3.35- 6.21 gm. , men Wharton's jelly volume 3.53±0.87 ml .and in a range 1.80-5.41 ml. the mean density of umbilical cord was1.45±0.98 ml/gm. and the range 0.98 - 2.46 ml/gm. and the men Wharton's jelly weight was correlated with the mean baby weight in gm. and with mean of placenta weight gm. this agrees with study in Turkey by Filiz [9].

The study of babies' weight is Shows, mean of babies weight was 3.22±0.51 gr. And this value correlated with the mean placental weight, is significant, whenever the babies weight increase their placental weight also increase this is proved by Sultan *et al.,* [10] and Kaplan[11].

The correlation between mean baby's weight and mean length and mean diameter of umbilical cord was non-significant .that was disagree to what has been claimed by Rio *et al.,* [12] who said that there is a significant relation found between umbilical cord length and diameter with baby weight .in the correlation between baby gender with the umbilical cord length and diameter was no significant .This has been supported by the study in Columbia University,USA by Mills *et al.,* [13].

## Conclusion

1) The best parameter regarding the umbilical cord, both grossly and ultrasonography, found in the mothers aged between 20-35 years old, which reflected on their babies' weight and health.

2) Umbilical cord parameter does not correlate with the maternal age, including umbilical cord length and diameter of umbilical cord.

Umbilical cord knot presence is randomly not dependent on the age of the mother; only the length of the umbilical cord sometimes affects the presence of the node; the longer the umbilical cord, the more likely the nodes are present. *Wharton's jelly weight (in gram) was correlated with mean baby weight; there was a significant correlation, whenever baby weight increases the Wharton's jelly increase. When correlated with mean of placenta weight (in gram), there was significant correlation, whenever placenta weight increases the Wharton's jelly increase.

# Treatment of Retained DJ(neglected DJ) in AL-Anbar Government, A Postconfict Study

**Omar Mahmood Shakir[1]; Dhia A.Kareem[2] ; Ameel Farooq Al Shawi[3] , Wafaa Khalel Ibrahim[4]**

*[1]College of Medicine, University of Fallujah, Urosurgeon, AL-Fallujah teaching hospital ,Iraq; [2]Urosurgeon, AL-Ramadi teaching hospital, Iraq, [3]Department of Community & Family Medicine, College of Medicine, University of Fallujah, Iraq; [4]Department of pathology, College of Medicine, University of Anbar, Iraq*

## Abstract

Double J ureteral stents have been used to relieve or improve drainage in cases of ureteric obstruction from any causes (intrinsic or extrinsic). These forgotten or retained ureteral stents could lead to many complications. The objective of the paper is to assess the methods that used for treatment of neglected double Jamong displaced persons. Across section study was done, 28 patients with neglected double J stent were chosen from urology departments in Al-Ramadi & Al-Fallujah teaching hospitals. **Result:** Out of total (28) , 20 (71.4%) were males while females were 8 (28.6%) of the sample. The indication of insertion varied between 13 (46.4% ) patients after Ureterorenoscopy procedure for ureteric stones (10 males & 3 females ) and five (17.9% ) patients due to traumatic causes , four (14.3%) patients due to pyelolithotomy , three (10.7%) patients PNL for removal of renal stone. The complications rare which ranged from fever postoperatively in nine patients (32.1%), two patients (7.1%) suffered from ureteric injury thatmandate double J insertion , three patients (10.7%) required more than two sessions to clear the ureter & remove of retained double J.

***Keywords:*** *Forgotten DJ, complications, Anbar governorate.*

## Introduction

Since their introduction into clinical use for first time in 1967 ,Ureteral stents have been widely utilized for many urological indications.[1]

Double J (DJ) ureteral stents have been used to relieve or improve drainage in cases of ureteric obstruction from any causes (intrinsic or extrinsic). They used also after iatrogenic injuries to the ureter during ureterorenoscopy (URS) and also after various operation in ureter &renal pelvis .[2]

Over the last years &with improvement in technology of stent material &design , the patient complaint from DJ will decrease . As a result, DJ stents have been left in place for a longer duration of time.[3]

**Corresponding author:**
**Omar Mahmood Shakir**
drnihadkhalawe@gmail.com ;
omermhmod@yahoo.com

These forgotten or retained ureteral stents could lead to many complications such as up or down slipping , fragmentation, encrustation and stone formation.[4-6].

Encrustations are most frequently noted in forgotten/retained DJ's, that stay in body for longtime. The causes of encrustation is multifactorial. Most common risk factors for encrustation of DJ are long time duration of stenting, urinary tract infection , past history urinary stones disease, such chemotherapy&chronic renal disease.[7]

For remove the severely encrusted DJ stent there is many procedures as (shock wave lithotripsy (SWL), ureterorenoscopy, cystolitholepaxy and even percutaneous nephrolithotomy (PCNL ) or open surgery according to patient condition & site of encrustation..[8,9]

The treatment depend on patient condition (encrustation site ,stone burden ,fragmentation of DJ…. etc),availability of equipment &Endourological tools &

experience of surgeon .

Iraqi health system is suffering due to wars, sanctions and violence. Iraq and Iraqis exposed to widespread violence since 2003 , that violence became a leading cause of death for Iraqi adults after March 2003 and the main cause for men aged 15-59years.[10]

The condition was deteriorated in June 2014 as several governorates in west and north of Iraq especially our governorate (AL- Anbar) were invaded by ISIS , the harm was huge , several reports documentedthat an extensive damage was occurred to the infrastructures of these provinces especially in health and teaching sectors left many hospitals and health care centers became out of work, in addition to that thousands of people were displaced to refugees camps in different regions including Kurdistan -north of Iraq- in which they lack the basic health services, they loss ability to manage their health disorders and they didn't find the special care for emergency conditions such as surgical operations.

So there were many patients neglected (not forget DJ) in there body especially those people who lived in camps for prolong periods might be months or years without receiving heath care.

After end of war & family retuned to AL-Anbar governorate ,the our teaching hospital (AL-Ramadi & AL-Fallujah) were receive many cases of neglected DJ ,&we decided to share our experience to world about this rare conditions.

The objective of the paper is to assess the methods that used for treatment of neglected DJ among displaced persons.

## Material and Methods

Study design and period

Across sectional study was carried out during the period of from March 2017 to April 2019 (after end of war with ISSI) were included in this study.

Sample size and sampling technique

Convenience sample of 28 patients with neglected DJ stent were chosen from Urology Department in Al-Ramadi teaching hospital & Al-Fallujah teaching hospital (in Al-Anbar government )

The inclusion criterion was

1. Patient with more than 6 months duration of the stenting .

2. No malignant obstruction require prolong stenting.

**Data collection procedures and instruments**

Assessment of patients was done via questionnaires that contain age, sex, indication of stenting, chief complaint of patient ,The indwelling time of the stent was measured from the time of stent insertion to time of stent removal, need of preoperative SWL , Procedure required &any complications occur during complications.

Kidney–ureter–bladder (KUB) x-ray and ultrasound of urinary system (US) were performed in all patients to evaluate the patient anatomical details , severity of encrustation, size &site of related stone , and any other complexity of the situation (e.g., broken or migrated stent).

A non-contrast computerized tomography (NCCT) and/or intravenous pyelography were perfumed to selected patient according to availability &if more details are needed.

The preoperative evaluation consisted of : A urine exam .; Blood urea & serum creatinine ; Complete blood picture ; In patients with positive infection in urine exam results, an urine culture performed & intervention was postponed after antibiotic treatment ; Viral screen and Other investigation need according to patient age &comorbidity such as random blood sugar, liver function test ,Echocardiography (ECG) ,…..etc.

All patients received preoperative antibiotic.

Treatment decisions were made on the basis of radiological findings and the clinical findings & availability of various treatment modalities

Patients needed various endourologic procedures under general or local anesthesia in one or more sessions.

To remove the stent and related stone burden, various combinations of the following were used:

1. Extracorporeal Shockwave lithotripsy (ESWL) :was performed using the Siemens Lithostar Modularis

AG Healthcare,

Munich, Germany.

2. Simple cystoscopic stent removal:under local or general anesthesia by cystoscopy 22F for adult & 13F pediatric cystoscopy .

3. Ureterorenoscopy (URS): The URS was done using 6F/7.5F &/ or 9F/12F Storz semirigid

ureteroscopes with using EMS pneumatic lithotripter or A Quanta holmium laser as an intracorporeal lithotripter.

4. Cystolitholepaxy :mourmyers lithotripter for adult & ureteroscopes with using EMS pneumatic lithotripter or A holmium as an intracorporeal lithotripter for children .

5. Open surgery :Pyelolithotomy , Ureterlithotomy .

KUB and urinary system US were used to assess the postoperative residual stone burden. Patients suspected of having residual stones or hydronephrosis were evaluated by NCCT. Patients were considered stone-free if the postoperative imaging studies revealed no residual stones more than 3 mm.

Aim of the study was explained to the participant &written consent was obtained from them.

## Findings

Out of total (28) , 20 (71.4%) were males while females were 8 (28.6%) of the sample.

Age of the subjects was between 5-61years ( mean of 35.25 +- 16.8)

The indication of insertion varied between 13 (46.4% ) patients after URS procedure for ureteric stones (10 males & 3 females ) and five (17.9% ) patients due to traumatic causes , four (14.3%) patients due to pyelolithotomy , three (10.7%) patients PCNL for removal of renal stone . DJ indwelling time ranged between 7-36 months (mean of 16.79+-9.2)

The most presenting complaint was lower urinary tract symptoms(LUTS )which stated by 18 (64.3 %) patients and loin pain was reported by five (17.9%) patients while three (10.7%) patients were asymptomatic.

The results reported that five (17.9%) patients need prior SWL

ospital .

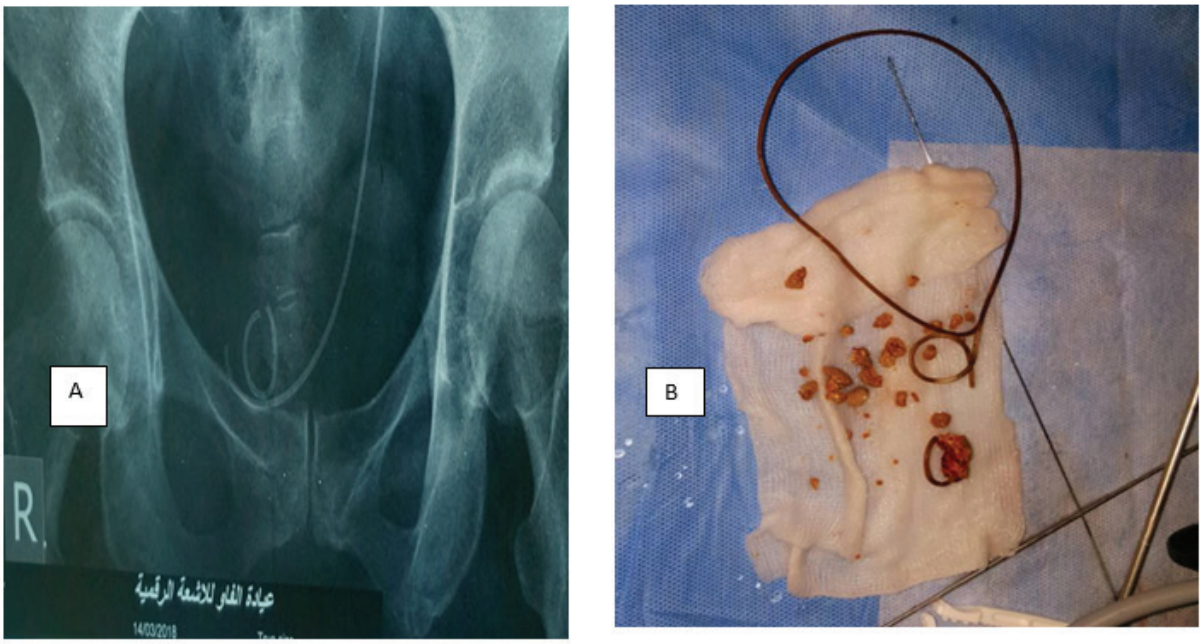

**Figure 1: Female patient with fragmented DJ A. Before Removal B. After Removal.**

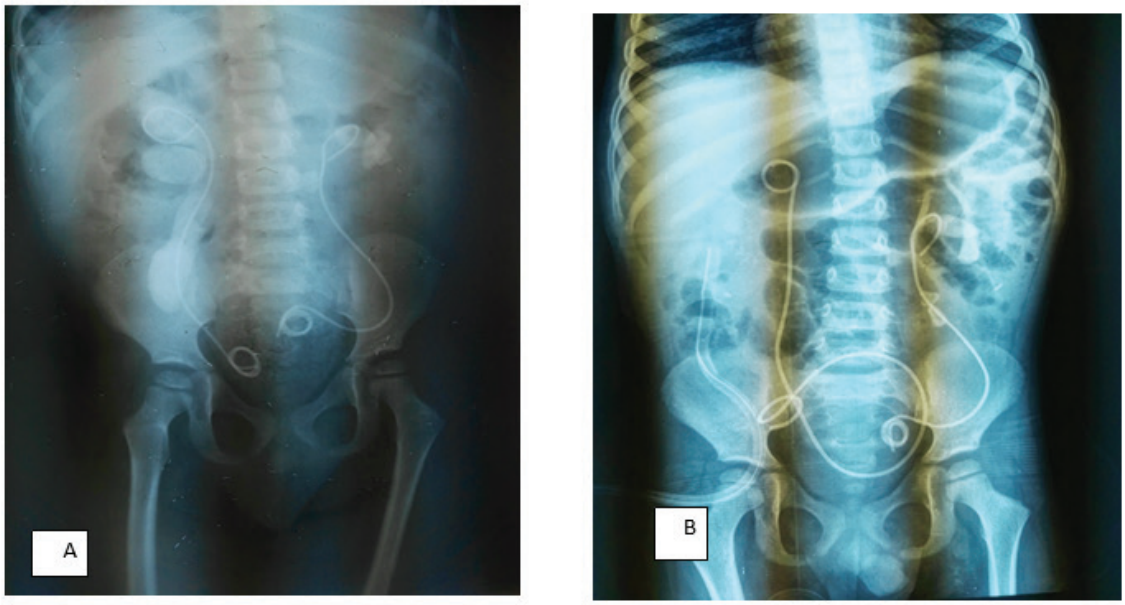

**Figure2: A. Before operation B. After open surgery.**

Regarding procedure, the results showing that 17 (60.7%) patients need URS with laser lithotipsy & one (3.6%) patient underwent URS with pneumatic lithotipsy ,alone or company with cystolitholepaxy in two (7.1%) patients (Table 1).

**Table 1 : Association of gender with indication, complaint ,procedure &complications**

| | Fever | 9 | 32.1 |
| | Ureteric injury need DJ insertion | 2 | 7.1 |
| | Need multiple sessions | 3 | 10.7 |
| | Total | 28 | 100.0 |

Six (21.4%) patients need only gentle cystoscopy removal by forceps, while three (10.7%) patients need open surgery ,one pyelolithotomy &other uretrolithotmy (Table 1)

& most difficult case was child in 5years old need combined open pyelolithotomy & ureterolithotomy & pneumatic litholepaxy due to huge stone burden in kidney &ureter(Fig 2).

The complications rare which ranged from fever postoperatively in nine patients (32.1%), two patients (7.1%) suffered from ureteric injury that mandate DJ insertion , three patients (10.7%) required more than two sessions to clear the ureter & remove of retained DJ ( Table 1).

In our study we had only one case with fragmented DJ (Fig. 1)

Statistically ,there was non-significant association between gender and procedure required or complications

The results revealed that statistically non-significant association between indications of DJ insertion & type of procedure that required & complications ( Table 2 ).

The findings revealed that statistically insignificant association between time of indwelling DJ &complications.

## Discussion

Although the uses of DJ increasing nowadays &with effectiveness in treatment of many urological problems and prevent many complications but it might be associated with several complications such as LUTS , hematuria ,up or down slipping &encrustation especially in retained DJ .[11]

The encrustation of neglected stents with a severe stone burden is a serious complications due to recurrent infections, hematuria, obstructive uropathy & even renal failure.[11]

Though there has been no definition for "forgotten" as any such term does not exist, but many previous studies consider a variable period of greater than 3 to 6 months to be considered as a forgotten stent.[12]

The treatment of retained or neglected DJ is a challenging procedure &need individualization of cases.

The literature has been shown that poor compliance is the major concern, which leads to forgotten DJ stent in situ[13]

Anbar governorate suffered from invasion of ISSI,thousands of people were displaced to camps without basic health services after end of war they consult our hospital for removal this DJ, the health system suffered from damage of infra- structure &lack of equipments. The patients with DJ were neglected for years. The results revealed that the mean of indwelling time was (16.79+-9.2) months , a study that conducted by Okuda *et al* revealed that the mean indwelling times of these stents was 20 months.[14]& other study reported the mean indwelling time of the DJS was 22.6 ± 30.3 (6–144) months [15]

The maximum DJ indwelling time in literature was 23 years while in our study, the maximum duration was

of 3 years.[2]

The most presenting complaint was LUTS which stated by (64.3 %) patients followed by (17.9%) patients suffered from loin pain while (10.7%) patients were asymptomatic.This finding was inconsistent with results of Damiano et al who observed flank pain in 25.3%, encrustations in 21.6%, LUTS in 18.8%, hematuria in 18.1%, fever more than 104°F in 12.3% and stent migration in 9.5% of the patients.[16] .

The most indication of DJ insertion was (46.4% ) patients after URS procedure for ureteric stones , (17.9% ) patients due to traumatic causes , & (14.3%) patients due to pyelolithotomy while in study of Senol etal were Urolithiasis in 83.3%, hydronephrosis in pregnancy in 9.2% , surgical procedures in ureter in 5.5%, and renal transplantation in 8%.[15]

In the literature,the fragmentation of ureteral stents was 0.3–10%.[4,6] In our findings , the fragmentation rate was 3.57% .

Although there was obvious increase in complication of removal retained DJ with increase of indwelling time but it failed to reach significant statistically may be due to small sample size .

In first step , we did KUB &US to the patients ,if no obvious encrustation we used gentle trial of removal DJ without forces to avoid any complications such as ureteral injury ,this succeed with six patients ,if this procedure failed then we sent the patient to NCCT to evaluated the site of encrustation &stone burden &any other complications, if mild to moderate encrustation that localized to pelvis or upper ureter, we sent him to SWL before endourological procedure done .if encrustation along DJ or in lower end of DJ we did endourological procedure .

At first we evaluated the lower coil of DJ , if encrustation was found then we fragmented it by mourmyer stone crusher for adults.

If encrustation around DJ in ureter, we introduced simirigid URS in between ureteral wall &DJ & fragmentation occur by laser or pneumatic lithotipsy with remove of small fragment by forceps. if there was obvious ureteric injury, we inserted DJ for 4 weeks durations,such conditionoccurred in two patient (7.14%).

If there was severe encrustation in kidney which occurred in 2 cases, we used open surgery because PNL not available in our hospital .

**Conclusion**

Forgotten/neglected DJ can lead to wide range of complications from simple lower urinary tract symptoms to the loss of renal function. The treatment of retained or neglected DJ (as in our study) is a challenging procedure &need individualization of cases. international algorithm might be needed to treated such difficult situation. Health education about serious complications that may occur due to longtime DJ insertion.

## Abstract

**Background:** Placenta is a temporary endocrine organ formed during pregnancy, which produces hormones important in the maintenance of a healthy pregnancy. hCG is the first one of these hormone that is measured in pregnancy test and used in the follow up of adverse pregnancy outcome, Alpha fetoprotein is a major plasma protein produced by the yolk sac and the fetal liver during fetal development.**Aim of study** :to study relationship between gestational complications and levels of maternal serum HCG and AFP and determine whether the semarkers are effective predictors adverse pregnancy outcomes. **Patients & Methods**:Prospective cohorts study in AlDiwaniyah maternity and pediatrics teaching hospital.We enrolled a total of 230 women at 14-23 gestational weeks and measurement of maternal serum HCG & AFP were done, of those with normal HCG & AFP formed (group l), group 2 involved women with elevated AFP , group 3 with elevated HCG & group 4 involved women with elevated both HCG & AFP.Follow up weekly of the patients for the development of adversepregnancy outcome.**Results**: A significant relationship between adverse pregnancy outcomes and abnormal elevation of HCG & AFP levels in the second trimester. In group 2 the patients developed higher rate of preterm labour & pre-eclampsia compared with the group 1. In group 3 with raised HCG the rate of pre-eclampsia & IUGR development were higher than group 1. In group 4 with elevated both HCG & AFP higher incidence of pre-eclampsia & placental abruption , with a specificity($p<0.001$). **Conclusion**: In the second trimester unexplained high AFP and HCG rates related to adverse maternal and perinatal outcomes.

## Introduction

Is a marker of glycoprotein hormone family ( human chorionic gonadotrophin , follicular stimulating hormone FSH , luteinizing hormone LH, thyroid stimulating

hormone TSH).All of them are dimers consisting of a common alpha subunit and distinct beta subunit that are associated non-covalently.The distinct beta subunits confer biological activity and display various degrees of homology. In adult human chorionic gonorionic gonadotrophin expression is often associated with pregnancy, however human chorionic gonadotrophin can be found in another conditions such as gestational trophoblastic disease and non-germinomatous germ cell tumors [(1)] .

Human chorionic gonadotrophin is produced almost exclusively by the syncytiotrophoblast of the placenta . However it is synthesized by the fetal kidney und fetal liver Most of the human chorionic gonadotrophin in circulation is metabolized by the liver. Also 20% of the circulating human chorionic gonadotrophinis excreted by thekidney[(2)].Human chorionicgonadotropin interacts with the LHCG receptor of the ovary and promotes the maintenance of corpus luteum during beginning of

**Corresponding author :**

E-mail: drnihadkhalawe@gmail.com

pregnancy. This allows the corpus luteum to secrete the hormone progesterone during the firsttrimester ,Because of its similarity to LH , hcG can be used clinicallyto induce ovulation in the ovaries as well as testosterone production in the testes. human chorionic gonadotropin also plays a role in the cellular differentiation. proliferation and may activate apoptosis [3] .

**Table (1): Human chorionic gonadotrophin levels in weeks from the last normal menstrual period[4]:**

| LMP in weeks | levels of hCG |
|---|---|
| 3 weeks LMP | 5-50 |
| 4 weeks LMP | 5-426 mIU/ml |
| 5 weeks LMP | 18-7,340 mIU/ml |
| 6 weeks LMP | 1,080- 56,500 mIU/ml |
| 9-12 weeks LMP | 25,700-288,000 mIU/ml |
| 13-16 weeks LMP | 13,300-254,000 mIU/ml |
| 17-24 weeks LMP | 4,060-165,400 mIU/ml |
| 25-40 weeks LMP | 3,640-117,000 mIU/ml |
| Women who are not pregnant | <5.0 mIU/ml |
| Women after menopause | 9.5 mIU/ml |

Maternal serum alpha-fetoprotein(AFP) is a glycoprotein of 591 aminoacids and it's a member of the albuminoid gene family [alpha- fetoprotein (AFP), albumin( ALB), alpha albumin (a-ALB), vitamin D binding protein (DBP)] . In adults AFP expression is often associated with atocellular cancer, non-germinomatous germ call tumors andgastrointestinal cancer , however AFP can be found in non-neoplastic conditions such as : hepatitis, cirrhosis and pregnancy [5].

Alpha-fetoprotein is normally produced in early pregnancy primarily by the fetal liver and yolk sac . It is also produced to a lesser extent by the fetal gastrointestinal tract as the yolk sac involutes at the 9th week of gestation, the fetal liver is the principal source of alpha-fetoprotein during development [6;7].

Measurement of alpha fetoprotein is generally used in two clinical contexts. First, its measured in the pregnant women through the analysis of maternal blood or amniotic fluid as a screening test for certain developmental abnormalities such as aneuploidy. Second ,serum level of AFP elevated in people with certain tumors , and so used as biomarker to follow these diseases [8].

**There is association between elevated of human chorionic gonadotropin , alpha fetoprotein and some obstetrical conditions , like:**Preeclampsia; Reduced fetal growth ;Preterm birth and Intrauterine death (still birth) .

**Aim of study:** To investigate the maternal serum determine whethote the relationship between gestational complications and high levels of serum human chorionic gonadotrophin and alpha- fetoprotein and to whether these markers are effective predictors to adverse pregnancyoutcomes.

## Patients and Methods

Between 25 Janwomen who att Maternity and Pedi weeks were enroll and consent fourteen 25 January 2017-15 December 2017, a total of 230 pregnantattended obstetrics and gynecology department, AL-Diwaniyah . Materially andPediatrics Teaching Hospital, with a gestational weeks between 14-23enrolled in this study. All cases were informed about the screening test ant forms were obtained. The study protocol was approved

by the localethical committee.

The inclusion criteria were stated as follows:

1. Single live pregnancy.

2. Gestational age between 14-23 weeks and dating was based according to thelast menstrual period or early sonogram.

3. Regular antenatal follow-up.

The exclusion criteria were:

1. Discordant gestational age according to first trimester

2. Multiple pregnancy

3. Lack of antenatal follow-up

4. Feto-placental or congenital anomaly

5. Diabetes mellitus

6. Molar pregnancy

7. History of chronic hypertension, chronic renal disease, autoimmune disorder,thrombophilia, cardiovascular diseases and liver diseases or malignancies.

8. History of preeclampsia, IUGR, preterm labour.

After taking detailed history, general and obstetrical examination were done. Routine investigations, liver function tests, renal function tests and determination of maternal serum HCG (mIU/ml) and AFP (ng/ml), the samples are collected from patients.

Each patents draw about 2 cc blood sample and put it in 360 Automatedthese patients were followimmunoassay Analyzer (TOSOH AIA) for 20 minute and record the results. Allmis Were followed up till puerperium and the fetal outcome was reported.

The study was started with 230 pregnant, and 17 patients were excluded from the study, as 14 patients were lost to follow up, one patient developed gestational labetes mellitus, one patient had a fetus with congenital abnormality as vmphalocele) and one patient had given birth to a baby with Down's syndrome.

## Statistical Analysis

Data analysis was carried out using SPSS (Statistical Program ofout using SPSS (Statistical Program of Social Sciences) ver. 32.0 SPSS. Continuous variables were expressedjous variables were expressed as mean and standard deviation, whereas percentages and frequencies werepercentages and frequencies were used for categorical variables. Groups were controlled in terms of conformity to normal distribution by graphical check and Shapiro Wilk test. Kruskall-Wallis variance analysis was performed for not normally distributing continuous variables and ANOVA was used for normally distributed continuous variables. Intergroup differences for categorical values were assessed with chi square test. Sensitivity, specificity, positive predictive value and negative predictive value were calculated together with risk estimation using Odds ratio. A p-value <0.05 was considered statistically significant.

## Discussion

The results of our research showed that in the second trimester unexplained high AFP and hCG rates have been found related to adverse pregnancy outcomes. Pregnancies in which both AFP and hCG rates increasing together are being more complicated with adverse pregnancy complications in a more serious manner than pregnancies in which rates increase one by one[9].

In a prospective study conducted by Genc Z., et al study (2005), showed that in the second trimester increased hCG rate was in relation with increased antenatal complications [10] .

In our study, the specificity of high( ≥ 2.0) MOM of AFP and HCG for the development of antepartum complications in group 4 was 100% and sensitivity was 40%, with positive predictive value of 100%. For group 3, the specificity of isolated high HCG MOM (≥≥2.0 ) for the development of antepartum complications was 99.4% with sensitivity of 62.5% with positive predictive value of 93.8% . While forgroup 2, the specificity of isolated high AFP MOM (≥≥2.0 ) in the development of antepartum complications 96.4%, sensitivity of 61.9% with positive predictive value of 68.4%. In the absence of fetal chromosomal or structural anomalies, mid trimester AFP levels (above 2.5) MOM were associated with a defect in placentation (placental abruption and abnormal placental adherence. They also associated with increased risk for pregnancy complications including fetal death [ OR 10.1 (95% CI: 7.5-13.5)], gestational hypertension [ OR 1.6 ( 95% CI:1.3-2.1)], preterm delivery [ OR 1.8 (95% CI 1.5-2.3)], preeclampsia [ OR 0.83( 95% CI: 0.44-1.56)] and IUGR[OR 2.37[11].

Hui D *et al .,* study (2012), showed that elevated mid trimester HCG levels have been associated with congenital abnormalities, placental dysfunction and adverse pregnancy outcome . However, In the absence of fetal chromosomal or structural anomalies, mid-trimester HCG (2.5 MOM) associated with an increased risk for pregnancy complications including: fetal loss [ OR 2.2(95% CI: 1.33.0)),gestational hypertension [OR 1.4 (95% CI: 1.1-1.8)],preeclampsia [OR 1.19(95% CI: 0.88-1.61)] , IUGR [OR 1.3(95% CI: 0.9-1.7)],preterm delivery [OR 1.7 (95% CI: 1.4-2.1)] [12]

Extremely high mid-trimester HCG ( > 10 MOM) imply a poor pregnancy outcome as shown by Lepage N, et al study (2003) [13].

In our research, the relationship with high AFP and/ or HCG levels and maternal complications have been found statistically significant (p= 0.001) & our sensitivity and positive predictive value were high.

## Conclusions

**A**s a result of our research, in the second trimester unexplained high nester unexplained high AFP and hCGrates have been found related to adverse maternal and perinatal outcomes. Pregnancies in which both AFP and hCG rates increasing together are being more complicated with adverse pregnancy outcome, and in a

more serious manner than pregnancies in which rates increased one by one.

# Evaluation of the Immune Response in Scabies Patient (Ordinary and Prisoners) Treated with Permethrin 5%

**Kawther Omran Hashim[1], Maan Abdul Aziz Shafiq[1], Hazima Mossa Al-Abassi[2], Majid Mohammed Mahmood[1]**

*[1]Department of Biology, College of science, Mustansiriyah University, Iraq, [2]Department of Biology, College of Education for Pure Sciences-IbnAl Haytham, University of Baghdad, Iraq*

## Abstract

Scabies is a common parasitic infection, caused by sarco-sarcoptes, the infection occurs when the *Sarcoptes* penetrates the corneal layer of the skin, predominant pathological manifestations, through inflammatory and allergic reactions to mite products.This study is designed to obtain the Evaluation of the immune response in scabies patient (Ordinary and Prisoners) treated with Permethrin 5%.The study included (28)Ordinary Scabies patients, (32) prisonersas well as a (30)healthy person as a control group. Blood samples were collected from all studied groups Enzyme-linked immunosorbent assay (ELISA) was used to measure Interleukine-4,IL-9 and total IgE.Results of the study showed that serum,IL-4 showed a significant ($P \leq 0.0001$) increasing in prisoners compared to ordinary patients and control groups(248.8±19.3vs.79.2±10.7pg/ml),(248.8±19.3vs.73.9±5.5pg/ml)respectively,while IL-9 showed a significant ($P \leq 0.001$), increasing in control compared to Ordinary Scabies patients group and prisoners (506.9±48.7vs.337.8±18.2 pg/ml), (506.9±48.7 vs. 424.1±36.5 pg/ml) respectively in post- treatment, There was positive correlation between (IL-4 and IgE).Levels of two cytokines (IL-4, and IL-9) were assessed in sera of Ordinary ScabiesPatients and control group, IL-4 showed a significant ($P \leq 0.0001$) increasing in Ordinary Scabies comparedto control group (92.5±7.0 vs. 73.9 ± 5.5pg/ml), respectively. While IL-9with asignificant decreasinglevel inOrdinary Scabies patients compared to control group(97.8 ±18.8 vs. 506.9 ±48.7 pg/ml) in pre-treatment, level of IgE were recorded in pre- treatment in ordinary patients and prisoners (314.8±37.5 vs. 17.8±3.7 IU/ml), (372.7±37.5 vs. 17.8±3.7 IU/ml) respectively, were a significantly increasing ($P => 0.05$) as compared to healthy control. In post- treatment IgE levels show a significantly lowering ($P => 0.05$), in prisoners than Ordinary patients(14.5±1.7 vs. 33.3±2.4 IU/ml).

***Keywords:*** *Scabies,IL-4, IL-9, totalIgE.*

## Introduction

Scabies is one of the diseases that are considered an endemic and epidemic in Iraq, it's a common parasitic infestation of global proportion, the source of scabies, prisons, military, relatives and hospital admission and travel, it's also affects many wild animals, causing severe economic losses**(1).** Although *Sarcoptes scabiei* worldwide spreads easily through close physical contact, Scabies is an acute itching disorder caused by an immune response to skin allergies and inflammatory reaction, IL-4 and IL-13, supporting their contribution to allergic inflammation, cause to increase IgE production, the elevated level of IL-4 suggests a preferential activation of TH2 cells and regulates IgE production, In addition to persist symptoms after treatment, most male prisoners are specifically of the type of nodular scabies **(2).**Increased physiological stress can have profound effects on the immune system**(3).**The effects of Glucocorticoid are the suppression of immune response mediators **(4).**Glucocorticoid secretion is increasingly used as an endocrine indicator **(5)**. Nervous tension plays a key role in the mechanism of response by the release of glucocorticoid **(6).**This study was conducted

**Corresponding author**
Kawther Omran Hashim

to evaluate the immune response in IL-4, IL-9and total IgE, in Ordinary scabies patients and Prisoners treated with Permethrin 5%.

*Immune response against scabies disease:*

Scabies mites are believed to have developed the ability to modify different aspects of the host's immune responses **(7).**

Prevent early immune and anti-inflammatory reactions, this delay allows to secrete unknown antigens that stimulate the proliferation of Regulatory cells and their secretion of IL-10, which would inhibit the inflammatory and immune responses in humans to the mites before a strong immune response occurs, resulting in delayed onset of symptoms**(8).**

*Role of IL-4*

Interleukin-4 is a multifunctional cytokine that plays an important role in regulating immune responses**(9).** Its effects depend on correlation and signaling through a receptor complex consisting of the IL-4Rα series and the common gamma chain (γc), leading to a series of phosphorylation events with kinases associated with receptors. This shift leads to the recruitment of mediators for cell growth, apoptosis resistance, gene activation and differentiation**(10).**

*Role of IL-9*

Initially, T cells were the main source of IL-9 since their discovery in 1988 were linked to the Th2 phenotype due to the location of genes within the Th2 cell and their preferential secretion with other cytokines, NKT cells are produced IL-9 that have been processing for nasal lymphoma cell lines (11).IL-9 has multiple cellular sources that may affect its polymorphic functions (pleiotropic) cytokines were studied primarily in the context of immune pathogenic T-helper-2.

*IgE*

IgE is important in defending the host against a variety of parasites, along with mast cells, basal cells, eosinophil, is an essential component of allergic inflammation and parasites. In humans, previous studies have shown that scabies lead to increased antibody production of IgE but with very different results **(12).** In allergies, activation of mast cells mediated by IgE depends on the antigen dose and route of entry, in the early stage increase in *S. scabiei*numbers subsequent to primary infestation with elevation of IgE, and then gradual reduction as host immunity develops; **(13). (14); (15);(16).**

## Material and Methods

*Subjects:*

Blood samples were collected from two groups: First- inmates including: Juvenile Prison and Iraqi Reform Section, (32 prisoners) aged (15-63 years), Second group: Ordinary Scabies patients in Allergy and Consultative Asthma Center (28 person), the ages ranged from (8 - 67) years, with (30 health person) as control group.The disease was diagnosed by a dermatologist; prisoners are sampled with the consent of the prisoner through a signature and thumbprint without any pressure.All samples were collected at period from May to August 2019.

*Blood sample collection*

Under sterile conditions, 2 ml of peripheral blood was withdrawn from patients and distinctly healthy control, and three were separated in a gel tube for 30 to 60 minutes for automatic coagulation at room temperature before centrifugation at 3000 rpm for 10 minutes, The obtained serum was divided into 3 Eppendorf tubes, and stored in Frozen at -20 ° C for serological tests. Elisa technique was performed to estimated serum level of IL-4,IL-9 and total IgE of all studied groups.

*Clinical examination*

The clinical examination had been done by the dermatologists in hospital and the scabies diseases were diagnosed according to clinical features.

*Statistical Analysis*:

Results are expressed as mean ± standard errors (M±SE) which were analyzed by one-way analysis of variance (ANOVA) followed by Fisher's test for multiple comparisons, using Stat view version 5.0. Differences were considered significant when $p<0.05$. The other data expressed as percentage (%) which were analyzed by chi square test using excel program version 2010. Regression analysis was performed by analysis of covariance (ANOVA) also using Stat view version 5.0.

## Results

*Results of Immunological study*

Total serum level for IL- 4, IL-9 and total IgE were investigated in serum of (ordinary Scabies patient and Prisoners as well as healthy control) groups. Results of the current study showed that serum Levels of two cytokines (IL-4 IL-9). were assessed in sera of scabies patients and control, IL-4 showed a significant ($P \leq 0.0001$) increasing in prisoners compared to ordinary patients groups(248.8±19.3vs.79.2±10.7pg/ml),(248.8±19.3vs.73.9±5.5pg/ml) respectively, while IL-9 showed a significant ($P \leq 0.001$), increasing in control compared to Ordinary Scabies patients group and prisoners (506.9±48.7vs.337.8±18.2 pg/ml), (506.9±48.7 vs. 424.1±36.5 pg/ml) respectively in post-treatment, There was positive correlation between (IL-4 and IgE). Levels of three cytokines (IL-4 and IL-9) were assessed in sera of Ordinary Scabies Patients and control group, IL-4 showed a significant ($P \leq 0.0001$) increasing in Ordinary Scabies compared to control group (92.5±7.0 vs. 73.9 ± 5.5pg/ml). While IL-9 with a significant decreasing level in Ordinary Scabies patients compared to control group (97.8 ±18.8 vs. 506.9 ±48.7 pg/ml) in pre-treatment, as shown in Table (1).

**Table (1): Comparison of serum level of IL-4,and IL-9Ordinary Scabies patients and prisoners as well as control according to treatment.**

## Discussion

The scabies test depends on the duration of infestation at the time of the test and the length of treatment, Th2 cells are important for the production of major cytokines, including IL4 and IL5, these cytokines are important role for class switching antibody, regulating systemic IgE synthesis, IgE level in Ordinary scabies and prisoners was Significantly increasing compared to controls, in pre- treatment ($P$=>0.0001), in post-treatment IgE levels show a significantly lowering in Prisoners than Ordinary patients **(17),**IL-4 showed a significant ($P\leq$0. 0001) increasing in prisoners compared to ordinary patients and control groups, while IL-9 showed a significant ($P\leq$ 0.001), increasing in control compared to Ordinary Scabies patients group and prisoners, in post-treatment, There was positive correlation between (IL-4 and IgE). Levels of three cytokines (IL-4 and IL-9) were assessed in sera of Ordinary Patients and control group, IL-4 showed a significant ($P\leq$0. 0001) increasing in Ordinary Scabies compared to control group. While IL-9 with a significant decreasing level in Ordinary patients compared to control group in pre-treatment. Prison was the main source of scabies infestation (80%). this may be due to overcrowding, poor hygienic standards; sharing the beds and prolonged contact with contagious infested prisoners, similar results were observed in previous Iraqi studies **(18); (15)** which reported that prisoners were responsible for infesting 83.3% and 60% of the Ordinary scabietic patients.From these studies, there appear to be differences between immune responses to humans.These responses may also be affected by due to duration of infestation and type of infestation in humans and host gender.The current results in agreement with **(19),(20**). Demonstrated a statistically significant elevation of IL-4 in scabietic patients (Ordinary and prisoners) as compared in controls.In our study, the results were different for ordinary patients and prisoners because most prisoners were under treatmentthe theory may vary in prisons in terms of morbidity, personal and social behavior, treatment, the nature of nutrition and the closed and densely populated environment and contact with others, The category covered is prisoners may carry diseases that may lead to the development of immunity and events in complications of the disease with common diseases, including psoriasis and autoimmune… ect **(21);(22).**Most prisoners with permanent symptoms with re-infestation due to Failure to take appropriate administration to prevent the disease and use the treatment incorrectly, while others suffer from simultaneous conditions with scabies, such as chronic or acute infections, Some male prisoners specifically have a nodular scabies type, and this type may take another route in terms of treatment and persistent symptoms after treatment nodules can last for several weeks or months after treatment and may require corticosteroid injections**(2**). Topical treatments are effective, but the most effective ones, permethrin 5%, alternative therapies may be less effective, poorly tolerated, or have more significant adverse effects such as sulfur, benzyl benzoate;The data showed that interleukin-9 is not induced by scabies proteins.In allergies, activation of mast cells mediated by IgE depends on the antigen dose and route of entry, in the early stage increase in *S. scabiei* numbers subsequent to primary infestation with elevation of IgE, and then gradual reduction as host immunity develops; This findings agreed with other studied (**14); (15); (16**).In our study we observed there is one explanation in the action of permethrin to reduce inflammation and eliminate allergic reactions in the

immune aspect: The most common anti-scabies treatment (permethrin 5%) inhibits activity and production of T cells, which are predominant cells in the inflammatory process by blocking the signal pathway, preventing the release of histamine from mast cells and basal cells**(23).** Antihistamines block histamine signaling pathways and thus will prevent cell migration to inflamed tissues and thus reduce the production of inflammatory mediators and cytokines.

## Conclusion

Interleukin-9 has a non-specific effect on local allergies and is not induced by scabies proteins, while it has an effect on systemic allergies.

**Acknowledgment:** We are thankful to the all patients for providing all samples in this study. All samples were collected after taking security statements from the Minister of Justice, the Iraqi Juvenile Reform Administration and the Baghdad Health Department in Karkh, samples of prisoners are taken with the consent of the prisoner by pledge, signature and thumbprint without any pressure.

# Association of birth Spacing with birth weight in Baghdad City

**Buthaina Ateyah Rashid[1]; Shaymaa Hadi Najm[2] ; Aws Azmi Shakir[1]**

*[1]M.Sc Community Health Technology College of Health and Medical Technology-Baghdad, Middle Technical University, [2]M.Sc Community Health Technology Institute of Medical Technology-Baghdad, Middle Technical University, Iraq*

## Abstract

**Background:** Birth spacing might influence infantile under nutrition through its association with preterm births and low birth weight. If a pregnancy occurs too soon after the previous birth, the mother may not have recovered her nutritional status, which can contribute to preterm birth and low birth weight. Birth spacing allows women to recover and be healthy for their next pregnancy.

**Objectives:** To determining the effect of birth spacing with birth weight, also to study the factors effecting birth spacing interval in a sample of women in Baghdad city.

**Materials and methods:** The study design was descriptive study (cross sectional). Which included 100 women collected from Mohammad-Baker-Al-Hakim Hospital in Shua'la city in Baghdad, during the period from 10th October 2017 till 10th March 2018 during data collection, the questionnaire from each woman was done.

**Results:** This study clarified that the highest percentage of women (46%) had a birth interval (>24) months and (26%) them had a birth interval of (8-12) month. while, lower percentage of women (12%) had a birth interval of (13-18) months. The highest percentage of birth babies of (3.2Kg) and more than (3.2Kg) (51.19%) had a birth interval of (>24) months, while, highest percentage of less than (3.2Kg), (50%) had birth intervals of (8-12) months.

**Conclusions:** The highest rate of women had a birth interval of (>24) months with birth interval of (8-12) months, had a birth interval of (13-18) months. Birth interval was longer in mother of breast feeding. The highest rate of birth space interval was among age group (26-30) years. The highest rate of birth weight babies had birth intervals of (>24) months with birth intervals of (8-12) months.

***Keywords****: Birth, Spacing, Birth Weight, Pregnant.*

## Introduction

Birth spacing had been made by the International Organizations based on the information that was available several years ago. While publications by the World Health organizations (WHO) [1] and other international organizations recommend waiting at least 2-3 years between pregnancies to reduce infant and child mortality, and also to benefit maternal health[2].

Several studies have reported greater risks of the adverse pregnancy outcomes low birth weight and small-for-gestational-age (SGA) after short pregnancy intervals [1]. Some investigators have attributed the higher risk of poor pregnancy outcomes to the associated factors rather than causally relations of short inter pregnancy intervals, such as maternal socio-demographic characteristics and lifestyle [3,4].

Foliate depletion, in particular, has been proposed as the nutritional factor that contributes most to the risk of fetal growth restriction [5]. As a consequence, their offspring may be at higher risk of intrauterine growth restriction and low birth weight [6,7]. Data on date of delivery, infant gender, birth weight, and gestational age (based on ultrasound or, if that measurement was not available <10% of cases, on the timing of the last menstrual period as recorded by the obstetric

care providers were obtained via the Youth Health Department at the Municipal Health Service [2,8].

Inter pregnancy interval was calculated as the number of months between the date of delivery and the date of the preceding birth, minus the duration of the pregnancy. The latter was defined by the gestational age at the time of delivery [9,10].

## Materials and Methods

A descriptive study (cross sectional) was done included 100 women collected from Mohammad-Baker-Al-Hakim Hospital in Shua'la city in Baghdad, during the period from 10th October 2017 till 10th March 2018. During data collection, the questionnaire from each woman was including the following:

A- Personal particulars: socioeconomic stratum (as described above), age, marital age, educational attainment and employment outside the home, if any.

B- Fertility experience: including gravidity, abortion, number of live births and deaths of children aged less than 5 years.

C- Family Planning: all respondent were asked about their knowledge of the socio-economic benefits of family planning, contraceptive method and the main source of such information. There were asked if they ever used contraception and which type. Women were also asked to indicate when they had started taking supplements- either before or after conception. Women who took folic acid supplements and had begun doing so before conception were classified as "early users" of folic acid; those who took folic acid supplements but had begun after conception were classified as "late users'' and those who did not use folic acid supplements at all were classified as "nonusers" [4]. A number of maternal physiologic, obstetric, lifestyle, and socio-demographic characteristics obtained via the questionnaire were considered as co variables. Physiologic and obstetric variables included age (<25, 25-34, or 35), parity (1, 2, or 3), height (in cm), pregnancy intention as measured by questioning whether the respondent had wanted to become pregnant (yes or no), and start of prenatal care (<18, 18-23, or 24 wk of gestation). Lifestyle variables included alcohol consumption before or during early pregnancy (self-reported previous week's behavior and behavioral change since pregnancy, recorded as no; yes, but not since pregnancy; or yes, also during pregnancy), smoking habits before and during early pregnancy (self-reported previous week's behavior and behavioral change since pregnancy, recorded as no; yes, but not since pregnancy; or yes, also during pregnancy), pregnancy body mass index (in kg/m2)based on self-reported height and weight, and psychosocial stress (presence of 0, 1, or 2) [3-6,10]. So this study was designed to determine the effect of birth spacing with birth weight also to study the relation between the factors affecting birth space interval in a sample of women.

**Statistical Analysis**: data were analysis through descript statistical measurement (frequency and percentage).

## Results

**Table (1) Relationship between birth interval and age group:**

| BSI* (months) | age group (years) | | | | | | Total |
|---|---|---|---|---|---|---|---|
| | >20 | 21-25 | 26-30 | 31-35 | 36-40 | >40 | |
| 8-12 | 8<br>27.56 | 5<br>27.77 | 6<br>23 | 4<br>25 | 3<br>30 | 0<br>0 | 26<br>26% |
| 13-18 | 6<br>20.68 | 1<br>5.55 | 1<br>3.8 | 2<br>12.5 | 2<br>20 | 0<br>0 | 12<br>12% |
| 19-24 | 5<br>17.2 | 3<br>16.66 | 4 15.38 | 2<br>12.5 | 2<br>20 | 0<br>0 | 16<br>16% |
| >24 | 10<br>34.4 | 9<br>50 | 15 57.69 | 8<br>50 | 3<br>30 | 1<br>100% | 46<br>46% |
| Total | 29<br>100% | 18<br>100% | 26 100% | 16 100% | 10 100% | 1<br>100% | 100<br>100% |
| X=30.78 | | | df=10 | | p-value(p<0.01) | | |

BSI* = birth space interval; x =chi-square value; df =degree of freedom; p=probability level.

Table (1) shows that the highest percentage of women (46%) had a birth interval of (>24) months and (26%) than had a birth interval of (8-12) months. While, lower percentage of women (12%) had birth intervals of (13-18) months.

**Table (2) Relationship between birth interval and type of feeding:**

| BSI* (months) | Type of feeding | | | Total |
|---|---|---|---|---|
| | Breast | Bottle | Mixed | |
| 8-12 | 7<br>14.89% | 15<br>44.12% | 4<br>21% | 26<br>26% |
| 13-18 | 2<br>4.26% | 2<br>5.88% | 8<br>42% | 12<br>12% |
| 19-24 | 9<br>19.15% | 5<br>14.7% | 2<br>10.53% | 16<br>16% |
| >24 | 29<br>61.7% | 12<br>35.29% | 5<br>26.34% | 46<br>46% |
| Total | 47<br>100% | 34<br>100% | 19<br>100% | 100<br>100% |
| X=55.43 | | df=6 | p-value(p<0.01) | |

BSI* = birth space interval; x =chi-square value; df =degree of freedom; p=probability level.

Table (2) presents that (61.7%) of women who were breast feeding their babies had longest birth interval (>24) months. While (44.12%) of mothers who bottle fed their infants had low birth interval (8-12) months.

**Table (3) Relationship between birth interval educational levels:**

| BSI* (months) | Type of education | | | | Total |
|---|---|---|---|---|---|
| | Illiterate | Primary | Secondary | University | |
| 8-12 | 2<br>15.38% | 5 29.41% | 13<br>24% | 6<br>31.58% | 26<br>26% |
| 13-18 | 4<br>30.77% | 6 35.92% | 1<br>1.96% | 1<br>5.26% | 12<br>12% |
| 19-24 | 3<br>23.1% | 3 17.65% | 6<br>11.76% | 4<br>21.1% | 16<br>16% |
| >24 | 4<br>30.77% | 3 17.65% | 3<br>66.66% | 8<br>42.1% | 46<br>46% |
| Total | 13<br>100% | 17 100% | 51<br>100% | 19 100% | 100 100% |
| X=38.25 | | df=10 | p-value(p<0.01) | | |

BSI* = birth space interval; x =chi-square value; df =degree of freedom; p=probability level.

Table (3) referred that the highest percentage of women had a secondary education (66.66%) with birth interval of (19-24) months. While, (42.1%) of them had university with birth intervals of (>24) months.

**Table (4) Relationship between birth interval and occupation:**

| BSI* (months) | Work | | Total |
|---|---|---|---|
| | Working | Housewife | |
| 8-12 | 18<br>27.27% | 8<br>23.53% | 26 26% |
| 13-18 | 2<br>3% | 10<br>29.41% | 12 12% |
| 19-24 | 9<br>13.64% | 7<br>20.59% | 16 16% |
| >24 | 37<br>56% | 9<br>26.47% | 46 46% |
| Total | 66<br>100% | 34<br>100% | 100 100% |
| X=29.21 | df=3 | p-value(p<0.01) | |

BSI* = birth space interval; x =chi-square value; df =degree of freedom; p=probability level.

Table (4) shows that (56%) of women was the working women with low birth interval, while housewife (26.47%).

**Table (5) Relationship between birth interval and parity:**

| BSI* (months) | Live baby | | | Total |
|---|---|---|---|---|
| | 1-3 | 4-7 | 8-11 | |
| 8-12 | 7<br>20.59% | 13<br>26.53% | 6<br>35.29% | 26<br>26% |
| 13-18 | 2<br>5.88% | 1<br>2% | 9<br>52.94% | 12<br>12% |
| 19-24 | 13<br>38.24% | 2<br>4% | 1<br>5.88% | 16<br>16% |
| >24 | 12<br>35.29% | 33<br>67.34% | 1<br>5.88% | 46<br>46% |
| Total | 34<br>100% | 49<br>100% | 17<br>100% | 100<br>100% |
| X=13.88 | df=6 | p-value(p<0.01) | | |

BSI* = birth space interval; x =chi-square value; df =degree of freedom; p=probability level.

Table (5) presents that the highest percentage of women has (4-7 live babies) in (67.34%) birth interval of (>24) months in comparison with (4-7 live babies) in (4%) birth intervals of (13-18) months.

**Table (6) Relationship between birth interval (months) and contraceptive:**

| BSI* (months) | Contraceptive use | | Total |
|---|---|---|---|
| | Yes | No | |
| 8-12 | 6<br>12.77% | 20<br>37.73% | 26<br>26% |
| 13-18 | 4<br>8.51% | 8<br>15% | 12<br>12% |
| 19-24 | 7<br>14.89% | 9<br>16.98% | 16<br>16% |
| >24 | 30<br>63.83% | 16<br>30.19% | 46<br>46% |
| Total | 47<br>100% | 53<br>100% | 100<br>100% |
| X=66.77 df=3 p-value(p<0.01) | | | |

BSI* = birth space interval; x =chi-square value; df =degree of freedom; p=probability level.

Table (6) reflects the highest percentage of women (63.83%) who were not using contraceptives and had low birth interval (>24) months. As Compared with (37.73%) who using contraceptive had high birth interval (8-12) months.

**Table (7) Relationship between birth interval and abortion:**

| BSI* (months) | Abortion | | Total |
|---|---|---|---|
| | Yes | No | |
| 8-12 | 10<br>33.33% | 16<br>22.86% | 26 26% |
| 13-18 | 5<br>16.66% | 7<br>10% | 12 12% |
| 19-24 | 6<br>20% | 10<br>14.29% | 16 16% |
| >24 | 9<br>30% | 37<br>52.86% | 46 46% |
| Total | 30<br>100% | 70<br>100% | 100 100% |
| X=66.77 df=3 p-value(p<0.01) sig = Ns | | | |

BSI* = birth space interval; x =chi-square value; df =degree of freedom; p=probability level.

Table (7) shows that the highest percentage of women (52.86%) who not abortion had birth interval (>24) months. Compared with (33.33%) who abortion had birth interval (8-12) months.

**Table (8) Relationship between birth interval and birth weight:**

| BSI* (months) | birth weight babies | | Total |
|---|---|---|---|
| | Less than 3.2kg | 3.2kg and more than 3.2kg | |
| 8-12 | 8<br>50% | 18<br>21.43% | 26<br>26% |
| 13-18 | 2<br>12. 5% | 10<br>11.9% | 12<br>12% |
| 19-24 | 3<br>18.75% | 13<br>15.48% | 16<br>16% |
| >24 | 3<br>18.75% | 43<br>51.19% | 46<br>46% |
| Total | 16<br>100% | 84<br>100% | 100<br>100% |
| X=26.66 | df=3 | p-value(p<0.01) | |

BSI* = birth space interval; x =chi-square value; df =degree of freedom; p=probability level

Finally table (8) clarifies the highest percentage of birth weight babies 3.2 kg and more than 3.2 kg (51.19%) had a birth interval of (>24) months, while the highest percentage of birth weight babies less than 3.2 kg (50%) had a birth interval of (8-12) months.

## Discussion

A number of maternal physiologic, obstetric, lifestyle, and socio-demographic characteristics obtained via the questionnaire were considered as co-variables. Physiologic and obstetric variables included age (<25, 25-34, or 35y), parity (1, 2, or 3), height (in cm), pregnancy intention as measured by questioning whether the respondent wanted to become pregnant (yes or no), and starting of prenatal care (<18, 18-23, or 24 wk of gestation).

Life style variables including the national objections, family objections and personal objections decades both professional and public attitude towards fertility control have changed significant proportion of gynecological practice is now concerned with problems of contraception [6-8,12]. It specifically means the age of the mother at which pregnancy occurs. The most suitable age for reproduction is between 20 and 35 years.

Complications such as difficult labor, failure of lactation, congenital anomalies, prematurity, neonatal mortality and stillbirths will increase [6,13]. Too many births appear to decrease the efficiency of reproduction and lead to maternal depletion. Improving quality of health care is an increasingly important goal of international family planning programs, for a variety of reasons [3,14].

The current study results present that the birth interval was 24 months [8-12,15], which is an inadequate spacing for the health of both the mother and her infant. Similar other studies were proved in India, Yemen and Baghdad in 2005 [4,5,12,16]. Most of mothers birth intervals who were breast feeding their infants than

those who used bottle feeding.

Regarding education, most of women were having secondary education (66.66%) with birth interval of (19-24) months while (42.1%) of them had finished university with birth interval of (>24) months. Higher education level usually reflects longer birth intervals [10,15,17].

Most women here were employed (56%) with low birth intervals. While the un employed women were (26.47%) and these findings were in agreement with a study done in Baghdad during 2005. Prolonged contraception with birth space interval for women in comparison to those ones who did not use any contraceptive the quality of family planning services is an important determinant of contraceptive usage, because it is likely to affect contraceptive on mother and children health [18-20]. Abortion was a factor that affect birth interval in women (52.86%) who were not aborted having birth interval (>24) as compared with (33.33) who had abortion with birth interval (8-12). The highest rate of babies birth weight was (3.2 kg or more than weight 3.2 kg) in (51.19%) associated with birth intervals of (>24) months. And the highest rate of baby's birth weight less than 3.2kg in (50%) of them having birth intervals of (8-12) months.

## Conclusion

In Conclusion, the highest rate of women have a birth interval of (>24) months and them had a birth interval of (8-12) months, had a birth interval of (13-18) months. Birth interval was longer in mother of breast feeding their babies had a birth interval of (>24) months and of mothers who bottle fed had low birth interval of (8-12) months. The highest rate of birth space interval was among age group (26-30) years. The highest rate of birth weight babies had a birth intervals of (>24) months and they had birth intervals of (8-12) months.

# Knowledge of Mothers Regarding Measles Control in Primary Health Care Centers in Al- Samawa City

**Salwan Abdullah Naji , Khadija S. AL-Mizury, Shatha K. Atrah**

*Community Health Department /College of Health and Medical Technology Baghdad /Middle Technical University/ Iraq*

## Abstract

**Background:**Measles is a very communicable viral illness that can be prevented by immunization. knowledge is key tools to control of disease.

**Objectives:**The aims of study were identify mothers knowledge regarding measles control and immunization.

**Methods:**A cross sectional study (descriptive study ) was conducted in Al-Samawa city/Iraq during the period between 2/3/ 2019 to1/7/ 2019. Data collected from (450) mothers who have at least one child less than(5)years of age,though using a special questionnaire format.

**Results:** The study finding out about (72.9%) of mothers participant were acceptable knowledge of measles control and(24.4%) were poor knowledge while the(2.4%) have agood knowledge.

**Conclusion:**The study concluded most of mothers had been acceptable levels for knowledge. However, educational program is still needed to increase the parents' knowledge especially among illiterate and less educated parents.

***Keywords:****Knowledge, Immunization, Vaccination.*

## Introduction

Measles is a very communicable viral illness that can be prevented by immunization[1].Most cases of measles occur during the dry season and in areas with temperate climates,the peak occurs during late winter and early spring[2]. Measles is decreased because of immunization but many areas of the world continue to experience outbreaks[1].It is spread by coughing and sneezing,close personal contact[3].Measles characterized by fever,cough,coryza,and conjunctivitis, followed by a maculopapular rash, during the prodromal period, aKoplik spots may be present[1].Vaccination is one of the most cost-effective interventions to prevent major illnesses that contribute to child mortality[1]. Measles vaccines are safe, effective and providing a crucial tool for global measles elimination[2].To prevent recurrent outbreaks of measles, 95 percent of the population must be immune[3]).Several attenuated measles vaccines are available worldwide, either as single-virus vaccines or in combination with other vaccine viruses (commonly rubella and mumps)[2].Elimination of an infectious disease is mean the total absence of cases in a population.This situation can occur only if the entire population is immune as a result of either natural disease or vaccination[3]. Determine knowledge of mothers regarding measles which helpful to control,The aims of study were to determine mothers knowledge regarding measles control and identify mothers information source regarding measles control**.**

## Material & Subject

### Study design

A cross sectional study was carried out in Al-Samawa city for the period between 2/3/2019 to1/7/2019. The study included(450)mothers at reproductive age, whose had at last one child or more under five years of ages, attended to primary health care center. This study included an interview with the mothers and using aspecial questionnaire format. The questionnaire contained 3

different parts. The first part included questions about the demographic characteristic and other 2 parts included questions about the knowledge and information source of mother toward measles control and vaccination .

## Statistical Analysis

Analysis of data was carried out using the Statistical Packages for Social Sciences(SPSS-25) Data were presented in simple measures of frequency, percentage, mean, standard deviation, and range (minimum-maximum values).

The significance of difference for different percentages(qualitative data)were tested using Pearson Chi-square test($\chi^2$-test)with application of Yate's correction or Fisher Exact test whenever applicable. Statistical significance was considered whenever the P value was equal or less than 0.05.

## Results

Table (2) shows the (42% ) of mothers participant answered correctly for measles causes by virus, while (47.8%),(39.1%),(25.3%) know correctly the measles transmission by droplet and airborne, direct contact and clothes and fomites respectively, high percentage (72.4% ,79.1%)from mothers participant know the measles accompanied by fever and rash. The majority (97.3%)from their know correctly the vaccine available. About(93.6%),(68.2%) of mothers answered correctly about vaccine name to prevent measles while that (61.6% ),( 60.9%),(43.8%) respectively from mothers know correctly the child age should be given the vaccine. High percentage(52.4% ,51.1%) of mothers observed side effect as fever, pain and swelling in site of injection when immunize their child.

Overall score for knowledge in figure (1)in which majority (72.9%) of mothers participant were acceptable knowledge of measles control and (24.4%) were poor knowledge while the (2.4%) have agood knowledge.

Table(5)shows predominant information source of knowledge was health worker about (92.6%) and statistically high significant association at P<(0.01).

## Discussion

The results of the study offer insight to the knowledge of mothers regarding measles control in Al-Samawa city,and can be utilize to conduct of population.

Table(1)show the majority percentage(53.6%) were from urban area, this result was similar to study result done in Iraq[4]. Regarding to age group of mother participant the study result revealed that most of mother's age group were(35-39)years, with Mean±SD of their age(31.4±6.5), our result found (87.8%)were married, this result was agree with study result done in Iraq[5] and in Jordan[6]. Present study showed a high percentage was primary school level(23.6%)this result was accordance with study result done in India[7]and discordance with other study result done in Jordan[6]who found (44.5%) were university and higher level .This difference attributed to variation in socio-economical status between the communities.

Regarding to occupation aspect, in our study the majorty of mothers were house wife, they were accounted(73.1%), this may be due to the most mothers were unable to work because low education level, family responsibility, aging and lost opportunity to find work. This result was similar to the study result done in Iraq [4] and in(KSA)[8].

About the crowding index refer to2nd class(2up to4) personal sharing in the room, they accounted(86.2%). A strong relationship between crowding index of family and measles vaccination coverage rate, this may be attributed to higher education level of families with high economic status, lead to good awareness about of important the measles vaccination.

Table**(2)**reveal that(98.4% )of their know about measles**,** this result was similar to the result study done in China[9]. Regarding to item of is measles / viral, our study show accounted(41.8%)of mothers participant know measles is viral disease, this finding disagree with study conducted in Switzerland[10],who reproted that mothers partcipant were(85.8%)know measles is viral disease this difference may due to differ in level of health eduaction and culture status bettween the commuites. According to item "mode of transmission"by; droplet and airborne, direct contact and clothes and fomites the correctly answered were (47.8%),(39.1%),(25.3%) respectively, our result agree with result study conducted in India[11]. About the "singe and symptom" high percentage( 79.1%,72.4%) from mothers participant know the measles accompanied by rash and fever, this finding were accordance to report of study in India[11]. According to item "there is a vaccine available to prevent measles"the majority of mothers participant were accounted(97.3%)know correctly,this result similar to other study done in KAS[8]. About(93.6%) of mothers participant answered correctly for vaccine name, this a high knowledge percentages for vaccine name may be due to the fact that the vaccines are named by the diseases they prevent. This result agree with study results done in Nigeria[12]

The study finding regarding to child age should be given the vaccine (measles , MMR) around (61.6%),(60.9%),(43.8%)respectively from mothers participant answered correctly, this finding accordance with study done in China[9]. About subject "frequent campaigns are useful for child"(93.1%)of mothers sample answer"Yes", our result similarity to study reported in Iraq[13] The current study showed large number(95.8%)of mothers participant know measles control and elimination is important, this result similar to study result done in Iraq[4]. Our study found the percentage(52.4%, 51.1%)of mothers participant observed side effect as fever, pain and swelling in site of injection respectively when immunize their child, this finding accordance with study result done in Iraq[4].

Table**(3)**shows,each mothers participant might have one or more from different information source about measles and vaccination. Our study reported(92.4%)of their consider the health workers as information source. Our finding accordance with study result done in Iraq[5]. Our study found that(47.3%)of their who reported TVas information source, this result compatible with study result done in Egypt[16]**.**

As for items" social media(internet/ facebook),relatives & friends and neighbors"were accounted(40.4%),(11.3%),(18.4%)respectively, our finding similar with finding in Iraq[4] [13]

Table(4)demonstration there was no significant association between knowledge and (residence, age of mother and marital status) of mothers participant, while relationship between knowledge and mother's educational level and mother's occupation was statistically significant at( P< 0.01), this results matched with study result done in Egypt[14]

Another finding in study was asignificant relationship at( P< 0.01) between knowledge and crowding index and type of house, this result agree with other study result done in Iraq[15]

Table(5)shows the association between health worker as (information source) of mothers participant and knowledge was ahigher significant at p<(0.001). Similarly to studies reported in Iraq[6].While about the items"TV&radio, social media(internet/facebook) and neighbors" as information source was significant association with knowledge of mothers participant at P<(0.05). Our finding agree with study done in (KSA)[9].

## Conclusion

Most of mothers had been acceptable level for knowledge and receive information from health worker.

**Conflict of Interest :** none

**Source of Funding :** self

**Ethical Clearance :** From patients and my college .

## Abstract

**Background**: Osteochondroma represents the most common benign tumor of bones and accounts for about 30-50 % of them. poor information's in previous studies act on demonstration of the significance of atypical histological changes as a premalignant precursor in mature osteochondroma regardless of the cap thickness. In this study, the proliferative activity of cartilaginous cap will be studied in skeletally mature patients regardless of the cap thickness to demonstrate the independent significant of histological features in predicting the malignant potential in osteochondroma. **methodology :** cases of skeletally mature osteochondroma (78 case) were isolated and separated into sessile and pedunculated, then into G1(without suspicious histological features) and G2 ( with suspicious features), and stained with Ki- 67 . Data were analyzed using SPSS version 21and p value < 0.05 was considered as significant. **Results**: There was significant association between study groups and Ki 67 staining results, majority (75%) of patients with suspicious histopathological features presented with positive results of Ki 67 staining ( p value < 0.001). while there was no correlation between shape of lesion and histopathological features ( p value 0.662). **Conclusion:** atypical histopathological features can be regarded as independent factor with the other clinical data when considering the diagnosis of grade 1 chondrosarcoma.

***Key words:*** *osteochondroma, proliferative marker, atypical histopathology, lesion shape, Ki 67 .*

## Introduction

Osteochondroma represents the most common benign tumor of the bony skeleton and accounts for about 30-50 % of them.[(1-2)] some researchers regards this tumor as developmental abnormality rather than a true neoplasm. It may result from small fracture in the growth plate in skeletally immature bone and herniated through periosteal bone to form a tumor like lesion.[(3-4)] pathologically, osteochondroma ( also called exostosis) is composed of cartilaginous cap of hyaline type , covered with fibrous sheath that is continuous with the periosteum and it in turn covering an underlying bone and medullary cavity that is continuous with that of the parent bone.[(5-6)] this continuity with the underlying bone is important radiological feature in the diagnosis and it is more clear in pedunuculated shape lesion than in sessile one. Development of osteochondroma in children whom treated with radiation for Wilm's tumor due to separation and migration of physeal plate support the suggestion that osteochondroma is a tumor like condition [(7-8-9)], on the other hand , presence of hereditary form of osteochondroma ( hereditary multiple osteochondromatosis or called hereditary multiple exostosis HME) support the fact that osteochondroma is a true neoplasm.[(10-11)] HME comprise about 15 % of osteochondroma and caused by mutation in EXT1 or EXT2 genes that are located on chromosome 8 and 11 respectively.[(12)] the most common location for osteochondroma is the metaphysis of long bones especially the lower limbs, flat bones are less commonly affected.[(13)] this benign tumor usually affect children and adolescent and stop growing after skeletal maturity. Clinically , it may be silent or cause disfigurement, pain due to pressure on a nerve or blood vessel and fracture.[(14)] the serious complication of this neoplasm is

malignant transformation, usually in form of secondary peripheral chondrosarcoma. Malignancy can complicate about 25% of HME and only 1-8 % of solitary exostosis [15-16]. At microscopy, the tumor composed of hyaline cartilage with lobulation , the chondrocytes are bland looking, evenly spaced and show ordered maturation in columns. The cartilage merges with the underlying bone that project from the bone of origin and continuous with it. Atypical histological features such as mild increased cellularity, occasional binucleation, more than one cell in the lacuna, and foci of necrosis are considered to be reactive changes in the growing cartilaginous cap and should not be overdiagnosed when the cap thickness is within usual.[3-17] the allowed cap thickness is up to 3 cm in children with immature skeleton and only few millimeters in skeletally mature adult.[3-18] Also new increased growth of exostosis in adult should raise the suspicion of malignant transformation into peripheral chondrosarcoma since osteochondroma is unusual to enlarge after maturity [19]. Another features that should brought the attention is the proximal location of tumor such as around the pelvis or shoulder, grossly irregular surface, cystic changes and soft tissue invasion.

Chondosarcoma arising in osteochondroma is usually of low grade as the trabecular bone permeation is usually absent, in addition, the cytological features may be bland with the exception of loss of columnar arrangement of the chondrocytes. This laid a hard work on the pathologist and necessitate clinico-radiological-pathological correlation for such a diagnosis.[19] Eefting *et al* suggested a statistically significant pathological criteria that could distinguished low grade ( G 1) chondrosarcoma from proximally located benign cartilaginous tumors [20]. Such a histological features included increased cellularity , nuclear pleomorhism, mitosis, entrapment, mucoid changes and loss of normal cellular arrangement. These features are added to the clinical data including age of patient above 40 years, proximal location and radiological data

Few studies work on demonstration of proliferative activity of osteochondroma cartilage in children comparing with proliferative activity in premature growth plate and in adult using immunohistochemistry with Ki 67 antibodies[21 ]. Ki 67 is a nuclear non histone protein that is expressed in all phases of cell cycle with exception of G0.[22] most articles focused on cartilage cap thickness as the main indicator of malignant transformation. However no enough previous studies act on demonstration of the significance of atypical histological changes as a premalignant precursor in mature osteochondroma regardless of the cap thickness. In this study, the proliferative activity of cartilaginous cap of osteochondroma will be studied in skeletally mature patients regardless of the cap thickness in order to demonstrate the independent significant of atypical histological features in predicting the malignant potential in osteochondroma. Also there will be a focus on the relashionship between unusual histological features in osteochondroma( increased cellularity, occasional binucleation and mild pleomorphism) with shape of the lesion ( sessile or pedunculated ).

## Methodology

Part of cases for study are collected from Al Hilla Teaching Hospital and Al-Hayat hospital retrospectively from the last 4 years ( 2015-2018). Cases with insufficient clinic-radiological data are ignored. The other part is selected prospectively from the work of orthopedic author ( use of suitable longitudinal incision to expose the tumor, careful dissection with radical excision of osteochondroma from its base with the mother bone with its basal cortex to avoid recurrence) . Exclusion criteria: osteochondroma from skeletally immature cases were excluded.

**Inclusion criteria:** all skeletally mature osteochondroma regardless of cartilage cap thickness were included.

**Ethical issues:** no patients identity or identifying photos are included in the study, so the permission of the institute, where the data are collected (including radiological and clinical information, as well as histological slides and paraffin blocks), is taken. The total number of collected cases was 130. Orthopedic author reviewed the radiological picture for each case and separate them into skeletally immature cases (excluded from the study) and skeletally mature cases (included) , so the final number of cases was 78 case. Also the included cases were divided into sessile shape lesions and pedunculated shape lesions. All study's cases were reviewed by two pathologists blindly from each other and without any clinical information. Cases are separated into group 1 (conventional osteochondroma

with no atypical histological features) and group 2 (osteochondroma with atypical histology).

Atypical histology defined by presence of increased cellularity, binucleated chondrocytes, occasional more than one cell in the lacuna, and mild pleomorphism with absence of other features that raise the suspicion of chondrosarcoma such as irregular arrangement of chondrocytes( not in ordered columns), mitosis, marked pleomorphism, necrosis, permeation and marked myxoid changes and separation of cells into specific lobules by fibrous bands.

Cases of both groups are then stained immunohistochemically with MIB 1 antibody (mouse monoclonal antibody, Dako 1:50). Three µm sections are cut, deparaffinized, rehydrated and stained with standard procedure. Heat induced antigen retrieval is used for all sections. Nuclear staining of Ki 67 was scored using the average method [22] by manual counting of Ki67 positive cells in three representative sections for each case and calculating the average percentage of positive cells by two pathologists.

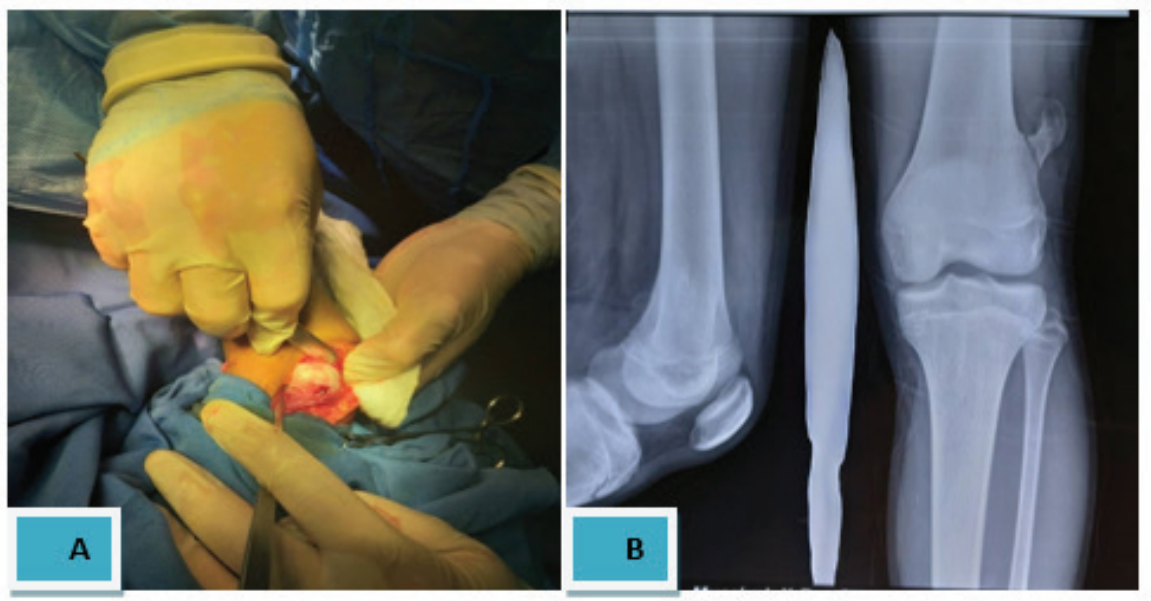

**Figure (1) : A an intra-operative picture of osteochondroma in 20 years old male show pedunculated shape tumor. B X-ray of 32 years old patient show osteochondroma in skeletally mature skeleton at lower femur and complicated by basal fracture. (our cases).**

## Data Analysis

Statistical analysis was carried out using SPSS version 21. Categorical variables were presented as frequencies and percentages. Pearson's chi square ($X^2$) was used to find the association between categorical variables. A *p*-value of ≤ 0.05 was considered as significant.

## Results

The Distribution of Patients According to Study Groups

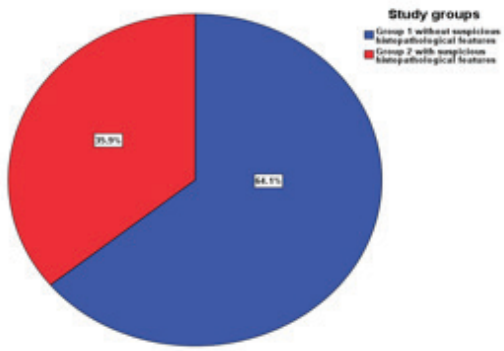

**Figure (2) shows distribution of patients according to study groups including (group 1 osteochondroma without suspicious histo-pathological features and Group 2 osteochondroma with suspicious histopathological features). Majority (64.1%) of patients presented with osteochondroma without suspicious histo-pathological features.**

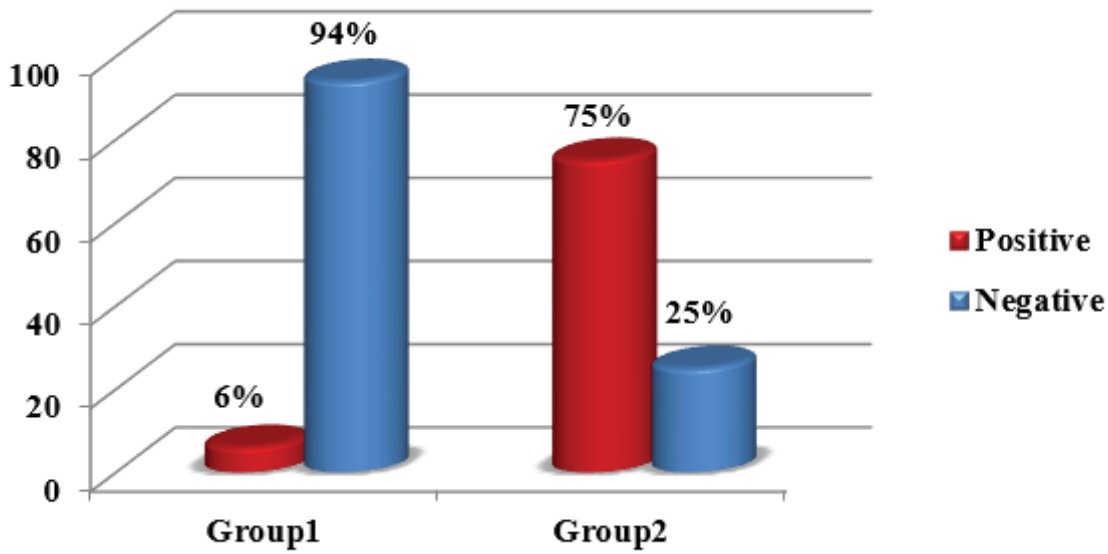

**Figure 2: Distribution of patients according to study groups**

The distribution of study groups according to Ki 67 staining results

Figure (3) shows distribution of study groups according to Ki 67 staining results including (Positive and negative). Majority (75%) of patients with osteochondroma with suspicious histopathological features had positive Ki 67 staining.

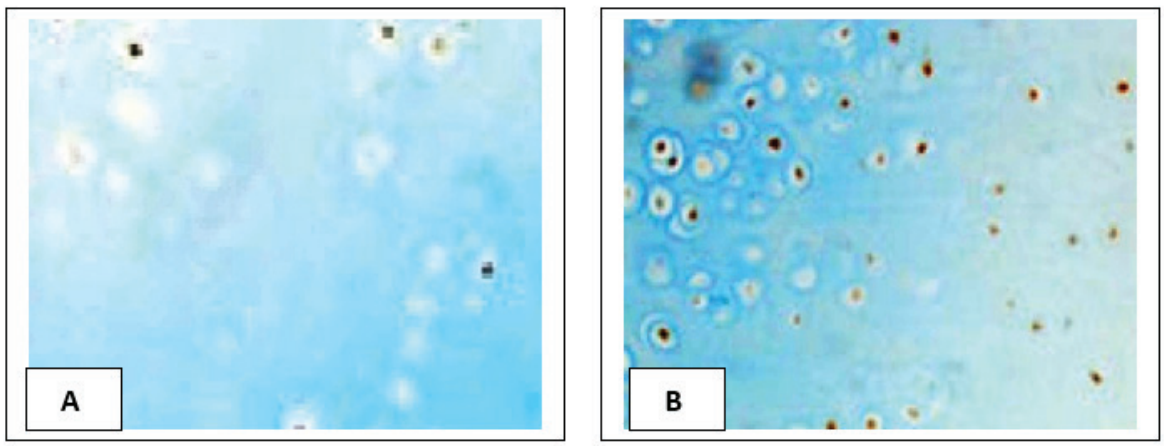

**Figure 3: Distribution of study groups according to Ki 67 staining results**

**Figure( 4 ): A** osteochondroma in 25 years male with conventional histological features (group 1) show negative Ki 67 staining. **B** osteochondroma in 32 years old male with increased cellularity and occasional binucleation (group 2), show positive Ki 67 staining.

**The Distribution of Study Groups According to Shape of Lesion**

Figure (5) shows distribution of study groups according to shape of lesion including (pedunculated and sessile). More than a half of patients with osteochondroma in two groups had pedunculated shape of the lesion.

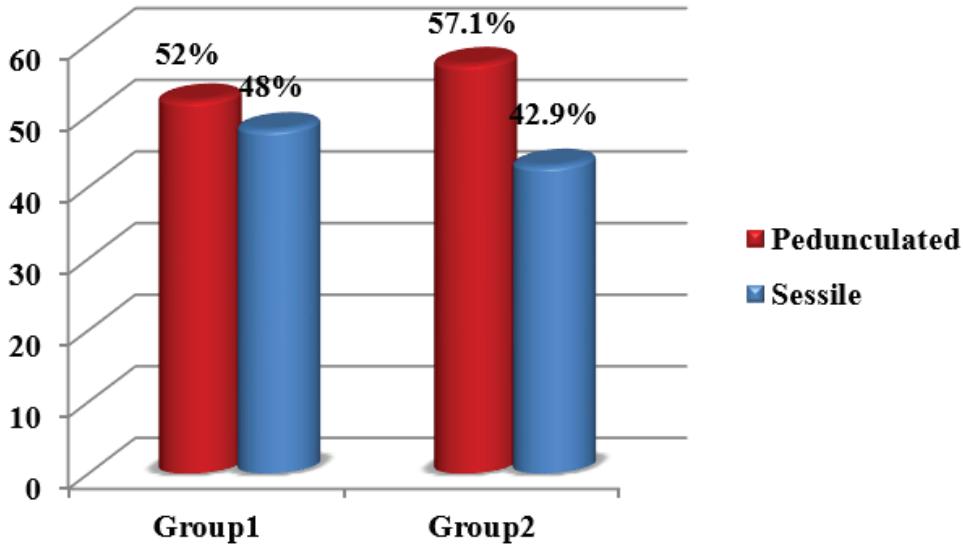

**Figure 5 : Distribution of patients according to shape of lesion**

**The association between study groups and study variables**

Table (1) shows the association between study groups including (group 1 osteochondroma without suspicious histopathological features and Group 2 osteochondroma with suspicious histopathological features), and study variables including (Ki 67 staining results and shape of the lesion).There was significant association between study groups and Ki 67 staining results, majority (75%) of patients with suspicious histopathological features presented with positive results of Ki 67 staining ( p value < 0.001). while there was no correlation between shape of lesion and histopathological features ( p value 0.662).

**Table (1) Association between study groups and study variables including ( Ki 67 stain results and shape of lesion)**

| **Study variables** | **Study groups** | | **Total** | $\chi^2$ | **P-value** |
|---|---|---|---|---|---|
| | Group 1 | Group2 | | | |
| **Ki 67 staining** | | | | | |
| Positive | 3 (6.0) | 21 (75.0) | 24 (30.8) | **40.11** | **<0.001*** |
| Negative | 47 (94.0) | 7 (25.0) | 54 (69.2) | | |
| Total | 50 (100.0) | 28 (100.0) | 78 (100.0) | | |
| **Shape of lesion** | | | | | |
| Pedunculated | 26 (52.0) | 16 (57.1) | 42 (53.8) | 0.191 | 0.662 |
| Sessile | 24 (48.0) | 12 (42.9) | 36 (46.2) | | |
| Total | 50 (100.0) | 28 (100.0) | 78 (100.0) | | |

*P value ≤ 0.05 was significant. (group 1 osteochondroma without suspicious histopathological features, Group 2 osteochondroma with suspicious histopathological features).

## Discussion

In a large studies reported by Mayo Clinic, it had been found that (81% ) of secondary chondrosarcoma arose at site of previous osteochondroma [23]. It has been estimated that 2/3 of these cases derived from sporadic osteochondroma. Although osteochondroma is rarely (1-2%) transformed into chondrosarcoma, its recognition is of high importance because most of these tumors are low grade and treated by adequate excision without need for chemotherapy or radiotherapy.[24] Huch et al performed a study on a group of solitary osteochondroma and other group of patients with multiple osteochondroma, comparing the immunohistochemical expression of Ki-67 in both groups as a marker of nuclear proliferative activity. They found that the proliferative activity in osteochondroma from patients younger than 14 years of age is similar to that in postnatal growth plate, while in individuals older than 14 years there was no significant detectable proliferative activity[ [21]. So , in the current study the only skeletally mature cases are included to avoid such overlap in the results of immunohistochemical staining with Ki-67 . In a study of de Andera *et al*, only cellular pleomorphism and mitotic activity show significant difference between osteochondroma and low grade chondrosarcoma on one hand and high grade chondrosarcoma on the other hand. While other cellular features as binucleation , necrosis, and irregular calcification was found in 72% of osteochondroma.

K. Huch et al supported the concept of increased suspicion for malignant transformation in osteochondroma of adult when Ki 67 positivity is detected [21]

The shape of osteochondroma ( pedunculated versus sessile ) was not studied previously regarding their relation to the microscopical features that raise the suspicion about malignancy ( increased cellularity, frequent binucleation, nodularity and necrosis). We found that no relation between the shape of the lesion and such a histological features. However the shape of the lesion may affect the accuracy of radiological diagnosis of osteochondroma ( more difficult in sessile tumors) as mentioned previously by Mark D. Murphey [2]

## Conclusion

Histopathological features , when atypical, can be regarded as independent alarming factor for malignant transformation ( the same as cartilage cap thickness and may precede it). There is no relation between shape of osteochondroma and risk of atypical histological features, proliferation, and hence risk of malignancy.

# Vitamin D Level Status and hypertension among Elderly Iraqi People in Al Hillah City

**Ismael Hasan Jawad[1], Hasan ALwan Baiee[2]**

*[1]Student, PhD. Nursing Student, University of Babylon College of Nursing, [2] Prof. Dr. University of Babylon College of Nursing*

## Abstract

**Background:** Vitamin D has different biological actions in the body . Vitamin D has the pleiotropic effects in multiple organ systems, and vitamin D deficiency was suggested to be associated with high blood pressure according to previous reports. Several interventional studies have examined the effect of vitamin D supplementation on high blood pressure patients

**Objective :** to identify Vitamin D level and its correlate with hypertension among old adult in Hilla city – Babylon province

## Introduction

Vitamin D, 25-hydroxyvitamin D (25(OH) D), is a dynamic fat-soluble vitamin that regulates calcium homeostasis and is important for bone and muscle health in people of all ages [1]. Vitamin D is logically present in some nutrients and dietary supplements and is formed endogenously when sunlight strikes the skin and motivates vitamin D synthesis. Serum concentration of 25-hydroxyvitamin D is the best indicator of vitamin D status in persons, with values of less than 30nmol/L (nmol/L = 0.4 ng/mL) measured to be insufficient for the universal health and wellbeing of adults [2]. A plethora of epidemiological and observational studies have established the correlation between vitamin D and general human wellbeing [(3–5)]. Studies suggest that adequate serum vitamin D of more than 30 nmol/L is concerned in avoiding cardiovascular disease [6] . An sufficient vitamin D serum level has also been informed to improve the immune system, avoid cancer, and limit its development [7]. Vitamin D is an essential part of nutrition. In association to the other vitamins, vitamin D has single metabolic and physiological special effects.[(3–7)] The deficiency of vitamin D is epidemically prevalent in the world; 20–25% of the population suffers from the deficiency of vitamin D in USA; Canada; Europe; Mexico; Asia; and Australia. [8] Surprisingly, the deficiency of vitamin D in the Persian Gulf nations is highly widespread, though there is adequate sunshine. The commonness of vitamin D (serum level of vitamin D) deficiency is upper among female adolescents and elderly in Iran and >80% in Saudi Arabia. Hypertension, also known as raised blood pressure, is a very common chronic disease and considered as a silent killer because it rarely causes symptoms(3). Generally, older age, lower incomes and higher body mass index are proposed as the associated factors with the risk of hypertension46). Accordingly, people having high blood pressure would increase in the condition of population ageing and prevalent westernized diet in Korean society(16). Therefore, it is very important to look into the evidences and results about vitamin D in regards with its roles in controlling blood pressure at this point.

## Methodology

This was across sectional descriptive observational study included a non-probability ( convenient sample ) of elderly in Hilla City.

– Babylon province, the period of the study started from the first of January through August 2019, a pretested

questionnaire was used to interview the participants after obtaining their verbal consents, the sample included old adult, serum level of Vitamin D that made by chemo immunoassay method (maglumi instrument),The data were analyzed statistically to assess the associations between variables.

## Results

The study included 300 participants 83.0% of the study sample had either insufficiency or deficiency of Vitamin D level. The proportion of adults with hypertension were more common among participants with deficient and insufficient vitamin D, 42% and 7% respectively , the difference was significant p<0.05.

**Table (1) the mean age and number of participations.**

| Parameter | Number | Mean of the age |
|---|---|---|
| 65-69 years | 168 | 67 years |
| 70 -74 years | 84 | 73 years |
| 75-80and more | 48 | 78 years |
| Total | 300 | |

This table shows distribution of study participants according to the mean age and number of participations.

**Table (2) Means of vitamin D level by gender.**

| | |
|---|---|
| Female | 19.5% ng/ml |
| Male | 25.8% ng/ml |
| Male and female | 22.5% ng/ml |

**This table shows distribution of study participants according to the means of vitamin D level by gender.**

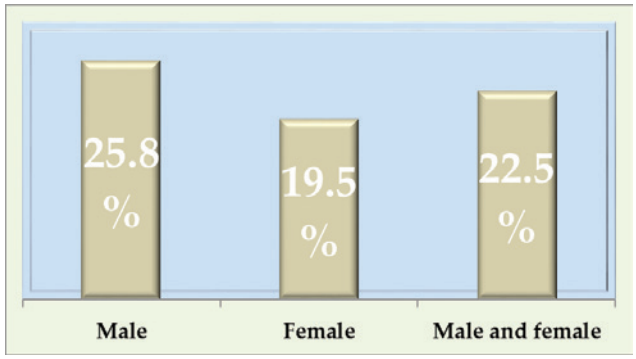

**Figure (2) Means of vitamin D level by gender.**

**Table (3) Frequency distribution of the study group of age.**

| Parameter | Frequency | percentage |
|---|---|---|
| 65-69 | 168 | 56.0% |
| 70 -74 | 84 | 28.0% |
| 75-80 and more | 48 | 16.0% |
| Total | 300 | 100% |

**This table shows distribution of study participants according to the age**.

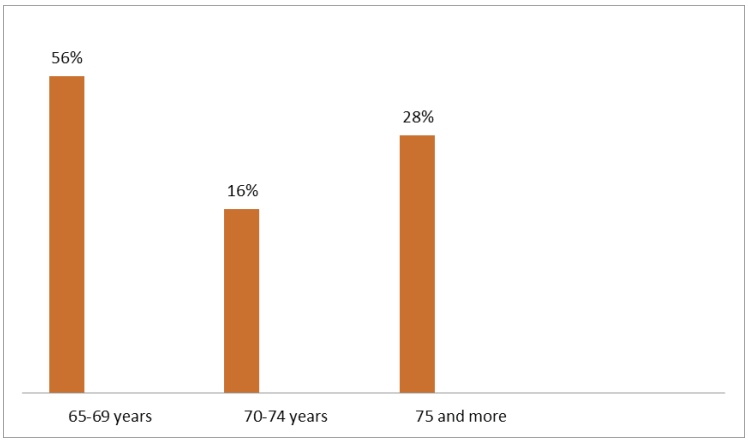

**Figure (2) Frequency distribution of the study group by age.**

**Table (4) Association between Vitamin D Hypertension) among males.**

| Study variables | Vitamin D level among male | | | | | χ2 | P-value |
|---|---|---|---|---|---|---|---|
| | Deficiency (0-20 ng/ml) | Insufficiency (21-29 ng/ml) | Normal (30-100 ng/ml) | Total | Deficiency | | |
| Hypertension Yes | 37 (54.4%) | 5 (26.3%) | 2 (15.3%) | 44 | 84.0% | 57.99 | < 0.002* |
| No | 31 (45.6%) | 14 (73.7%) | 11 (84.7%) | 56 | 55.3% | | |
| Total | 68 (100.0%) | 19 (100.0%) | 13 (100.0%) | 99 | | | |

This Table shows Association between Vitamin D Hypertension) among males.

**Table (5) Association between Vitamin D and Hypertension)among females.**

| Study variables | Vitamin D level among female | | | | | χ2 | P-value |
|---|---|---|---|---|---|---|---|
| | Deficiency (0-20 ng/ml) | Insufficiency (21-29 ng/ml) | Normal (30-100 ng/ml) | Total | Deficiency | | |
| Hypertension Yes | 90 (66.1%) | 16 (72.7%) | 5 (11.6%) | 111 | 81.0% | 59.11 | < 0.001* |
| No | 46 (33.9%) | 6 (27.3%) | 38 (88.4%) | 90 | 51.1% | | |
| Total | 136 (100.0%) | 22 (100.0%) | 43 (100.0%) | 201 | | | |

**This table shows Association between Vitamin D and Hypertension)among females.**

## Discussion

In this study, the Vitamin D Level Status Among Iraqi Patients in Al Hillah City and the relation of these dependent variables to various epidemiological factors were assessed in 300 patents the most of sample are female 67% . The prevalence of vitamin D deficiency in those countries is higher in women than in men It seems that the skin complexion, poor sun exposure, vegetarian food habits and lack of vitamin D food fortification .

In this study most of patients are in the age group 65-69 years this result agree with (Heshmat et al 2008) who found that It was also indicated that vitamin D shortage is highest among individuals who are elderly, institutionalized, or hospitalized. It is recounted that 60% of the old adult in nursing homes were vitamin D deficient in the United States (Elliott et al.2003).

Findings of relationship between level of vitamin D and hypertension for male and female sample male and female have deficiency in the level of vitamin D (84 %) (81%). This results are agree with (Songcang 2017) who found that vitamin D deficiency is highest among people who have hypertension .

## Conclusion

Results of the current study showed a widespread, severe Vitamin D deficiency among participants of both sexes and in elderly people , urgent large scale public educational campaigns are needed to address this high priority public health problem in our society. We suggest that physicians should keep a check on the Vitamin D levels of elderly people in order to curb the ever-increasing incidence of hypertension.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the University of Babylon College of Nursing, Iraq and all experiments were carried out in accordance with approved guidelines.

# Impact of Physical Activity Program upon Elderly Quality of Life at Al-Amara City/Iraq

**Ghazwan Abdul Hussein AlAbedi[1], Arkan B. Naji[2]**

*[1]Lecturer, Community Health Nursing Department, College of Nursing/ University of Misan,*
*[2]Ph.D., Prof, Community Health Nursing Department, College of Nursing, University of Baghdad*

## Introduction

**Objectives**: The study aimed to evaluate the effectiveness of the physical activities program for the elderly among the quality of life; to determine association between elderly life qualities with their socio-demographic data.

**Method:** A quasi experimental design was carried out from 14th January 2019, to 20th September 2019 in the city of Al-Amara. A random sample was used to select 6 out of 14 primary health care centers. A purposive sample was used through inclusion and exclusion criteria include (50) elderly visiting health centers for therapeutic or preventive reasons. The collected sample was divided equally (25) into two groups of men and women (study and control group) while the first group underwent an activity program. The data of the study were collected through the interview method and using the designed tool which contained (3) parts.

**Results**: The findings of the study show that the two groups have a low level of activity and quality of life for the elderly before the program is conducted, while after the implementation of the program, the study group showed a significant improvement in physical activities at a high level score (2.36± 0.209), while the control group stay in same level score (1.37± 0.183). Quality of life demonstrated very good level score for post–test in the study group (3.91± 0.436) more than control group (1.73± 0.203).

***Key words:*** *Elderly, Quality of Life, Physical Activity, Primary Health Care.*

## Introduction

Elderly is a fragile and vulnerable segment of population need especial care due to the multiple problems which leads to a decline in the body's physical capacity and physiological system [1] . World Health Organization (WHO) mentions that there are more than six hundred million elderly people worldwide; it is estimated that this rate will double by 2025 and 2 billion by 2050 [2] . The annual statistical report issued by the Iraqi Ministry of Health showed that the proportion of elderly people over 60 years of age is expected to increase 3.4% in 2010 to 5% in 2015, and the increase is expected to reach 7.2% in 2050 [3] .

The views of most gerontologists agree that the ages of the elderly are 65 years and older. This age is the length of time that people are approaching the end of their occupation, work and the preparation of retirement plans. In addition, they work to end their responsibilities, duties and tasks that they performed during adulthood and thus they become inactive [4] . Global reports indicate that physical inactivity is continuous increasing. The prevalence of physical inactivity is estimated at 21.4% worldwide. In England, nearly 39% of the elderly performed the recommended levels of physical activity, while in the United States about 23% were considered physically inactive and therefore had many health problems[5]. Physical activity (PA) is "Any bodily movement produced by skeletal muscles those results in energy expenditure". All activities carried out by the elderly that is includes walking, leisure-time activity, regular exercise, housework, and work-related activity can offer many benefits through physical, psychological and social aspect in the elderly life qualities [6] .

Generally, to achieve a better healthy life, it is preferable for the elderly to engage in physical activity on an ongoing basis. Based on this principle, most health education programs are available in most countries to

disseminate new ideas and knowledge, which in turn promotes health and prevents risky behaviors [7] . Finally, it is necessary to integrate physical activity into the lives of older people as a way to improve their QoL. Participation in lifestyle activities impacts upon physical, social, psychological, and environmental well-being for individuals all of these elements lead to for integration of life quality [8]

## Methodology

A semi-experimental design was used during the period 14th January 2019, to 20th September 2019, Simple random sample is used by the researcher to select (6) primary health care centers (PHCs) at Al-Amara city. A purposive sample (50) elderly visiting PHCs for therapeutic or preventive reasons, these elderly were collected from the centers. The sample comprised of (50) elderly people who agreed to participate in the program were divided into two groups, each group of study and control consisted of (25) elderly, the first group was involved in the activity program, while the second group was not exposed to the program. Data were collected through interview technique based on inclusion criteria for both sexes including: elderly people at an early age 65-74 year, mobile, independent, and able to communicate with others. The exclusion criteria included elderly with chronic diseases (asthma, diabetes, non-controlling blood pressure, and congestive heart failure).

The program includes six time-consuming lectures (45-60 minutes) to educate the elderly about physical activities and conduct pre- and post-program tests to assess effectiveness on quality of life. The questionnaire was used as a tool to collect data through the interview technique used and observation the practices of the elderly. The first part contains demographic characteristics, while the second part relates to the PA tool which includes (24) elements divided into four parts includes leisure time, household activities, balance, and flexibility exercises. The third part was used to measure the QoL of the elderly, through constructed questionnaire which contains (31) items, the first domain include three items about overall QoL and overall health status, while the remaining 28 questions were divided into five dimensions of health including: physical, psychological and emotional, social relationships, environment, and spiritual health. Summing the total scores for each certain domain manifested the elderly perception about their QoL. These items was rated according to the Likert scale and the scoring for these questions was range from (1 to 5), the higher scores corresponding to a better QoL classified as (5), while low scores classified as (1). The allocated time for the questionnaire was (20-30) minutes to complete. This scale was evaluated according to five levels as following: Low level = (1-1.80): 1; Moderate (1.81- 2.60): 2; Good level (2.61- 3.40): 3; Very good (2.41- 4.20): 4; Excellent (4.21- 5): 5. The Physical Activity Tool was rated according to Likert scale (Always; sometimes and never), and scoring as (3) for always, (2) sometimes, and (1) never, respectively. This scale was evaluated according to four levels: Low level =(1.00-1.66): 1; Moderate (1.67- 2.33): 2, and High (2.34- 3.00): 3. The time practice of PA checklist for each elderly took about (120-180) minutes. The validity and reliability of the questionnaire is determined by a panel of (16) experts and degree of Alpha Cronbach for QoL and PA for (31) items (r= 0.88) and (24) items (r= 0.86) respectively.

Our study data were analyzed by using the Statistical Package for Social Sciences (SPSS) version 20, and through applying two statistical approaches (1) descriptive by: percentage, frequency, standard deviation and arithmetic mean (2) inferential analysis through (t-test, and chi-square test) to determine relationship between the study and control groups. The results were affirmed as significant at $P \leq 0.05$ and no significant at $P > 0.05$.

## Study Finding

The results of the data analysis were consistent with the objectives of the study. The presentation below shows the important findings of the study.

**Table (1) Distribution of the study and control group according (Physical Activities) with comparisons significant**

**Table (4): Association between the elderly Quality of life with their Socio-demographic Variables for study group**

| Elderly Variables | Pre- Test | | | | Post- Test | | | |
|---|---|---|---|---|---|---|---|---|
| | Chi-Square | d.f | P value | Sig. | Chi-Square | d.f | P | Sig. |
| Age | 1.347 | 3 | 0.718 | NS | 101.387 | 3 | 0.000 | S |
| Gender | 8.692 | 3 | 0.034 | NS | 15.86 | 3 | 0.001 | S |
| Occupational Status | 30.128 | 9 | 0.000 | S | 35.353 | 9 | 0.000 | S |
| Marital status | 7.203 | 6 | 0.302 | NS | 69.249 | 6 | 0.000 | S |
| Education levels | 47.615 | 15 | 0.000 | S | 48.338 | 15 | 0.000 | S |
| Monthly Income | 20.514 | 6 | 0.002 | S | 19.955 | 6 | 0.003 | S |

**Sig.= Significant, S= Significant at( P< 0.05), NS= Non Significant at (P > 0.05), d.f = degree of freedom, P = probability value.**

Regarding association, the table showed that there was no significant relationship between elderly QoL with age, sex and presence of spouse or not, except (profession, education, monthly income) show significant differences in pre-test ($P < 0.05$). While, in the post test the results of the table above shows that there is a significant relationship between quality of life of the elderly with all demographic variables, when analyzed by chi-square.

## Discussion

In our study, shows that there are highly significant differences (P=0.000) with very good levels at study group for all domains QoL which includes: life overall, physical health, emotional and psychological, social, the environment, and spiritual facet. In agreement with this study Pucci et al., [13] found positive correlations between health perceived by elderly and the time practicing physical activity. Also, Ludendorff et al.; Naji and Abdulridha [14 ,15] confirm the elderly who are physically and mentally active demonstrate and can perceive better performance of activities, better health and, therefore, better quality of life.

The results revealed that there is no significant relationship between the QoL of the elderly with their social and demographic data in the pre-test of the study group, whereas in the post-test period there was a significant association about these variables in ($P <0.05$). This findings were supported by Hamer et al., [16] who stated that maintaining a lifestyle physically active by the elderly at an early age (65 and above) leads to better health, longevity and healthy ageing in comparison with those remaining inactive lifestyle. Ramocha et al., [17] in study conducted in South Africa that show there are significant association between elderly QoL and their gender at ($P= 0.001$) after participation in physical activity program. In agreement of our study, Ramires et al., [18] in their study, they mentioned that retirement status and lower monthly income for seniors may reduce transportation and work-related activities, which may also be replaced by many activities such as leisure time, household…etc., thus are important factors in improving the QoL of older people. In regarding to marital status and education level, the result shows a significant association with QoL in the post-test at very good level for life quality. This result may come from spousal support and completion of school education which plays an important role to ensure that older persons remain physically active through internal / external activities, including gardening, shopping, walking, sexual relationship and religious activities, which improve their satisfaction with life.

## Conclusion

The study showed that elderly physical activities and quality of life were low at the beginning of the program. However, these variables in the study group increased significantly in the post-test at a high level as a result of participation in the physical activity program. Regarding the relationship between quality of life and demographic data, the result showed that there was no significant relationship in the pre-test except (educational level, occupation and financial situation), but there was a high statistical significance between gender, age, occupation, marital status, education and monthly income with the quality of life of the elderly.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the College of Nursing and all experiments were carried out in accordance with approved guidelines.

# Fear and Anxiety Disorders Related to Childbirth among Primiparous Women in Kirkuk City

**Abbas Lateef Muhe-Aldeen[1], Ameer Salah-Aldeen Abdulrazaq[2], Ahmed Mohammed Jasim[3]**

*[1]M.Sc. Lecturer Psychiatric & Mental Health Nursing. Lecturer; [2]M.Sc. Psychiatric & Mental Health Nursing. Assistant Lecturer, [3] M.Sc. Adult Nursing. Assistant Lecturer*

## Abstract

**Objective:** This study aimed to assess the level of fear of childbirth and level of anxiety among primiparous women; and find out the relationship between fear of childbirth & level of anxiety and some socio-demographical data of the sample.

**Methodology:** A descriptive study, non-probability (Purposive) sample consist of 100 nulliparous pregnant women was carried out from November , 1st, 2018 to October, 10th, 2019 in (AL Salam) primary health care center and two hospitals (Azadi teaching & Kirkuk general) at gynecological consultation in Kirkuk city. To achieve the objectives of the study a developmental & constructed questionnaire conducted for the purpose of the study, which consisted of three parts: the socio-demographic characteristics; Anxiety scale for pregnancy (ASP) it consists of 14-items to determine the severity of the anxiety symptoms & the Wijma Delivery Expectancy/ Experience Questionnaires (W-DEQ) consist of 33 items was used to investigate fear of childbirth**.**

**Results**: The majority of the pregnant women (39%) aged group (26-30years), (48%) was gestational age/ week 14-26 weeks, (33%) of them graduated from secondary school, regarding to the occupation (63%) was housewife, financial status was barely sufficient and constitute (86%), and (99%) of them from urban residency, tenant housing (82%), nucleus family type (86%), and (73%) of them preferred normal vaginal delivery mode and ( 96%) of the women were regularity antenatal visiting.

**Conclusions:** The study detected a severity of the anxiety related pregnancy was moderate, and level of fear of childbirth was mild. Also founds a significant relationship between anxiety level and age of primiparous women.

***Keywords:*** *Fear, Primiparous Women, Childbirth , ASP, W-DEQ, Stress, Pregnancy Related Anxiety*

## Introduction

Childbirth is a significant physiological, social and emotional event in the life of a woman and her family; however, it is seen as a problem in terms of psychological anxieties for pregnant women. [1] Fear of childbirth is common and more intense in pregnant primiparous women than in pregnant parous women. The fear can easily lead to avoidance including the widespread demand for epidural analgesia, or for an elective caesarean section. They may be also fear of giving birth to a baby with congenital anomalies, or about problems perinatal that can compromise their life or health. Women with afraid of childbirth are vulnerable to increased surgical intervention and subsequent psychological problems. [2] Pregnant women with a clinically significant worries of childbirth appear to have personalities with strong neurotic traits. Even low self-efficacy and low self-esteem appear to increase significantly the risk that a woman will experience high distress at the time of delivery. [3] A variety of issues in pregnancy may increase anxiety in women, among such issues are fear about childbirth and health of the baby, quality of care during delivery, the extent of husbands' support and involvement in maternal health care, and the level of support from relatives and friends. [4] Pregnancy

anxiety is different from general anxiety. It is a relatively distinct syndrome which is provoked by pregnancy-specific fears and worries. Women who are anxious, experience both emotional and somatic symptoms such as worry, muscle ache, palpitation, sleep disturbance, and gastrointestinal problem. It has been suggested that high levels of pregnancy-related anxiety play a role in preterm birth, postpartum depression, and caesarean section. In addition, it could affect fetal, infant and child development. [5,6] Women still suffer from the fear of death during labor. When this specific anxiety or fear of death during labor precedes pregnancy and is so intense that tokos (childbirth) is avoided whenever possible, this is a phobic state called "tokophobia". Tokophobia may effect women from childhood into old age. [7] More recently, pregnant women fearful of childbirth reported a lack of trust in the obstetric staff team, fear of their own incompetence and fear of dying. Other studies have suggested that the greatest fear was of labor a physically damaged or congenitally anomalies child. Women may be worried about their ability to give birth. Studies show that the prevalence of moderate childbirth fear in pregnant women varies between 18–31%, and the prevalence of severe fear of childbirth is between 2–11%. [8]

## Methodology

### *Participants*

A descriptive study, non-probability (Purposive) sample consist of 100 primiparous pregnant women was carried out of from November , 1st , 2018 to October, 10th , 2019 in (AL Salam) primary health care center and two hospitals (Azadi teaching & Kirkuk general) at gynecological consultation in Kirkuk city.

### Data Collection

All the women were informed about the study and their consent was obtained. The data were obtained through interview (face to face) by the researcher.

### *Instrumental*

*Socio -demographic characteristics:* Consists of the questions containing information related to primiparous women's.

*The Wijma Delivery Expectation / Experience Questionnaire (W-DEQ-A):* It is a Likert-type scale consisting of 33 items was used to investigate fear of childbirth. It has 6 subscales and each question is scored from 1 to 6 points. [9]

*Anxiety scale for pregnancy:* consist 14 items, 7 positively worded and 7 negatively worded, with items responses ranging from "not at all" (1 item) to "very much" (4 items). Developed to determine the severity of the anxiety symptoms, this scale consists of 14 questions and total scores which ranged from 14 to 56.

### *Statistical analysis*

The data were analyzed through the use application of descriptive statistical analysis (Frequency, Percentage (%) & Mean of score) and inferential statistical (ANOVA) by using (SPSS) version (23).

## Results

**Table (1) Distribution of primiparous women according to the severity level of anxiety related pregnancy**

| No. | Level of anxiety | Frequency ( f ) | Percentage (%) |
|---|---|---|---|
| 1. | Normal | 2 | 2.0 |
| 2. | Mild | 39 | 39.0 |
| 3. | Moderate | 57 | 57.0 |
| 4. | Sever | 2 | 2.0 |
| Total | | 100 | 100.0 |

**Table (2) Distribution of primiparous women according to the severity of childbirth fear used (W-DEQ) during pregnancy**

| No. | Level of childbirth fear (W-DEQ) | Frequency ( f ) | Percentage (%) |
|---|---|---|---|
| 1. | Mild fear | 94 | 94.0 |
| 2. | Moderate fear | 4 | 4.0 |
| 3. | Sever fear | 2 | 2.0 |
| Total | | 100 | 100.0 |

The table (4) show that the severity of fear of childbirth had mild fear among most primiparous women (94%) by used (W-DEQ).

**Table (3) Comparison of the anxiety level and demographical characteristics among primiparous women.**

## Discussion

The objective of this study was to determine the level of fear of childbirth and anxiety level in pregnant women. In this study, the average scores of the W-DEQ-is mild and the ASP were determined at moderate level. Similarly, in the studies by Dağlar (2014) [10] , the ASP average score and in the studies by Subaşı, et. al (2013) [11] ,the W-DEQ-A average score were found moderate and these results disagree the findings in this study. The average W-DEQ-A and ASP scores of the primiparous women with low education level and their childbirth fear and anxiety levels were found high. Similarly, in the studies by Dağlar (2014) [10] , Laursen, et. al (2008) [12] , the childbirth fear and anxiety levels were found high for the pregnant women with low education level. In this context, it may be said that the information regarding pregnancy and birth is not provided suitably for their education level.

Therefore, the self-acquired, interpreted and audited information obtained from the visiting and attending primary health care center and private clinic about pregnancy and childbirth can be associated with the decrease levels of anxiety & fear. On the other hand However, Subaşı, et. al (2013) [11] reported that PT had an effect on reducing anxiety and childbirth fear. In this study, the pregnant women with preterm labor risk (14-26weeks) had moderate level of anxiety and low W-DEQ-A scores. Likewise, Şen & Şirin (2013) [13] and Alipour, et. al (2011) [14] suggested that the preterm birth risk increased the anxiety and childbirth fear. Women with sever antenatal levels of fear of childbirth may have an high risk of experiencing fear perinatal and appraise an ongoing delivery as threatening. Given the positive relationship between fear of childbirth and general symptoms of anxiety & depression Laursen, et. al (2008) [12] the fear of childbirth among primiparous women could possibly also be the result of a generalization of other anxieties. Since a biopsychosocial perspective, comprising several etiological factors, is typical for clinical anxiety, a complex etiology also for child-birth related anxiety would be of no surprise. In discard the anxiety and childbirth fear, psychological factors such as social and spousal support are high important (Sani, 2015) [15] . In this study, the anxiety level mean scores of the primiparous women with no social support other than their spouses were found low. Likewise, high anxiety and childbirth fear were found in the women with mild spouse support (Gao, et. al 2015) [16] and who were unsatisfied with their spousal support (Lukasse, et. al, 2011) [17] . The data of this sample, it can be said that spouse presence alone is not sufficient, they do not know the ways to cope with anxiety and fear, their education is incomplete, they also have childbirth fear and cannot perform intervention appropriately. In the limited studies carried out about the spouses, it was reported that fathers also have the birth fear (Hildingsson, et. al , 2014 [18] ; Bergström, et. al , 2013 [19] ). The level of birth fear, according to the average score of W-DEQ-A was low in those with extended families. In this study, it can be said that traditionally-structured family factor has an important place in the process of pregnant women and childbirth. When reviewed the studies parallel to this study, Laursen, et. al (2008) [12] found that the surplus of social support reduced the fear of birth and (Gao, et. al 2015) [16] , Şen & Şirin (2013) [13] reported high level of anxiety and birth fear in those with inadequate social support.

It was found that there was a relationship between the anxiety and fear of childbirth (Spice Jones, et. al, , 2009) [20] and the pregnant women with sever anxiety level had 2.4 times more childbirth fear. But in this study, the total W-DEQ-A score was mild, and the anxiety level scores also moderate. Saisto, et. al, (2001) [21] emphasized that anxiety is an important determinant in the increase of childbirth fear. Similarly, Subaşı, et. al (2013) [11] found a significantly positive relationship between the average W-DEQ-A and anxiety scores.

## Conclusion

The study detected a severity of the anxiety related pregnancy was moderate, and level of fear of childbirth was mild. Also founds a significant relationship between anxiety level and age of primiparous women. A non-significant relationship between fear of childbirth and socio-demographical characteristics among primiparous women. It is important for perinatal health caregivers (midwives and nurses) to ask pregnant women about their feelings related to the current pregnancy, childbirth, and future motherhood, and to give women who express fears an chance to discuss them, paying special attention to nulliparous women with negative experiences of earlier pregnancies. Training pregnant women about

childbirth can provide them with behavior control, development of positive feelings, an increase in the self-confidence and improvement in the birth process and its outcomes. Interventions should be proceed in high-risk women considering psychological variables

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Psychiatric & Mental Health Nursing, Iraq and all experiments were carried out in accordance with approved guidelines.

# Effectiveness of an Educational Program on Nurses' Knowledge and Practices Concerning Nursing Care for Critically – Ill Patients at Critical Care Units in Misan Governorate Hospitals

**Aqeel Azeez Arrar[1], Suad J. Mohammed[2]**

*[1]MSc. Lecturer, Adult Nursing Department- College of Nursing/ University of Misan, Iraq, [2]Assistant Prof., Adult Nursing Department - College of Nursing/ University of Baghdad*

## Abstract

**Background:** Nursing care for critically ill patients includes the implementation of basic care tasks intended to enable patients to perform daily life activities. Critical care nursing provide specialized care to patients experiencing a life threatening or potentially life threatening illness. This care is complex, intensive and continuous.

**Objective:** The study aim to evaluate the nurses' knowledge and practices concerning nursing care for critically – ill patients at critical care units, and to construction of educational program.

**Methodology:** A quasi experimental design has been carried out in intensive care unit at Shaheed Al - Sadder teaching hospital and Al Zahrawi surgical hospital started from the 26th of June 2018 to the 30th of October 2019. Select purposive sample comprised of 60 nurses is divided into two groups equally, study group were exposed to the nursing educational program, and control group.

**Results**: The study reveal that the majority of nurses had moderate level knowledge and practices in pre test towards nursing care for critically- ill patients for both groups (study and control), total mean are with regard to knowledge (mean of study group = 0.45 and control group) = 0.42), and in practice (mean of study = 1.86 and control = 1.85). while for post-test presented improve in study group were (mean of the study = 0.83 and control = 0.42) with regard to knowledge, (Study mean = 2.62 and control group = 1.84) for practices.

***Keyword :*** *Effectiveness; Education Program; Nurse; Knowledge; Practice; Nursing Care; Critically – ill Patients; Critical Care Unit.*

## Introduction

The nursing care for critically ill patients includes the implementation of basic care tasks intended to enable patients to perform daily life activities as well as advanced care tasks that support health recovery or the maintenance of clinical conditions. Patients who are hospitalized in critical care settings require nursing care to meet their basic needs. These interventions are integrated as indicators of patient outcomes and quality of care in critical care units [1] . The care that critically ill patients received at the end of life in critical care units is highly dependent on critical care nurse's knowledge and skills [2]. Attributes required to practice include advanced knowledge, critical thinking, advanced problem solving, leadership, advocacy and judgment [3]. The most of patients in the critical care unit are usually on mechanical ventilation and are not oriented properly or they are comatose. Therefore, providing care to patients in intensive care units requires an empowered nursing workforce who is equipped with contemporary knowledge, vigilance and expertise [4] . A Critical Care Nurse is one of the roles of a broader group of nurses called Clinical Specialists. Also called Critical Care Registered Nurse and Intensive care nurses, the exact term used will depend on area of specialization and

training. Although the scope of practice for a CCN varies by state as defined by the state board of nursing, a critical care nurse most commonly provides evidence based nursing care to deliver advanced care in intensive care, critical care and coronary care units [5]. The nurses should understand that the unique physiological, psychological, and emotional problems that arise in critically ill patients require a delicate balance between the scientific, technical, and humane components of nursing care [6]. Within this context of intensive care, the nursing contribution involves meticulous observation and skilled intervention, the provision of basic hygiene, nutrition and prevention of harm, as well as the provision of emotional and psychological support to both the patient and their families [7].

## Methodology

A quasi- experimental design was used to achieve the aims of this study, with the application of pre and post-test approach for both study and control groups. This study applied in Misan governorate hospitals in critical care units at Shaheed Al - Sadder teaching hospital and Al Zahrawi surgical hospital and started from the 29th of June 2018 to the 30th of October 2019. A non-probability (purposive) sample consisted of ( 60 ) nurses have been selected to obtain representative and accurate data. The size of sample was divided into two groups randomly, each one consisted of (30) nurses as the study group was exposed to an educational program while the control group was not exposed. The study instrument was adopted and developed by the researcher to evaluate the nurses' knowledge and practices concerning nursing care for critically – ill patients, it consisted of three parts: First part. Self-administered questionnaire sheet related to socio-demographic characteristics of the nurses consisted of (7) variables, which included name of hospital, age, gender, achievement education, years of experience in nursing , and years of experience in the critical care unit and training sessions. Second part: questionnaire sheet is assessment nurses' knowledge, it was composed of (43) questions in four domains(general information about intensive care nursing consisted of (4) items, Standard measurements for infection control in the critical care units consisted of (6) items, nursing care for critically – ill patients undergoing mechanical ventilation consisted of (20) items, and medications and solutions used in intensive care unit consisted of (13) items). Each question comprised of (4) alternatives for multiple choice. The questions were scored as correct (1) point and incorrect (0) point. Scores of response are categorized according to the following : Poor knowledge = (> 0.33): 1; Fair knowledge = (0.33-0.66):2; Good knowledge = (0.67-1.00):3.

Third part: questionnaire sheet checklist to evaluate nurses' was composed of (74) items divided into three domains (one domain:(7) items nurses' practices related ethical and legal considerations in the intensive care unit, two domain: (10) items related to the Standard precautions for infection control in the critical care unit, and three domain:(57) items related to nursing care for patients undergoing mechanical ventilation is in accordance with body systems and divided in eight subdomains nursing care for the following :( respiratory system (18) items, cardiovascular system (6) items, nervous system (5) items, digestive system (5) items, urinary system (6) items, skin and avoid the occurrence of bed ulcers(7) items, musculoskeletal system (4) items, and Psychosocial (6) items). These items were rated according to the Likers' scale; always (3) ; sometimes (2); and never (1).

## Results

**Table (1): Overall Evaluation of Nurses' Knowledge Concerning Nursing Care For Critically – ill Patients in the Study and Control Group at Pre and Post Test**

Regarding the nurses' practices regarding eye care in critically ill patients, it was found that nurses' practices scores were unsatisfactory [15]. The nurses' practices regarding body fluid balance assessment through observational checklist it revealed that percentage of satisfactory practice improved post structured educational program [16] . Finding of table-5- reveals that all nurses in both groups at pre-test period had same evaluation level for the nurses' practices, and also in the post test to the control group are accounted mean score (1.86); (1.85) & (1.84) respectively were have fair level, while post test to the study group is accounted mean score (2.62). Also results is showed, there are high significant differences( between pre and post tests of study group, and as well as post- test between study and control group) in all domains for nurses' knowledge related to nursing care for critically –ill patients. while shows that there are no significant differences between (pre and post-tests of control group, and pre-test between study and control group).. The study showed that, there was highly statistically significant relation between total nurses' knowledge score and practices level regarding pre and post program implementation, this means that when knowledge increased, the competent nursing practice increased [17].

## Conclusions

Illustrated from this study not all intensive care unit nurses were trained adequately on the nursing care guide in the intensive care unit approved by the Iraqi Ministry of Health which was prepared by Hammam Mithaq, ( 2017). The findings of the present study show that nurses' knowledge and practices were in moderate level at pre test regarding the nursing care for critically – ill patients at critical care units in Misan governorate hospitals.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the College of Nursing and all experiments were carried out in accordance with approved guidelines.

# Genotyping Tinea Capitis Fungi based on Barcoding ITS rDNA Marker

**Falih Hasan Mohammad Alkhafaji[1], Hiba Jabur Sallal[2], Zaidan Khlaif Imran[2]**

*[1]Arabic Board Certificate in Dermatology and Venereology, Ministry of Health, Babylon Health Directorate, AL-Sadiq Teaching Hospital, Hilla, Iraq, [2]Biology department, All women college of Science, University of Babylon,Babylon province, Hilla, Iraq*

## Abstract

The study included isolating and diagnosing of Tinea capitis fungi isolated from clinical samples who are visited the outpatient clinics in Babylon / Hilla province. 50 samples were collected 40 clinical samples (hairs and scales), and 10 hair samples as control group. The results showed that: numbers of dermatophytes fungi were identified based on microscopic and Molecular criteria. *T. mentagrophytes, T. tonsurans, M. audounii, M. canis*. . Also two yeast species were identified: *Candida albicans, Candida parapsilosis*.

***Key words:*** *Tinea capitis, Genotypes, ITS rDNA.*

## Introduction

Tinea capitis is a scalp skin-attacking disease that attacks hair follicles and shafts , also causes eyebrow and eyelashes infection. The disease is regarded a shallow mycosis or dermatophytosis form. Several synonyms, including scalp ringworm and tinea tonsurans, are used [1]. The disease possess a health risk due to its ability to change patterns and high prevalence among children after pyoderma [2]. Poor economic and social status and poor hygiene are all associated with infection, in addition there are three factors that help to increase the disease: moving from pets to the house, early identification of suspected pests, incubation period of weeks is infectious but asymptomatic [3]. The aim of study conduct molecular typing of suspected fungi were associated with Tinea capitis samples, and those isolated from patients who are visited the outpatient clinics.

## Material and Method

**Collection of Specimens:**

A 40 hair and scalps samples were collected in this study from all patients diagnosed with head lesions (outpatient clinics). After that, the infected area was sterilized with 70% alcohol to remove the bacteria. Hair samples were collected using forceps and skin scraps from the scaly edge of the area using a surgical blade. The sample was transferred to the laboratory in sterile filter paper.

**Cultivation of Samples:**

All clinical samples collected were cultured on SDA agar media that containing chloramphenicol (250mg/l), Streptomycin (150mg/l) and cyclohexomide (250mg/l) then all samples incubated at (28-30°C) for two weeks. Then after the result of culture appeared the samples were examined morphologically from where the color of colony, shape, texture and reverse pigment. Then maintained the samples by using a screw-cup slant on SDA and preserved during the study [4].

All samples that give positive results of Tinea capitis purified by taking a pure colony from culture media that obtain a mixed culture.

**DNA extraction:**

The isolates of yeast and filamentous fungi under interest were subjected to DNA extraction. In brief; a loop full of yeast colonies and tiny portion of mycelia

**Corresponding author**
**Falih Hasan Mohammad Alkhafaji**
E-mail: ex.Falkhafagy@yahoo.com

were suspended in the lysis buffer supplemented by Promega Yeast Extraction Kit (USA) and following up the extraction steps based on the instruction of this Kit. A dry DNA pellet dissolved in diluted rinse and preserved in - 20 °C until use [5-8].

The genomic DNA was extracted according to Imran and Al.Shukry (2014); The PCR procedure was as previously described by [5-7].The universal primer pair used in this study was ITS5/ITS4 Forward: (5′-GGAAGTAAAAGTCGTAACAAGG-3′) and Reverse (5′-TCCTCCGCTTATTGATATGC-3).

**Sequencing of Selected PCR Product**

A 10 dermatophyte isolates PCR products were sent to Korea's Macrogen Laboratory and obtained the positive sequence information for various species. The sequencing findings were subjected to multiple sequence alignment with reference strains deposits in GenBank for identification.

## Results and Discussion

**Prevalence of dermatophytes among Tinea capitis sufferers:**

A total of 50 samples, 40 samples (hairs and scales ) were collected from different age and genders of patients with Tinea capitis and 10 samples were collected by the same techniques from likely healthy persons (as control samples), the clinical specimens were collected from private clinics in Babylon province. Identification results based on cultural and microscopic methods showed that 35 (87.5%) of 40 clinical samples were positive cases. The majority of the patients were males 57.14 % (20/ 40) while, 42.85 % (15/40) specimen from females. While only one specimen shown positive out of 10 samples from control group.

**The relations between the infection and age for both genders:**

It had been registered the number and percentage of infected patients by Tinea capitis , depending on gender and age ,table (1) had shown the significant difference between genders and infection with this disease , the number of males (20)( 57.14%) and the number of females reached (15)( 42.85%) to the consultative of the dermatology .

It was clear from the current study, males infection with Tinea capitis was (57.14%) while in females (42.85%) it was found existence of significant differences of the infection in both sexes agreed with results of other researchers outside of Iraq, including Sehagal *et al*.,(1985) in the city of New Delhi, India, Ayaya *et al*.,(2001) in Kenya ,and Ali-Shtayeh,(2002) in Palestine and Morar *et al*.,(2004) in South Africa , Wani *et al*.,(2006) in Kashmir, who found that Tinea capitis affects males more than females in their studies.

**Table (1) Distribution of age and gender among patients of Tinea capitis.**

| Age/year | Gender | | | | Total Infection | |
|---|---|---|---|---|---|---|
| | Male | | Female | | | |
| | Number | percentage | Number | percentage | Number | percentage |
| 1 – 10 | 16 | 45.71% | 14 | 27.08% | 30 | 85.71% |
| 11 – 20 | 3 | 8.57% | 0 | 0% | 3 | 8.57% |
| 21 - 30 | 1 | 2.85% | 0 | 4.16% | 1 | 2.85% |
| 31 – 40 | 0 | 0% | 1 | 2.85% | 1 | 2.85% |
| Total | 20 | 57.14% | 15 | 42.85% | 35 | 100% |

Phenomenon of wearing veil by female may help in the reduction of the infection and transmission. This result was approached with reached Ali, (1990), who had the highest infection rate among people aged between (5-10) years, and by Abbas (1995), the highest infection rate among people aged 6-9 years.

**The Identified fungi:**

A total of 6 fungal isolates have currently been identified based on evidence of morphological, microscopic, and molecular analysis. The dermatophytes were: *T. mentagrophytes, T. quinckeanum, T. tonsurans, M. audonii, M. persicolor, and M. canis.* Also, two *Candida* spp. were *C. albicans, C. parapsilosis.*

**Table (2): Fungal isolates from hair infected with Tinea capitis.**

| **Fungal isolates** | **No. of isolate ii i isolates** | **Percentage of frequency** | **Males (%)** | **Females (%)** |
|---|---|---|---|---|
| M. audounii | 19 | 54.28% | 10(28.57%) | 9(25.71) |
| M. canis | 2 | 5.71% | 2(5.71%) | 0(0%) |
| M. persicolor | 9 | 25.71% | 4(11.42%) | 5(14.28%) |
| T.mentegrophytes mentagrophytes mentagrophytes mentagrophytes mentagrophytes mentagrophytes | 1 | 2.85% | 1(2.85%) | 0(0%) |
| T. quinckeanum | 1 | 2.85% | 0(0%) | 1(2.85%) |
| T. tonsurans | 3 | 8.57% | 3(8.57%) | 0(0%) |
| Total | 35 | 100% | 20 (57.14%) | 15(42.85%) |

Table 2 shows the types of dermatophytes isolated from the human, the most common isolate predominant was *M. audonii which* represent 19 (54.28%) of cases followed by *M. persicolor* 9 (25.71%). It showed the presence of differences between sex and species of the fungi isolated.

**Molecular identification**

The results genotyping of 12 dermatophytes under interest based on the rDNA region ITS1-5.8S-ITS2, 28S partial sequence shown deferent genotypes. The dermatophytes were: *Microsporum* spp*; Trichophyton* spp. shown in Figure (1).

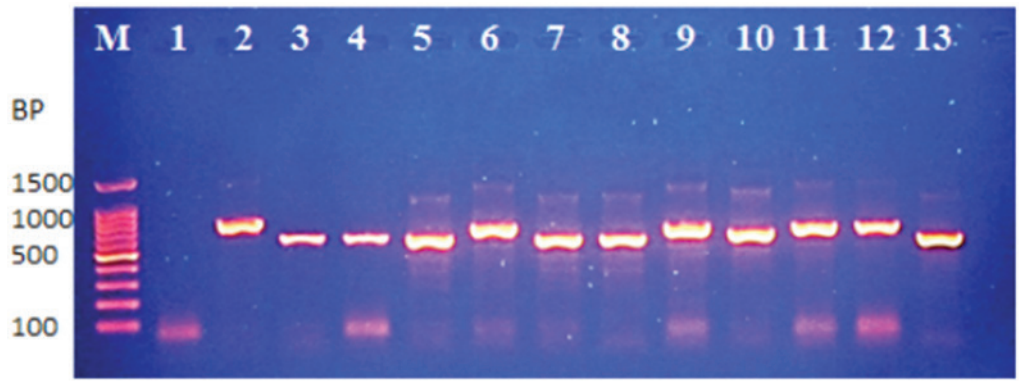

**Figure (1): Profile gel electrophoresis of PCR products of 12 dermatophyte isolates of fungi amplified by ITS5/ITS4 primer: Lanes (left to right): isolate of 1- negative control; 2-,***M. audouinii* **(800 bp and; 3-5** *T. mentagrophytes***(780 bp ); 6-** *Candida*

***parapsilosis* (600bp) [9] ; 7 - 9** *T. queckanum* **(700 bp) ; 10-11 -** *T. tonsurans* **( 700 bp ) ; 12 -** *M. persicolor* **( 700 bp ), these results according to sequence analysis ; 13 -** *Candida albicans* **(500 bp ) [9] ; Molecular M (100bp for each step.). 1.6% agarose gel at 70 volt for one hour.**

There are high variations in PCR products among of fungi under interest as in used ITS5 / ITS4 as primer pair for amplification of ITS1-5.8S-ITS2, 28S region with primers flanking region, consider good barcoding region due to high variation for another ward the amplification of this region show high polymorphism in PCR product. (*M. audouinii, M. canis, M. persicolor, T. mentagrophytes, T. queckanum, T. tonsurans*) these range not always require for other specific genetic analysis. [9]

**DNA sequence analysis:**

About16 µl of PCR products were sent to Macrogen Laboratory in Korea for sequencing analysis. After the sequence results had been obtained, each sequence alignment with the sent isolate's nitrogen bases sequence. They correspond to reference sequencing samples in the gene bank using NCBI Blast Nucleotide.

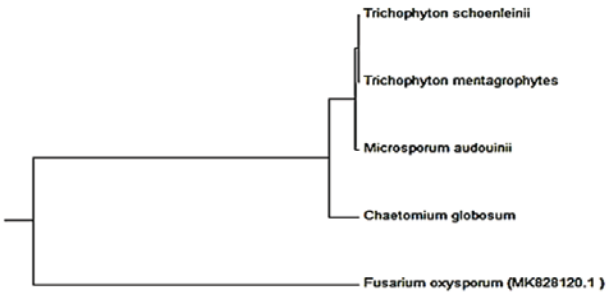

**Figure (3): Phylogeny construction for all identified isolates based on sequence charts with one reference strain (marked with the accession number, while our isolates have full names).**

## Conclusion

Conclusion of this study gave attention that particular study about Tinea capitis more producible in their result compared with survey studies of dermatophytes fungi in whole human body.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Ministry of Health and all experiments were carried out in accordance with approved guidelines.

# Encrypt Medical Image using CSalsa20 Stream Algorithm

**Kian Raheem Qasim[1], Sara Salman Qasim[2]**

*[1]Lecturer, University of Information Technology and Communications, [2]Assist. Lecturer, University of Middle Technical - Mansour Technical Medical Institute - Computer & Internet Center. Sarah*

**Abstract**

As a result of the tremendous development in the field of information technology and the internet and exposure to a flood of violations to circumvent and steal information organized and unorganized. The urgent need for the emergence of data protection technologies and data encryption techniques. As a result of the tremendous development in the field of information technology and the internet and exposure to a flood of violations to circumvent and steal information organized and unorganized. The urgent need for the emergence of data protection technologies and data encryption techniques one of these methods, The Salsa20 encryption stream and all of its reduced versions Salsa20 / 7 and Salsa20 / 12 are among the fastest stream ciphers today. In this paper, the Salsa20 method is therefore improved by adding a new variable by using chaos theory which can achieve faster propagation than the original Salsa20 and has been applied by encrypting medical images that need confidentiality because some patients do not want anyone to know about a disease so the patient's medical data is encrypted and no one can access it. This method has been tested and measured with the original Salsa20 with a series of tests. Most tests show that the proposed messy salsa is faster than the original salsa.

***Keywords***— *salsa20, medical image, chaotic map.*

## Introduction

In clinical computer systems, medical images are critical and sensitive information [1]. To transfer medical images through a nonsecurity network, a reliable encryption algorithm must be developed. Among the three main features of security services (CIA),the most important characteristics of the exchange between doctors of medical images are confidentiality [2]. It is important to protect the confidentiality of image data from unauthorized access in conjunction with the rapid development of electronic data exchange [3]. Violations of security can affect the privacy and reputation of users. Data encryption is therefore widely used in open networks such as the Internet to ensure security [4]. Due, to the, significant increase, in digital data transmission via public channels, digital image security has become more popular and attracting a great deal of attention in the modern digital world. Throughout our culture, the advancement of multimedia technology has enabled digital images to play a greater role than conventional documents, which require serious privacy protection for all applications [5]. Each data type has its own advantages, so different techniques must be used to protect confidential image data from unauthorized access. Most, available, encryption algorithms use text data. Nevertheless, it is not feasible to use traditional methods of encryption due to the large data volume and real-time requirements. The last major trend is therefore to reduce the computational requirements for stable multimedia distribution [6]. Several authors have suggested various image coding schemes to overcome problems with image coding [7]. A classification of the schemes proposed in open literature is provided in [8]. In this paper, we, scanned the image encryption application for Salsa 20. Salsa20 has an interesting complete structure that appears to be a good choice for encoding images. A series of tests were used to justify the visual coding efficiency of Salsa20

**Salsa20 Algorithm**

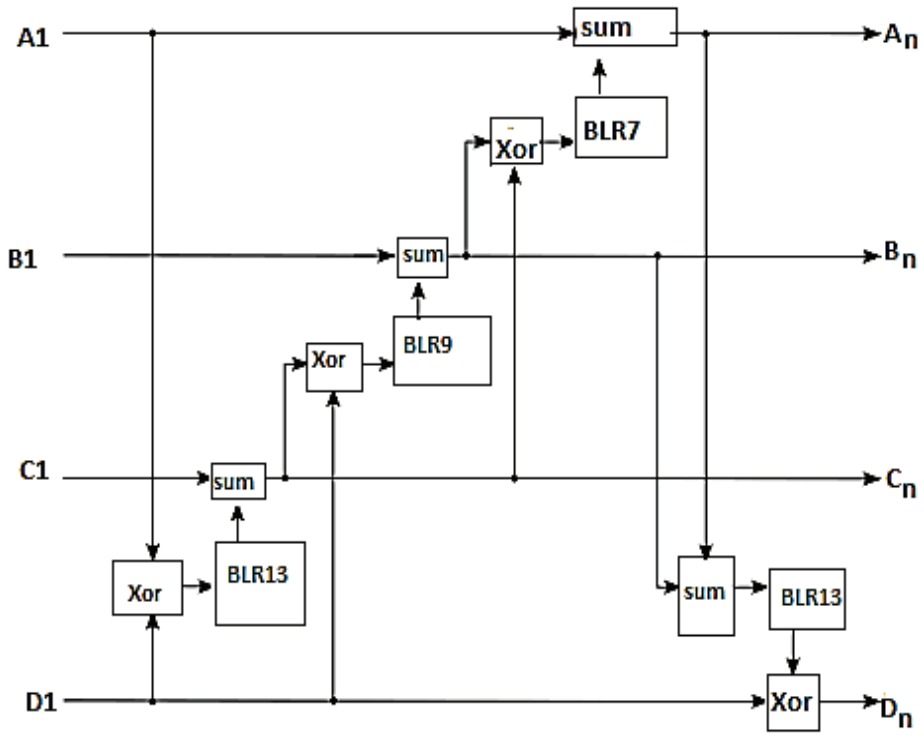

**Figure (1) salsa20 work**

**Salsa 20 is a stream cipher designed depend on rotation operations 32-bit addition, and adding 32-bit bitwise (XOR). The salsa algorithm assigns block size 4 X4 to consist of a key (256-bit), nonce (64-bit), position (64-bit), and four output key constant from (32 to 512) bits. The Salsa20 core is a hash function for 64-byte input and 64-byte output that is stream cipher that works in counter mode. The producer of the 64-byte keystream through hash key, block, nonce, and the results are XOR operation with 64-byte plaintext. The Salsa20 hash function indicates a quarter function. In the figure (1), shown the method Salsa20 works, where you perform several operations that will be explained later. Where this method is implemented on the image and to implement it will need several stages first generating the key using the method of Salsa and encrypt the image through it.**

### Salsa20 operation

Salsa20 algorithm includes several processes the functions offered in order from lower-level to a higher level that is more complexity:

### 1.Summation between Two words

Add four byte words are indicated through of $a + b$ algorithm and divided result into a parameter of $2^{32}$ (thus, can be stored that the maximum value that in a single word). The summation of the words $a$ and $b$ is equal $((a + b) \bmod 2^{32})$. $((a + b) \bmod 2^{32})$. The result is a valid word of 4 bytes long.

### 2.Xor Operation between Two Words

Xor Operation is referred to for two words of 4 bytes in the description of the methods as *a XOR b*. To perform an XOR add-in, comparison *bit by bit* between two words, and the addition of XOR is executed for each pair. The consequence is an accepted word length of 4 bytes.

### 3.Binary Left Rotation

Left bit rotation of the word 4-byte wrd is indicated in the algorithm as ***wrd <<< at***. Move left-most to the positions rightmost. The rotation of the bits to the left can be represented by a word of 4 bytes in the form of multiplication: $(\mathbf{2^{at} \cdot wrd \bmod (2^{32}-1)})$. The results are an accepted word 4-byte long.

**4.Function of Quarter Round**

In this method take four words for input and return other string of four words.

If v is a four words input:

$v = (v_0, v_1, v_2, v_3)$

The function can be defined as:

Quarter (v) = $(u_0, u_1, u_2, u_3)$

Where:

$u_1 = v_1$ Xor $((v_0 + v_3) <<< 7)$

$u_2 = v_2$ Xor $((u_1 + v_0) <<< 9)$

$u_3 = v_3$ Xor $((u_2 + u_1) <<< 13)$

$u_0 = v_0$ Xor $((u_3 + u_2) <<< 18)$

Quarter functionality may be implemented, without having to allocate any Extra memory. First, u1 alteration to v1, then u2 alteration to v2, the next u3 alteration to v3, and u0 alteration to v0. This method is reversed cause of the above adjustments are reversible.

**5.Function of Row Round**

This method takes input 16 words and convert it and return a 16-word string. The method similar to the column round function but doing different order of words.

If u input 16-word:

$u = (u_0, u_1, u_2, ..., u_{15})$

The method can be defined as:

Row round (u) = $(v_0, v_1, v_2, ..., v_{15})$

Where:

$(v_0, v_1, v_2, v_3)$ = Quarterly $(u_0, u_1, u_2, u_3)$

$(v_5, v_6, v_7, v_4)$ = Quarterly $(u_5, u_6, u_7, u_4)$

$(v_{10}, v_{11}, v_8, v_9)$ = Quarterly $(u_{10}, u_{11}, u_8, u_9)$

$(v_{15}, v_{12}, v_{13}, v_{14})$ = Quarterly $(u_{15}, u_{12}, u_{13}, u_{14})$

The square matrix displayed 16-word inputs:

| | | | |
|---|---|---|---|
| $u_0$ | $u_1$ | $u_2$ | $u_3$ |
| $u_4$ | $u_5$ | $u_6$ | $u_7$ |
| $u_8$ | $u_9$ | $u_{10}$ | $u_{11}$ |
| $u_{12}$ | $u_{13}$ | $u_{14}$ | $u_{15}$ |

in the array, the Rows may be alteration at the same time. Each of them is changed through the Quarter round function.

The first row, the word is alteration order as follow:

$u_1, u_2, u_3, u_0$

The second row, the word is alteration order as follow:

$u_6, u_7, u_4, u_5$

The third row, the word is adjusted in the order:

$u_{11}, u_8, u_9, u_{10}$

Finally, words are altered in order in the last and fourth rows:

$u_{12}, u_{13}, u_{14}, u_5$.

**6.Function of Column round**

This method takes input 16 words and returns the sequence of 16-word. The method similar to the Row round function but doing different order If u is the input of 16-word:

$u = (u_0, u_1, u_2, ..., u_{15})$

The method may be defined as follows:

Column (u) = $(u_0, u_1, u_2, ..., u_{15})$

Where:

$(v_0, v_4, v_8, v_{12})$ = Quarterly $(u_0, u_4, u_8, u_{12})$

$(v_5, v_9, v_{13}, v_1)$ = Quarterly $(u_5, u_9, u_{13}, u_1)$

$(v_{10}, v_{14}, v_2, v_6)$ = Quarterly $(u_{10}, u_{14}, u_2, u_6)$

$(v_{15}, v_3, v_7, v_{11})$ = Quarterly $(u_{15}, u_3, u_7, u_{11})$

The square matrix displayed 16-word inputs:

| | | | |
|---|---|---|---|
| $u_0$ | $u_1$ | $u_2$ | $u_3$ |
| $u_4$ | $u_5$ | $u_6$ | $u_7$ |
| $u_8$ | $u_9$ | $u_{10}$ | $u_{11}$ |
| $u_{12}$ | $u_{13}$ | $u_{14}$ | $u_{15}$ |

in the array, Columns may be alteration at the same time. Each of them is changed through the Quarter round function.

The first column, the word is alteration order as follow:

$u_4$, $u_8$, $u_{12}$, $u_0$

The second column, the word is alteration order as follow:

$u_9$, $u_{13}$, $u_1$, and $u_5$

The third column, the word is alteration in order:

$u_{14}$, $u_2$, $u_6$, $u_{10}$

The last four columns, the word is alteration in order:

$u_3$, $u_7$, $u_{11}$, $u_{15}$

**7.Function of Double Round**

This method input 16 words and returns the sequence of 16-word.

If x is input of 16-word, then the Function is defined as follow:

***double round (u) = row round (column round(u))***

**8.Function of Little Endian**

This method can be changed the sequence order is 4 bytes.

If bt is 4byte sequence:

$bt = (bt_0, bt_1, bt_2, bt_3)$

then the method definition as:

$$\text{little endian (bt)} = bt_0 + 28bt_1 + 216bt_2 + 224bt_3$$

The function of little-endian is reversible. It simply modified the word order of bytes.

**9.Function of Salsa20 Hash**

The Function of Salsa20 Hash takes input 64 bytes and returns the sequence of a 64-byte.

If the input is 64byte sequence

input = $(bt_0, bt_1, bt_2, ..., bt_{63})$ Then 16 words are created

$wd_0$ = little endian$(bt_0, bt_1, bt_2, bt_3)$

$wd_1$ = little endian$(bt_4, bt_5, bt_6, bt_7)$

[...]

$wd_{15}$ = little endian$(bt_{60}, bt_{61}, bt_{62}, bt_{63})$

$(u_0, u_1, ..., u_{15}) = \text{double round}^{10}(wd_0, wd_1, ..., wd_{15})$

$$\text{Output} = lE^{-1}(u0 + wd0) + lE^{-1}(u1 + wd1) + \ldots + lE^{-1}(u15 + wd15)$$

**10.Function of Salsa20 Expansion**

The Function of Salsa20 Expansion takes two bytes' sequences. The first sequence maybe 16 or 32 bytes and the second sequence (N) is 16 bytes long. The method returns a sequence other than 64 bytes. If 32-bytes long represent the first sequence, then divided 16 bytes of two shorter sequences ($T_0$ and $T_1$). The definition of function Salsa20 expansion by utilizing the function of the Salsa20 hash, as shown below:

Salsa20 Expansion $T_0$, $T_1$(N) = Salsa20 Hash ($at_0$, $T_0$, $at_1$, N, $at_2$, $T_1$, $at_3$)

where:

$at_0$ = (97,120,101,112), $at_1$ = (32,51,100, 110)

$at_2$ = (121, 98, 45, 50), $at_3$ = (101,107, 32,116)

If 16-bytes long (T) represent first sequence, then Function definition by utilizing the Function of Salsa20 Hash as below:

Salsa20 Expansion T(N) = Salsa20 Hash ($bt_0$, T, $bt_1$, N, $bt_2$, T, $bt_3$)

where:

$bt_0$ = (97,120,101,112), $bt_1$ = (32,49,100, 110)

$bt_2$ = (121, 98, 45, 54), $bt_3$ = (101,107, 32,116)

The vector of constant values ($at_0$, $at_1$, $at_2$, $at_3$) means32-byte T' expansion in ASCII code. Similarly, the second vector of constant values ($bt_0$, $bt_1$, $bt_2$, $bt_3$)

means 16-byte T' expansion in ASCII.

### 4. Chaotic Function and Logistic Map

Chaotic maps usually utilized in the investigation of dynamical frameworks [13]. Every now and again, Chaotic maps produce fractals. In spite of the fact that a rehashed procedure may develop the fractal, a few fractals are considered assets as opposed to regarding maps that produce them [14]. Thisais on theagrounds that there are many different iterative methods to generate a similar fractal. The logisticamap is a simple quadratic mathematical polynomial demonstrating complex chaoticabehavior. due to its simplicity, the logistic map remains useful as a testbed for new ideas in the theory of chaos and for the application of chaos in cryptography [15]. The basic form of the logisticamap can be mathematically interpreted, as shown in Eq. (1):

$$X_{n+1} = rx_n(1 - x_n)X_{n+1} = rx_n(1 - x_n) \quad \text{... (1)}$$

Where x is a stateavariableathat can, have any value between 0 and 1, and r is the system parameter that falls at the interval [1, 4]. Figure (2) shown the logistic map bifurcation diagram. The bifurcation variable r is shown on the plot's horizontal axis and the vertical axis displays the logistic function's possible long-term population values. Each of these bifurcation points is a bifurcation that doubles over time.

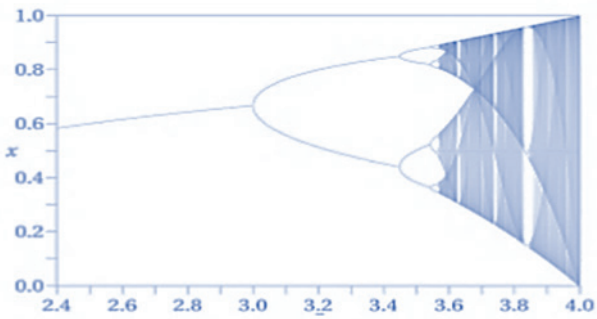

**Figure (2) Bifurcation diagram for the logistic map**

### 4. The Proposed Method of CSalsa20 algorithm

The proposed method consists of two main stages: - firstly, a random key is generated using the Salsa 20 algorithm with a logistic map secondly, encryption for the medical image after partition and return original image as shown in Figure (3).

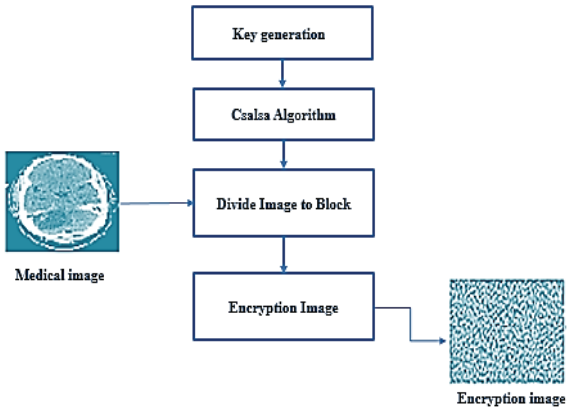

**Figure (3): Block diagram of Proposed Extraction Method**

A. Key generation CSalsa20 algorithm

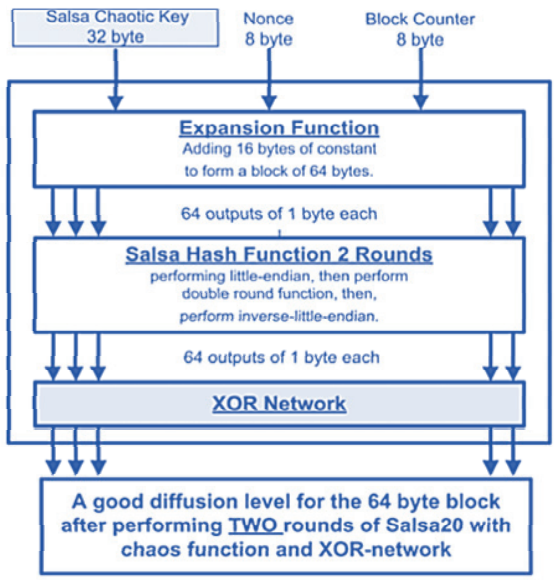

**Figure (4) System block diagram**

chaotic key generation can improve the resistance of Salsa20 against various attacks and help remove the statistical leakage that may be detected in the first rounds. The application of the chaotic logistics map to create the messy key will increase the input differences between any two successive periods from 1 bit to 33 bits because each block has four new bytes of clutter. These 33 new bits came from the 1-bit counter bit of the block, and the other new 32-bits come from the secret key's four chaotic bytes. Figure (5) illustrates how the chaotic key is produced. The first byte of the original key is the transformed integer within the [ 0, 255] range to the appropriate range for the logistic map, which falls within the [ 0, 1] range. The resulting float value is then fed as input to the logistic map. Because of its

speed, the logistic map was chosen because it has the minimum calculations needed to achieve the chaotic behaviour. The sequences of random numbers are generated. Each sequence depends on the Initial value and control parameter. The sequences are very sensitive to change of these two initial values. This consists of a series of 64-byte keys that are applied to the grayscale image after dividing this image into a set of blocks (8*8) where each block of the image takes 64 bytes of the key and then work on the rest of the block, but every time it is encrypted with a key, the current keys are combined with the previous using Xor so that the current key is more random and continue this process for all blocks.

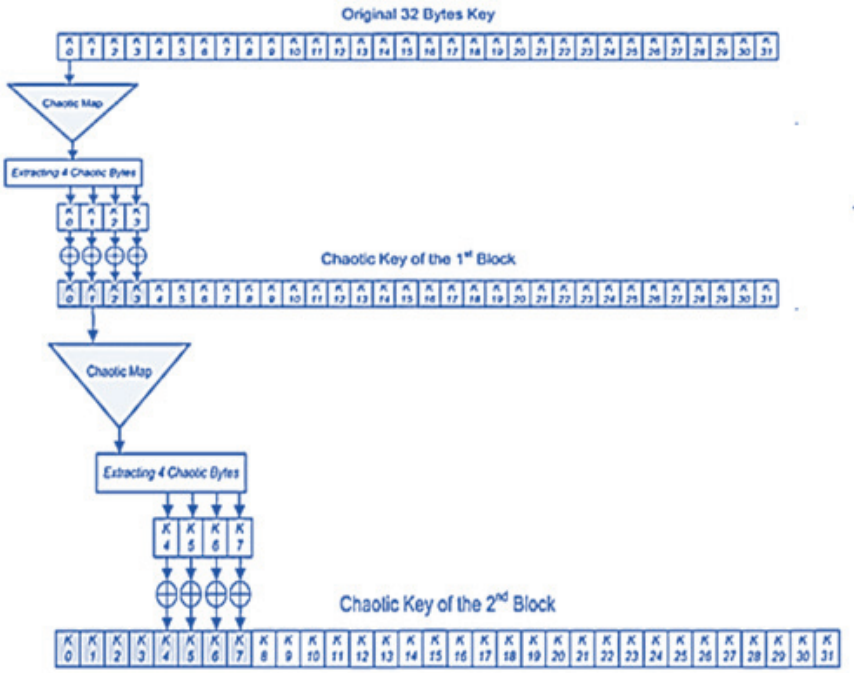

**Figure (5) key generation**

B. Encryption Medical Image

Generate a random block by a CSalsa20 algorithm these blocks important when need to retrieve the image because it depends on the number of blocks and its original image. After divided image to set of blocks where each block corresponds to 64 bytes of keys after that make XOR between the key and the image. The current keys are combined with the previous make Xor operation so that the current key is more random e XOR operation and this method continues to the last block exists in the image, so the result of encryption is very strong in this case because of the diffusion of this algorithm good.

## 4. Experimental Results

The experimental results of proposed methods. The three techniques are evaluated for finding the performance of them. The stream cipher used with the key generation from all techniques to test them.

### *1.Key Generation*

key generation mixed with Salsa Algorithm to generate a requested length of keys that used for encryption. The implementation of the Logistic Map Algorithm generates also sequence of numbers (32-bit number) as shown in Table (1). these numbers are real number when used logistic map multiplied by powered 10 number, rounded and modulated with $2^{32}$ to get exactly 32-bit number.

**Table (1) CSalsa number generator**

| Key generation of CSalsa20 | | | |
|---|---|---|---|
| 347892 | 424951 | 842773 | 786421 |
| 523986 | 723765 | 262307 | 734170 |
| 546233 | 345192 | 635897 | 544215 |
| 648901 | 631182 | 827878 | 831516 |
| 241792 | 440634 | 251371 | 239573 |
| 765231 | 586234 | 734682 | 684156 |
| 905569 | 872618 | 778436 | 856498 |
| 578456 | 582236 | 647712 | 574477 |
| 459458 | 814245 | 856919 | 948034 |
| 367238 | 204838 | 460448 | 382587 |
| 802299 | 680789 | 932983 | 961345 |
| 612988 | 424949 | 562136 | 782357 |

### *2.Encryption Various Medical Image*

An encryption image by the improvement of Salsa20 algorithm that used logistic map for generated keys. It may be clearly seen that there an emerging pattern in the medical image. However, encryption image by CSalsa20, there is no evidence of any leakage in the image. This is illustrated by the histogram calculation of the image before and after encryption as shown in Figure (6).

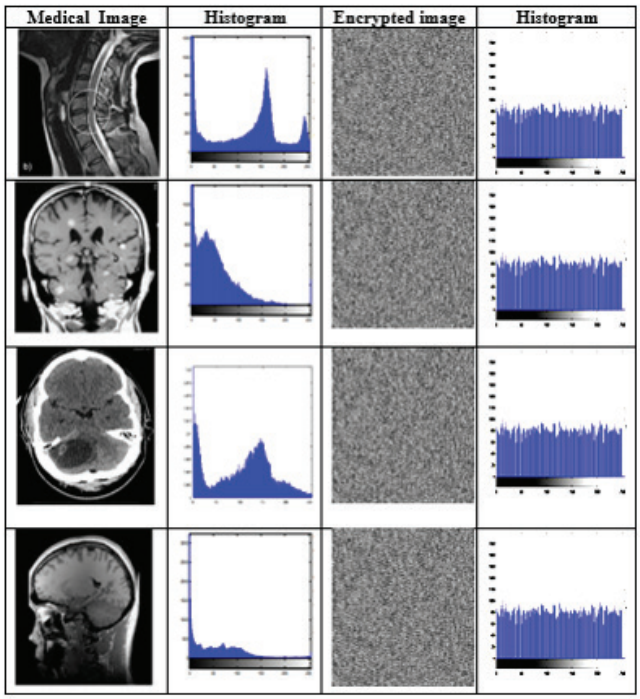

**Figure (6): the original tested images with histograms.**

## Conclusion

The suggested two-round chaotic salsa (CSalsa2) allows only two rounds of scrambling data to achieve a good rate of diffusion, making the cipher faster. A novel technique is introduced in this work to incorporate the chaotic logistic map into the Salsa20 algorithm. The XOR-network is utilized to addressatheastatisticalaleakage observed at the second round of Salsa20. The CSalsa2 proposed should reach a good diffusion rate faster than the original Salsa20, according to the speed measurements. Differential attacks infected the original reduced-round versions of Salsa20. At the inputs of any two Salsa20 sequential blocks, there is the only 1-bit difference. Moreover, the proposed chaotic Salsa model has 33-bits of variations. The widening of the input differences will reinforce the system against various types of attacks.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the University of information technology and communications and all experiments were carried out in accordance with approved guidelines.

# Evaluation of Students' Self–management and Academic Achievement in the University of Baghdad

**Basima J. Jasim**

*Instructor, Al-Kindy College of Medicine, University of Baghdad*

## Abstract

**Objective(s):** To evaluate university students' self-management and academic achievement; to compare between these students relative to their self-management and academic achievement; and to determine the relationships between these students' self-management, academic achievement and their socio-demographic characteristics in the University of Baghdad. For the period of November 2nd 2018 to May 30th 2019.

**Methods:** A descriptive design, using the evaluation and comparison approaches, is employed throughout the study. Two self-evaluation questionnaires are constructed for the purpose of the presents study. Content validity and internal consistency reliability are determined for the study instruments through a pilot study. A non-probability, purposive sample, of (80) university students is selected from the Medical Colleges, College of Engineering, College of Sciences and College of Education in the University of Baghdad. Data are collected through the use of the study instruments and the structured interview technique as means for data collection for the period of February 21st 2019 to March 20th 2019. Data are analyzed through the application of the descriptive statistical data analysis approach which includes frequency, percentage, mean, total score and range and inferential statistical data analysis approach of Analysis of Variance and Multiple Linear Regression.

**Results:** The study depicts that most of the college students experience fair to good level of self-management and good level of academic achievement.

**Conclusion:** The study concludes that students do not present differences in their self-management and academic achievement. Self-management is affected by students' gender and education and academic achievement is influenced by students' socioeconomic status

***Key Words:*** *Evaluation, Comparison, Self-management, Academic Achievement, University of Baghdad.*

## Introduction

Self-management is a key assistant for all learning (for children and adults!) for both materials and academic courses, and other content areas, or skills. Self-management allows students to follow through plans to complete the tasks, and study of the tests, and continue to focus in the classroom. In adults, it is important that the objectives of access in the field of learning, such as the development of new professional skills [(1)]. Self-management helps students become successful learner. It refers to the strategies, techniques and methods that we use to guide the activities and behaviors effectively when it comes to the study, including self-management, setting goals, planning and time management. Self-management is an essential skill that will help them throughout their lives [(2)]. Students should be invited to the learning management process in the classroom. Here are some of the tools used by many teachers to enable students to self-management [(3)]. It found self-management techniques to be more effective in student behavior management interventions mediated by the teacher. When self-management strategies are related to behavioral interventions and equal Functionally, the students increased the amount of time in the job, and showed social behaviors more convenient, and completed more tasks. Self-management interventions for student self-monitoring include: notes both the students and records the target behaviors and self-assessment: It compares the performance / her with the

specified criteria and self-education student is directed oriented student behavior through the use of personal data and setting goals: Students set a target and create a personal commitment and guidance for progress towards this goal [(4)]. Academic achievement for students is the current level of student learning. More specifically, for the purposes of each student succeed in the accountability act (ESSA), academic achievement refers to the percentage of students in the school that meets their learning standards currently classroom level or beyond. This achievement is measured using tests at the state level in math and reading. Achievement is measured also by using assessments in the case of science, but will not be used scientific assessments of accountability under ESSA. Often measure the academic achievement of the students in terms of the semester or cumulative average point for graduates (GPA) or the number of courses or credit hours that have been completed [(5)]. Research concerned with the phenomenon of academic performance of students during the learning process based on the average score points (GPA). In this regard, students' ability to control the factors that affect the learning process, which is called academic self-management affected. A successful student is regarded as the one who is able to control the factors which influence their learning process. A study is conducted to verify the role of academic self-management in improving students' academic achievement. The quantitative methodology with a simple random sampling technique is employed. The total samples are (105) students of Padjadjaran University. The results show that (78%) of the subjects possessed high academic self-management, meaning that the majority of subjects used academic self-management to control factors which influence the learning process. The final model of academic self-management can be used in order to empower students to improve their academic achievement, so that they have capital to move forward and build their future (6). Based on the early stated evidence, the present study ought to evaluate students' self-management and academic achievement at Colleges in the University of Baghdad.

## Methodology

A descriptive design, using the evaluation and comparison approaches, is carried throughout the present study to evaluate colleges students' self–management and academic achievement; to compare between these students relative to their self-management and academic achievement; and to determine the relationships between these students' self-management, academic achievement and their socio-demographic characteristics in the University of Baghdad for the period of November 2nd 2018 to May 30th 2019. The study is conducted on students at Medical Colleges (Medicine, Dentistry, Pharmacy and Nursing), College of Engineering, College of Sciences, and Ibn Al-Rushud College of Education in the University of Baghdad. A "non-probability" purposive, sample of (80) university students, is selected. The sample is comprised of (20) students from Medical Colleges (Medicine, Dentistry, Pharmacy and Nursing), (20) students from College of Engineering, (20) students from College of Sciences, (20) students from Ibn Al-Rushud College of Education. It is consisted of (40) males and (40) females and (18-27) years old. Each student, who has participated in the present study, has signed a consent form for the agreement to be involved in the study and as prerequisite for the ethical consideration. Two questionnaires, Students' Self-management (21) items and Students' Academic Achievement (20) items, are constructed for the purpose of the study throughout review of relevant literature and consultation with a panel of experts. A pilot study is carried out from January 7th 2019 to February 20th 2019 to determine the internal consistency reliability and content validity of the study instruments. The internal consistency reliability of the questionnaires is determined through the use of split-half technique and the computation of Cronbach alpha correlation coefficient. A purposive sample of (20) student is gathered for the purpose of the reliability of the study instruments. The results indicate that the correlation coefficient is ($r = 0.87$) for the self-management questionnaire and ($r = 0.88$) questionnaire to the academic achievement questionnaire. Such scores reveal that the study instruments are adequately reliable measures for the concepts underlying the present study. Content validity of the study instruments is determined by panel of (12) experts. These experts are faculty members at the early mentioned colleges in the University of Baghdad. They are provided with copies of the questionnaires and asked to review and evaluate the study instruments for content clarity and adequacy. Their responses depict that the study instruments are valid measures for the phenomena underlying the study. Data are collected through the use

of the study instruments and the structured interview technique as means for data collection for the period of February 21st 2019 to March 20th 2019. Data is analyzed by applying descriptive statistical data analysis approach which includes the frequency, percentage, mean, total score and range and inferential statistical data analysis approach which includes analysis of variance and multiple linear regression.

## Results

**Table (1): Overall Evaluation of the Colleges Students' Self–management**

| List | Levels | Frequency and Percentage |
|---|---|---|
| 1 | Poor (21–34.33) | 4 (5%) |
| 2 | Fair (34.34–43.67) | 30 (37.5%) |
| 3 | Good (43.68–63) | 46 (57.5%) |

This table depicts that most of the college students have experienced good level of self-management (57.5%) but more than one third of them have experienced fair level of self-management (37.5%).

**Table (2): Overall Evaluation of the Colleges Students' Academic Achievement**

| List | Levels | Frequency and Percentage |
|---|---|---|
| 1 | Poor (20–22.33) | 0 (0.0 %) |
| 2 | Fair (22.34–34.67) | 0 (0.0 %) |
| 3 | Good (34.68–60) | 80 (100 %) |

This table depicts that all of the colleges' students have experienced good level of academic achievement (100%).

Dependent Variable: Self-management B= Regression Coefficient, Std. Error= standard error, t= T-test, Sig.= Level of Significance

This table indicates that there is highly significant relationship between students' academic achievement and their socioeconomic status only and age is excluded out of the regression model.

## Discussion

Findings out of the data analysis indicate that most of the colleges' students have practiced fair to good level of self-management. Such findings are very obvious in the overall evaluation of colleges' students' self-management (Table 1). This can be interpreted in a fashion that the colleges' students have experienced this varied level of self-management as result of their inadequate background relative to such management. It has been reported that successful learner can achieve own learning goals through self-management. It denotes to approaches, procedures and methods that can be castoff to straight students' actions and performances efficiently. When it originates to study, self-management contains goal setting, planning and managing the time. Self-management is a main ability that will benefit students during their life [(2)]. Self-management helps students control impulses, set goals, and get organized so they can be strong self-motivators. Students who can regulate their emotions, control impulses and manage stress are more likely to identify goals and consistently meet them. The students have to be provided with goal-setting, the breadth and depth of research on the topic of self-management and how growing this skill can temper the current problem. Students will assess strategies that schools and other educators use to empower students with self-management mindsets and skills and tweak them so they are relevant to the classroom and students. While there are relatively simple self-management interventions, it is important to note that this course will not provide a cure-all methodology, but strategies and foundational knowledge to grow the students' self-management skills in the long term [(7)]. Findings out of the data analysis reveal that all of the colleges' students have experienced good level of academic achievement. Such findings are very noticeable in overall evaluation of colleges' students' academic achievement (Table 2). This can be justified in a manner that the colleges' students are well-oriented toward this achievement regardless to their educational background or colleges. Academic achievement is the current level of student learning. More specifically, academic achievement refers to the percentage of students in the school who meet the education standards currently classroom level or beyond. This achievement is measured using tests at the state level in math and reading. Achievement is measured also by using assessments in the case of science, but will not be used scientific assessments of accountability under which ESSA. Why Does Academic Achievement Matter? A standards-based education system promotes equity by establishing a baseline of knowledge and skills that all students, regardless of their background, should master as part of their education. Measuring academic achievement provides key information about students' mastery of standards. Identifying schools where many students are struggling to achieve proficiency on state tests provides a reasonable starting point when searching for schools that would most benefit from support. Looking at academic achievement data in combination with other information helps to prioritize schools for support. More broadly, academic achievement for all students is one of the key goals of the public school system, and mastery of state standards provides students with useful skills for a fulfilling and productive life. While not all aspects of achievement can be efficiently measured and compared statewide, it is important to include some measurement of academic achievement when evaluating and prioritizing support for schools. The tests used to measure academic achievement are meant to provide system-level data about how schools, districts, and the state are functioning. An individual student's scores should not be used to determine, for example, which courses they can or cannot take during their K-12 years. Schools should look at multiple sources of student-level data when planning instruction and support for individual students [(8)]. Such comparison shows that there are no differences between colleges' students' self-management (Table 3) and academic achievement (Table 4). In general, such findings present evidence that these students almost share the same level of self-management and academic achievement regardless of differences in their area of study or specialty. Analysis of such relationship indicates that there is highly significant relationship between students' self-management and their gender and education (Table 5). Such findings can be explained in a mode that the better the students' education the well they perform self-management, as well as male and female students present different application of self-management through their study. There is also a very important relationship between the academic achievement of the students and their socioeconomic status (Table 6). This can be clarified in a way that the better the students' socioeconomic status the advanced their academic achievement. A study is

looking at the relationship between socio-economic status (SES) peer academic achievement and individual. Results of the study indicate that the social status of the family, peers, in particular, has a large independent and objective academic achievement on the impact of the individual, which is only slightly less than the social status of the family of the individual [11].

## Conclusion

Most of the colleges' students experience fair to good level of self-management and good level of academic achievement probably due to their education and orientation. Colleges' students do not present differences in their self-management and academic achievement due to the level of their consciousness of such issues. Self-management, for students, is affected by their gender and education. Academic achievement is influenced by the students' socioeconomic status.

# Risk factors for Cardiovascular Diseases among Diabetic Patients attending Al Nasiriyha Diabetic and Endocrinology Center

**Qasim Ali Khasal[1], Dheyaa Kadhim Jabbar[2], Fatima J Shinjar[3]**

*[1] Lecturer, Adult Nursing Department, Faculty of nursing, University of Thi-Qar, Nasiriyah City, Iraq,*
*[2] Lecturer, Community Health Department, Nasiriyah Technical Institute/ Southern Technical University / Iraq,*
*[3] Assist. Lecturer, Adult Nursing Department, Faculty of nursing, University of Thi-Qar, Nasiriyah City, Iraq*

## Abstract

**Objective**: To determine the risk factors for cardiovascular disease among patients with type 2 diabetes.

**Methods:** The data were collected by utilization of the study instruments and employment of scheduled interview as means data collection. The data collection process was performed from July 2nd / 2019 / October 2nd/ 2019. A questionnaire was designed constructed by the researcher to measure the variable .The questionnaire consisted of3 parts which are demographical, clinical information and risk factors. The reliability of the questionnaire was determined through a pilot study and the validity through a panel of experts. The data were analyzed through the application of descriptive statistic frequency, percentage, and the application of inferential statistical procedures, which include Pearson correlation coefficient, and contingency coefficient.

**Results:** Results: The result of the study showed that the most common modifiable risk factors were low HDL-C levels (69%), smoking (40%), hypertension (46%), Overweight (57%), high triglycerides (21%), hypercholesterolemia (15%), and high LDLC (12%). All these factors were positively and significantly associated with the development of CVD. Whereas, the most common non-modifiable risk factors were age 50 years and more, sex, family history of CVD .

***Keywords:*** *risk factors ,cardiovascular diseases, diabetic patients.*

## Introduction

The International Diabetes Federation (IDF) estimates that worldwide, 415 million people have diabetes, 91% of whom have type 2 diabetes mellitus (T2DM) [1]. People with diabetes comprise 8.8% of the world's population, and IDF predicts that the number of cases of diabetes will rise to 642 million by 2040 [1]. The prevalence of T2DM has been steadily increasing over time. Using data from the Framingham Heart Study, Abraham et al. [2] noted that the overall annualized incidence rates of the disease per 1000 persons increased from 3.0 in the 1970s to 5.5 in the first decade of the 2000s. That change represented an increase in the incidence of T2DM of 83.3% and was higher in males than females by a factor of 1.61. Cardiovascular diseases, i.e. Coronary heart diseases, stroke, and peripheral vascular diseases account for the majority of deaths in diabetic patients (2). Diabetes mellitus, hypertension, cigarette smoking, dyslipidemia, obesity and physical inactivity are established risk factors for cardiovascular diseases (CVD). These risk factors are known as traditional or conventional cardiovascular risk factors (2, 3). The conventional cardiovascular risk factors have

**Corresponding Author:**

Adult Nursing Department, Faculty of nursing,
University of Thi-Qar, Nasiriyah City, Iraq;
E-mail: qasem9361@gmail.com

greater impact on diabetic patients than non-diabetics [2, 4]. The multiple risk factors intervention trial (MRFIT) showed the presence of any one, two or all three risk factors (hypertension, cigarette smoking, dyslipidemia) increased the risk of CVD death more in diabetics than non-diabetic men (RR of 4.8, 4.0 and 2.6, respectively) [4]. In view of the growing burden of diabetes and its cardiovascular complications in the developing world, it is crucial to determine the physical and metabolic characteristics of diabetic persons in this part of the world. This study was conducted to assess the prevalence of cardiovascular risk factors among diabetic patients on follow-up at the diabetic clinic of Al Nasiriyha Diabetic and Endocrinology Center.

## Material and Method

**Design of the Study:** A descriptive quantitative design was carried out through the present study in order to achieve the early stated objectives during the period from 8th of January, 2019 to the 5 th of July, 2019.

**Administration Arrangement**: After getting the approval of the council of Nursing College upon the study, the researcher submitted a detailed description including the objective and methodology (questionnaire) of the study to the Thi-qar Health Directorate ( Training and development department) in order to obtain an official permission, and was presented to AL- Diabetic Center ensure their agreement and cooperation .

**Setting of the Study :** The study was conducted at outpatient clinics in Al Nasiriyha Diabetic and Endocrinology Center, one of these Center is located in An Nasiriyah city, Thi-qar, Iraq.

Al Nasiriyha Diabetic and Endocrinology Center is the only center in Thi-qar that provides diabetic patients with education on insulin self-injection techniques. A follow-up appointment with a clinician, in addition to the low-cost services such as affordability of medications and laboratory tests once every 3–5 months, is commonly provided by this center for every registered diabetic patient.

**The Sample of the Study** : The Sample of the Study :A non-probability (purposive) sample of (100) patients was selected. All the patients who diagnosed DM and they had a medical records and attending Al -Nasiriyha Diabetic and Endocrinology Center

**Ethical consideration:** The participants in were verbally informed about the aims of the study and had been asked to participate voluntarily. They also had been informed that they can refuse to answer a certain question or withdraw from the study at any time. Emphasis was placed on creating a relaxed atmosphere during interview through the use of good communication skills with participants.

**The Study Instruments** : consisted of two major parts constructed for the purpose of the study. Part I: Socio- Demographic Data: It consists of (7) items, related to the Socio-demographic characteristics of these patients which include (age, gender, and occupational status, level of education, marital status, monthly income, and residential area). Part II: Past History: Chronic Diseases (hypertension, diabetes mellitus and others), family history which includes (high blood pressure, diabetes mellitus, and heart disease). Part III: The three part consists of the questionnaire related to risk factors, which includes four sections (diagnosis, past history, smoking and alcohol consumption, BMI measures and biochemical measures). Part IIII: This domain was measured through (3) items of physical activity (1) item, simple exercises such as (curvature, stop, a leisurely walk and Physical relaxation exercises); (1) item; moderate exercises such as (Brisk walking, shopping , move light things) and (1) items, strong exercises (Vigorous exercise ) such as (Jogging quickly , running, drive car , lifting heavy objects , exercise). These items were rated and scored by three level types option scale for each type of physical activity as (don't do (1), sometime 1-6 times weekly (2), always 7 or more time weekly (3),. The high score of physical activity domain obtained, it means higher modification by patients.

Three rating scale were used for physical activity and the first of stress management as following

$$= \frac{\text{cut of point}}{\text{no.of scale}} \times 100 = \frac{\text{cut of point}}{\text{no.of scale}} \times 100$$

$$= \frac{2}{3} \times 100 = = \frac{2}{3} \times 100 = 66.6$$

So the interval had been ranged between (66.6-100) that, represented the rate of the lifestyle modification

$= \frac{100-66.6}{3} = 11.1 = \frac{100-66.6}{3} = 11.1$

66.6 + 11.1= 77.7

66.6 to 77.7 is low lifestyle modification

77.7 + 11.1=88.8

77.8 to 88.8 are moderate lifestyle modification

88.8 + 11.1 = 99.9 = 100

88.9 to 100 is high lifestyle modification

In addition less than 66.6 is no effect

Risk factors and positive screens were determined using accepted guidelines to match comparable publications. Obesity was defined as a measured BMI of ≥30 kg/m2.20 Stress was a risk factor if the subject reported being stressed at ≥3 days a week. Alcohol abuse was defined as a male consuming ≥3 drinks/day or a female consuming ≥2 drinks/day.17 A positive screening for hypertension was defined as a systolic blood pressure ≥160 mm Hg or a diastolic blood pressure ≥90 mm Hg. Positive screen for diabetes was a random blood glucose level ≥160 mg/dL.22 Random blood cholesterol ≥200 mg/dL was a positive screen for high cholesterol.

**Conducting Pilot Study:** Before starting the data collection, a pilot study was conducted on (10) patients who have coronary artery disease for the following purposes:

Determine the reliability of the questionnaire .Estimate the time required for the data collection .Obtain the clarity and the content adequacy of the questionnaire and observation Identify the barriers that may be encountered during the data collection process

**Validity:** The validity of the instrument was established through a panel of (8) experts. who had more than five years' experience in their fields in order to achieve study objectives.

**Reliability:** results of the reliability showed very high level of stability and internal consistency of principle parts concerning item's responses' of the questionnaire, all those were calculated by using the major statistical parameter: Alpha Cronbach, revealed that the person correlation coefficient is (0.73).

**Statistical Analysis :**analysis of the data was employed through the application of the following statistical data analysis approaches: A: Descriptive statistical data analysis: including Percentage , Mean, SD, (Frequency=( F

B: Inferential statistical data analysis.

| | The strong physical activity | 46(46) | 40(40) | 14(14) | 1.68 | 59.66 | Low |

Cut of point=2, No= number, %= percentage, M.S=mean of score, R.S= relative sufficiency, low lifestyle modification = 66.6 – 77.7, moderate= 77.8 – 88.8 , high= 88.9 -100

## Discussion

The result of the present study has revealed that the prevalence of the smoking is (65% ). Even with the diabetic the (40.0 %) of patient were current smokers , and 25% were previous smokers. The report indicates that cigarette smoking increases the risk of coronary heart disease by itself. When it acts with other factors, it greatly increases the risk. Smoking increases blood pressure, decreases exercise tolerance and increases the tendency for blood to clot, (AHA, 2010). (14). Regarding alcohol consumption the present study revealed patient no consume alcohol is (98% ). , may be due to our value ,that the alcohol consumption is not continence with Muslim religion so the patient feel embarrassed to say or write. Regarding to the BMI (body mass index) the present study revealed about a third of diabetic patients, their BMI was equal and more than (25-29.9 Kg/m2). Similar result presented by (Ahmed, et al., 2018) (19). who conducted a study to Evaluation of risk factors for cardiovascular diseases among Saudi diabetic patients attending primary health care service. showed an overall prevalence of obesity were (57.7%). This difference in percentage between Iraqi people and other country may refer to high stress from siege and strong army operations through the war for many years. According to biochemistry (Lipid profile) the study shows that (15%) of the diabetic patients had total cholesterol levels of 240mg/dl or more. Significant proportions, (22% of the patients) were on the borderline high-risk levels (200-239 mg/dl). Similar result presented by (Abdosh, , et al., 2019) who conducted a study to Cardiovascular diseases risk factors among adult diabetic patients in eastern Ethiopia. showed an overall prevalence of Dyslipidemia (90.6%) (Table 4). Regarding to the triglyceride level the result of the present study shows that (21.0%) of diabetic patients had a prevalence were 200 mg/dl and more. The result demonstrated physical activity, according to relative sufficiency, the highest relative sufficiency was for mild physical activity such as (A leisurely walk, curvature, prostration ), while the lowest relative sufficiency was for strong activity such as (driving, Lifting heavy objects) that means there is no modification related to physical activity. This result may be due to the most (48.0 %) of the diabetic patients. Aged 60 years and more who already cannot do the strong exercise, or may be due the their cultured value In An Nasiriyah city, it is a sham to practice any type of sport when you become an old man may be due to the 22 percent of samples were woman, she usually spends most of time at the home.

## Conclusions

In accordance with the results of this study ,the researcher can conclude the following:

**1.** The most common modifiable risk factors were low HDL-C levels (58%) , smoking (65%) , hypertension (61%), obesity (27%), high triglycerides

(21%), hypercholesterolemia (15%), and high LDLC (12%). All these factors were positively associated with the development of CAD.

**2.** There is no modification related to physical activity where the relative sufficiency was lowest for strong physical activity than mild physical activity .

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Faculty of nursing and all experiments were carried out in accordance with approved guidelines.

# Comparative Study between the Effect of Melatonin and Hyaluronic acid on Induced Bone Defect Healing in Rabbit

**Rawaa Abdul-Jabbar Mahmood[1], Noor Abdulkareem Razouki**

*[1] Assist. Lecturer, B.D.S., M.Sc. Al-Rafidain University College, Iraq;*
*[2] Assist. Lecturer, B.D.S., H.D.D., M.Sc., Al-Rafidain University College, Iraq*

## Abstract

This study was aimed to highlight the individual effects of melatonin (MEL) and hyaluronic acid (HA) on bone healing and repair mechanism and to investigate a possible effect, for a topical application. New Zealand rabbits used in this study were divided into three groups for two healing intervals the experimental groups were: 1. Experimental groups (20 rabbits): all animals subjected to surgical operation in right tibia, creating bone defect 3mm in depth and 4mm in diameter filled with 0.1ml. Hyaluronic acid gel and left tibia bone defect filled with melatonin gel. 2. Control group (10 rabbits): induced bone defect on the right side only. Animals' scarifications were done in 2 weeks and 4 weeks' durations. Routine processing and sectioning technique was performed for histological evaluation. At the 2weeks healing interval, highest mean value of all measured parameters were recorded at melatonin group while at 4 weeks, there is high significant difference in all parameters; (p-value 0.000) among all control and experimental groups**.** A significant number of positive effects of MEL, as well as HA, as individual compounds on the bone healing regeneration.

***Keywords:*** *Melatonin, Hyaluronic acid, Bone, Rabbit*

## Introduction

Biomaterials have different groups but we focus here on the naturally derived types that present already in the body from natural origin like melatonin and hyaluronic acid [1]. It should be stable, biocompatible; ideally osseoinductive and conductive, porous and similar to biological bone mechanically [2] Melatonin is discovered and isolated by Lerner in 1958, is a natural hormone produced mainly by the pineal gland but also by other tissues and organs, such as the retina, brain, bone marrow, Harderian gland, ciliary body, lens, thymus, airway epithelium, gonads, placenta, gastrointestinal tract and skin, in a circadian manner, with the highest level during the night (between midnight and 2 a.m. for healthy adults) and a minimum during the day. [3,4]

It act as a radical scavenger antioxidant (N-acetyl-5-methoxytryptamine) which has the ability to stimulate antioxidant enzymes that neutralize free radicals and ROS. Melatonin also contributes to the maintenance of bone health by promoting osteoblast differentiation and limiting osteoclastic activity. Bone healing process consists of inflammatory, proliferative, and remodeling phase. The production of free radicles causes cell damage and distribution of bone healing process due to the production of free radicals causes cell damage and disruption of bone healing process due to the chain reactions of protein and lipid peroxidation. Melatonin participates in the physiological functions of bone cells, promotes angiogenesis and, through its free radical scavenging properties, it may also serve as a preventive agent against radical-induced hard tissue damages [5]

Hyaluronic acid (HA) is a naturally-derived polymers biomaterial. It is a major component of the extra cellular matrix (ECM) and present in nearly every mammalian tissue and fluid. It plays a role in wound healing and it has been found in high concentrations in the early fracture callus, in lacunae surrounding hypertrophic chondrocyte in the growth plate and in the cytoplasm of osteoprogenitor cells [6]. (HA) has osteoconductive potential; it accelerates the bone regeneration by means of chemotaxis, proliferation and

successive differentiation of mesenchymal cells. HA may act as biomaterial scaffold for other molecules, such as BMP-2 and TGF-β, used in guided bone regeneration techniques and tissue engineering research**.** [7].

## Materials and Method

The materials used in the present study were hyaluronic acid gel, melatonin (5mg, USA), anesthetic solution: Ketamine hydrochloride 50 mg and Xylazine 2%, formalin 10%, ethanol alcohol 96%, xylol, paraffin wax, and Hematoxylin and Eosin (H&E) stain.

Thirty male New Zealand rabbits weighting (1.5–2kg), aged (6-12) months used in this study; they were divided into control group (10 rabbits) and experimental group (20 rabbits) tibial induced bone defect(with 3mm an diameter and 4mm depth) into right tibia filled with 0.1ml Hyaluronic acid gel and left tibia bone defect that filled with melatonin gel(5mg). While the control group induced bone defect in right side only. Rabbits are sacrificed by an overdose of anesthetic solution at two healing intervals 2 weeks, 4 weeks fifteen on each period. All tissue specimens, experimental and controls were fixed in 10% neutral formalin Animals were scarified and processed in routine paraffin blocks after complete decalcification of bone. Histological evaluation was performed using light microscope (OpticaB-350, Italy). Histomorphomatrical parameters are measure the number of bone cells (osteoblasts, osteocyte, and osteoclasts), trabecular area ($mm^2$), bone marrow area ($mm^2$) and trabecular number. Measurements were performed by image processing software program (ImageJ.exe)**(8)** . Microphotographs were taken by a camera (AIPTEK HD 1080P, China) attached to the microscope at power X40.

## Statistical analyses

Data were analyzed using SPSS (statistical package of social science) software version 25. In this study the following statistics were used:

1. Descriptive statistics**:** including means, standard deviations and statistical tables and figures.

2. Inferential statistics: including:

a) One-way ANOVA test**:** to compare the measured variables among the groups.

b) Tukey's HSD test**:** to test any statistically significant difference between each two groups.

c) Independent sample t-test**:** to test the effect of time on the measured parameters.

**Cl. 27(1), March 2015 Evaluation the effect**

## Results

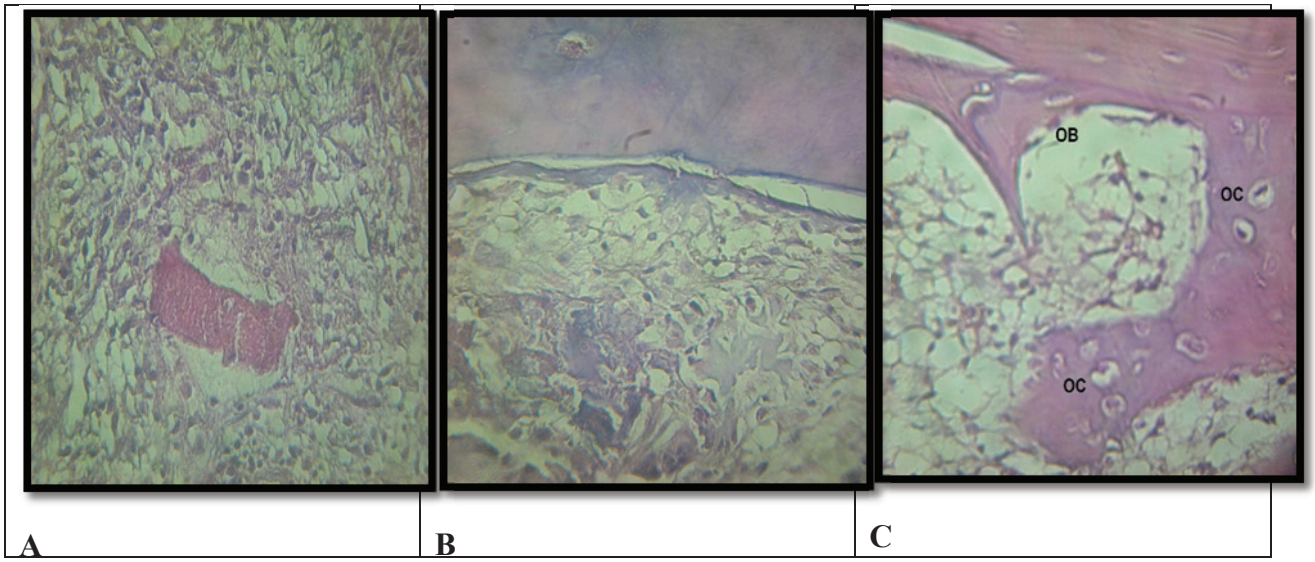

**Figure (1): Microphotograph view of defect area of 2 weeks healing period shows in: (A) Control group blood clot surrounded by inflammatory cells and bone marrow stromal cells (100X) .(B) Hyaluronic acid group: shows flecks of bone trabeculae and osteoid tissues rimed by few osteoblast(100X). (C) Melatonin group shows bone marrow surrounded by bone trabeculae with osteocyte (OC) inside and osteoblast (OB) at periphery (400X).**

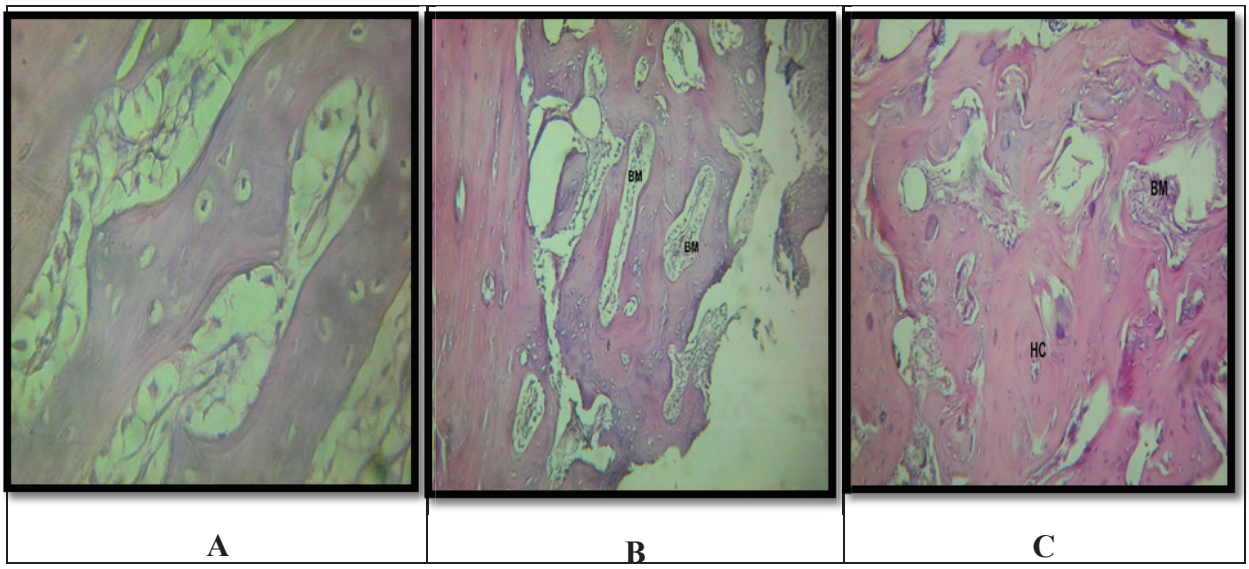

**Figure (2): Microphotograph view of defect area of 4 weeks healing period shows in: (A) Control group new bone trabeculae enclosing bone marrow (400X). (B) Hyaluronic acid group shows compacted bone trabeculae enclosing less bone marrow area (100X). (C) Melatonin group shows defect site filled with new bone (NB) enclosing marrow tissue (MT) (100X). Use Magnified views**

**Histomorphometrical analysis of bone architecture parameters:**

All measured parameters showed increased mean values with time, except for bone marrow area mean values decreased in all groups. At 2 weeks healing interval, highest mean values of all measured parameters were recorded at melatonin group however bone marrow area showed highest values in control group (Table 1). The melatonin and HA groups show a high significant differences in all bone histomorphometrical parameters compared with control group except **o**steocytes count non significance difference was recorded between control and HA groups(Table 2) .

**Table 1: Descriptive statistics and group difference in 2 weeks**

| Parameters | Groups | Descriptive statistics | | | Group difference | |
|---|---|---|---|---|---|---|
| | | N | Mean | S.D. | F-test | p-value |
| Trabecular Numbers | Control | 5 | 2.220 | 0.148 | 77.998 | 0.000 |

| | Melatonin | 10 | 0.462 | 0.025 | | |
| | HA | 10 | 0.153 | 0.018 | | |

**Table 2: Post hoc Tukey's HSD test for multiple comparisons at 2weeks healing interval**

| Parameters | Groups | | Mean Difference | p-value |
|---|---|---|---|---|
| Trabecular Numbers | Control | Melatonin | -3.590 | 0.000 |
| | | HA | -1.780 | 0.000 |
| | Melatonin | HA | 1.810 | 0.000 |
| Osteocytes | Control | Melatonin | -17.880 | 0.000 |
| | | HA | -0.230 | 0.880 |
| | Melatonin | HA | 17.650 | 0.000 |
| Osteoblasts | Control | Melatonin | -18.860 | 0.000 |
| | | HA | -4.700 | 0.000 |
| | Melatonin | HA | 14.160 | 0.000 |
| Bone Marrow Area | Control | Melatonin | 0.278 | 0.000 |
| | | HA | 0.080 | 0.000 |
| | Melatonin | HA | -0.198 | 0.000 |
| Trabecular Area | Control | Melatonin | -0.364 | 0.000 |
| | | HA | -0.055 | 0.000 |
| | Melatonin | HA | 0.309 | 0.000 |

At 4weeks of induced bone defect healing period, there were high significant differences (p-value 0.000) among all control and experimental groups (Table 3). The melatonin group revealed highest mean value in all parameters except bone marrow area and osteoblasts which recorded high significant differences (p-value 0.000) at control group and HA group respectively (Table 4).

**Table 3: Descriptive statistics and group difference in 4 weeks**

| Parameters | Groups | Descriptive statistics | | | Group difference | |
|---|---|---|---|---|---|---|
| | | N | Mean | S.D. | F-test | p-value |
| Trabecular Numbers | Control | 5 | 3.540 | 0.456 | 98.179 | 0.000 |

## Discussion

This study was aimed to highlight the individual effects of (MEL) and (HA) on bone healing and repair mechanism and to investigate a possible effect, for a topical application.

Thus, it seems that local administration of melatonin during bone fracture could directly stimulate osteoblasts from the endosteum. This was in agreement with the findings shown by Nakade et al [9]

Melatonin has been recently reported to stimulate osteoblasts proliferation and differentiation **[9, 10].**

These results were also in agreement with those of Cutando et al [11]

Finally, (MEL) acts as stabilize cell membranes, thereby making them more resistant to oxidative attacks. [12-15].

HA enhances the bone healing regeneration [16] While Aslan etal [17] revealed that HA stimulate bone healing through accelerating the three phases of healing; inflammation, proliferation and migration of mesenchymal cells and they confirmed that HA needs an osteoconductive scaffold to be effective, Other study illustrated that the HA was osteoconductive material that enhance osteogenesis and accelerated bone healing process by promoting cell adhesion and osteoblast differentiation. [18]

## Conclusions

A significant number of positive effects of MEL, as well as HA, as individual compounds on the bone healing regeneration.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved and all experiments were carried out in accordance with approved guidelines.

# Knowledge and Protective Health Behaviors Concerning Risk Factors for Coronary Heart Disease among Baghdad University Students

**Aqeel H. Jasim[1], Haider M. Majeed [2], Tahseen R. Mohammed[1]**

*[1]Instructor, PhD., [2]Assistant Instructor, Fundamentals of Nursing Department, College of Nursing-University of Baghdad*

## Abstract

**Background:** Coronary heart disease, a gradual buildup of fatty deposits in thecoronary arteries, occurs as a result of several risk factors with 75% attributable tolifestyle choices.

**Objectives**: to evaluate knowledge and behaviour of Baghdad University students concerning coronary heart disease and to identify the relationship between demographic characteristic data with student's knowledge and healthbehavior.

**Methodology**: A cross-sectional design study utilizing a stratified random sampling method. Students of all colleges of Baghdad University (BU) in Baghdad City were included. The respondents were randomly selected from each college. The sample size was 200. Knowledge, health behaviour questionnaire was developed and distributed to the respondents involved. The data collected was analyzed using SPSS version 20.0.

**Results:** The majority of the study were female who accounted for (54%) of the total participants while male constituted (46%). Most of the study participants (35%) were ages between 20 and 21 years old. Study participants' distribution in equal forms on colleges twenty-five percent for each college. (28.5%) of the students were first class.The majority of students (76.5%) were single and the remainder was married. Majority (79%) lived in urban areas while the rest (21%) lived in rural areas.

**Conclusions:** findings of study shows that, undergraduate students have poor knowledge regarding risk factors for coronary heart diseases, as well as results demonstrate overall students have good behaviour toward preventive measurement about risk factors of CHD.

***Keywords:*** *Knowledge, Health behavior, Students, Risk Factors, Coronary Heart Disease*

## Introduction

Coronary heart disease (CHD) is a major public health problem worldwide. The coronary atherosclerosis is the major cause of coronary artery disease. However non atherosclerotic types of coronary heart disease are also reported. The clinical presentation of coronary artery disease includes angina pectoris, myocardial infarction, and chronic coronary heart disease[(1).]According to the World Health Organization (WHO), there were 7.4 million deaths due to ischemic heart disease in 2012, with high-income countries and upper-middle-income countries accounting for 158 and 107 deaths per million, respectively[(2,3).]Multiple risk factors are involved in the development and progression of CAD. In general, risk factors of CVD and CAD can be divided into two groups. The first group is non-adjusted risk factors such as age, sex, race, and family history. The second group is adjustable risk factors such as hypertension, diabetes mellitus (DM), dyslipidaemia, overweight, and smoking[(4,5).]

## Methodology and Materials

A cross-sectional descriptive and analytical study to assess the knowledge and health behaviour regarding coronary heart disease among students of Baghdad University. This study was conducted at Bagdad University between December15th 2016 up to the end of 10thmarch 2018. A tool of knowledge, health behaviour questionnaire was developed and distributed to the participants in this study. The questionnaire was validated by conducting the pre-testing among 20 students in a pilot study. The content validity of the questionnaire was verified by expert of faculty of nursing. The questionnaires were distributed to the selected undergraduate students of all the four colleges in Baghdad University. The stratified random sampling method was utilized in selecting the participants. The inclusion criteria for the participants were age of 18 years old and above of both genders, male and female, which include Year 1 to Year 4 from each faculty. The sample size calculated was 200, inclusive of the 10% non-response rate.Proportional allocation from all grade levels (1 to 5 in all colleges).

## Results

The majority of the study were female who accounted for (54%) of the total participants while male constituted (46%). Most of the study participants (35%) were ages between 20 and 21 years old. Study participants' distribution in equal forms on colleges twenty-five percent for each college. (28.5%) of the students were first class. High percentage of the students was single and the remainder was married. Majority (79%) lived in urban areas while the rest (21%) lived in rural areas.

## Discussion

Throughout the course of the data analysis of the current study indicated that students' knowledge concerning risk factors for coronary heart diseases. Thirteen questions to evaluate general knowledge related to risk factors of CHD. Only (45%) of the study sample answered correctly and (55%) responded incorrect "do not know". Knowledge questions were split to dietary pattern, medical and risk factors. Knowledge related to risk factors for CHD was answer correctly (Know) by (99%) majority of participation answer smoking main causes for CHD, most of them stated 56.5% alcohol main risk factors for CHD, most of them reported (73%) hypertension risk factors for CHD, (66.5%) answer hypercholesterolemia one of causes CHD, and most of them told (57%) diabetes mellitus all of them answer these main risk factors for cardio vascular disease, most of students(45.5%) told being overweight increase person risk for CHD,(43%) of them stated that high blood sugar puts strain on the heart disease, only (37%) of students answer correctly that individual with DM have high cholesterol.

The finding of the study agree with result obtained from other study who reportedrespondents' knowledge regarding the CHD risk factors who reported twenty five percent students graded smoking as the top most risk factor for CAD followed by hypertension high cholesterol, age, Family history, and high cholesterol diet. Correct identification of risk factors in the form of positive responses was highest for cholesterol levels (91%)[6].

Students' knowledge regarding risk factors for CHD. The most of the participants answered the danger factors questions items knowlikeambulation is type of exercise to be a preventive of CHD (43%), taken up fruits or vegetable is able to prevent from CHD (52%), avoid drinking alcohol reduced the risk of getting heart disease (68.5%), tobacco cessation prevent the risk of getting heart disease (51.5%) and body mass index of more than (30) is considered as obese (53.5). From all the risk factor questions, knowledge concerning physical inactivity (24%), stress (35.5%), both gender experience same symptoms of heart attacks world (40).

This findings is same line with result obtain from other study the researcher reported thatthe majority also demonstrated adequate knowledge regarding several CHD prevention measures, such as regular physical activity blood pressure control and smoking cessation .However, fewer participants demonstrated correct knowledge of other CHD risk factors, including diabetes, stress .Fewer subjects were aware of (HDL) and (LDL) as risk factors [7,8].

Health behaviour preventionaboutrisk factors coronary heart disease**.** Twenty questions exploring students health behaviour concerning of CHD.

This result of study are good agreements with other studies done by other researchers whose reportedthat the item with the highest proportion of positive health behavior was "smoking is bad for health" (93.7%,) (149) , "exercise to maintain a healthy lifestyle" (87.4%,) ( 139), I maintain my weight according to my body mass index (BMI(74.8%,)(119) ,take less oily food for healthy lifestyle (74.8),(119) ,I believe walking a lot can give benefits to my health (72.3), (115) and I should take fruit or vegetable in my diet for maintaining my health(77.4),(123) [9,10] .

Association between student'sknowledge score and the demographic characteristics (age, gender, academic year and marital status. The association between sociodemographic and students'knowledge score was explored. There are no significant relationship between gender and students knowledge(Chi-square = .526a), age (Chi-square = 2.118a) academic year (Chi-square = 3.507a) and marital status (Chi-square = .900a).

This result agrees with that of the other researcherwho reported ,The responses provided by the third year student nurses straight from school education and those mature students were found to be non-significant in relation to the twoage categories ($p>0.05$). The HB however, was shown to differ significantly between males and females ($p=0.04$), demonstrates the mean scores attained for both CHD knowledge and health behavior byboth gender[11,12].

The association between sociodemographic and Students attitudes Score was explored. There are no significant relationship between (age, gender, academic, marital status) and students'behaviour scores.

This finding Agree with results obtained from the study done by other researcherwho reported.The present study identifies that there was no significant relationship between total CHD knowledge and HB of the third year student nurses [13].

## Conclusions

This study demonstrate that, despite poor students knowledge regarding risk factors for CHD, as well as study indicated overall students have fair health behavior toward preventive measurement about risk factors of CHD.We recommendtohealth education programs about risk factors of coronary heartdisease; seek to improve understand the trouble of heart disease and work cooperatively to reduce them. Should be transmitted through the mediums of radio and television, posters, pamphlets, social media like Facebook and Twitter to be beneficial to accessing to younger people.

# Evaluation of Quality of Nursing Documentationin Surgical Wards at Baghdad Teaching Hospitals

**Tahseen R. Mohammed[1], Haider M. Majeed[2], Aqeel H. Jasim[3]**

*[1]Instructor, Fundamentals of Nursing Department, College of Nursing-University of Baghdad),*
*[2]Assistant Instructor, Fundamentals of Nursing Department, College of Nursing-University of Baghdad,*
*[3]Instructor, Fundamentals of Nursing Department, College of Nursing-University of Baghdad*

## Abstract

**Background:** Nursing documentation has been one of the most important functions of nurses.

**Objectives**: To evaluatequality of nursing documentsfor nursing care at surgical wardand to find out the relationship between demographic characteristic with nursing documents.

**Methodology:** A descriptive design study was conducted in the period of 1st January 2017 to 15th August 2017. Utilizing a stratified random sampling method (60) nursesworking in surgical ward atBaghdad teaching hospitals.

**Results:** The majority of the study participants were female who accounted for (58.3%) of the total participants while male constituted (41.7%) making a female male ratio of 1.5:1. Most of the study participants (46.7%) were between ages 18 and 27 years old. (71.7) of the nurses were married and the remainder was single. (45%) of the participants had instituite graduate.Majority of them (31.7%) were employee (1-5) years in surgical wards, and finally most of nurses(66.7%) have training session in the nursing documentation.

**Conclusions**: The study showed that nurses have poor nursing documentation in surgical ward and there is no significant association between the nursing documentation with some demographic characters of selected nurses but significant association between the nursing documentation with training course.

## Introduction

Nursing documentation is considered as an important indicator todevelop nursing care. According to patient safety law, nurses have todocument nursing interventions[1] Nursing documented has jointly practical and legal embodiment in client care thus kind documentation and true notify are fundamental to mprove efficiency in client care. in any case of the way used to document, the client's health-care register is a solemn, legal records is client's patronage specifics[2,3].Nurse's ability to script in a pure brief, fair and legally precise way can safely decrease the danger of misunderstanding and passive patient result concerning to bad communication [4, 5].Nurses have accepted that registration isn't dismissing from nursing care and it is not permissive. It is an integral section of on file nurses' practices, and an important instrument that RNs use to secure high-fineness client care. Literature debate exceedingly the barriers encountered by nurses in recorded involving time limited, mismatches among staffing resources and work overload, shortage of pure guidelines for fill up documentation, repeated at documentation, and the routine systems and institutional policies usually related with protection precise documentation [6]. The major responsibility of nursing documentation are patients' information transport to other health team members, promote professional autonomy [7].

## Methodology and Materials

A descriptive design study carried out toevaluate quality of nursing documentation in surgical wards atBaghdad teaching hospitals. The study was carried out during the period extended from 1st January 2017 to 15th August2017. The study population included all nursing staff in four selected hospitals. Inclusion criteria for nurses were having at least 12 month clinical experience and havingany educational level degree in nursing. The sample size estimated 70 nurses with pilot study. Then, these nurses selected to participate with stratified random sampling, according to the number of nursing staff employed in each hospital. Then, for evaluate of each nurse's documents, in four parts of nursing documents, was selected randomly and analyzed. The demographic data of self fill reporting. For evaluate of nursing documents for nursing care four observational checklists were used. These checklists were evaluate four parts of nursing documents including recording vital sign assessment (4 items), recording wound care(dressing) (11items), recording medication treatment (4 items) and recording intake and output (I & O) of fluids (10 items). The validity of checklists was determined by content validity and after receiving commends from 10 nursing member checklists were revised. The content validity of the instrument was established through a panel of (15) experts. . Test- Coefficients for (29) items of nursing documentation for nursing care were($r= 0.83^{**}$) . Data were collected between 8.30am to12.30 pm**.** The data is analyzed by using SPSS version 20.0.

## Results

This table revealed that( 58.3%) of the study samples were females, and most of them were age group (18-27) years old, a high percentage of them were institute graduate (45%), most of them(71.7%) were married, (31.7%) were for (1-5) years were employment in nursing, Majority of them (31.7%) were employee (1-5) years in surgical wards, and finally most of nurses(66.7%) have training session in the nursing documentation

**(A.D.): Assessment Degree, M.s=mean of score [(1 – 1.67) = poor (p); (1.67 – 2.34)= Fair(F) ; [(2.34 – 3) = Good (G)]**

This finding of this table indicated that the mean of score was poor documentnonitems(5,6,7,8,9,10,11,12,13,20,21, 22,23,24,25,26,27,28&29),items (2,3,4,14 and15) was fair documentation, and good documentation on the remaining items.

## Discussion

Throughout the course of the data analysis of the current study, the findings show the majority of the study were female who accounted for (60%) of the total participants while male constituted (40%). Most of the study participants (46%) were ages group (18-27) years old,the level of education represented that most of them (38%) were from institute graduate,most of them(74%) were married, (38%) for (1-5) years were employment in nursing, most of nurses(70%) have training special session in the nursing documentation. Majority of them (34%) were employee (1-5) years in surgical ward, and finally

These findings are in line with study done by other researcherwho reported that study the average age of nurses was 32.40+ 5.58 years and they have a 6.40+ 3.58 years clinical experience .of all, 147(86.8%) nurses were female and 168 (98.8%) of them has a BS degree in nursing.83 (48.8%) nurses working in medical wards and 87(51.2%) were working in surgical wards [8].

These findings agreed with findings obtained from other study, who stated that the majority of participation nurses were female142 (87.6%) ,most of them 104(61.2%) were married their mean of age group was 31.38years,majority of them (51.2%) were working in surgical wards and almost of them (98.8%) had bachelor of science degree in nursing[9].

Twenty nine questions to assess nurses documentation for nursing care in surgical ward,in order to response to first question of the study table five. This table shows thenursing documentation in four selected parts of nursing documents including recording vital sign, recording wound care ,recording medication treatment, and recording intake and output of fluids ,the total mean of score was poor nursing documentation .Further investigation of results of study revealed the most of items that weren't recorded by nurses in recording wound care dressing ,location of wound(68%), size of wound (82%),wound discharge (96%),all items related to Amount of discharge,colour of discharge,odor

of discharge(96%),signs of wound healing(94%) all items that mention up that weren't recorded by nurses ,total mean of score related to wound care was poor.

In recording intake and output of fluids most items that weren't recorded were including, where not recording fluid take through mouth(64%), intravenous fluid(72%), nasogastric tube and gastrostomy route (88%) all items are absent (88%) all items are absent (88%) all items are absent in nursing documentation. Also recording were absent in fluid output including urination,defecation,vomiting (74%) ,chest tube, drain (88%) and nasogastric tube (92%) of all items related fluid intake and output not recorded by nursing ,the total of mean of score related to fluid intake and output was poor.

In recording vital sign assessment art most items are recorded the mean of score of vital sign was fair. In recording medication treatment most items are recorded by nurses, the total of mean of score related drugs treatment was good.

This finding was in good agreement with that obtained from other researcher reported that the quality of nurses' documents was moderate. Further investigation showed that most items that weren't recorded by nurses in recording nursing report part were including "recording the time of reports" (100%), "recording the response of patients to interventions" (97.9%) and "recording the time of nursing cares" (96.5%). In recording medication treatment part most items that weren't recorded were including" respect suitable method for correct errors" (40.6%) and other items were completely respected by nurses. In recording intake and output of fluids most items that weren't recorded were including recording accurate time of checking I & O of fluids" (100%) and "recording the differences between the intake and output of fluids" (78.3%). In recording vital sign assessmentpart most items that weren't recorded were including "recording the location of controlling vital signs", "recording the unit of temperature", "the limb used for controlling the blood pressure" (100%) and "the unit of blood pressure" (97.1%)[8].

Another study agree with the finding of the study who stated the nursing records showed In the vital sign section, data showed that all of them had moderate level and their mean score were 10.69 ± 0.52. In I&O fluid section data showed that 18.6% of flow sheets had moderate quality but most of them 81.4% had suitable quality and their mean score were 13.24 ± 1.07. In chronology sections, all of flow sheets had suitable quality. In drug intervention part, mean score was 11.78 ± 1.42 and most (85.9%) of them had good quality[9].

These findings agreed with study done by other researcher who reported that the quality of nursing care records was poor and inadequate to reflect individualized nursing care. Their results suggested that more emphasis is needed in nursing practice, and nursing education on the quality of record keeping in order increasing its evidential value[12].

These finding is the same line with study done Rangraz Jedi et al byIn one study, assessedthe quality of 540 nursing documents and reported that only 11% of these documents didn'tContain necessary information. Hanifi, (2002) assessed the quality of 30 medical records and reported that only 16.1% of nursing documents had a good quality and 35.8% of them didn't contain necessary information [14]. Findings of most other studies have also showed that nursing documents have inadequate information about nursing care process and are consistent with the findings of our study [15,16].

In order to respond to second question of the study the association between the nursing documentation for nursing care with some demographic characters of selected nurses. There are no significant relationship between nursing documentation and demographic characteristics of nursing, but significant relationship between nursing documentation and training course.

This finding was in good agreement with that obtained from other study who reportedthat correlation between age and clinical experience of nurses with quality of their documents chi-square test was used. Results showed that there was no meaningful statistical correlation between qualities of nurses' documents with their age ($\chi 2 = 1.34$, df = 2, p = 0.51)[8].

## Conclusions

The study concluded that; nurses that working in surgical ward in all selected teaching hospitals had poor documentationin most aspect of nursing daily documentation for nursing care. We recommend

conducting teaching programs or sessions must emphasize on all aspects of nursing documentation, for improving quality of nursing documentation and also the study recommends to nursing documentation must be covered widely and in-depth in nursing curriculum of nursing schools.

# Knowledge of Mother Regarding Children Vaccines

**Faraj H. Johni**

*Ph.D. Physiology / Medical Institute Baghdad*

## Abstract

Vaccines are important factors in the health system , and more benefit for the health and develops population, the study was conducted among chidden with age between one month to three yeas old age for period 4 months from April to July 2018 , were data collection among mothers (N=300) attending primary health care center in Al-Noor City – Baghdad , were 120(48%) at age (26-30) years old ,125 (41.6%) with primary education .

***Keywords:*** *Knowledge, Children Vaccination ,Vaccines.*

## Introduction

Immunization which is process that the individuals immune system becomes opposite to an agent cause ,immunization are widely used and less risk ,easier way .The immunization protects children from deadly diseases but also help in developing children immune system [1] . Vaccines are the more important factors in the health system ,and more benefits for the health and develops populations ,with WHO records, the children will die before 5 years each year due to some diseases that could prevented with vaccines can save life after birth, and protection more people from disability [2]. Some people still not use vaccination at all , or not completing their vaccines programs , administrations of vaccines through pregnancy is the save method in order to protect the pregnant females and fetus and young infant from diseases , vaccination program success which is depend on the knowledge and awareness of usefulness of vaccines to those who are at risk , without knowledge and fear of vaccination which lead to lower rate in this people(3).It is important to valuate parental knowledge toward immunization of children , immunization of the child starts immediately after birth (first 2 vaccines of hepatitis B and BCG ) are administrated through the first 72 hours of life(4).

Vaccinations ranges have increased at development and developing counties through World Health Organization (WHO) Expanding Program on Immunization (5)

Vaccination is the administration of vaccines in order to produce immunity in the body against of some diseases about to 85% of infants all over the world received 3 doses of diphtheria ,Tetanus ,pertussis , immunization program funds that vaccines against 12 diseases ,tuberculosis , hepatitis , diphtheria , tetanus, polio ,hemophilia influenza type b , measles ,rubella , mumps ,Rota virtue and pneumococci infection(6) Negative attitudes from parents such as fear of vaccination , side effects of vaccines like midlines , which are barriers for child vaccination, the knowledge of parents about vaccination from internet , socio media , medical workers, mothers consider the internet source is the main source after medical workers.(7) most side effects of vaccine are minor like pains , swelling or redness at the site of injection , but the major side effects such as severe allergic reactions which occur due to vaccines developed for short seizures which is called febrile seizure that occur at six months to five years old (8)

Vaccination which are contain of dead form of virus or bacteria which are causing the body to make antibodies that protect the child from the diseases. Most of vaccines are completed between birth and the age of six years, some the vaccines give more than once , and at different age , also in combination most countries will not permit the child start school without a complete vaccines or vaccine records , some times when a child risk the vaccination is missed(9)There is important for the parents to develop knowledge about vaccination because

the knowledge help to develop positive attitudes toward vaccination in order to reduce the burden of dreadful infectious diseases acceptance of any program is highly dependent on parental attitudes towards immunization fear of side effects which has negative impact on parental attitudes , vaccination dose is given at less than the minimum recommended dose to start vaccine and the minimum four – week interval may lessen the antibody response due to sub-optimal sero conversion rate and it should be repeated it the vaccine is administer greater four days before the minimum age (10)

**Aim** : To estimate the knowledge of mothers toward vaccines among children aged for one month to three years attending primary health care centers of family medicine in Baghdad –Iraq .

**Material and Methods :**Descriptive observation study was conducted on three hundred mothers for duration 4 months from April to July 2018 , in the out patient department of primary health care center which is called of family medicine in Al-Noor city , Baghdad , Iraq , mothers which are visited were enrolled in the study , mothers with children of age one month to 3 years, all participated Women given advices towards the aim of present study , a data collection included 3 days per week and it suits our present study was a framed , it contains demographic data , as child age , mother age , education status , mother occupation ,majority of served mothers with age 20 to 50 years , a qualitative interview was done using 30 mothers and based on their response questionnaire was framed in order to correct unclear questionnaire during scheduled visits from 3-4 times a week , the questionnaire was prepared by three experts with public Health Care Center and was validated it interviewed by some colleges in the same field .Completed questionnaire were collected at the following vistas at total 300 mothers survey in four months from April to July 2018 , knowledge about various vaccines according to the National vaccination program offered by the Iraq Ministry of Health , Mother responses were measured on Likert Scale that is consisted of Yes /No , do not know choice , evaluated mothers knowledge by summing their correct answer to 7 questions (1 point per correct answer ) .Mother knowledge was evaluated a poor (scoring 0-2 points ) , average ( 3-4 points), or good > 5 points .Statistical analysis was performed using SPSS software version 20.0 . The questionnaire was designed in English and translated to Arabic by the doctors , it comprises demographic and socio- economic questions, questions on perceived adverse effects of immunization and source of information, questions testing of childhood immunization , aim , duration of protection , severity of diseases prevented age at start program .

Results :

Among the selected mothers were (120(40%) at the age (26-30) years old and 30 (10%) at age(20-25) years old as in table 1 .Table (2) , shows the distribution of samples according to education level , the percentage of samples according to education level , the percentage of mothers were higher among primary education , compared with low percentage of mothers of university education 25(8.3%) .Table 3 , shows distribution of participated according to source of information were 150 (50%) of mothers had received information from medical workers , while 50(16.6%) of mothers received from internet and 100(33.3%) from family and friends .Table (4) shows mothers knowledge regarding vaccines , most respondents(83.3%) considered vaccines should be given from the birth , but only (16.6%) of them considered the side effects of vaccines to be dangerous ,number of mothers (75%) knew the places of vaccination at public health center , and (33,3%) of mothers satisfied that vaccines have any side effects while number of respondents (50%) knew that vaccines are available today in Iraq population .Table (5) , show distribution of studied sample about contraindication o vaccines very low numbers of respondents (16.6%) were believed the common cold of child is contraindication o vaccine and (8.3%) of mothers considered that ever is contraindication , while (6.6%) of respondents were considered the diarrhea is contraindication for vaccination. Table (6), shows the distribution of samples according to knowledge regarding reasons for incomplete vaccination were (66.6%) of respondents know that vaccines was not available , while (8.3%) of them identified that family problem as the reason or incomplete vaccination.

**Table (1) :Distribution of studied sample according to age (yeas) , (N=300)**

| Variable | N | % |
|---|---|---|
| Age (years) | | |
| 20- 25 | 30 | 10% |
| 26-30 | 120 | 40% |
| 31-35 | 100 | 33.3% |
| 36-40 | 50 | 16.6% |

**Table (2) : Demographic characteristics o the studied sample according to Education level ,(N=300)**

| Variable | N | % |
|---|---|---|
| Primary Education | 125 | 41.6% |
| Secondary Education | 100 | 33.3% |
| University Education | 25 | 8.3% |
| Nil | 50 | 16.6% |

**Table (3): Distribution of samples according to source of information ,(N=300) .**

| Variables | N | % |
|---|---|---|
| Family & Friends | 100 | 33.3% |
| Medical workers | 150 | 50% |
| Internet | 50 | 16.6% |

**Table (4):Distribution of studied sample according to their general knowledge about vaccines,(N=300) .**

| Variables | Yes | No | Don't know |
|---|---|---|---|
| Vaccines are available today in Iraq population | 150(50%) | 50(16.6%) | 100(33.3%) |
| Do you think that vaccines have any side effects | 100 (33.3%) | 150 (50%) | 50(16.6%) |
| Are side effects of vaccines dangerous | 50(16.6%) | 200 (66.6%) | 50(16.6%) |
| Childhood vaccination prevent life –threatening diseases | 200(66.6%) | 50(16.6%) | 50(16.6%) |
| The places for vaccination include public health center | 225(75%) | 25(8.3%) | 50(16.6%) |
| Allowing non immunization children to sent to school | 200(66.6%) | 50(16.6%) | 50(16.6%) |
| Vaccines should be given from birth | 250(83-3%) | 25(8.3%) | 25(8.3%) |

**Table (5): Distribution of selected sample according to knowledge of vaccines regarding the contraindication of vaccines , (N=300)**

| Variables | Yes | no | Don't know |
|---|---|---|---|
| Child with common cold be vaccinated | 50(16.6%) | 150 (50%) | 100 (33.3%) |
| Child with fever be vaccinated | 25(8.3%) | 200(66.6%) | 75(25%) |
| Child with diarrhea be vaccinated | 20(6.6%) | 200(66.6%) | 80(26.6%) |

**Table (6): Distribution of studied sample according to knowledge regarding vaccines for incomplete of vaccination ,(N=300)**

| Variables | N | % |
|---|---|---|
| Mother was too busy | 75 | 25% |
| There was a family problem | 25 | 8.3% |
| The vaccines was not available | 200 | 66.6% |

## Discussion

The distribution of mothers demographic characteristics had revealed that the majority (40%) of them were of (26-30) years old and (41.6%) primary education , in the current study it is clear that medical workers were the main source of information need to be utilized to provide proper education program about vaccination , this result is lower than what is found by knowledge A,et al , 2011 [11] .in United States (81.7%) of mothers consider medical workers as main source of information toward vaccination . In the present study regarding the knowledge about vaccines , 50% of mothers agreement that vaccines are available today not considered that vaccines have any side effects on comparing with another study conducted by Zagminask ,2007 [12] ,(57.0%) of surved mothers considered that vaccines have any side effects , high percentage o respondents (83.3%) agree that vaccines should be given from birth , this is higher than results done by Iron Tam PY, 2009 [13](76%) of them agree that vaccines give from birth but in the present study (75%) of the respondents agree that public health center is the main place for vaccination ,this higher than the results done by Suryadeva , 2013 [14] ,(50%) of mother agreement that public health center is the main place for vaccination (66.6%) of respondents believed that vaccination prevent lie threatening diseases , this similar results done by Mahlingam S,(2014), [15] ,60% of mothers agreement that vaccination prevent life threating diseases. In the present study regarding contraindication vaccines, most respondents (66.6%) not considered that fever and diarrhea diseases are contraindication about vaccines but result done by Abubaker IE,2017 [16] were 61.7% of participated parents considered the fever and diarrhea are contraindication for vaccines .

The current study shows knowledge of mothers regarding reasons for incomplete vaccination ,(66.6%) of respondents believed that vaccines not available , this slightly higher result done by Vinod kumar M,2017 [17] ,50% participate considered that vaccines not available are to reason o incomplete vaccination .

## Conclusion

Evaluation of mothers knowledge toward children's immunizations is the tool for good communication between health professionals and parents ,the medical workers are the main source of information about vaccination , the majority of mothers do not have comprehensive information routine vaccination schedule .

# Effect of Corrective Exercises According to the Biomechanical Indicators of the Footprint of the Paraplegic

**Haider Fayyadh ALamiri**

*University of Kufa / Faculty of Physical Education and Sport Science*

## Abstract

The value of scientific research depends on the type of data and the accuracy and quality of the devices used in these devices and foot scanner (foot scan), a device for the analysis of walking movements and helps in the detection of the values of many variables of the amount of pressure and the deviation and deviation of the foot and direction and time of contact and the extent of benefit Of these variables in the identification of errors and the development of appropriate exercises appropriate to them and this is what the importance of research as a serious attempt to identify the current mechanical situation of this category of disabled and study the details of this case and the problem of research is the lack of appropriate corrective exercises and the objective of the research to design corrective exercises and knowledge of their effect on some values of the biomechanical variables of the footprint at a speed of (2 km / h). Corrective exercises Led to an improvement in the level of walking of the sample by the development of the values of the variables investigated.

***Keywords:*** *Biomechanical indicators , print foot, paralysis.*

## Introduction

The specialty design of special corrective exercises on the scientific map in the area common between the science of biomechanics and medical science and know that these exercises [1] , which are developed to address a clear line identified by the trainer or The real performance for the purpose of correcting the motor path of the same skill [2], but it is developed to avoid errors and install the correct performance and from this premise and concept must be observed the conditions of the special exercises of the use of scientific observation [3], that requires accurate use of modern technical equipment to reach to diagnose mechanical sound errors and then think of appropriate solutions [4]. Jogging can be considered a simple and difficult process at the same time because it is simple because it is one of the only repetitive movements and difficult because of the mechanical complexities where we cannot find two runners[5, 6], the running in the same way and can be defined as a feature characterized by the human and designed by the person according to the length and habits of the lower end In jogging , the overlap of muscle work and the synchronization or timing of joint movements illustrate the collective work of the movements of the body as a whole. The Jogging is a typical example of the flexibility of kinetic control provided by the brain and kinematics in the regular (angles, distances and speed) [7] , This flexibility of nerve control is very important for the therapist's natural observations to compensate for the patient's lack [8] . The result of course is not known because the use of these exercises was scheduled from the medical point of view do not care about jogging steps on the basis of sports is not enough [9] , We must determine the nature of mechanical work in advance so that the researcher is a picture of what work to be done and calculated and accurately and away from random work, It is only known that the value of scientific research depends on the type and accuracy of the data. These devices are the( gait analysis), which is a device for analyzing walking movements and helps In the detection of the values of many variables of the amount of pressure and force and the deviation and deviation of the foot and direction and time of contact and the extent of benefit from these variables in the identification of errors and the development of appropriate exercises appropriate to them and this is what the importance

of research as a serious attempt to identify the current mechanical situation of this category of disabled and study the details of This situation is exploited by modern scientific instruments and tools to identify the strengths and weaknesses that[10,11] , If compared to the test of the proper performance will provide a scientific basis and a basis for the diagnosis of errors and on the basis of which are built special exercises without ignoring any of the important aspects of mechanics performance, as well as revealed the relationship between the steps walking and jogging, which makes them a new step to build training curricula with the highest efficiency and to reliance on accurate values showing the priorities of the variables that must be included in the curriculum in the future [12,13].

## Materials and Method

The researcher used the experimental method in the one-group model with the comparison of the test (the natural data of the footprint). "Experimentation is a deliberate and precise change of the specific conditions of an event and observation of the resulting changes in the event itself and its interpretation [15] ,The researcher used the field observations of two of the infected patients attending in physical education and sport science faculty/ Kufa university, for the measure some biomechanical indicators of the footprint at a speed of (2 km / h) as tribal observations compared to similar distance observations [16] . A report on the mechanical variables, which (Zebris Medical GmbH) produces, is produced in the form of a table that includes these variables, their values and both feet.

**Table (1) show the mean and standard deviations of physical characteristics of students who they participate in this study were not significantly different in both right and left foot rotation.**

## Result and Discussion

This work makes the center of the body undergo a rotational and rotational transmission . In this sense, the sensors of the foot scanner record the length of the foot line as a reaction What happens in the center of gravity is not arbitrary but depends on The mechanical motor chain which acts simultaneously between the two extremities of the body. The safety of this work is evident in the work of the soles of the foot [18] , which carries a center that carries the body and moves towards the next step. This transition is under mechanical conditions to ensure the proper transition. On specific points in the soles of the foot and any defect in the step will lead to imbalance in the process of mechanical balance.

The results of analysis of Gait line length revealed significant values in both right and left , this is evidence that the sample of the research a new form or style at this speed so that the search sample became pressure on the foot more, as the movement of the foot and moving from the heel to the foot became the length of the pressure line longer in the right foot and explain this researcher the change that special exercises have affected the work of the muscular nervous so that there is a use of a greater focus on this foot and this has to do with the forced rhythm exercise that was subjected to the sample, this exercise has earned them a good rhythm of the movement starts from slow to faster on the other hand [(19, 20),] Foot than it used to be the soles of the use of welded larger and this is between the results of the statistical analysis. Comparing this increase in the length of the foot line with the data from a foreign study shows that this increase is evidence that the research sample began to touch the ground more, which leads to the drawing of a new line different from the previous increase in the search for the correct use of the soles of the foot It is considered one of the most important indicators of the transmission of the foot line equally on the three foot parts (heel foot - made foot - fore foot) [21] , if this line passes through the three areas and the principle of distribution of the right as this study concluded that the shortness of this line is evidence of disorder in use Foot and so be clear when giving different forms of this line from the normal shape [22] . The study of scientific experiments and research in this field shows that there are areas that pass this line, which is ideal for the work of the foot as well as detail the length of the line according to areas of transmission on the surface of the foot if the line passes areas identified in the form indicated the good use of foot because this the line moves on areas where the foot pressure occurs [23] .

Contact time of stance time, As for the variable foot contact, which showed significant differences time in favor of the post test shows that this variable on a great link to the previous variable (line foot length) One of them is linked to the other and close association, the researcher believes that it makes sense when it increased the length of the foot line, it is indicated by increasing the length of build and pressure distribution is greater distance, and this process certainly need a longer time than the previous when the line is shorter [24] , and shows the ratio of length of the line to be based on time, and this is further evidence that the sample began using the soles of the foot full form and without delay and explains, The researcher said that the exercises ware aimed at rhythm [25] , they had a clear impact in improving the way the foot placed during the movement, which led in turn to adjust the way the transfer of the center of gravity which prints that pads of the foot on the ground, and remember one associated with this subject that studies the movement process is composed of 35% of likely for both men and 65% fulcrum distributor the foot is connected to the ground by the heel, the first with the tendon of the instep slightly outward, with a small rotation outside the hip joint.

As for the highest amount of force, there was a difference in the front of the foot right and the level of significance. The researcher explained this because the results of the tribal test had abnormal values at this particular speed. When compared with the results of the post-test, there was an improvement of the body side without any other, knowing that this improvement was not related With the amount of force above ,Among the variables that recorded a change and the test's favor is the highest amount of force [26] ,The magnitude of the change in force is illustrated by the fact that in the post-test, the starting point of the force indication is equal and the shape of the curve has a clear peak than the tribal test, and here is an important indicator that there is a kind of laxity in the force quantities. These exercises lead to the opening of new nerve paths in the cortex of the brain.

## Conclusion

Through the application of corrective exercises, the

researcher reached a set of conclusions which are as follows, The higher the speed of running, the longer the pressure line and the contact time of the three parts of the foot and this indicates an improvement in the work - nervous - muscular and the biggest focus in the tribal test corrective exercises directly affected the amounts of forces that the foot on the belt of the car more than the tribal test, and this indicates that the sample of the study possessed a different program of locomotives than before.

The amount of power exerted by the two men is affected by changes in velocities, in a systematic manner and coordinated with the requirements of performance. The curves of pressure and strength become more similar between the two extremities of the body and this indicates that the research sample became the distribution of neuromuscular work closely between the ends of the body, unlike the tribal test in which the sample depends on the right side much more than the injured side.

# Effects of Caring Children with Leukemia on their Mothers` Psychosocial Status

**Adraa H. Shawq[1], Khitam M. AL-Mousawi[2] , Zaid W. Ajil[3]**

*[1] Lecturer, [2] Assistant Professor, [3]Lecturer, Pediatric Nursing Department, College of Nursing, University of Baghdad, Iraq*

## Abstract

**Study aim:** to assess the influence of care burden for children with leukemia on their mothers` psychosocial status.

**Methodology**: A Descriptive study, conducted at two pediatric hospitals in Baghdad city. A purposive sample of (60) mothers was participated in the study after obtaining their consent form. The instrument of the study was used to assess mothers` psychosocial status in addition to their sociodemographic characteristics. The data was processed and statistically analysed by SPSS program version 23.

**Result**: the result of the study showed mothers have (81%) in self esteem, (77%) in psychosocial distress, (80%) for social interaction, and (76%) for social isolation. There were association between mothers` psychosocial status and their age, educational level, and occupation.

**Conclusion:** the result of the study concluded that mothers of leukemic children have generally accepted level of psychosocial status except they isolated themselves.

***Key words****: psychosocial status, Children, Leukemia, effects*

## Introduction

Childhood cancer is a widely public health problem because of its negative influence on family and society. Leukemia is most common types of childhood cancers under 15 years of age, which represents 25% of all cancer in children. Like other terminal illness, it may cause several physical and mental problems for caregivers. Parents of leukemic children might experience various levels of anxiety and disappointment especially during initial stages of the diagnosis of their children [1, 2, and 3]; Mothers of children with cancer have participated in some educational programs that focused exclusively on improving child's health outcomes with less attention toward the needs of the caregivers. However, most mothers of leukemic children have psychosocial needs, which to be better if addressed in order to improve their general health status and provide best care for their children at home [4]. As reported in several studies that mothers of children with chronic diseases may suffer from different negative psychosocial consequences [5]. Parents of children with leukemia challenged many effects of the disease and its burden. In addition to the cost of additional health care services with a long term follow up. In addition, theses concerns require more action on the part of parents in order to identify children's social and academic needs [1, 6]. Park, et al (2016) conducted a study that showed psychosocial status depressive symptoms and worse quality of life in parents of children with advanced cancer [7].

## Methods and Materials

**Research design:** A descriptive study conducted at oncology units in pediatric hospitals; data was collected from November 1st 2018 to May 8th 2019.

**Setting:** The study was carried out at two pediatric teaching hospitals: child central pediatric teaching hospital and welfare pediatric teaching hospital in Baghdad city.

**Instrument of the study and procedure:** The

questionnaire was developed on the basic of are view of the literature and the opus groups of parents. The questionnaire format was consisting of two parts : the first part is demographic data related to the mother, and the second part is related to the psychosocial effect of hospitalization on mother of children withleukemia in oncology units. The researchers using question that reflect mother behaviors (assessment to psycho and social characteristic ) that observed by parent. The answers were scored 1,2,3,4, and 5 (never , rarely very , sometimes ,most of the time ,every time) respectively. Validity of the instrument was coducted after experts reviewed and content validity was established. Furthermore, changes were made in questionnaire items according to the recommendation and notes of experts. The reliability of instrument was r= 0.83 at the level ($p \leq 0.05$) which was statistically acceptable.

## Statistical Analysis

SPSS programme version 23 was used, frequency, percentage, and mean used in data analysis.

## Results

41%of mother their ages are between (35-44), 25%graduated for secondary school and 66%of mother their housewife according to their child demography data 42%of children have age between (10-12) years, 42% children 3-5 years age of onset disease, 60%of child male and 50%child first order in family.

**Table 1. Mothers` psychosocial dimensions**

| List | Psychosocial dimensions | Mean | Percent |
|---|---|---|---|
| 1 | Self –esteem | 4.08 | 81% |
| 2 | Psychological distress | 3.85 | 77% |
| 3 | Social interaction | 4.01 | 80% |
| 4 | Social isolation | 3.84 | 76% |
| Total | | 3.94 | 78% |

This table shows the mother response to psychosocial dimension and there is a High level in self esteem dimension and mean 4.08 Social interactions at mean 4.01, psychological distress at mean 3.85, and social isolation at mean 3.84 respectively.

## Discussion

The results of the present study showed that 41%of mother their ages are between (35-44), 25%graduated for secondary school and 66%of mother their housewife according to their child demography data 42%of children have age between (10-12) years, 42% children 3-5 years age of onset disease, 60%of child male and 50%child first order in family. This result supported by the study conducted by Mahmoud and Elaziz (2015) it showed that the majority of caregivers' age is between (25-40) years old. Also, they found that most of caregivers were mother half of than are housewife. However, the study result supported that mothers of children with leukemia are more worthy to take care of their sick children than other family member [6]. Also, the study result shows that there is a high level of psychological and social stress among mothers of leukemia children when they response to psychological stress scale. This result consistent with the result of the study conducted by Creswell, Wisk, Litzelman, Allchin, and Witt (2014) that showed caring of children with advanced cancers was associated with increased to the diagnosis with relevant depressive symptoms in parents [7]. The findings of this study supported that mothers of children with cancer have high a high level of psychological and social stress. Many studies suggested that there are significant difference in the levels of stress, depressive, and anxiety among parents of children with cancer [8,9]. Parents' psychosocial status would affect by their children health conditions and the procedures of treatment of leukemia in the pediatric hospitals. Also, psychosocial status includes depressive symptoms like level of sadness, anxious, feeling of hopelessness, decreased energy, feeling of guilty, restlessness, and insomnia [9]. In addition, psychosocial status of mothers concerns their children with leukemia has a critical impact on their children's health status and other family members. However, parents of children with cancer need additional psychosocial interventions that would provide the necessary support during treatment periods [10].

The present findings showed that mothers of children with leukemia have a high level in their self-esteem dimension during provide care for their children in the oncology units. Steiner, Shlonsky, and Joubert (2017) found that parents of children with end-stage cancer need additional psychosocial interventions services in order to increase child-parent communication and their coping skills to promote parental psychosocial wellbeing [(11)].

The study result showed that there is an association relationship between mothers' psychosocial level and their demographic characteristics; correlation was significant at the level of 0.05. This result consistent with the result of a study conducted by Bemis et al., 2015 that reported most socio demographic variables for mothers of children with cancers were positively correlated with all level of stress and depressive symptoms [(17).]

## Conclusion

The level of psychosocial status of mothers of children with leukemia showed acceptance and they have a high level of stress also all caregivers have stress of at different. However, there is an association between mothers' psychosocial level and their demographic characteristic such as mother age, educational level and occupational status.

## Recommendation

Based on the study results, the study recommended:

1- Social institutions should provide psychosocial interventional programs for parents of children with leukemia to reduce the stress in the family and intervention programs to provide the information about coping strategies to help the families deal with the problem.

2- Activating the role of psychiatric nurses and social worker in pediatric hospitals in order to help families of children with leukemia to decrease the level of stress during their attendance to the hospital.

**Conflict of Interest:** The researchers report no conflict of interest.

**Funding:** This study did not receive any funding from any agency.

**Ethical Clearance:** A permission to conduct this study was obtained from the ethical committee in the college of nursing at University of Baghdad.

# Social Factors associated with Relapse in Psychotic Patients Attending Teaching Hospitals in AL-Furat Al-Awsat Governorates

**Ali A. ALHatab[1], Saja H. Mohammed[2]**

*[1] Ph.D. Student - [2] Prof. Dr. Department of Psychiatry and Mental Health Nursing, College of Nursing, University of Babylon, Hillah City, Iraq*

**Abstract**

**Background**: The relapse in mental disorders is extremely painful and costly for the patient and his family as well as for the community. These frequent readmissions are strain on the health institutions and on the Ministry of Health Budget.

**Objectives:** To find out the relationship between the social factors of relapse and sociodemographic data of psychotic patients attending teaching hospitals in AL_Furat Al-Awsat Governorates.

**Methodology:** The design was (Descriptive-Correlational) used to describe the variables and the relationships that occur among them in this study. The sample was (a non-probability) purposive of (181) relapsed psychotic patients were selected from our patients centers from teaching hospitals in AL_Furat Al-Awsat Governorates, during the period from 9th May 2019 to 20th August 2019. The instrument included two parts: sociodemographic variables and the social factors associated with relapse. The researcher used descriptive statistics tools such as frequency, percentage, mean of score and used in inferential statistics such as Chi-Square.

**Results:** The findings of the study indicate that (45.86%) of the sample their diagnosis was schizophrenia, (25.97%) were schizoaffective and (11.60%) were major depressive disorder with psychotic features. Also, the findings of the study indicate that (58.6%) of the study samples they have poor social factors, while (24.3%) they have moderate social factors and (17.1%) they have good social factors.

**Conclusion:** There is a high significant relationship between the most sociodemographic data and social factor (that included family support and financial factors).

***Keywords:*** *Social Factors, Relapse, Psychotic patients.*

## Introduction

According to the American Psychiatric Association (APA), the mental disorder defines as a health state described by high dysfunction in-person behavior, emotions, cognitions or that reflect a disorder in the psychological, biological or developmental processes following mental functioning [(1)]. Relapse is recurrent through the beginning years of the disease which may be associated non-compliance to treatment and regain symptoms that lead to an increase in the danger of relapse more than 5 times. The occurrence of relapse with psychotic patients living with their families depends largely on follow-up, how to treat and what the family provides them [(2)]. Psychotic relapse is the recurrence of treated psychotic symptoms and causes the patient's condition is deteriorating and cause hospital readmission [(3)]. Can be serious outcomes for clients and families during relapse at an early phase of psychosis. The functional outcomes consider the most visible result of relapse and there is have a relation with interruption of remission. The most important predictor of functional consequences (social relationships, employment, and school) length of remission join negative and positive

symptoms which have been shown to be by far at 1- and 2-years follow-up of patients with early-phase psychosis [4]. The major goals and challenges to the client and their families were relapse prevention [2]. Relapse may be poor to affect their consequences for a long time and affect social interaction and occupational growth. Analyzes indicated that the treatment of relapses of psychosis would be very costly and estimated to be four times the cost of care for individuals without relapse [5].

## Objectives

1. To assess the type of diagnosis with most relapse rate.

2. To identify the social factors that contributes with most relapse clients.

3. To find out the relationship between the social factors of relapse and sociodemographic data of psychotic patients.

## Methodology

ü **Design of the study**: A descriptive-correlational was used to describe the variables and the relationships that occur among them in this study. This design was carried out to accomplish the aims of this study using assessment method on psychotic patients attending the out patients clinic of teaching hospitals in AL_Furat Al-Awsat Governorates, during the period from 9th May 2019 to 20th August 2019.

ü **Sample of the study**: The sample was (a non-probability) purposive of (181) relapsed psychotic patients were selected from teaching hospital out patients center in AL_Furat Al-Awsat Governorates.

ü **Study instrument**: A questionnaire was created by the researcher to reach the study objectives. A large body of relevant literature were extensively reviewed to find the appropriate tool for the current study.

All the instrument domains are measured and rated on three levels rating as a 3-point Likert scale from 1 to 3 respectively; 1 indicates never, 2 indicates sometimes, and 3 indicates always.

The social factors associated with relapse of patients with psychotic illnesses are determined based on the mean of items scores. Effect levels of these domains were measured as follow:

- (Low effect = 1-1.66(
- )Moderate effect = 1.67-2.33(
- )Sever effect =2.34-3).

ü The instrument included two parts: sociodemographic variables and the social factors associated with relapse.

**Part1: The Socio-demographic information**:

This part includes: (gender, age, age at diagnosis, duration of disease, level of education, social status, occupation, monthly income, type of living, residence, family type, who give care to the patients, number of relapses, admitted to the hospital, type of diagnosis).

**Part 2: Social Factors associated with relapse:**

Includes the association social factors with psychotic patients relapse:

Ø **Social Factors**: consists of (18) items, divided to (2) domains:

· Family support (10 items).

· Financial factors (8 items).

**Data Analysis**: The results of the study were analyzed and assessed using the Statistical Package for Social Sciences program (SPSS, Version 26). The researcher used descriptive statistics tools such as frequency, percentage, mean of score and used in inferential statistics such as Chi-Square.

## Results

**Table 1: Descriptive the samples according to types of diagnosis**.

| Diagnosis | f | % |
|---|---|---|
| Schizoaffective | 47 | 26 |
| Schizophrenia | 83 | 45.9 |
| Major depressive disorder with psychotic features | 21 | 11.6 |
| Bipolar Disorder | 16 | 8.8 |
| Delusional Disorder | 6 | 3.3 |
| Postpartum Psychosis | 5 | 2.8 |
| Substance/medication-induced psychotic disorder | 3 | 1.7 |
| Total | 181 | 100 |

This table shows (45.9%) of the sample their diagnosis was schizophrenia, (26%) were schizoaffective and (11.6%) were major depressive disorder with psychotic features.

**Table 2: Social Factor associated with relapse of psychotic patients.**

| **No.** | **Factors Domains** | | |
|---|---|---|---|
| **1** | **Levels (Social Factors)** | **F.** | **%** |
| 1 | Good | 31 | 17.1 |
| 2 | Moderate | 44 | 24.3 |
| 3 | Poor | 106 | 58.6 |
| | Total | 181 | 100 |

This table shows as regarding social factors, the study samples (58.6%) they have poor social factors, while (24.3%) they have moderate social factors and (17.1%) they have good social factors.

This table shows that there is a highly significant relation in (gender, age, duration of disease, social status, occupation, monthly income, family type and who give care to the patients) with (Social factors) at p **£** 0.05. While this table shows that there is non-significant relation in (age at diagnosis, level of education, type of living, residence, number of relapses and admitted to the hospital) with (Social factors) at p > 0.05

## DISCUSSION

The results shows that (45.9%) of the study samples have schizophrenia, (26%) have schizoaffective and (11.6%) have major depressive disorder with psychotic features. (Table 1). This result comes with (fikreyesus, et al.,2016) they found that (72.5%) have schizophrenia, (14.2%) have brief psychotic and (13.3%) have schizophreniform and schizoaffective [(3)]. Also, this result was agree with (Hui C, et al, 2013) who found that nearly one-fourth (n = 70) of respondents with diagnosis of schizophrenia had relapse [(6)]. This is due to the fact that first episode psychosis showed that the diagnosis of schizophrenia was associated with high risk of relapse and elevated severity level, also the nature of the disease according to previous studies, is more severe and less responsive to treatment and suffer many relapses.

The social factors included (family support and financial factors). (Table 2). The result of our study shows that (58.6%) of the study samples they have poor social factors, while (24.3%) they have moderate level of social factors and (17.1%) they have good level of social factors. This result may be due to the fact that psychosis increases the family burden because of the difficulty of dealing with the patient and their refusal to take the medication prescribed by the doctor often, and also revealed that the lack of adherence to treatment is because of the high cost of the drug and the weak economic situation of the families and caregiver can't buy it, so these families leave treatment and use of other incorrect methods of dealing with this disease.

The result also shows that there is a high significant relationship in social factors with gender at p value (.000). This result was disagree with (Hussien, et al., 2008) they found non-significant relationship between factors related to family and gender [(7)]. This result may be because our community thought about stigma especially with female patients which lead them to keep them in the home instead of sending them to the hospital.

The result shows that there is a high significant relationship in social factors with age at p value (.000). (Table 3). This result was disagree with (Hussien, et al.,

2008) they found non-significant relationship between factors related to family and age [7]. This is because most of the samples in the study were between the ages of 38-47 years who were significantly affected by social factors.

The result shows that there is non-significant relationship in social factors with age at diagnosis at p value (.080). (Table 3). This result was agree with (Hussien, et al., 2008) they found non-significant relationship between factors related to family and age at diagnosis [7]. This is because that psychotic disorder often significant appears earlier in men than in women, and the patients are generally affected in the twenties to early thirties years of old.

The result shows that there is a high significant relationship in social factors with duration of disease at p value (.001). This result may be due to the fact that the short duration of the disease will lead to poor adaptation to the disease because of the difficulty acceptance of the illness by the patient and the family, since most of the samples in our study were from the duration of the disease (1-4 years) which is the shortest duration in the study so, we see the majority of social factors are significant affected by the duration of the disease.

The result shows that there is non-significant relationship in social factors with level of education at p value (.270). This result was agree with (Hussien, et al., 2008) they found non-significant relationship between factors related to family and level of education [7].

The result shows that there is a high significant relationship in social factors with social status at p value (.001). This result was disagree with (Hussien, et al., 2008) they found non-significant relationship between factors related to family and social status [7]. This is due to the reason most patients in the study were separated and more likely to relapse for several reasons, including the loss of help and loss of independent and the loss of hope for healing through treatment, leading the patient resort to witches and charlatans.

The result shows that there is a high significant relationship in social factors with occupation at p value (.000). This result was disagree with (Hussien, et al., 2008) they found non-significant relationship between factors related to family and occupation [7]. While this result was agree with (Chaurotia, et al, 2016) they found that unemployment was more significant relapse group with unemployment [8]. This result may be due to the support of most studies to the real fact that the lack of a job leads to the poor economic status of the family and therefore the family is inability to buy treatment and thus relapse of the patient and persistence of his poor condition.

The result shows that there is a high significant relationship in social factors with monthly income at p value (.000). This result was disagree with (Hussien, et al., 2008) they found non-significant relationship between factors related to family and monthly income [7]. This result may be because of patients' dependence on their family and may be due to the fact that low level of employment leads to lower income for the patient's families, which can lead to poor attendance in the hospital as well as the poor economic status of the families, which has led to the lack of support for their patients and consequently recurrent relapse [9].

The result shows that there is non-significant relationship in social factors with type of living at p value (.643). (Table 3). This is due to the fact that most of the study sample live with their families like parents or brothers and most of them have housing so there is no relationship with the high rate of relapses.

The result shows that there is a high significant relationship in social factors with family type at p value (.001). These results were disagree with (Hussien, et al., 2008) they found non-significant relationship between factors related to family and family type [7]. This is due to the fact that most of the study samples live with single families and isolated from any social communication and these families are very interested in the secrecy of their son's illness and this is one of the reasons that has a role in the recurrence of the patient's relapse.

The result shows that there is a high significant relationship in social factors with who give care to the patients at p value (.004). This result was disagree with (Hussien, et al., 2008) they found non-significant relationship between factors related to family and person responsible for the patient [7]. This result may be due to the fact that all the previous studies support that the psychiatric patient, especially in psychosis, needs to be followed up by the family, but most of the samples in this

study were followed by their brothers, so the brothers were the main reason for the recurrence of relapse due to poor follow-up and neglect and not to give them treatment and the adoption of incorrect methods and far from treatment, such as witches and charlatans.

The result shows that there is non-significant relationship in social factors with number of relapses at p value (.195). This result was disagree with (Hussien, et al., 2008) they found a significant relationship between factors related to family and number of relapses [7].

The result shows that there is non-significant relationship in social factors with admitted to the hospital at p value (.290). This result was agree with (Hussien, et al., 2008) they found non-significant relationship between factors related to family and type of admission [7]. This result may be due to the fact that psychotic patients who weren't compliant to treatment do have increased risk for violence. This is due to the result of most of the patients in the study who violently violated them before admitting to the hospital and receiving treatment for the first time and very affecting their social relationships, especially if the target of the violence is the employer or a family member, friend or teacher and husband. Therefore, most families are forced to bring the patient for not tolerating the harm of the patient to others. Family use in this manner increases the severity and relapse of the illness.

**Conclusions:**

The majority of samples were diagnosed with schizophrenia. The greater of samples were among the most affected factors in the study were poor social factors. There is a high significant relationship between the most sociodemographic data and social factor (that included family support and financial factors).

Recommendations:

**1.** AL_Furat Al-Awsat region: It is a large area where educational hospitals are available, but it is free of Psychiatric Units that psychiatric patients need treat patients in those area.

**2.** Educate patients families and society about accepting mentally ill as a member in the society and give education about how to deal with stress and home care for patients.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Department of Psychiatry and Mental Health Nursing and all experiments were carried out in accordance with approved guidelines.

# Linkage between Cariogenic Streptococcus Mutans and Atherosclerotic Plaques of Cardiovascular Disease Patients in Iraqi Population

**Adil Ateyah A. A. AL-Nasrawi[1] , Haider Ali Muhammed[1] , Ali Kadhim Aljarah[1]**

*[1]Assist. Prof., Department of Microbiology, College of Veterinary Medicine, University of Kerbala-Iraq.*

## Abstract

This study was done to identify the correlation between cariogenic S. mutans and CVD patients of Iraqi population.

**Materials and Method:** Eighty six cardiovascular Iraqi patients between (24-70) years old were investigated for their association with cariogenic S. mutans. Pathological samples of vascular and heart valve biopsies and atherosclerotic plaques from the catheter tips of the diagnostic and therapeutic catheters of CVD patients were analyzed with molecular PCR technique with two types of primers, 16s universal primer and S. mutans serotype-specific primer sets genotyping was performed to determine the linkage between cariogenic S. mutans and CVD patients in Iraqi population.

**Results:** DNA samples of cariogenic S. mutans was specified in 60 / 86(69.7%) of the enrolled cardiovascular disease patients, distributed according to the gender between 42/60 (70 %) in males and 18/60 (30%) in females and according to the age between 33/60(55 %) of the positive patients were at 24-60 years and 27/60 (45 %) of the positive patients were > 60 years old.

***Keywords:*** *Cardiovascular disease, Biofilm, Cariogenic Streptococcus mutans, PCR; Universal 16S ribosomal-RNA and Serotype-specific primers genotyping.*

## Introduction

Cardiovascular diseases are the major etiological causes of both weakness and mortality in numerous developing and developed countries, It is expected that during the next time, heart diseases will be the direct cause of fatality in human being [(1)]., Cardiovascular diseases are the reason of approximately 40% of mortality in Europe each year and they killed over 3.9 million people, the bulk of deaths were due to heart disease and stroke [(2)]. Cardiovascular diseases refer to many different illnesses that attack the heart muscle, blood vessels and valves due to biofilms formation, atherosclerotic plaques, very broad etiological agents involved in these diseases including factors such as age, sex, and diet [(1)] . Biofilm are considered as accumulation of microbial masses that adheres to solid surfaces in dental plaques or intravenous catheter or as synergistic with polysaccharide matrix in extracellular. About 65% of infections in human are because of formation of microbial biofilms [(3)]. The biofilms are created by original adherence of bacteria to a solid surfaces, progress of a multi-dimensional intricate structure and disinterest to development in other place. The greatest example of biofilm development is dental plaques which lead to dental caries, periodontitis and other associated systemic disorders. [(5)]. Despite of the high diversity of the human oral microbiota, and its close contact with the circulatory system, various bacteria are implicated in biofilm formation, Streptococcus mutans is the fundamental pathogen in oral cavity which is causal factor of dental plaques and dental caries, considered the most common diseases throught the world [(6 , 7)]. This pathogen which pass through the bloodstream may results in infective endocarditis [(8-9)]. Many previously studies recorded that periodontopathic bacterial species, as well as several Streptococcal species, were specified in cardiovascular specimens like heart valve and atheromatous plaque, and S. mutans was the higher counts that diagnosed [(4-10 )] .

## Materials and Method

The present study was performed during the period of July 2018 to September 2019, collection of specimens was in Cardiology Unit of AL-Hussein Educational Hospital in Kerbala City for (86) cardiovascular disease patents distributed into ( 42 males and 18 females), aged between (24 to 70) years old who received endarterectomies, catheter-based atherectomy, or similar procedures because of various manifestations of ischemia for heart valve and blood vessels and atherosclerotic patients. Also a pool of (23) diagnostic catheterization tissue specimens were from 15 males and 8 females that obtained as a control group.

Subjects and Collection of Specimens

After clinical diagnosis of CVD patients, the vascular and atheromatous plaque biopsy samples from the tips of the therapeutic and diagnostic catheters of CVD patients and control group were achieved with highly sterile conditions, each endarterectomy specimen was immediately transferred into1.5 ul polypropylene microcentrifuge tube contained 500 ul of 0.9% sterile normal saline solution, and rapidly transferred and subjected to the laboratory for molecular investigation.

**Isolation of DNA**

DNA Extraction from all of the vascular and atheromatous plaque biopsies was carried out by using Genomic DNA Mini Kit (Geneaid, Korea)/ Tissue protocol according to the manufacturer's instructions. The concentration of chromosomal DNA was measured with Q5000 UV-Vis Spectrophotometer at (260nm) and DNA quality was assessed by the 260:280 nm absorbance ratio, and about 20-25 nanogram /microliter of isolated DNA aliquots were used for molecular detection of Streptococcus mutans by Nested Polymerase Chain Reaction (Nested PCR) technique according to [20- 21- 22] .

**Detection of Streptococcus mutans By Nested PCR**

Isolated DNA was used for detection the genus specific of Streptococci was performed by PCR depending upon pair of primers specific to 16s rDNA of the genus Streptococci in Table no.1, according to the amplification reaction program in Table no.2. And the DNA product samples of 1st amplification reaction were used as a template for the detection of Species specific S. mutans by means of 16s rDNA primer pair of Specific species S. mutans in (table no.1) according to the 2nd amplification reaction program in (table no.3) [23- 24] .

### DNA Analysis and Electrophoresis

The amplified DNA products of the 1st and 2nd PCR (Nested PCR) reactions were analysed by electrophoresis in a concentration of (1.5) % Agarose gel (which prepared from 1.5 gm. of very pure agarose powder melted in 100 ml. of 1X TBE buffer ( 0.89 M Tris Base, 0.89 M Boric acid, 20 mM EDTA) (PH 8.3), separation of amplified DNA products was done by mixing 5 µl of PCR product with 2 µl of 6x loading dye, then, the mixture was loaded into the well of the gel with the using of DNA ladder with molecular weight 1K bp. Ladder and 100 bp. (Accu Bioneer/Korea) as a molecular size marker via the agarose gel at an electric current of 90 Volts for one hour through horizontal gel electrophoresis system (Sigma Chemicals Co. USA).

## Statistical Analysis

The collected data were analyzed using the statistical system and Chi-Square ($\chi 2$) test, with P-value of $\leq 0.05$.

## Results and Discussion

Nested Polymerase chain reaction (N-PCR) technique was subjected in the current study for detecting Streptococcus mutans in CVD samples, whole genomic DNA, which was yielded directly from CVD specimens was applied to 1st reaction of N-PCR using universal primers pair specific to 16s rDNA of the genus Streptococci., then, the positive amplified DNA products (1505 bp. size) by PCR which represent Streptococcus genus, were detected in all the 1-5 CVD samples (Fig. 1). The 2nd reaction was performed by using (DNA products of the 1st N-PCR reaction as a template) with 16s rDNA primer pair specific to the species of Streptococci mutans.

Moreover, Streptococcus mutans was specified in all positive 1-5 CVD samples. (Fig. 2) that revealed the existence of the amplified PCR products (282 bp.) as applied by [23- 31] , this procedure was identical to the

investigations of a similar related studies for identifying S. mutans targeting 16S rRNA gene which was a proper manner for determining the microbial population of the biofilms in pathological specimens of CVD [18-21-22-30] , as well as divers variety of PCR and sequencing techniques, in which amplification and nucleotide characterization of 16S rRNA gene remains using primer sets targeting the sequence common in eubacterial species, were broadly performed for identifying bacterial species [32] . Moreover, universal primers for 16S rRNA gene of species specific S. mutans was depended in a broad range of similar studies including [7-20 -21] .

In the present study, specification of DNA samples of S. mutans within the biopsies of heart valve, blood vessels and atheromatic plaques of Iraqi CVD patients is the propel evidence for contributing the fundamental cariogenic pathogen in the target biofilms, DNA aliquots of S. mutans was found in 60/86(69.7%) of the enrolled CVD patients with significant importance X2= 5.882 (P-value of ≤ 0.05) in male patients were 42/60 (70 %) more than in females 18/60 (30%) table 4., this result was consistent with numerous previous related studies revealed the most frequently microorganism found in the heart valves samples was the S. mutans (89.3%), of 42 CVD patients with a mean age of 55.6-13.8 years regarding the medical conditions that led to valve replacement surgery and was agreed with Japanese patients revealed S. mutans was higher percentage (77.8)% than the other oral and periodontal bacteria, using simple PCR method and Streptococcus mutans was commonly diagnosed (69%) in the heart valve and (74%) in atheromatous plaque of the vascular wall specimens.

**Table 4. Distribution of Cariogenic Streptococcus mutans in cardiovascular disease Patients and control groups.**

| **Streptococcus mutans in Subjects** | | | | | | **Statistical analysis** |
|---|---|---|---|---|---|---|
| **Variable** | | **Cardiovascular disease group 86** | | **Control group 23** | | |
| | | **(+)No, Percentage** | **(-) No, Percentage** | **(+) No, Percentage** | **(-) No, Percentage** | |
| Gender | Male | 42/60 (70 %) | 11/26 (42.3 %) | 3/23 (13%) | 12/23(52 %) | X2= 5.882 DF= 1 P ≤ 0.05 |
| | Female | 18/60 (30 %) | 15/26 (57.7 %) | 3/23(13%) | 5/23(22 %) | |
| Age | 24-60 years | 33/60 (55 %) | 20/26 (77 %) | 2/23(8.7%) | 12/23(52 %) | X2= 3.687 DF= 1 P ≤ 0.05 |
| | > 60 years | 27/60 (45 %) | 6/26 (23 %) | 3/23(13%) | 6/23(26 %) | |

Daboor, et al., (2015) revealed S. mutans is actively trained in its automatic modes of biofilm formation., the cariogenic Streptococcus mutans successfully employs dietary sucrose for the production of exopolysaccharide, which proceed as a scaffold for its biofilm, thus participating to its pathogenic activity, situational stress tolerance, and resistance of many antimicrobial agents [(5)] .

On the other hand, in the current research, specification of DNA of S. mutans in CVD patients 42/60 (70%) in males more than 18/60 (30%) in females with significant importance X2= 3.687 (P-value of ≤ 0.05), this result may be elevated in the collectively number (53) of CVD males patients more than total (33) CVD females that enrolled in this study in comparison to the control group that reflects no significant difference as demonstrated in Table 4.

As well as, CVDs are commonly occurs in human due to a diverse array of intrinsic and extrinsic factors and mechanisms particularly biofilms forming bacteria like S. mutans and related members and their products, this result concur to previous finding by [(30 )] concluded that increasingly evident of a broad range of mechanisms are utilized by different members of the viridans group Streptococcai to promote thrombosis in cardiac and vascular atherosclerosis plaques and the progression of CVDs such as Infective Endocardits.

## Conclusions

The present study adds considerable evidence for the involvement of oral commensal bacteria S. mutans strain in human CVDs via its ability to colonize and populate in oral environment and spread throughout blood stream to cardiovascular system forming biofilms and atherosclerotic plaques in male CVD patients more than in females and in younger ages more than old peoples, S. mutans, which shows serious impacts on the human's health. So that, more work has to be done for the sake of preventing this terrible and transferrable bacterium from invading the bloodstream and eventually the endothelial tissues of the heart and preventive techniques such as brushing twice a day, reduction in sucrose rich foods, regular mouth washing, proper flossing and brushing, essentially keeping the mouth free from existence of bacteria which causes dreadful diseases.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols

were approved under the Department of Microbiology and all experiments were carried out in accordance with approved guidelines.

# Effect of Omega-3 on Induced Cutaneous Wounds Healing in Rabbits

**Falah Mahmood Hameed**

*Lecturer Assistant, Department of Surgery and Obstetrics, College of Veterinary Medicine, University of Kerbala-Iraq*

## Abstract

The present study was designed to evaluate the effects of omega3 on full-thickness cutaneous wounds healing in rabbits. All animals were created wound (1.5 cm2) full-thickness in dorsal back region in (16) male adult rabbits, clinically healthy weighing from (1.3- 1.8 kg). Under the effect of intramuscular administration of a mixture of xylazine hydrochloride 5mg/kg with ketamine hydrochloride 35mg/kg of and 1 mg/kg of Diazepam. The treatment group was given 300 mg of omega3 orally daily with single dose (group A), while in group (B), the rabbits were left without treatment, as a control group. For clinical and histopathological evaluation, each group was divided into four subgroups (two wounds/subgroup) on 3, 7, 14 and 21th days post-wound creation and treatment. The result revealed, Clinically, the rate of wound healing was same in all groups, no differences when section taken from the edge of the wounds. The results histopathologically, shown the treated groups have greater cellularity with improved vasculature with the superiority of omega 3 -treated groups than those in untreated groups. Conclusion; the histopathologically and clinically results confirmed that given effects of omega3 to the treated groups leads to enhance and develop of cutaneous wound healing.

***Keywords:*** *omega3, wounds healing, rabbits,*

## Introduction

A wound is a disruption of the normal continuity or contiguity of body structures caused by physical injury [(1)]. Wound healing is a biological process that happens after a physical, chemical, or biological causes led to breaken of epithelial barrier [(2-3)]. The wound care is older skill such as old human civilization, in the recent decades, available the advanced medical science, improve healing suffer from lack when get oral medication. Therefore, an active drugs as oral formulation to be immensely beneficial to the heal wound due to simple of use and enhance of healing time, Omega-3 is one of them [(4)]. Though, recently that adequate levels of essential nutrients is being recognized to prevent and treat some disturbances [(5)]. Omega-3 fatty acid is one of the essential fatty acids in human body that can be found in the sea products, especially fish and fish oil and in some of the seeds oils. omega-3 have many important benefits like they entered in a good feeding and treated for many diseases as they decrease rheumatoid arthritis [(6)]. Current modern studies demonstration that omega-3 can control the activity of the nuclear factor (NF-kß) [(7)], that acting a main role in the gene expression regulation in inflammatory reactions and associated in the pathogenesis of cardiovascular disease [(8)]. Therefore, The purpose of this study was to evaluate and compare the effects of omega3, on full-thickness cutaneous wounds healing.

## Materials and Method

### Experimental Animals

Sixteen adult male rabbits were used in the study that divided into two groups (eight rabbits for each group) weighing from (1.3- 1.7 kg). The animals were housed in the animal house of the Veterinary Medicine College, Karbala University, maintained in individual cages along the period of the experiment under controlled conditions including, management, environment and feeding.

### Surgical operation

Food was hold for 6-12 hours and water 5 hours

before surgical operation. The area of dorsal back region should be shaved and cleaned, after that general anesthesia was induce with diazepam as a preanesthetic in dose 1mg/kg b.w. after 10 min. injected with xylazine in dose 10 mg/kg b.w. and ketamine in dose 50 mg/kg b.w. all this drugs injected intramuscularly [9]. The rabbits were hold in ventral recumbency and the dorsal aspect (back) of the animal was prepared for aseptic surgery. On each animal, one square (1.5×1.5) cm full-thickness skin wounds were created in dorsal back region. The rabbits was divided to two groups, group (A) as the treatment group was treated with single dose daily of 300 mg omega3 orally for 3 weeks, while, in group (B), the rabbits were left without treatment, as a control group.

**Clinical Evaluations:** In this study, all rabbits were exposed to complete clinical examination every three days during the experimental period. All wounds were taken by digital photographs after the area prepare with carefully shaved to see margin of the wound. The scab was removed carefully for each wound for well visualize of the granulation tissue and epithelization area.

**Histopathological evaluation** :The histopathological evaluation was performed on day (3, 7, 14 and 21) post-treatment with omega3 and the same period was depended for the control group (four rabbits / period). For histological analysis, a biopsy specimens were obtained (5-6) µm in thickness and they included about (3-4) µm of skin intact on both sides of the wound they were fixed in (10%) neutral formalin solution, and prepared routinely and staining by hematoxylin-eosin (H&E) [10].

## Results

### Clinical Evaluation

The clinical statement of wounds seemed actually that the treatment and control wounds were showed quickly decreased in size through the current study. The change was started at 3rd days in both control and treated wounds, which became clear at day 14th, especially in treated wounds. These differences continued to be present until day 21th post-treatment. In addition, the size of the treated wounds observed lesser than those in control wounds. The clear differences appeared in the in total wound healing between treatment & control wounds, mainly at the end of the study **(Fig.3.1**).

### Histopathological Evaluation

The histopathological experimentally produced for tissue biopsies of the wound margins and beds shown the chief differences between control and treatment wounds were began after three days post-treatment. The histopathological sections, of treated group on day 3 post-wounding, shows aggregation of intensive of inflammatory cells. At the same period, the histopathological sections of control group were shown a little infiltration of inflammatory cells.

On 7 day post-treatment, the histopathological observation in control group was showed the new blood vessels and inflammatory cells. The histopathological sections of treatment group, 7 days post-treated, were showed presence of proliferation of more small blood vessels with proliferation of fibroblasts cells. On 14 day post-wounding, the histopathological section of control group, was showed the new blood vessels, inflammatory cells. the histopathological section of treated group on day 14 post-treated, was showed more vascularity with formation of keratin and thicken of epidermis. The histopathological section of control group, 21st days post-wounding, showed the presence of epidermis and presence of sebaceous glands. The histopathological section of treated group, 21st day post-treatment, was appeared thick epidermis layer with well development of hair follicles and presence of sebaceous gland.

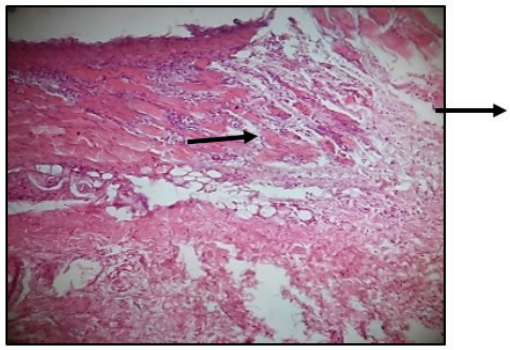

**Fig.1**: Histopathological section of treated group on day 3 post-wounding, shows aggregation of intensive of inflammatory cells (black arrow) (H&E X100).

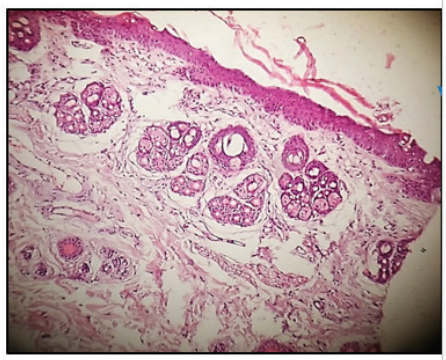

**Fig 2**: Histopathological section of control group on day 3 post-wounding, shows little infiltration of inflammatory cells (blue arrow) (H&E X100).

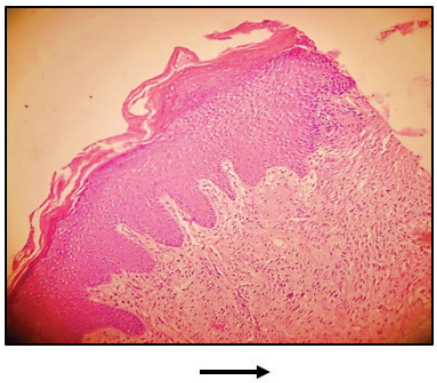

**Fig 3**: Histopathological section of control group on Day 7 post-wounding, shows the new blood vessels (black arrow), inflammatory cells (blue arrow) (H&E X100).

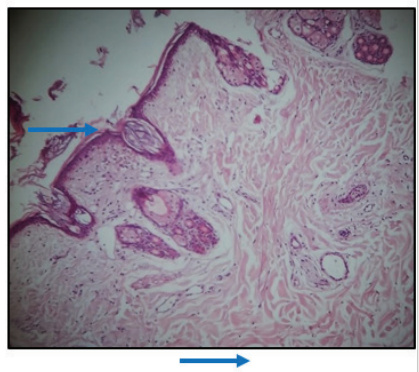

**Fig. 4**: Histopathological section of treated group on day 7 post-wounding, shows more small blood vessels (angiogenesis) (yellow arrow) with proliferation of fibroblasts cells (black arrow)) (H&E X100).

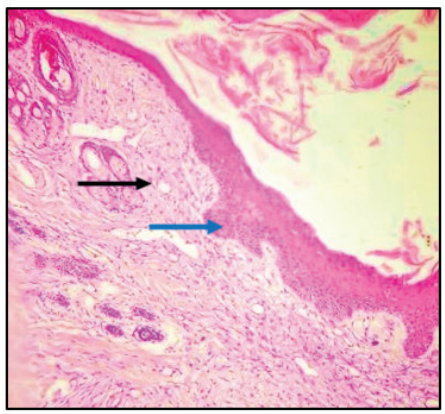

**Fig 5**: Histopathological section of control group on 14 day post-wounding, shows the new blood vessels (black arrow), inflammatory cells (blue arrow) (H&E X100)

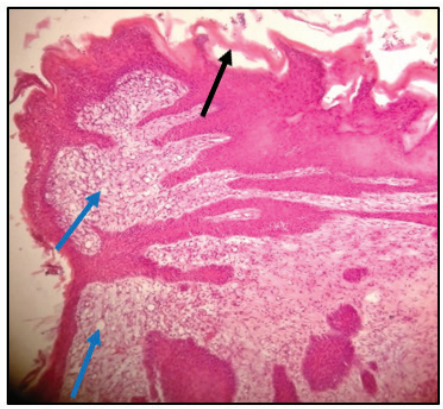

**Fig 6**: Histopathological section of treated group on14 day post-wounding, shows more vascularity (blue arrow) with formation of keratin (black arrow) and thicken of epidermis (H&E X100).

## Discussion

### Clinical Evaluation

Wound healing process is a biological, complex, progressive that occurs directly because of disruption in epithelial barrier consequently after chemical, physical, or biological causes. In this process activation occurs for inflammatory cells such as platelets, neutrophils, macrophages and fibroblasts [2-3]. In the current study, the assess and compare the effects of omega3 on the healing of full-thickness cutaneous wounds in the rabbits supply improved blood vessels and better epithelization, to all post-treated groups compared with the control groups. The clinical observations of wounds in the present study appeared that the level of development of healing process was started rapidly in both control and treatment wounds, but the progression was high in the treated groups & than those in control wounds. The clinical following-up appeared that all wounds of treatment and control groups were decreased rapidly in size along the study, but the clinical inspection revealed that the rate of wound closure (contraction) in treated groups were significantly more along the period of the study as compared to control groups. These differences were continued to be present until day 21 post-treatment. These results are close to the results obtained by [11] who used topical and systemic effects of omega-3 on oral mucosal wound healing in albino rats. They investigated the omega3 have greatly enhanced ulcer healing with superior effects when using topical application. In the other research that shown increase cell membranes fluidity when used omega-3 [12]. Cell membranes provide a significant function into and out of cells by regulating crossing of chemical signals, hormones, and nutrients; this led to different effects, from increasing glycogen storage to enhancing muscle protein synthesis [13]. On the other hand, [14] Animals before surgical incision for 21 days get a food containing fish oil was made and for 10 or 30 days after wounding, showed that content of collagen was similar at the same period.

In the study of [15] revealed that omega-3 enhanced closing of open wounds at first (5 days), not as other fatty acids moreover may have significant effects on healing of the wound. Treated the wounds with oleic acid healing faster than the wounds that treated with linoleic acid.

### Histopathological Evaluation

The valuation histopathologically of tissue biopsies from the wound peripheries and beds in the current study discovered that the chief differences between control and treatment wounds were happening at day 3 post-treatment and continuous until the end of the study. The histopathological sections showed that the proliferation of blood capillaries and intensive of inflammatory cells infiltration in treated group were more developed than that in control wounds through 3 and 7 day of the study. Also in the histopathological section of treated group on day 14 and 21st days post-treated, was showed more vascularity with formation of keratin and thicken of epidermis with well development of hair follicles and presence of sebaceous gland than control group.

These results are in agreement with the results obtained by [11] when use local and systemic omega 3 application, there was a gradual reduction in inflammation, increase in epithelial and connective tissue regeneration, appearance of keratin layer, and finally high vasculature, all occurring gradually throughout the period of 2, 4, and 8 days, giving the best repair effect at the end of the treatment period. In the study of [16] showed that omega-3 fatty acids augmented closure of open wounds first 5 days, Also mention that omega-3 in fish oil may have a support effect on primary wound epithelialization, then reducing scar formation through inhibit later collagen deposition.

## Conclusions

Omega3 can be used for acceleration and enhancement of cutaneous wounds healing. The healing in the treated group appear an effective when compared with control group.

**Financial Disclosure:** There is no financial disclosure.

# Use of Iraqi Castor (*Ricinus Communis*) Leaf Extract as Anti-Inflammatory in Treatment of Skin Wounds in Rabbits

**Namir I. Mohammed[1], Jassim M. Khalaf Albozachri[1]**

*[1]Assist. Lecturer, College of Veterinary Medicine, University of Kerbala, Karbala, Iraq*

## Abstract

The present study was investigate to study the effects of castor leaf extract on histological healing rates of skin wounds in rabbits. sixteen adult clinically healthy rabbits from both sexes weighing from (1.25- 2 kg) were used. All animals were created wound ($4cm^2$) full-thickness in abdominal region .The treated group (B) application of the extract on the wound to all animals while group A (control group) leave without treatment. On day 3, 7, 14 and 21 post operations collect skin tissue biopsy samples for histopathological examination each time two rabbits. The result revealed, Clinically, the rate of wound healing was same in two groups, no differences when section taken from the edge of the wounds, histopathological result was show: In 3rd day of skin wound healing group (A) (control group) show demarcation line consisted of polymorphonuclear (PMN), there was thickened at cut edges of epidermis with inflammatory cells, the inflammatory responses of group (B) (treated group) were observed in low range than the control groups. In 7th day of skin wound healing group

(A) show few small vessels were present and tensile strength of the tissue by organized collagen fibers, group (B) show good tensile strength, increased in small vessels and better wound healing. In 14th day of skin wound healing group (A) show vascular density was noticeable, group (B) show increased vascular density than in group (A).

***Keywords:*** *Castor, Skin, Rabbits, wound healing. Anti-inflammatory*

## Introduction

Ricinus communis, also called castor oil, is one of the most important shrub belonging to the family (Euphorbiaceae) and spread in tropical and subtropical regions[(1)].The castor are almost small tree 6 meters in length and they are spread globally in South Africa, India, Brazil and Russia[(2)]. In Iraq, it spreads in central and northern Iraq, as well as in the western regions[(3)]. All parts of the plant are used medically, the stem of the castor plant use as anticancer and antidiabetic[(4)], in Indian medicine, the roots of the castor plant and its five-lobed leaves were used in the treatment of various diseases such as skin ulcers, liver disorder, hypoglycemic and laxative [(5)]. The wound healing is a complex, interactive integrative process that commences right after injury invading cellular and chemotaxis activity[(6)].The wound is a physical injury of body that described by distraction normal continuity structures of body. Wound may cause damage in superficial structures skin and reach to structures underlying the skin[(7)]. The tolerance of injury was a varies with tissue type. Therapeutic considerations are based on the type of skin wound and often determine the amount of tissue damage[(8)]. The anti-inflammatory pharmacological activity of castor (Ricinus communis) observed due to the presence of phytochemicals like flavonoids, alkaloids and tannins that present in the plant extract and various biological activates[(9)]. The plant extract has antibacterial activity against Escherichia coli, Salmonella newport, Serratia marcescens, Streptococcus progens and Shigella flexneri[(10)],Bacillus subtilis and Staphylococcus aureus[(11)], Klebsiella pneumoniae, Escherichia coli, Proteus vulgaris, and Pseudomonas aeruginosa[(12)].

The aim of this study was to estimate the benefits of using Iraqi castor (Ricinus Communis) leaf extract in

skin healing in rabbits.

## Materials and Method

This study was carried out on sixteen adult clinically healthy rabbits from both sexes weighing from (1.25-2 kg) were divided equally into two group A (control group) and group B (treatment group) .The animals were housed in the animal farm of the College of Veterinary Medicine, University of Karbala, maintained in individual cages under normal environment including climate, management and feeding all animals were subjected to the creation of a full wound (4 $cm^2$) in the abdomen after preparation for sterile surgery [13].

In this study used fresh leaves of Ricinus communis Linn. (Fam. Euphorbiaceae) with entire petiole. The leaves were collected from soada region in Karbala province, and washed after collection to remove the debris then dried this leaves and the dried leaves were powdered to get a coarse powder then moistened the dried powder material of Ricinus communis (200 gm) with adequate amount of methanol and subjected to soxhlet extraction 3 cycles of solvent and concentrated to get about 16 gm [14].

General anesthesia was induced by diazepam (diazepam 10). The ampoule contains 2 ml (10 mg/ml), Aleppo, pharmaceutical industries, Aleppo - Syria) as surgery at 1 mg/kg body weight. After 10 min syringe with zylazine (2% zylazine® contains 50 ml (20 mg/1 ml), Ceva Saute animal, Spain) at a dose rate of 10 mg/kg body weight. Ketamine® (10%) contains 10 ml Vet. Injection, Kepro Pharmaceuticals, Netherlands) at a dose rate of 50 mg/kg body weight. All these drugs are injectable [15].

On each animal, one full thickness (4 $cm^2$) was created in the abdominal area using a mold made from X-ray film for all animals and the wound tailor was sewn by 3-0 silk by intermittent horizontal stitching. after that application of the extract on the wound to all animals in group B (treatment group) while group A (control group) leave without treatment.

On day 3, 7, 14, and 21 collect skin tissue biopsy samples for histological examination of groups A and B group for each time two rabbits. The samples were fixed in 10% neutral formalin then cut into 5 μm thick sections and stained with hematoxylin and eosin (H & E), and investigated for microscopy [16].

## Results and Discussion

All animals were noted to eat and behave normally in the first three days after surgery. Clinically, the rate of wound healing was same in all groups, no differences when section taken from the edge of the wounds.

The animals remained healthy, without clinical of infection after the surgery period. The macroscopic observation of all groups during the wounding confirmed the aseptic conditions. Wound healing is a complex biological method that takes place in all tissues and all organs of the body. Various cell types, including keratinocytes, neutrophils, macrophages, lymphocytes, fibroblasts and endothelial cells, are involved in this process [17].

In 3rd day of skin wound healing group (A) (control group) the inflammatory reaction was dominant. On the skin surface, necrosis of skin tissue was saturated as a consequence of mechanical damage . This stage was observed also under the tissue necrosis. The demarcation line consisted of polymorphonuclear (PMN), the epidermis was thickened at its cut edges with inflammatory cells, while in treated group show inflammatory responses at lower range than control groups (Figure. 1).

The inflammatory response is started very soon after the trauma on wound event, its the wound healing first phase. Wound and surrounding tissues become inflamed during the first phase and cells mostly neutrophils and monocytes are mobilized to infiltrate the clot and start the complex procedures of synthesis granulation tissue [18].

In 7th day of skin wound healing were increased new organized collagen bundles and relatively advanced epitheliumat the wound because treated with castor leaf extract (group B) when compared with non-treated wounds (group A). In treated tissues with castor leaf extract appear several small vessels (angiogenesis), whereas in control tissues was present only a few vessels. The tensile strength of the tissue originate from organized collagen fibers, the collagen was observed consistent arrangement with tissues in the treated group

that give good tensile strength and improved wound healing (Figure 2).

The cell surface binding edges of wound have to myofibril contraction, also present of fibroblasts other cells. A fibrin or fibrinogen was showed to interact specifically with platelets [19]. In 14th day of skin wound healing increased in the mean vascular density of the castor leaf extract treated groups(B) when compared with control groups(A). Consequently, it can be established that treated group by castor leaf extract improved angiogenesis at the wound beds when compared with non-treated groups (Figure. 3).

Small amount of voltage produced as long as the collagen bundle was subjected to stress was arrangement and absorption of collagen [20] .In 21th day of skin wound healing through rich neovascularization all wounds contained abundant fibroblasts and collagen bundles, that noticed only in the wounds treated with castor leaf extract (Figure 4).

Moreover, platelet concentrates comprise many chemotactic growth factors and powerful mitogenic, which regulate tissue repair key processes complex, including cell proliferation, chemotaxis, migration, cellular differentiation, and extracellular matrix synthesis [21] . According to the result of this study the effect of castor leaf extract in wound healing shown positive result in acceleration of epithelial migration, the angiogenic response and fill of tissue. Castor leaf extract accelerate healing both normal tissue and impaired wounds when locally applied.

## Conclusion

The results of systematic review and hisological analysis shown that the time of wound healing in group was treated with castor leaf extract shorter than non-treated group.

# Assessment of Child Complications Related to Fluids and Electrolyte Disorders in Babel Hospital for Mothers and Children in AL-Hilla City

**Abdul Mahdi A. Hassan**

*Assist. Prof. Ph.D., Child and Mental Health Nursing, College of Nursing, University of Babylon*

**Abstract**

This is a descriptive study aimed at assessing children's complications related to fluid and electrolyte disorders. Data were collected in Babel Hospital for Maternal Children through a questionnaire model and data analysis by frequency and percentage, the results showed that (86%) of children lose their appetite, while (14%) They do not lose their appetite, results also show (72%) suffer from diarrhea, while (28%) do not suffer from diarrhea, as results show (20%) suffer from dry mouth, while (80%) do not suffer from dry mouth, The results also show (10%) suffer from syncope, (90%) do not suffer from syncope.

**Objectives:** Evaluation of complications related to fluid disturbances with electricity in the child.

Knowing the demographic characteristics of young children who suffer from fluids in disorders such as age, number of children in the family, and number of children in the family.

**Methodology**: A descriptive study used to assess complications related to a fluid electrolyte disorder for a young child. This study was conducted at Baby and Mother Hospital of Babel during the period (5/2 / 2019_3 / 6/2019).

A purposeful sample of (50) children, and the study was proven by a committee in the College of Nursing. Statistical SPSS was used to analyze the results of this study

**Results**: According to the interpretation and discussion of the study results, (72%) of the children had diarrhea (48%) of the children had vomiting. (62%) are dependent on artificial feeding, (34%) of children have experienced accidents or fall from a height.

***Key words:*** *small child, liquids, electrolyte disturbance*

## Introduction

Total body water (TBW) consistently represents 70% of lightweight body weight across age and sex, but differs as a percentage of actual body weight between groups and individuals due to the variance of fatty tissue deposition, which contains less water than the muscles. TBW is -75% of total body weight in newborns, 70% in infants and 45% in the elderly. The average age of an adult male (70 kg) is 60% of the total body weight (42 l) as water and an adult female (50 kg) has 55% (27 l). This water is distributed between extracellular compartments (ECF) and intracellular (ICF). [1]

Electrolytes are chemicals in the body that regulate important physiological functions. Examples of electrolytes are sodium, chloride, magnesium, potassium, and calcium. [2]

The concentration of electrolytes in the body is controlled by a variety of hormones, most of which are made in the kidneys and adrenal glands. Sensors in specialized kidney cells monitor the amount of sodium, potassium and water in the bloodstream. [3] Electrolyte disturbance is a defect in some ionized salts (such as bicarbonate, calcium, chloride, magnesium, phosphate, potassium and sodium) in the blood. [4]

Electrolyte imbalance can also be caused by a lack or excess of minerals in the body, there are medical reasons such as: Addison's disease (deceased production of hormones by the adrenal glands), alcoholism, diabetes, diarrhea, heat exhaustion, kidney disease and vomiting.

May be caused by an electrolyte imbalance with medications including:

ACE inhibitors, calcium supplements

Some of the hormones that protect potassium (which cause the kidneys to retain potassium), diuretics, which promote fluid secretion through the kidneys and potassium supplements. (5)

## Methodology

1- Study design: A descriptive design used to evaluate complications related to a child's liquid electrolyte disturbances.

2- Preparing the study: This descriptive study was conducted in Baby and Mother Hospital in Babylon during the period (5/2/2019-3 / 6/2019)

3- Selecting the sample: A purposeful sample of (50) sick children.

4- Administrative permission: The study was proven by a committee in the College of Nursing.

Statistical analysis: Use descriptive statistics to analyze the results of this study.

## Results

**Table (1): Complication of fluid & electrolytes disturbance**

| No | Variables | Frequency | | Percentage | |
|---|---|---|---|---|---|
| | | Yes | No | Yes | No |
| 1 | Is the child suffering from diarrhea? | 36 | 14 | 72% | 28% |
| 2 | Is the child suffering from vomiting? | 24 | 26 | 48% | 52% |
| 3 | Is the child suffering from a fever? | 13 | 37 | 26% | 74% |
| 4 | Is the child drinking adequate amounts of water? | 27 | 23 | 54% | 46% |
| 5 | Is the child lost his appetite? | 43 | 7 | 86% | 14% |
| 6 | Is breastfeeding a child? | 19 | 31 | 38% | 62% |
| 7 | Is the sunken eyes of a child? | 32 | 18 | 64% | 36% |
| 8 | Is the child suffering from lack of elasticity of the skin? | 15 | 35 | 30% | 70% |
| 9 | Is the child suffering from dry mouth? | 10 | 40 | 20% | 80% |
| 10 | Is the child suffering from lack of urine output? | 26 | 24 | 52% | 48% |
| 11 | Is your child suffering from a lack of sweating? | 20 | 30 | 40% | 60% |
| 12 | Is the child suffering from fainting ? | 5 | 45 | 10% | 90% |
| 13 | Is the activity of the child changing , become idle? | 40 | 10 | 80% | 20% |
| 14 | Is the color of the skin change , becoming pale? | 35 | 15 | 70% | 30% |
| 15 | Is the color of urine changing ? | 30 | 20 | 60% | 40% |

## Discussion

Also (48%) of the children suffer from vomiting, while (52%) do not suffer from this point, and excessive vomiting, especially over a long period of time, leads to the loss of excess water and electrolytes from the body, and the result agrees as my opinion.

(26%) of children suffer from fever, while (84%) do not suffer from this point, the temperature rises quickly or exceeds 39.5 degrees Celsius, and breathing increases, and the heart rate usually rises. Dehydration is caused by excessive sweating and increased vapor loss due to the rapid respiratory rate.

Also (38%) of infants are breastfed, while (62%) depend on breastfeeding, which may cause diarrhea at some time or vomiting.

(30%) of children suffer from decreased elasticity of the skin due to fluid and electrolyte loss, while (70%) do not suffer from this point.

Also (10%) of children suffer from syncope there may be too much or too little sodium that can cause cell dysfunction and coma, while (90%) do not suffer from this point.

(14%) of children suffer from physical disabilities and diseases, while (86%) do not suffer from them. There are diseases that cause fluid and electrolyte loss such as kidney or digestive disorders.

Also (34%) of children experienced accidents or falls from high places. In these cases, the child experienced severe bleeding that leads to fluid and electrolyte disturbances, while (66%) do not suffer from this point.

## Conclusion

According to the interpretation and discussion of the study results, the following conclusion was concluded:

1- (72%) of children suffer from diarrhea.

2- (48%) of the children suffer from vomiting.

3- (62%) depends on industrial nutrition.

4- (34%) of the children were exposed to accidents or fall from a height.

**Recommendations:**

1- Baby food must contain minerals and vitamins.

2 - The child must drink a lot of fluids, and drink a lot of fluids when you have a fever, vomiting or diarrhea.

3- Protecting the child from any accidents.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the College of Nursing and all experiments were carried out in accordance with approved guidelines.

# The Rate of Post-Spinal Puncture Headache in Patients Undergoing Spinal Anesthesia According to the Size of Spinal Needle (G22 versus G24): Case Reference Study

**Ahmed Matrood Kadhim[1] , Salman Abbas Badi[1], Watheq Maeh Naji[1]**

*[1]Anesthesia and intensive care specialist / Al-Diwaniyah Teaching Hospital / Department of Anesthesia / Al-Diwania / Iraq*

## Abstract

**Background:** A number of disadvantages have been described in associations with spinal anesthesia such as short duration of pain relief, increased incidence of hypotension and post-spinal puncture headache (PSPH). Post-spinal puncture headache symptom has been explained by intracranial hypotension (low CSF pressure) because of CSF leak at site of puncture, causing traction on pain sensitive structures.

**Aim of the study:** The present study was aiming at comparing the incidence rate of PSPH in relation to the gauge of used spinal needle.

**Patients and Method:** The current observational case reference study was carried out at Al-Diwaniyah Teaching Hospital in Al-Diwaniyah Province, Iraq. The beginning of the study is dated back to the 3rd of April 2018 and the study continued till September the 15th 2019. It included 60 patients undergoing spinal anesthesia for various surgical operations. In 30 patients a spinal needle of 22 gauge was used whereas in the second group (n = 30), a spinal needle of gauge 24 was used. All patients were instructed to be nil by mouth overnight.

**Results:** The Rate of post-spinal puncture headache (PSPH) show significant variation according to needle caliber size. Patients who experienced headache in the first group (gauge 22) were more frequent that those in group 2 (gauge 24), 22 (73.3 %) versus 8 (26.7 %) and the difference was highly significant ($P < 0.001$). In addition, severe headache was only seen in group 1 (gauge 22).

**Conclusion:** The incidence and severity of post-spinal puncture headache (PSPH) is significantly related to spinal needle caliber size so that narrower needles are associated with less frequent and milder form of headache in comparison with wider bore needles.

***Key words:*** *post-spinal puncture headache, spinal anesthesia, size of spinal needle*

## Introduction

Of the well-known types of regional anesthesia, spinal anesthesia involves the introduction of local anesthetic agents, opiods or other agents into the subarachnoid space. Actually it is one common form of neuraxial block [3,13] . Indeed, the inception of spinal anesthesia can be dated back to 1885 when James Leonard Corning (made a description of accidental form of the procedure; however, the first planned procedure was pioneered by August Bier in 1898 [12,16]. August Bier reported the "post spinal puncture headache (PSPH)" in addition to other complications such as vomiting, leg pain and backache and proposed that headache is due to loss of cerebrospinal fluid [13,16]. A number of advantages have been described in association with spinal anesthesia such as negligible failure rate, the onset of anesthesia is very rapid, satisfactory pain relief because of dense neuronal block and avoidance of patient morbidity following major surgical operations [3,4,6] ; however, consensus about these advantages is lacking [13]. Actually, this type of anesthesia is preferred for cesarean section operation

because of rapid onset of action [8]. The conclusions of some meta-analyses and randomized controlled clinical trials provided some controversy about the outcome and advantages of spinal anesthesia [3,18].

A number of disadvantages have been described in associations with spinal anesthesia such as short duration of pain relief, increased incidence of hypotension and post-spinal puncture headache (PSPH) [5,20,22]. Post-spinal puncture headache symptom has been explained by intracranial hypotension (low CSF pressure) because of CSF leak at site of puncture, causing traction on pain sensitive structures [5,22]. Several terms have been used to describe such headache including post lumbar puncture headache, post-spinal headache, lumbar puncture headache post-dural puncture headache (PDPH) and spinal headache [13].

The present study was aiming at comparing the incidence rate of PSPH in relation to the gauge of used spinal needle.

## Patients and Method

The current observational case reference study was carried out at Al-Diwaniyah Teaching Hospital in Al-Diwaniyah Province, Iraq. The beginning of the study is dated back to the 3rd of April 2018 and the study continued till September the 15th 2019. It included 60 patients undergoing spinal anesthesia for various surgical operations. In 30 patients a spinal needle of 22 gauge was used whereas in the second group (n = 30), a spinal needle of gauge 24 was used. All patients were instructed to be nil by mouth overnight.

They were given the following premedications: ranitidine 50 mg and metoclopramide 10 mg. An intravenous line was established using the antecubital vein by an 18 gauge cannula on arrival to operative room. Monitering included: pulse oximeter, blood pressure, pulse rate and ECG. An intravenous fluid in the form of ringer lactate was given in a dose of 10mg/kg for 10 minutes before starting subarachnoid block. A midline approach was used with the patient in sitting position at L3-L4 or L4-L5 level with a Quincke spinal needle (22G or 24G). Keeping the needle bevel parallel to dural fiber was assured. Injection of heavy bupivacaine 9-12.5 mg (1.8-2.5ml) was performed once clear CSF fluid was obtained.

The approval of this study was made by the institutional ethical approval committee and a verbal consent was made by every participant. Variables included in the current study were gender, age, type of operation and the development of post-operative headache. The obtained data were transformed into an SPSS (IBM, Chicago, USA, version 23) spread sheet for purpose of statistical description and analysis. Chi-square test was used to study association between categorical variables whereas, independent samples t-test was used to study mean difference of quantitative variables between the two study groups. The level of significance was set at $P \leq 0.05$.

## Results

The present study included 60 patients undergoing spinal anesthesia for various types of operations who were randomly allocated into two groups according to spinal need caliber size (gauge 22 versus gauge 24). The age range and mean age in addition to frequency distribution of patients according to gender are shown in table 1. There was no significant difference in mean age and frequency distribution according to gender between both study groups ($P > 0.05$), table 1. Table 2 shows the frequency distribution of patients according to type of surgical operation.

The Rate of post-spinal puncture headache (PSPH) is shown in table 3. Patients who experienced headache in the first group (gauge 22) were more frequent that those in group 2 (gauge 24), 22 (73.3 %) versus 8 (26.7 %) and the difference was highly significant ($P < 0.001$). In addition, severe headache was only seen in group 1 (gauge 22), table 3.

**Table 1: General characteristics of patients enrolled in the current study**

| **Characteristic** | **Group 1 (Gauge 22) n = 30** | **Group 2 (Gauge 24) n = 30** | **P** |
|---|---|---|---|
| Age (years) | | | |
| Range | 30 - 80 | 38 - 75 | 0.119 † NS |
| Mean ±SD | 51.60 ±14.02 | 56.87 ±11.63 | |
| Gender | | | |
| Male, n (%) | 22 (73.3 %) | 24 (80.0 %) | 0.542 ¥ NS |
| Female, n (%) | 8 (26.7 %) | 6 (20.0 %) | |

n: number of cases; SD: standard deviation; †: independent samples t-test; ¥: Chi-square test; NS: not significant at P > 0.05

**Table 2: Types of operations according to group**

| **Operation type** | **Group 1 (Gauge 22) n = 30** | **Group 2 (Gauge 24) n = 30** |
|---|---|---|
| Anal fissure | 0 (0.0 %) | 2 (6.7 %) |
| Bilateral inguinal hernia | 0 (0.0 %) | 2 (6.7 %) |
| Cesarean section | 4 (13.3 %) | 2 (6.7 %) |
| Fistula in ano | 0 (0.0 %) | 4 (13.3 %) |

| Transurethral resection of the prostate (TURP) | 2 (6.7 %) | 0 (0.0 %) |
| Ureteroscopy | 4 (13.3 %) | 4 (13.3 %) |
| Vesical stone | 0 (0.0 %) | 4 (13.3 %) |

**Table 3: Rate of post-spinal puncture headache (PSPH) according to group**

| **Headache** | **Group 1 (Gauge 22) n = 30** | **Group 2 (Gauge 24) n = 30** | **P** |
|---|---|---|---|
| No | 8 (26.7 %) | 22 (73.3 %) | < 0.001 ¥ HS |
| Mild | 10 (33.3 %) | 6 (20.0 %) | |
| Moderate | 6 (20.0 %) | 2 (6.7 %) | |
| Severe | 6 (20.0 %) | 0 (0.0 %) | |

n: number of cases; ¥: Chi-square test "presence versus absence of headache"; HS: highly significant at $P \leq 0.01$

## Discussion

In the current study were able to show that post spinal puncture headache is a relatively common complication in association with spinal anesthesia; however, it was obvious that the rate of this complication and it severity is related to the caliber size of the spinal needle in such a way that smaller needle (24G) was associated with less frequent and less severe headache than large bore needle (22G). Therefore we can suppose that narrow needle is associated with minimum CSF loss and therefore little if any dural traction due to reduce subarachnoid pressure.

The use of a large bore spinal needle has been stated to be a risk factor for development of post-spinal puncture headache (PSPH) in addition to a list of other risk factors (Nath et al., 2018; Veličković et al., 2017). The use of a cutting needle, particularly if rotated or inserted perpendicular to the long axis of the fibers of the dura, while, the use of a narrow caliber pencil-tipped spinal needle reduces the risk. The incidence rate has been estimated to be highly variable in available published medical literature; however, it may be as low as 10% to as high as 40%, but the incidence can be very low when using small size spinal needle (less than or equal to 24 gauge) (Akdemir et al., 2017).

The kind and the width of needle are important factors in PSPH, taking into consideration that research clearly highlights that greater dural damage leads to a higher rate of this complication. Quincke cutting needles are often accompanied by a higher rate of PSPH in comparison with pencil-point or blunt needles. Gisore et al. (2010) and Schmittner et al. (2010) concluded a significantly lower rate of PSPH with pencil-point needles in comparison with Quincke cutting needles (4.5% vs. 24.2%, P = 0.042 and 1.7% vs. 6.6%, P = 0.02), in clear support to our current findings. A modification to the Quincke needle has been introduced, with a cutting point and a double bevel to make a small dural hole followed by hole dilation. A number of previous reports have shown that the wider the needle, the more the incidence of PSPH. In addition it has been shown that the severity of headache is also related to the size of spinal needle. This is also in accordance with our findings.

Based on current study findings and some previous reports, the incidence and severity of post-spinal puncture headache (PSPH) is significantly related to spinal needle caliber size so that narrower needles are associated with less frequent and milder form of headache in comparison with wider bore needles.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Al-Diwaniyah Teaching Hospital and all experiments were carried out in accordance with

approved guidelines.

# The Crime of Establishing a Shell Bank – A Comparative Study

**Hawraa Ahmed Shakir[1] , Israa Mohammed Ali Salim[2] , Ammar Ghali Abdulkadhim El-Eisaw [2]**

*[1] Ph.D. Dr., Faculty Member, Faculty of Dentistry, University of Babylon, [2] Ph.D. Dr., Faculty Member, Faculty of Law, University of Babylon*

## Abstract

The establishment of a shell bank is a way to legitimize the funds that are the subject of several serious crimes such as terrorist crimes, human trafficking crimes, drug and arms trafficking crimes and other crimes committed by groups and organizations that engage in very dangerous criminal activities that generate many financial revenues, and thus the establishment of a shell bank provides protection for that money from legal and judicial oversight. The crime of establishing a shell bank is a positive crime, as it occurs only with positive behavior issued by the perpetrator. In addition, this crime is an intentional crime. The mens rea of which is only achieved through the availability of criminal intent with both its elements of knowledge and will.Likewise, the crime of establishing a shell bank is like any crime for which establishment two elements are required, namely the corpus delicti and the mens rea, and it also requires the availability of a special pillar represented by the crime scene, which is the shell bank.

***Keywords:*** *Comparative Study, Bank, Crime*

## Introduction

The crime of establishing a shell bank is a form of money laundering, as the Iraqi legislator stipulated this crime and [1] organized its provisions in the Anti-Money Laundering and Counter -Terrorist Financing Law no. (39) of the year 201. Hence, researching the topic of the crime of establishing a shell bank requires clarifying the importance of the research topic and its problems, as well as defining the scope of the research, its methodology and plan, as follows:

**First: Research Importance:**

The importance of discussing the topic of the crime of establishing a shell bank is evident in the fact that this crime is a serious and emerging one, as it is used as a means to legitimize the money and profits obtained from other criminal activities [2], as despite national and international efforts being made to confront these criminal activities, the perpetrators of these activities are using sophisticated and highly secretive means, including the creation of a shell bank to hide the truth of these criminal activities. Therefore, an analytical study of this crime had to be made. [3]

## Methodology

This research will be based on the comparative analytical approach, so it will be an analytical study of what is the crime of establishing a shell bank, its elements and its punishment by referring to the sources and discussing jurisprudence opinions related to the research topic. As for the comparative study, it is based on the analysis of legal provisions related to the research topic and making a [4] comparison with other legislations. The Iraqi legislator handled the crime of establishing a shell bank in Article (42) of the Anti-Money Laundering and Counter-Terrorist Financing Law in order to uncover the source of the illicit money obtained from criminal activities, and realizing the concept of the crime of establishing a shell bank [5].

**First Theme:**

**The Definition of the Crime of Establishing a Shell Bank**

We will define the crime of establishing a shell bank, which requires a linguistic then a terminological definition, in two parts, as follows:

**Part One:**

**The Linguistic Definition of the Crime of Establishing a Shell Bank**

The crime of establishing a shell bank is a term made up of several words, so we will explain the linguistic meaning of each one of them as follows:

Crime: It linguistically means offense, which is every positive or negative matter punishable by law, whether it is a crime, a misdemeanor, or a felony.

Establishing: The verb establish, established, established, means creating or cause something to exist, for example establishing a company, or establishing a new political regime

Bank: bank, banking The bank in the economy is an institution that performs credit operations, such as accepting deposits, making offers, issuing cash, and facilitating payments.

Shell, sham not real, not genuine. A sham contract is the contract that has no legal existence in spite of its form, as it is fictitious unrealistic. Shame works mean unrealistic fictional works.

**Part Two**

**The Terminological Definition of the Crime of Establishing a Shell Bank**

Legislations, the subject of the comparative study, were devoid of the definition of the crime of establishing a shell bank, and they were satisfied with mentioning its provisions, which is an acceptable course due to the difficulty of establishing a comprehensive collective definition. As for the judiciary, it did not define the crime of establishing a shell bank within the limits of the judicial decisions we reviewed so far.

The Crime of Establishing a Shell Bank in jurisprudence: Criminal jurisprudence did not define such crime. However, it has defined the crime of money laundering, a copy of which is the crime of establishing a shell bank, stating that: (It is a group of operations of an economic nature that aims to change the character of the money, conceal its nature and camouflaging its unlawful source), it also defines it as (the main crime arising from a person's possession of unlawful money as a result of an unlawful act and his intention and act of laundering it). It is also defined as (a financial process that aims to conceal the illicit source of funds and legalize it).

Based on the foregoing, we can set a definition for the crime of establishing a shell bank, and we may say that it is (obtaining a license to establish a bank that does not have a physical presence and is not subject to financial supervision to conceal the reality of the money obtained from criminal activities).

**Second Theme:**

**The Distinctive Nature of the Crime of Establishing a Shell Bank**

The crime of establishing a shell bank has specific characteristics that distinguish it from other crimes. Likewise, the crime of establishing a shell bank is similar to other crimes in certain aspects. However, this similarity does not prevent any difference in other aspects. Therefore, we will address this theme in two parts, the first of which shall address the characteristics of the crime of establishing a shell bank, while the second part shall be about distinguishing the crime of establishing a shell bank.

**Part One:**

**The Characteristics of the Crime of Establishing a Shell Bank**

The crime of establishing a shell bank has a number of characteristics that can be summarized as follows:

1. The crime of establishing a shell bank is an intentional crime. The mens rea of which is only achieved through the availability of criminal intent with both its elements that are the recognition of the act that constitutes the crime and the will and determination to do that act and to achieve its consequence.

2. The crime of establishing a shell bank can be classified as a misdemeanor, whereby There are three categories of criminal offence: felony, misdemeanor and infraction. The type of offence determines the severity of the penalty prescribed by the Code. Since the penalty stipulated in the Iraqi legislation for the crime of establishing a shell bank is imprisonment for a period of no less than three years and a fine of no less than ten million dinars and no more than five hundred

million dinars, or one of these two penalties, so it is a misdemeanor.

3. The crime of establishing a shell bank is a crime with positive activity in which the criminal behavior constituting its corpus delicti is positive.

4. The crime of establishing a shell bank is a formality, because its criminal outcome has no external physical presence. Where crimes are divided in terms of criminal outcome into formal crimes and material crimes. Material crimes are the ones that have a material result that causes change in the outside world, while formal crimes are those the outcome of which is invisible and do not have an external physical presence.

**Part Two**

**Distinguishing the Crime of Establishing a Shell Bank.**

The crime of establishing a shell bank is similar to both the crime of opening a shell account and the crime of issuing forged banknotes in certain aspects, and it is different there from in other ways, and this shall be addressed as follows:

**First: The Crime of Establishing a Shell Bank and The Crime of Opening a Shell Account**

The crime of opening a shell account is defined as (hiding the true identity of the money depositor, which prevents identifying the real source of the money in question)

The crime of establishing a shell bank differs from the crime of opening a shell account in terms of the locus delictie. In the crime of establishing a shell bank, the locus delictie is establishing a shell bank that does not have a physical presence. As for the crime of opening a shell account, the locus delictie is depositing money in the name of an unreal person. The two crimes also differ in terms of the perpetrator. In the crime of opening a shell account, it is represented by the financial institution. In the crime of establishing a shell bank, the perpetrator may be a natural person, and it may be a legal person, because the Iraqi legislator has given the right to establish a bank to the person in general, whether natural or legal. Both crimes also differ in terms of the criminal behavior, as the criminal behavior in the crime of establishing a shell bank is represented by the act of (establishment), whereas in the crime of opening a shell account, the criminal behaviour is represented by the act of (opening, accepting or depositing)

**The Crime of Establishing a Shell Bank and The Crime of Issuing Forged banknotes**

The crime of issuing forged banknotes is defined as (falsifying any bond issued by the bank and having a financial value such as loan and investment bonds)

The crime of issuing forged banknotes resembles the crime of establishing a shell bank in the sense that both of them are intentional crimes. The mens rea of which is only achieved through the availability of criminal intent with both its elements that are knowledge and will. Both of them are also positive crimes, as they can never be committed by negative behavior, but rather a positive action must be issued by the perpetrator.

The crime of issuing forged banknotes differs from the crime of establishing a shell bank in terms of the locus delictie. In the crime of establishing a shell bank, the locus delictie is a shell,while in the crime of issuing forged banknotes, the locus delictie is the forged banknotes. The two crimes also differ in terms of the criminalization ground. In the crime of issuing forged banknotes, the criminalization ground is to protect the financial value of these securities and credit for banking operations and securities issued by banks, while the reason for criminalizing the establishment of a shell bank is to disclose the illicit money obtained from criminal activities and to arrest and punish the perpetrators. The two crimes also differ in terms of the crime penalty. The crime of issuing forged bank notes is considered a felony, while the crime of establishing a shell bank is a misdemeanor.

**Second Topic:**

**The Pillars of the Crime of Establishing a Shell Bank**

We will address the pillars of the crime of establishing a shell bank in two parts, the first of which shall be dedicated to the special pillar of crime of establishing a shell bank, while the second part shall talk about the general pillars of the crime of establishing a shell bank.

**First Theme:**

**The Special Pillar of the Crime of Establishing a Shell Bank**

For the crime of establishing a shell bank to exist it requires the availability of a special pillar in addition to the general pillars. The special pillar of this crime is that the crime locus delictie be a shell bank, as stipulated by the Iraqi Legislator in the provisions of Article (42) of the Iraqi Anti-Money Laundering and Counter-Terrorist Financing Law, which states that: " Any person who establishes a shell bank in Iraq shall be punished with imprisonment for no less than three (3) years and a fine of no less than ten million (ID 10,000,000) and up to one hundred million (ID 100,000,000), or either one of both sanctions." It is legally settled by the provisions of paragraph (20) of Article (1) of the Iraqi Anti-Money Laundering and Counter-Terrorist Financing Law has defined the shell bank as it states that: "20. Shell Bank: a bank that is incorporated or licensed in a country or jurisdiction in which it has no physical presence and that is not affiliated with a regulated financial group subject to effective banking regulation and supervision." It has also been defined by Article (1) of the Kuwaiti Anti-Money Laundering and Counter-Terrorist Financing Law, which states that: "Shell bank: a bank that is incorporated or licensed in a country or jurisdiction in which it has no physical presence and that is not affiliated with a regulated financial group subject to effective consolidated supervision." It has also been defined by Article (3) of the Sudanese Anti-Money Laundering and Counter-Terrorist Financing Law of the year 2014, which states that: "Shell Bank: the bank that does not have a physical presence in the country in which it was established and obtained a license there from, and who is not affiliated to any financial group subject to unified and effective banking regulation and supervision."

It is worth mentioning that the meaning of the real bank and what are the legal conditions that are to be met there by, which the shell bank lacks must be determined. The Iraqi legislator has defined the bank in Article (1) of the Iraqi Banking Law as " a person holding a license or permit under the Banking Law to engage in banking business and other banking activities in accordance with the amended Governmental Companies Law no. 22 of the year 1997" The Kuwaiti legislator has also defined it in paragraph (1) of Article (1) of the Kuwaiti legislator in paragraph (1) of Article (1) of the Decree of Financial Stability in the State for the year 2009 as it stipulated that as it stipulated that: " Banks: The Kuwaiti banks registered with Central Bank of Kuwait." it has been also defined by Article (4) of the Sudanese Banking Work Regulation Law of 2004, stipulating that: "Bank: means any institution registered under the provisions of the Companies Act of 1925 or an institution or body established by law or any foreign bank licensed to conduct banking business under this law." Then, the establishment of the bank requires submitting an application to the Central Bank of Iraq to obtain a license for incorporation, and the Central Bank shall grant permission to establish the bank after verifying the authenticity of the information provided pursuant to Articles (5,6) of the Banking Law as well as verifying the identity of the applicant and the owner as a valid decent person, after pledging that the bank will have a fixed physical presence in Iraq; moreover, the licensed bank must be subject to banking supervision.

Based on the foregoing, the shell bank lacks the most important conditions for the bank establishment, which is that the bank must a fixed physical presence in Iraq and that it must do banking activities that are the reason for granting the license. In addition, the shell bank is not subject to banking supervision.

## Conclusion

After investigating the research subject (The Crime of Establishing a Shell Bank - A Comparative Study) is completed, we have reached a number of conclusions and recommendations, the most important of which are included hereinafter.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Faculty of Dentistry and all experiments were carried out in accordance with approved guidelines.

# Prevalence Rate of Hepatitis C virus (HCV) and Hepatitis B virus (HBV) Infection in Iraqi Patients on Hemodialysis: Cross Sectional Study

**Wisam Hatef Kareem Al-Muramdy**

*Ph.D. Dr. Physician / Department of Medicine/ Al-Diwaniyah Teaching Hospital/ Al-Diwaniyah Province/ Iraq*

## Abstract

**Background:** Globally, the prevalence rate of chronic HCV infection is highly variable and it is estimated to range from 5 % up to 60 %. In the United States, it has been estimated that the prevalence rate of HCV in patients on hemodialysis is 5 times as that seen in the general population; the prevalence rate in those patients has been approximately 8 %. Hepatitis B virus infection was also a common health issue affecting patients on hemodialysis; however, a great reduction in the incidence rate of HBV in those patients has been noticed over that last decades. This reduction in the incidence of HBV has been attributed to vaccination, the use of erythropoietin instead of frequent blood transfusion for treatment of anemia and screening of blood donors.

**Aim of the study:** the current study was planned and carried out aiming at exploring the prevalence rates of both HBV and HCV in patients and hemodialysis.

**Patients and methods:** The current cross sectional study was based on the inclusion of 160 patients with chronic renal failure and on regular hemodialysis. The study was carried out in the dialysis unit at Adiwaniyah Teaching Hospital, Adiwaniyah Province, mid-Euphrates region of Iraq. The study started on the second of January 2019 and Ended on the 15$^{th}$ of September 2019. From each patient, a 5 ml sample of venous blood was obtained and send to the central Laboratory of Adiwaniyah Teaching Hospital for purpose of serologic identification of HBV and HCV infection in addition to estimation of both blood urea and serum creatinine.

**Results:** HCV was detected in 34 (21.2 %), while HBV was seen in 2 (1.2 %) and combined HBV and HCV infection was observed in 2 (1.2 %). According to serologic method, 122 (76.2 %) were free of HCV or HBV infection.

**Conclusion:** HCV was far more frequent than HBV infection in Iraqi patients with hemodialysis with prevalence rates of 21.2 % versus 1.2 %, respectively.

***Key words:*** *Prevalence, HCV, HBV, Iraqi patients, hemodialysis*

## Introduction

Based on available laboratory investigations routinely done for hemodialysis patients, Hepatitis C virus infection appears to be highly prevalent in comparison with the general population [(1)]. Besides, the existence of such chronic HCV infection is associated with morbidity in patients on hemodialysis [(1)]. The principal risk factors for HCV infection in those patients are contact with blood and blood products [(1)]. Globally, the prevalence rate of chronic HCV infection is highly variable and it is estimated to range from 5 % up to 60 % [(2- 3)]. In the United States, it has been estimated that the prevalence rate of HCV in patients on hemodialysis is 5 times as that seen in the general population; the prevalence rate in those patients has been approximately 8 % [(4)]. The incidence rate of HCV in patients on hemodialysis in Europe is also higher than that in the general population with considerable variation in the incidence rates from region to region, but in general it is lowest in northern European countries such as England

and Sweden and lowest in southern European countries such as Italy and Spain [5- 6].

Hepatitis B virus infection was also a common health issue affecting patients on hemodialysis; however, a great reduction in the incidence rate of HBV in those patients has been noticed over that last decades. This reduction in the incidence of HBV has been attributed to vaccination, the use of erythropoietin instead of frequent blood transfusion for treatment of anemia and screening of blood donors. Nevertheless, the risk of acquiring HBV by hemodialysis patients is still high because of several risk factors such as shared hemodialysis devices, increased exposure to blood and blood products, immunodeficiency state and frequent skin breaching. Indeed, acute infection with HBV in dialysis patients is usually mild and frequently asymptomatic; however, significant proportion of patients may progress to carrier state or chronic hepatic disease, increased risk of cirrhosis and even liver cancer [7- 8].

Here in Mid-Euphrates region of Iraq, there are limited resources with respect to hemodialysis unit in Adiwaniayh Teaching Hospital at Adiwaniayh province. The number of hemodialysis devices and related equipments is limited and vaccination against HBV is frequently unavailable. For these reasons, we expect to find a relatively high prevalence rate of HBV and HCV infections in Iraqi patients on hemodialysis. Therefore, the current study was planned and carried out aiming at exploring the prevalence rates of both HBV and HCV in patients and hemodialysis.

## Patients and Method

The current cross sectional study was based on the inclusion of 160 patients with chronic renal failure and on regular hemodialysis. The study was carried out in the dialysis unit at Adiwaniyah Teaching Hospital, Adiwaniyah Province, mid-Euphrates region of Iraq. Patients were randomly selected in such a way that the first patient was chosen according to a random digit generated by computer software and the rest of patients were selected as every other 3 patients. The study started on the second of January 2019 and Ended on the 15$^{th}$ of September 2019.

The main variables included in the present study were age, gender, cause of renal failure, blood urea and serum creatinine before and after the last session of dialysis in addition to the primary outcome which was serologic evidence of HBV and HCV infection. From each patient, a 5 ml sample of venous blood was obtained and send to the central Laboratory of Adiwaniyah Teaching Hospital for purpose of serologic identification of HBV and HCV infection in addition to estimation of both blood urea and serum creatinine before hemodialysis session. Another sample of venous blood was obtained few hours after the end of dialysis session in order to measure blood urea and serum creatinine after hemodialysis. The same routine laboratory methods that are usually carried out in central laboratory were performed in the current study.

Data were then transformed into an SPSS spread sheet (IBM, Chicago, USA, version 23). Categorical data were expressed as number and percentage, whereas numeric data were expressed as mean, standard deviation and range. Paired t-test was used to study difference in mean blood urea and serum creatinine before and after hemodialysis sessions. The level of significance was considered at $P \leq 0.05$.

The study was approved by institutional ethical approval committee and verbal consent was obtained from each participants. In addition to formal official agreement obtained from Health Directorate in Adiwaniyah province.

## Results

The general characteristics of patients enrolled in the current study are shown in table 1. The mean age of patients was 47.65 ±16.43 years with a wide range of age of 5 to 86 years. The study included 83 (51.9 %) males and 77 (48.1 %) females. According to blood group, the most frequent group was O+, 37 (23.1 %), followed by B+, 37 (23.1 %) and then by A+, 31 (19.4 %), whereas, the least frequent blood group was AB-, 1 (0.6 %), as shown in table 1. The most frequent cause of renal failure was systemic hypertension, 49 (30.6 %) followed by diabetes mellitus, 17 (10.6 %); other causes are shown in table. In 34 (21.3 %), no cause was identified.

Prevalence rate of hepatitis C virus (HCV) and hepatitis B virus (HBV) infection in patients on hemodialysis is shown in table 2. HCV was detected in 34 (21.2 %), while HBV was seen in 2 (1.2 %) and

combined HBV and HCV infection was observed in 2 (1.2 %). According to serologic method, 122 (76.2 %) were free of HCV or HBV infection.

Mean blood urea before dialysis was 250.90 ±52.81 mg/dl and it was reduced following dialysis to 100.38 ±16.97 mg/dl. Mean serum creatinine before dialysis was 12.43 ±1.75 mg/dl and it was reduced following dialysis to 9.88 ±1.78 mg/dl. The reduction in both serum creatinine and blood urea was highly significant ($P < 0.001$); however, normal serum creatinine or blood urea levels were not achieved in any participant, as shown in table 3.

**Table 1: General characteristics of the study sample**

| **Characteristic** | **Value** |
|---|---|
| Age (years) | |
| Mean ±SD | 47.65 ±16.43 |
| Range | 5 -86 |
| **Gender** | |
| Male, n (%) | 83 (51.9 %) |
| Female, n (%) | 77 (48.1 %) |

| Serum Creatinine | Mean ± SD | 12.43 ±1.75 | 9.88 ±1.78 | < 0.001 HS |
| | Range | 6.6 -16.1 | 4.6 -13.7 | |

SD: standard deviation; †: Paired sample t-test; HS: highly significant at $P \leq 0.01$

## Discussion

The advent of hemodialysis has dramatically improved the quality of life of patients with chronic renal failure since it has extended their life span and reduced significantly complications associated with chronic renal failure. However, the problem of contact with blood and blood products accompanying hemodialysis has resulted in substantial increase in the prevalence rate of HCV and HBV infection in those patients.

Here in Iraq and particularly in the mid-Euphrates region of Iraq, we suffer shortage in resources and equipments related to hemodialysis. Therefore, a relatively large number of patients share limited number of hemodialysis devices and equipments. In addition, to the limitation in screening programs related to detection of infected blood and blood products in the available blood bank within our relatively poor province. Therefore, we expect to see a relatively high prevalence rate of HCV and HBV infection in patients undergoing regular hemodialysis.

For those reasons the current cross sectional study was planned and conducted in the hemodialysis unit of Adiwaniayh Teaching Hospital. One limitation was the unavailability of molecular diagnostic PCR method for more accurate detection of HCV and HBV genome in the blood of patients undergoing dialysis, thus we depend for identification of these viruses on the available routine serological methods in the central hospital laboratory.

The current study showed that HCV infection prevalence rate was 21.2 %, whereas, that of HBV was 1.2 %. The present findings suggested a higher prevalence rate for HCV in hemodialysis patients than that reported in the United States (8 %) (4, 9). In addition it is more than that reported in Sweden and England, 8.8 % and 2 %, respectively (5, 6). However, it approaches the reported prevalence rate in Spain, Italy and Turkey, 25 %, 27 % and 30 % (5, 6). Therefore, it appears that in our patients, the prevalence rate of HCV is among highest levels worldwide. This may be attributed to limited number of equipments that are shared by large number

of hemodialysis patients. In addition, it may be attributed to less proper screening of blood and blood products for HCV infection in the available local blood bank. In the currents study, on the other hand, the prevalence rates of HBV infection alone or in combination with HCV were relatively small, 2 % and 2%, respectively. Indeed, these figures are very close to what was reported by other authors in other regions of the world. For example, the estimated prevalence of HBV alone in hemodialysis patients in North India was 1.5 % while co-infection with both HBV and HCV was seen in 0.8% (10). Co-infection with both HBV and HCV was reported from various studies to range from 0.8 % up to 37 % (10-16).

Indeed, it has been stated that approximately 2 % of all mortality in hemodialysis patients are attributed to concomitant viral infection. Therefore, efforts should be made by our health institutes in order to minimize to a lesser degree the prevalence rate of HCV and HBV infection in our hemodialysis patients. These efforts should be mainly directed toward provision of a larger number of hemodialysis equipments to minimize sharing such equipments among large number of patients and also efforts should be directed toward screening of blood and blood products for infectious agents and particular for HCV and HBV.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Al-Diwaniyah teaching hospital and all experiments were carried out in accordance with approved guidelines.

## Abstract

**Aim:** This study aimed to determine the impact of mass media upon juvenile delinquency in Basra Central Prison and AL- Maqal Police Station

**Subjects and Methods:** A descriptive analytic study design was carried out at juvenile delinquency in Basra Central Prison and AL- Maqal Police Station from 3rd February 2019 until 4th April 2019 in AL-Maqal Police Station and 14th April 2019 until 14th May 2019 in Basra Central Prison. Non – probability (purposive) sample of 100 juveniles who were Basra Central Prison and AL- Maqal Police Station were selected. To know the impact of mass media upon juvenile delinquency using several measures are Content-based Media Exposure Scale (C-ME), International Self-Report Delinquency Questionnaire (ISRD), and Subtypes of Antisocial Behavior questionnaire (STAB) of 60 items of statements that measure impact mass media on juvenile's behavior; and these statements are loaded into seven dimensions including social; psychological; ethical; political; economic; religious; and violent. Reliability of instrument was determined through the use of Alpha Cronbach approach and the instrument validity was determined through a panel of experts. The analysis of the data was used descriptive statistics frequencies, percentages, mean, standard deviation and Analysis of Variance (ANOVA). In order to assess the impact of mass media upon juvenile delinquency.

**Results**: The findings of the present study reveal that indicate to high percentage unsatisfactory behavior (44%) in social and psychological status, (53%) in violent status, while impact upon ethical, political, economic and religious unsatisfactory behaviors have low than third, the total percentage of unsatisfactory behavior of all sample as (28.3%)**.**

**Conclusion:** The study concluded that the unsatisfactory behavior level of (social, psychological, ethical, political, economic, religious, and violent) dimensions were moderate of juvenile delinquency.

***Keyword:*** *Impact; Mass Media; Juvenile Delinquency; Prison; Police Station.*

## Introduction

Mass media is a means of communication that have major role to widespread, communicate information and ideas and influence large number of people in a short duration. Therefore, advances in technology and technical capacity make mass media reach to most remote parts of the world [14] . Every media messages are composed of many elements like information, facts, images, sounds, beliefs, attitude, and events, individuals acquire information and store it in their memory. During media exposures, the media messages can activate some elements that already exists in the individual that are applicable through used the skills of creating something in individuals or recall of previously learned elements or incorporate these elements with others; this new information is likely to trigger negative attitudes or changes in behavior, when occur repeated exposures of the media gradually and continually making these elements more fixed and harder to change that become as individuals' behavioral patterns . This attitudes or effects might can show up immediately (during an exposure or immediately after the exposure to the media message), or it can take a long time to show up, or it can last a long

time, or it can be temporary and disappear after a few seconds [11]. All people live in a society that depends on communication and information to do daily activities in the right direction, media can be present stories or issues in dramatic ways through flow of the undesirable things that covered politics issues, stories of legends, crimes and detective cases. That are unrestricted of audience and contain on amount of vulgarity, nudity and brutality with perfect blend of drama, comedy thrill, horror, emotions, action, songs or dance and romance to earning a place in juvenile's heart and mind and obscured flow good things like love, altruism, happiness, and valuable information [12]. Many juveniles have problems and are getting into trouble, deal with pressures among friends and family, poverty, violence, parental problems, and gangs, truancy, a fight in school, drug or alcohol ingestion, gender, values, or ethnical, difficulty dealing with past traumas like abuse. Juvenile's independence, sometimes all these conflicts result in behavior problems, many this factors put juveniles and families at risk for juvenile delinquency and media violence can interact negatively with a juvenile's developing path of delinquency, the juvenile will apply the learned behavior at school, community, environment and attempts to force his will or assert his pride [5]. Juvenile delinquency is present in several countries around the world, juvenile offending increases during puberty, peaks in middle adolescence that engage or tendency in antisocial, aggressive behavior [1]. It is conduct that is beyond control and subject to legal action by the juvenile that is be out of line with the norms and values of society due to the misleading information from the media are full of scenes of hatred, violence, aggression and extremism that exposing to juveniles with over engaged in it used. It has a negative impact on individual, family, and society, that involve on various types of behaviors with it has multiple motivations, stimuli and consequences. In very simple words, this phenomenon leads to growing and cultivates to tendency of delinquency which threatens the peace of the society to pursue individual interests. The delinquency considers as one of the most contemporary social problems, not only in developing countries as Iraq but also in developed countries [3]. Juveniles commit acts of crime response to a specific motivation according personal propensities and environmental inducements, the media content have a lot of temptations through stimulate or give simple or complex ideas, and the individuals develop, and complete these ideas with make these ideas as a part of life. Therefore, media may be make unacceptable behavior of individuals make acceptable or desirable by cover negative behavior that the juveniles have responds and interaction to easily that lead to conduct or wrongful act that does not acceptable or incompatible to the moral or legal standards of community like obscenity, pilfering, loitering, gambling, drug abuse, begging [2], robbery, breach of trust, cheating, extortion, possession of dangerous drugs, murder, burglary, fraud [8], due to juveniles are not yet mature to distinguish or desire to selection the wrong or right of ability to self-control with engage or imitation of content the mass media [15].

## Materials and Method

A descriptive analytic study design was carried out at juvenile delinquency in Basra Central Prison and AL- Maqal Police Station from 3rd February 2019 until 4th April 2019 in AL-Maqal Police Station and 14th April 2019 until 14th May 2019 in Basra Central Prison. Non – probability (purposive) sample of 100 juveniles who were Basra Central Prison and AL-Maqal Police Station were selected. These prisoners were selected according to the following criteria: both sexes of prisoners (males and females); delinquent who were temporarily detained in police station convicted of crime, felony, or misdemeanor who is awaiting trial; and delinquent convicted of felonies or crime for punishment or rehabilitation convicted of misdemeanors and major offenses in central prison; juveniles who were at 14-17 years. For the purpose of the present study a questionnaire was designed and developed by the researcher which consists of four parts: The first part of the questionnaire concerned with determination of the sociodemographic characteristics of the sample, and the second part was habits and patterns of mass media; the third part was offenses committed by the juvenile; while last part was effect mass media on juvenile. Reliability of instrument was determined through the use of Alpha Cronbach approach (r = 0.943), and the instrument validity was determined through a panel of (19) experts. In order to achieve the early stated objectives, the data of the study were analyzed through the use of Statistical Package of social sciences (SPSS) version 24 through statistical procedures that includes: frequency, percentage, Mean of score, standard deviation, and Analysis of Variance (ANOVA).

## Results

**Table (1) Distribution of the samples by their sociodemographic characteristics of delinquent**

| No. | Variables N=100 | | Frequency | Percentage % |
|---|---|---|---|---|
| 1 | Age | 14-15 | 41 | 41% |
| | | 16-17 | 59 | 59% |
| | | Total | 100 | 100% |
| 2 | Gender | Male | 82 | 82% |
| | | Female | 18 | 18% |
| | | Total | 100 | 100% |
| 3 | Residence | Rural | 23 | 23% |
| | | Urban | 77 | 77% |
| | | Total | 100 | 100% |
| 4 | Residence Area | Slum Houses | 51 | 51% |
| | | Legal Houses | 49 | 49% |
| | | Total | 100 | 100% |
| 5 | School Status | Continuous | 15 | 15% |
| | | Interrupted | 64 | 64% |
| | | Did not Enter at School | 21 | 21% |
| | | Total | 100 | 100% |
| 6 | Socio-Economic Status | High | 4 | 4% |
| | | Middle | 75 | 75% |
| | | Low | 21 | 21% |
| | | Total | 100 | 100% |

**F= Frequency, %= Percentage**

Table (1) The results revealed that the majority of the samples (59%) at age 16-17 year; were male (82%); were living in urban area (77%) in slum houses (51%) have interrupted at school (64%); and middle socioeconomic status (75%).

**Table (2) Distribution of the Study Sample by their Habits and Patterns of Mass Media**

| No. | Habits and Patterns of Mass Media | Frequency | Percentage |
|---|---|---|---|
| 1 | Read Books, Magazines Newspapers | 4 | 4% |
| 2 | Watch Television | 98 | 98% |
| 3 | Listen Radio | 21 | 21% |
| 4 | Use the Mobile | 95 | 95% |
| 5 | Use the Internet | 86 | 86% |
| 6 | Use the Personal Computer | 6 | 6% |
| 7 | Watch the Cinema and Theater | 0 | 0% |

**F= Frequency, %= Percentage**

Table (2) The results revealed that the samples of habits and patterns of mass media were (98%) watch television; (95%) use the mobile; (86%) use the internet; (21%) listen radio; (6%) use the personal computer, while (0%) were watch the cinema and theater.

**Table (3) Distribution of the Study Sample the Offenses and Misdemeanor Committed by the Juveniles**

| No. | Types of Offenses and Misdemeanor Committed by the Juveniles | Frequency | Percentage |
|---|---|---|---|
| 1 | Theft | 29 | 29% |
| 2 | Rape | 13 | 13% |
| 3 | Drug Abuse | 21 | 21% |
| 4 | Murder | 17 | 17% |
| 5 | Beatings | 4 | 4% |
| 6 | Kidnapping | 2 | 2% |
| 7 | Threat | 1 | 1% |
| 8 | Vagrancy | 5 | 5% |
| 9 | Motorcycle/ Car Accidents | 0 | 0% |
| 10 | Forgery | 5 | 5% |
| 11 | Cheating | 0 | 0% |
| 12 | Betrayal | 2 | 2% |
| 13 | Sabotage | 1 | 1% |
| 14 | Total | 100 | 100% |

**F= Frequency, %= Percentage**

Table (3) The results revealed that the samples of types of offenses and misdemeanor committed by the Juveniles that indicate to (29%) theft; (21%) drug abuse; (17%) murder; (13%) rape; (5%) were vagrancy and forgery; while were (0%) motorcycle/ car accidents and cheating.

**Table (4) Assessment Juvenile's Behavior Levels and Test the Impact of Mass Media upon Juveniles among Study Group.**

| No. | Item | Juvenile's Behavior Levels | | | Total |
|---|---|---|---|---|---|
| | | Unsatisfactory | Moderate | Good | |
| 1 | Social and Psychological | 43% | 40% | 17% | 100% |
| 2 | Ethical Status | 23% | 34% | 43% | 100% |
| 3 | Political | 8% | 18% | 74% | 100% |
| 4 | Economic Status | 32% | 29% | 39% | 100% |
| 5 | Religious Status | 18% | 35% | 47% | 100% |
| 6 | Violent Effect | 53% | 34% | 13% | 100% |
| 7 | General Negative Effects | 21% | 53% | 26% | 100% |
| 8 | Total Juvenile's Behavior | 28.3% | 34.7% | 37% | 100% |

**F= Frequency, %= Percentage**

Table (4) The results revealed that the samples of juvenile's behavior levels that indicate to high percentage unsatisfactory behavior (43%) were social and psychological status; (53%) were violent status; while (28.3%) were total juvenile's behavior as unsatisfactory behavior.

## Discussion

The results revealed that the majority of the samples (59%) at age 16-17 year, while 14-15 year were (41%); more than three-quarters (82%) the samples were male and the rest of the sample were females; more than three-quarters (77%) were living in urban area, while were little more than half (51%) living in slum houses; the majority of the samples have interrupted at school (64%) and third (21%) the juveniles were did not enter at school; with three-quarters (75%) of juvenile's families have middle socioeconomic status, while (21%) were juvenile's families have low socioeconomic status. Concerning the results of the habits and patterns of mass media before enter the prison, the juveniles were (98%) watch television; (95%) use the mobile; (86%) use the internet, this finding agrees and supported with results obtained from study done by (Mangwere et al, 2013) it indicates to more use the juveniles of mass media are watch television (100%), use the mobile (72%) and use the internet (56%); while listen radio were (21%); (6%) were used the personal computer, while (0%) were watch the cinema and theater of study sample.

Regarding the types of offenses and misdemeanor committed by the Juveniles that indicate to (29%) theft; (21%) drug abuse; (17%) murder; (13%) rape; (5%) were vagrancy and forgery; while were (0%) motorcycle/ car accidents and cheating. this finding agrees and support with results obtained from study done by (Hameed, 2011); reports indicate theft (38.13%), drug abuse (17.79%), also this finding agree with results obtained from study (Chowdhury et al, 2012) that indicate to theft (47.37%) and murder (36.84%)and other commit a misdemeanor. This result due to the juveniles attract to delinquent behavior due to inspired by media.

Concerning the juvenile's behavior levels that indicate to high percentage unsatisfactory behavior (43%) were social and psychological status; (53%) were violent status; while (28.3%) were total juvenile's behavior as unsatisfactory behavior. This finding agree with results obtained from studies (Helles and Mahdi, 2010); (Saleem et al, 2013) and (Hammond and Ioannou, 2015) all these studies indicate to high unsatisfactory behavior in social and psychological and violent status of delinquency juveniles.

## Conclusions

The findings of the present study conclude that the mass media have impact upon juveniles that lead to unsatisfactory juvenile's behavior in social, psychological status with occur violent effect that lead the juveniles to broken the law and then delinquency.

# Evaluation of the Quality of Primary Health Care Services for Adolescents With Chronic Illness in Kirkuk City

**Burhan A. Hama Hussein[1], Mohammed F. Khalifa[2]**

*[1]Academic Nurse, Kirkuk Health Directorate, Kirkuk, Iraq, [2] Professor, Community Health Nursing Department, College of Nursing, University of Baghdad*

## Abstract

**Background:** Providing interventions, and implementing of best-practice care for patients with chronic diseases is of greatest challenges currently facing primary care providers. This study aimed to evaluate the quality of primary health care(PHC)services for adolescents with chronic diseases in Kirkuk city.

**Methodology:** A descriptive (quantitative design) was conducted through (18) primary health care centers (PHCCs) in Kirkuk city. A questionnaires was designed for the purpose of the study. A simple random sample of organization structure PHC services (18) health professional were selected through the use of probability sampling approach. Data were analyzed is performed through the use of descriptive statistical data analysis approach.

**Results:** The overall evaluation of quality of PHC services in Kirkuk city is adequate on (77.7 % : N=14), fair on (16.7 % :N=3) and Inadequate on (5.6%: N=1 ) .Domains such as quality of health service represent high mean of scores on its items, Except on 2 items of Tangibles and on items of Responsiveness 2 on from the quality of PHC are low.

**Conclusion**: The study indicates that the quality of PHC services does not execute impact upon adolescents' health status. This study depict that the evaluate of the quality of PHC services is adequate relative to all of its dimensions of general health status, tangibles, accreditation, responsiveness, assurance and empathy.

***Keywords:*** *Adolescents', Chronic Diseases, Primary Health Care Services.*

## Introduction

The PHC services can control chronic diseases with adolescents' depends on a collaborative relationship between adolescents and clinicians to set goals, develop treatment plans, support patients and families who have the day-to-day care responsibilities. Providing interventions, and Implementing of best-practice care for patients with chronic diseases is one of the greatest challenges currently facing primary care providers[(1)]. Patients with complex chronic diseases often require long-term care from different healthcare services and focusing on the importance of effective primary care to delivering quality healthcare, improving health outcomes, and reducing disparities by professionals care to ensure good quality care[(2)]. Although health technology could improve the ability of primary care. The internal medicine specialists need to help these patients[(3)]. The importance of effective PHC services in delivering quality healthcare, improving outcomes, and reducing disparities of health[(2)].The strategies implemented in practice are still unsystematic about the healthcare need for adolescents with chronic diseases. [(4)]. It has been demonstrated that the use of primary care is associated with improved access to health care services, reduced hospitalizations, cost-effectiveness, and enhanced equity[(5)].To develop satisfaction competency-based and self-management programs for adolescent with chronic diseases and development knowledgeable in both pre-service and in-service management. In addition, it provides guidance for services on how to assess or improve the arrangement of daily care , content, and quality health-care services for adolescents with chronic diseases[(6)]. Also the study used as the basis for

selecting the quality health care services' and recognize main strategic directions for adolescents with special health care needs, especially those with chronic illnesses continuing need specialist services .

## Methodology

A descriptive study used a quantitative design conducted on PHCCs in Kirkuk Governorate. A total of (18) PHCCs are selected for the purpose of the study.

Probability sampling approach (simple random sampling) has been used.

The questioner was comprised of organization structure are on ( 22) item it is comprised such as about: Tangibles, Accreditation, Responsiveness ,Assurance, and Empathy of PHC services**.**

The questionnaire provided a three-point scale:(1)Adequate, (2) Fair, (3), Inadequate.

## Results

**Table (1): Overall Evaluation of the Quality of Primary Health Care Services**

| **Dimensions** | **Adequate** | **Fair** | **Inadequate** |
|---|---|---|---|
| 1. Tangibles | (20 - 14.68)<br>( 11 ) | (14.67- 9.34)<br>( 4 ) | (9.33 - 4)<br>( 3 ) |
| 2. Accreditation | (25 - 19)<br>( 15 ) | (18- 12)<br>( 2 ) | (11 - 5 )<br>( 1 ) |
| 3. Responsiveness | (20-14.68)<br>( 13 ) | (14.67-9.34)<br>( 3 ) | (9.33-4)<br>( 2 ) |
| 4. Assurance | (20 - 14.68)<br>( 17 ) | (14.67- 9.34)<br>( 1 ) | (9.33 - 4)<br>( 0 ) |
| 5. Empathy | (25 - 19)<br>( 15 ) | (18 - 12)<br>( 3 ) | (11 - 5)<br>( 0 ) |
| Overall Evaluation | (110 - 80.33)<br>( 14 ) | (80.32 - 50.67)<br>( 3 ) | (50.66 - 22)<br>( 1 ) |

## Discussion

**The evaluate of the Quality of Primary Health Care Services for Adolescents With Chronic Illness**

Throughout the course of data analysis, the study depicts that the quality of PHC services does not enforce any effect on adolescents' health status (Table 1). The logically driven interpretation for such findings can be presented in a way that as long as the quality of PHC services is adequate for adolescents with chronic diseases they definitely maintain a good level of health status.

Analysis of such quality indicates that the quality of PHC services is adequate with respect to its domains of tangibles, accreditation responsiveness, assurance and empathy (Table 1). Such findings can be interpreted in a way that the PHCCs are concerned about adolescents with chronic diseases. So, they are well equipped to present such health care services to this target segment of the population in the community.

These findings are very well-noted in the high mean of scores on items of the domains of such quality (Table 1). Except on 2 items of Tangibles the nature of

the departments, places of waiting, offices, doctors, and other existing staff matches what you expect in your mind and items of Responsiveness 2 on Patients are not expected to receive immediate service from the quality of PHC staff are low. These items have presented the actual state through which the PHC services are managed and provided.

The quality of service assessment works under the supposition that five dimensions of quality of PHC underlie service quality improved quality of health care has been highlighted an important outcome for the of PHC service is reflected in the official vision of the department.

A sequential exploratory mixed method design is carried out to identify quality determinants for healthcare services for adolescents and young adults with chronic illness based on the perceptions and the experiences of adolescents and young adults themselves. The study uses the initial qualitative phase employed semi-structured in-depth interviews to elicit the elements and determinants of quality of healthcare as identified by adolescents and young adults living with chronic diseases.

The second phase employs a questionnaire developed from the data gathered during the qualitative phase to survey the target population. This is distributed to a larger sample of adolescents and young adults with chronic illnesses or conditions to determine and confirm the relevance of the identified care elements and quality determinants. The study reveals four most important determinants: the provision of young people information relating to all aspects of source of revenue with chronic illness, services that facilitate and encourage independence, services characterized by the organization with the capacity to be both dynamic and responsive, and finally health care professionals knowledgeable and skilled in relation to adolescent-specific issues [7]. da Nóbrega and other colleagues (2017) have discovered in a qualitative study that continuity of care, well data recording system and well-formed follow-up system care considered as the major contributors to a better quality of health care services to adolescents. The global standards are developed based on the needs assessment in conjunction with the analysis of (26) national standards from (25) countries. The final document is reviewed by experts from the WHO regional and country offices, governments, nongovernmental organizations, academia, and development partners. The standards were subsequently tested in Benin and in a regional expert consultation of Latin America and Caribbean countries for their usability [9].

The report highlights the need to strengthen improving PHC, particularly to better manage the large numbers of patients with multiple chronic conditions .It has been reported that the care given to all children, including young adolescents, in health facilities is evidence-based, safe, effective, timely, efficient, equitable and appropriate for their age and stage of development [10]. The WHO has undertaken a systematic review to assess the effectiveness of adolescent health services for adolescents living with chronic diseases compared to standard of care. Young people engaged in adolescent- health services compared to standard care showed small but significant improvements in various outcomes, including health outcomes, health care utilization, uptake, self-efficacy and service acceptability. World Health Organization is recommending that adolescent health services should be implemented in chronic disease services to ensure engagement and improved health outcomes [11].

## Conclusion

The findings depict that the quality of PHC services is adequate relative to all of its dimensions of general health status, tangibles, accreditation, responsiveness, assurance and empathy. The study confirms that the quality of PHC services does not execute impact upon adolescents' health status.

# Self-evaluation of Continuing Nursing Education Programs in Kirkuk Health Directorate Hospitals

**Hussein M. Abdulfatah[1] Salma K. Jeehad[2]**

*[1]Community Health Nurse Specialist, Kirkuk Health Directorate,*
*[2]Professor, Community Health Nursing, College of Nursing, University of Babylon*

## Abstract

**Objective(s):** To self-evaluate Continuing Nursing Education Programs in Kirkuk Health Directorate Hospitals

**Methodology:** A descriptive design, using self-evaluation approach, is employed throughout the present study. A non-probability sample of (251) staff nurse who are recruited from Kirkuk Health Directorate Hospitals; Kirkuk General Hospital and Azady Hospital. A questionnaire is constructed for the purpose of the study which is comprised of (1) part, (6) aspects and (52) item. Content validity and internal consistency reliability are determined for the questionnaire through a pilot study. Data are collected through the use of the questionnaire and structured interview a means of data collection. Data are analyzed through the application of descriptive statistical data analysis approach of frequency, percentage, mean of scores, total scores and ranges.

**Results:** The study indicates that the overall self-evaluation of the Continuing Nursing Education Program in Kirkuk Health Directorate is poor for the majority of the subjects (81.7%) and the mean of scores on items of aspects of self-evaluation of the Continuing Nursing Education Program is low on all items of these aspects.

**Conclusion:** The study concludes that overall self-evaluation of continuing nursing education program is depicted as poor relative to all aspects of continuing nursing education program of program goals, program planning, program performance, program operation and management, program outcomes and program effectiveness.

**Recommendations:** The study recommends that staff nurses should be seriously involved in the self-evaluation of the continuing nursing education programs for the reason that they are considered the consumers of such programs. Further research can be carried out on a large sample size, varied range scale of variables, large sample size and nation-wide continuing nursing education programs.

***Key wards:*** *Self-evaluation, Continuing Nursing Education Program, Kirkuk Health Directorate*

## Introduction

As professions go, nursing is pretty new. Until just more than 150 years ago when Florence Nightingale provided the building blocks for the field -- which included a training school and a nursing guidebook -- anyone who found themselves in the role of caregiver could be considered a nurse. In fact, Nightingale once said that every person must at some time or other of the life becomes a nurse [(1)].

Of course, that is back in the mid-19th century. Over the years, nursing has become a highly respected occupation that requires specific education and training. Not only that, but nurses also provide a wide spectrum of services to patients of all kinds [(2)].

Continuing education is the process that includes all the experiences after the initial training. Is characterized as the set of experiments after the initial training, allowing the worker to maintain, increase or improve

your skills, so that this is consistent with the development of their responsibilities, characterizing, competence and individual attribute. It is a set of continuing education practices, aimed at developing the potential for a change in attitudes and behaviors in the cognitive, affective and psychomotor human being, the prospect of transforming their practice [3].

Continuing nursing education (CNE) denotes to courses precisely for nursing professionals, intended at possession them up-to-date with the state-of-the-art health knowledge. CNE safeguards professional growth and enables re-licensure and certification points in numerous countries. CNE also enlarges nurses' knowledge, skills and attitude while donating to their career development [4].

Continuing education program is any postponement of opportunities for reading, study and training to any person and adult following their attainment of or removal from full time school and/or college program [5].

Nursing is not just a set of specific skills, nor the nurse is only a person trained to perform specific tasks. Nursing is a profession. To be professional and act this way should be given careful consciously and based on their knowledge. Thus, a profession requires extensive education of those who practice and it is important to have a fundamental and theoretical body of knowledge and skills that generates defined standards. Hence the importance of continuing education becomes a key strategy for updating the professionals who are working in the field, bringing new concepts and knowledge relevant to a safer practice and conscious [3].

One of the delights of continuing nursing education is the amusing opportunity it offers for research. The very diversity of learners, content, programming potentials, and instructional strategies provide fertile Fields for investigation. Studies in continuing nursing education may discourse newly identified problems or provide new viewpoints on the study of acquainted problems. The instruments and techniques advanced to conduct these investigations are themselves a basis of possible claims in the delivery of continuing education, for example, in the refinement of needs assessment devices or evaluation strategies. Thus, reports of investigations should be examined on numerous levels: for their donations to knowledge in the field, for applicability to the solution of practical problems, and for the use of study instruments and methodologies for further investigations or in programming [6].

Continuing nursing education (CNE) programs are designed to contribute to nurses' professional development by filling a gap in knowledge, skills, and practice. CNE is also the method through which nursing professionals improve their practice and keep up to date on the latest knowledge and advances in health care. It is important for nurse educators to evaluate the outcomes of CNE programs to make sure the gaps have been addressed. An outcome is defined as the end result of a learning activity measured by evaluation or change in practice [7].

Continuing nursing education and the application of new knowledge to practice are increasingly important means to improve patient care in today's health environment. The willingness and ability to transfer knowledge, skills, and attitudes are critical to improving patient outcomes [8].

The evaluation of continuing nursing education is a vital part of improving the quality of educational activities. This evaluation defines if nurses meet the wanted learning outcomes and offers feedback on ways to advance the educational experiences that eventually progress patient care [6].

Based on the early stated evidence, the present study ought to evaluate the Continuing Nursing Education Programs at hospitals in Kirkuk Health Directorate.

## Methodology

A descriptive design is employed throughout the present study to self-evaluate continuing nursing education programs in Kirkuk Health Directorate from November 3rd 2018 to April 30th 2020.

After receiving the approval of the Council of Nursing College for the study and prior to data collection, proposal and questionnaire of the study have been submitted to the Ministry of Planning Central Statistical Organization and the Ministry of Health and Environment Kirkuk Health Directorate in order to obtain an official permission to carry out the study. The permission, after being granted, is presented to the hospitals to ensure the agreement and cooperation.

The study is conducted at Kirkuk General Hospital and Azady Teaching Hospital in Kirkuk health Directorate. These settings are the designated site for data collection, because all of them are representing the classification of hospitals as general and specialized ones.

A purposive "nonprobability" sample of (251) staff nurse is selected for the present study. All staff nurses, who have participated in the study, have presented with consent form and they are asked to sign the form for their agreements for the participation in the study. All participants are introduced with the study objectives and they are presented with the opportunity of being aware of the study affairs. Such action has been implemented to protect the participants' human rights and facilitate access to them in order to gather the necessary data for the study.

The study instrument consists of the following:

Part I: Self-evaluation of Continuing Nursing Education Program

This part is comprised of the following:

1. Program goals:

This part is comprised of (7) items which are concerned with the program goals. It is evaluated as poor (7-12), fair (13-17) and good (18-21).

2. Program Planning:

This part is comprised of (6) items which are concerned with the program planning. It is evaluated as poor (7-12), fair (13-17) and good (18-21).

3. Performance:

This part is comprised of (7) items which are concerned with the program performance. It is evaluated as poor (10-17), fair (18-24) and good (25-30).

4. Operation and Management:

This part is comprised of (8) which are concerned with program's operation and management. It is evaluated as poor (10-17), fair (18-24) and good (25-30).

5. Program Outcomes:

This part is comprised of (10) item which are concerned with the program outcomes. It is evaluated as poor (10-17), fair (18-24) and good (25-30).

6. Program Effectiveness:

This part is comprised of (8) item which are concerned with the program effectiveness. It is evaluated as poor (8-13), fair (14-18) and good (19-24).

Each one of these aspects is evaluated based on the calculation of the total scores and ranges.

A pilot study is conducted for the determination of the study instrument validity and reliability for the period from February 12$^{th}$ to March 7$^{th}$ 2019.

The content validity of questionnaire is determined by panel of (10) experts who are provided with copy of study instrument and are asked to review and evaluate the instrument for its content clarity and adequacy. Some items are excluded and others are added after taking all the comments and recommendations into consideration. So, the questionnaire is considered adequately valid measure after performing the modifications that are based on the experts' responses.

Internal consistency reliability of the questionnaire is determined through the use of split-half technique and the computation of Cronbach alpha correlation coefficient on responses of (20) staff nurse. The correlation coefficient is (r=0.85) which indicates that the questionnaire is adequately reliable measure.

Data are collected through the use of the study instrument and the structured interview technique as means of data collection for the period from March 10$^{th}$ 2019 to May 8$^{th}$ 2019.

The data are analyzed through the use of descriptive statistical data analysis approach of frequency, percent, mean of scores, total scores and ranges.

## Results

**Table (1): Overall Self-evaluation of the Continuing Nursing Education Program**

| **Poor (52-87)** | | **Fair (88-122)** | | **Good (123-156)** | |
|---|---|---|---|---|---|
| F | % | F | % | F | % |
| 205 | 81.7 | 43 | 17.1 | 3 | 1.2 |

**F: Frequencies, %: Percentages**

This table indicates that such overall self-evaluation of the Continuing Nursing Education Program in Kirkuk Health Directorate is poor for the majority of the subjects (81.7%).

## Discussion

Analysis of overall self-evaluation of the Continuing Nursing Education Program in Kirkuk Health Directorate has indicated that staff nurses have appraised such program as poor for the majority of them. Such finding provides empirical indication that the continuing nursing education program has experienced series of inadequacies with regard to all aspects of the program. Such self-evaluation is noticed in all the poor mean of scores on items of program goals, program planning, program performance, program operation and management, program outcomes and program effectiveness.

Continuing nursing education (CNE) has become essential for the assurance and improvement of quality patient care. CNE includes self-education and directed training activities designed to acquire new knowledge further to that which is acquired through the basic nursing education. It is a process that begins with the end of studies and lasts for the entire life of the individual. A descriptive correlational study investigates the motivating factors for participation of nurses in continuing nursing education (CNE) and their perceptions about the necessity for programs in CNE. The Participation Reasons Scale (PRS) is completed by (475) nurses working in three hospitals in Athens and the Peloponnese region and the socio-demographic data of participants are recorded. The study shows that the majority (62.3%) of the sample showed positive perceptions and attitudes about CNE programs which are based on real needs. Subjects rated all five factors (dimensions) of the PRS as "moderately important" in high percentages, specifically: "Professional improvement and development" 98.9%, "professional service" 91.8%, "collegial learning and interaction" 82.6%, "personal benefits and job security" 91.0%, "professional commitment" 88.4%. "Professional commitment" recorded the highest mean score (4.95±0.744). "Professional improvement and development" correlated positively with "collegial learning and interaction" ($r=0.229$; $p<0.001$) and "personal benefits and job security" ($r=0.115$; $p=0.015$). The study concludes that motives and personal professional attitudes exert a significant effect on the participation of nurses in CNE programs [(9)].

A cross-sectional study with (152) nurses in a public hospital in Pernambuco is carried out to analyze the opinions of nurses on a permanent education program, identifying reasons that influence adherence. The study findings depict that respondents have agreed that lifelong learning improves formation professional. The majority of participants has appreciated the methodology and approves three types of program: in practice simulation room; on the spot; and clinical meeting. The study has found to be essential to consider the opinion of nurses reporting workload after participating in training activities and who prefer to be consulted in advance about the subjects offered. Recognize and value the professional advice shows up relevant for to adopt measures aimed at increasing the effective entry into the program [(10)].

## Conclusion

The study concludes that overall self-evaluation of continuing nursing education program is depicted as poor relative to all aspects of continuing nursing education program of program goals, program planning, program performance, program operation and management, program outcomes and program effectiveness.

## Financial disclosure

There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Kirkuk Health Directorate and all experiments were carried out in accordance with approved guidelines.

*[1]Ph.D. Student, [2]Prof .Dr., Department of Biology, College of Sciences, University of Babylon, Iraq*

## Abstract

Scabies is one of a neglected parasitic disease. It causes complications that lead to inflammatory and allergic immune response ,Cytokines play an important role in the pathogenesis and disease progression. Various reports have implicated cytokine gene polymorphisms in susceptibility to develop some immune mediated conditions, The purpose of this study was to investigate the association of interleukin -10(IL-10) gene polymorphism with the scabies risk and its effect on IL-10 production . The results revealed that a significant increase (P≤0.05) in levels of IL-10 in patients groups compared with healthy group, also the data found that a statistically higher IL-10 serum levels among carriers of the G allele (G/A heterozygotes or G/G homozygotes vs. A/A homozygotes) in the –1082 G/A IL-10 polymorphism in both scabietic patients and control groups .The frequencies of genotypes GG and GA of IL-10 (1082 G/A) polymorphism were significantly increased(P≤0.05) , whereas genotype AA was decreased in patients than the healthy subjects .IL-10 (1082 G/A) polymorphism was associated with the susceptibility of scabies, thus giving additional support for the genetic basis of this disease

***Keywords:*** *Scabies, Interleukin-10. Genetic polymorphism*

## Introduction

Sarcoptes scabiei var. hominis. is ectoparasitic caused humans scabies ,also is consider ubiquitous disease, with an estimated 300 million infections per annum worldwide[1]. Furthermore, scabies is commonly found within developing countries, low socioeconomic communities and global regions experiencing significant environmental stressors such as during times of war and environmental disasters, [2].Scabies was transmitted by person to person contact, by infected persons interacting with fomites such as clothing, bedding or shared household items that are contaminated with mites or mite eggs that were shed from infected individuals[3] meantime, mites can survive without host survive for 24–36 h ,at room conditions (21°C and 40–80% relative humidity) [4] . The IL-10 gene maps to the junction of 1q31–q32 [5] and this gene is highly polymorphic with a number of single nucleotide polymorphisms in the promoter region ,in addition there is 3 polymorphic susceptible sites found in IL-10 promoter region include -1082(G/A), -592(C/A) and -819(C/T) [6]**.** The aim of this study were to investigate the association between IL-10 G-1082A promoter polymorphism of interleukin-10 gene among some Iraqi scabietic patients using ARMS-PCR technique .

## Materials and Method

1. **Patients and control:**

A total of 60 patients infected with Sarcoptes scabiei var. hominis (25 males and 35 females) and 30 healthy individuals (15 males and 15 females) were included in current study.

2. **Blood samples :**

The blood samples were drown from each patients and healthy subjects(5ml) . The sample was divided into two parts , the first placed in EDTA tube for genetic study, while the other part was kept to clot at room temperature, then centrifuged at 3000 rpm for 10 minutes, after that sera samples were transferred into eppendrof tubes and stored at deep freeze until used .

3. **Laboratory investigations :**

A.**Immunological assays :**

The levels of IL-10 was estimated by ELISA according to the manual procedure of kits provided by Bioassay Technology Laboratory /UK .

**B. PCR amplification**

Genomic DNA was extracted from the blood of scabietic patients and controls using DNA mini kit (favergen-Korea). Interleukin-10 gene was amplified using amplification refractory mutation systems (ARMS)-PCR methodology for IL-10 (1082 GA) according to ]7 [.The set of primers used to amplify various types of polymorphism are summarized in table 1. The PCR amplification was performed in a total volume of 20 µl. (master mix is a premixed ready to use solution containing Taq DNA polymerase, dNTPs, MgCl2 and reaction buffers) supplied by Bioneer company (Korea), 5 µL of genomic DNA, 1µl of each primer (10 pmol/1µL) and 13 µL from nucleases free water for polymorphism IL-10(1082 G/A). Reaction consisted of 10 temperature cycles of denaturation for 15 s at 94◦C, annealing for 50 s at 65◦C and extension for 40 s at 72◦C. Then 25 cycles of denaturation for 20 s at 94◦C, annealing for 50 s at 59◦C, extension for 50 s at 72◦C. Final extension was performed at 72◦C for 7 minutes. Electrophoreses of the PCR product was performed in 2% agarose gel, stained with ethidium bromide and photographed.

**Table (1) Primers of IL-10(-1082 G/A)**

| IL-10(1082 G/A) | Sequences | Product size |
|---|---|---|
| anti-sense primer | 5'-CAG TGC CAA CTG AGA ATT TGG-3' | 258 bp |
| Sense primer G | 5'-CTA CTA AGG CTT CTT TGG GAG-3' | |
| Sense primer A | 5'-ACT ACT AAG GCT TCT TTG GGA A-3' | |

**4.Statistical Analysis:**

The results were analyzed by using SPSS version 24.0 .The data were expressed by means ±standard deviation (±SD) . Multivariable logistic regression was used to determine independent indicators of SNPS and Allels By use OR and CI 95% . All P values were two-tailed, with a value of less than 0.05 considered statistically significant

## Results

The results in table (2) revealed that a significant differences( $P<0.05$) in the levels of IL-10 between patients groups(first infestation and re-infestation) and control group , which reached 251.60±85.82 and 177.23±69.03 pg/ml in first infestation and re-infestation groups respectively, while it was 42.19±14.77 pg/ml in control group .

**Table (2): The levels of IL-10( pg/ml) in patients( first infestation, re- infestation) and control groups .**

| Groups | Mean±S.D. | LSD | p.value |
|---|---|---|---|
| First Infestation | 251.60±85.82 | 32.926 | 0.001 |
| Re infestation | 177.23±69.03 | | |
| Control | 42.19±14.77 | | |

The distribution of IL-10 (-1082 G/A) variants in patients and controls are summarized in tables 3 and figure1. It can be seen that the frequency of GG and GA genotypes in first infestation, re-infestation and control groups which reached 56.7%, 43.3%, 35.5%; 40.0%, 43.3% and 29.0% respectively. It was significantly increased in patients than control, in which GG genotype increased as rate OR=3.834 compared with GA and AA genotypes in studied groups. On the other hand, the frequency of AA genotype in first infestation, re-infestation and control groups was 3.3%,13.3% and35.5% respectively, that decreased in patients compared with control group .The distribution of IL-10 (-1082 G/A) genotypes in first infestation group was AA (homozygous mutant type), GA (heterozygous) in frequencies rate 3.3% and 40.0% respectively, but without significance or odd ratio, also the distribution of IL-10 (-1082 G/A) genotypes in re- infestation group were AA, GA in frequencies rate 13.3% and 43.3% respectively, without significance but OR=1.222, as consider GG reference category .Moreover, the distribution of IL-10 (-1082 G/A) allele in first infestation, re- infestation and control groups were in A allele frequency rate 23.3%, 35.0% and 50.0% respectively, but significantly without OR, while between first infestation and control groups was significant but without OR, in addition between re- infestation and control was non- significant and OR ,in the other hand the distribution of IL-10 (-1082 G/A) allele in first infestation, re- infestation and control groups were G allele frequency rates 76.7%, 65.0% and 50.0% respectively, but significantly with OR=1.815 can consider a risk factor with scabies, while between first infestation and control group was significant with OR=3.286, whereas between re- infestation and control group was non- significant and with OR=1.857.

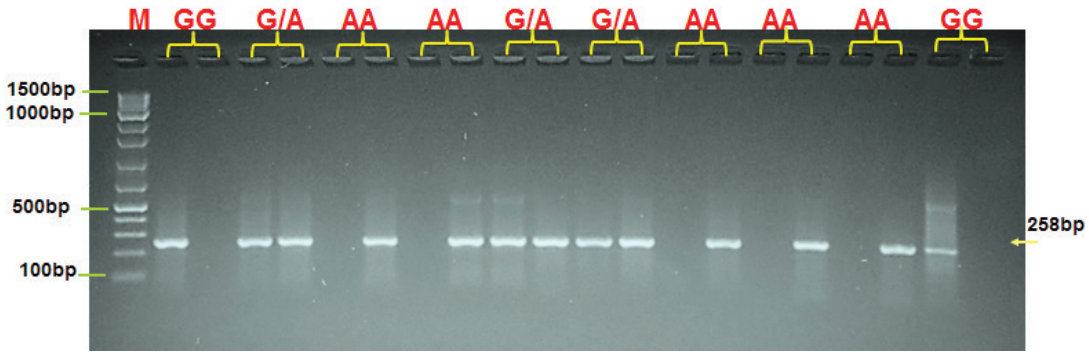

**Figure 1: Agarose gel electrophoresis image that showed the two reaction ARMS-PCR product analysis of IL-10 (1082) (G/A) gene polymorphism. Where M: marker (1500-100bp). The GG wild type homozygote genotype lanes were showed only G allele amplification at 258bp ARMS PCR product size. The AA mutant type homozygote genotype lanes were showed only A allele amplification at 258bp ARMS PCR product size. In addition, the G/A heterozygote genotype lanes were showed G allele and A allele amplification at 258bp and 258bp product size respectively**

*first infestation/re-infestation

The correlation between genotype of IL-10 (1082 G/A) and level of IL-10 in patients and control groups was appeared in table (4) .The results found that a statistically higher serum levels of IL-10 in patients that carry of G allele (G/A heterozygotes or G/G homozygotes), in which the IL-10 levels in first infestation, re-infestation and control groups were 290.96 ,229.22 and 56.93 pg/ml respectively for GG genotype , whereas it was 210.62 ,154.09 and 43.43 pg/ml respectively for GA genotype.

On the other hand, there was lower in level of IL-10 serum in patients that carry of A allele(AA homozygote

mutant type), in which its levels in first infestation, re-infestation and control groups was 74.11 ,83.44 and 27.98 pg/ml respectively for AA genotype .

**Table (4): The correlation between IL-10 (1082 G/A) genotype and IL-10 (pg/ml) level in patients and control groups.**

## Discussion

There are a significant differences in the levels of IL-10 between the three groups of the study. ]8 [Illustrated that there was a significant differences in the levels of IL-10 between patients and healthy groups which reached 269±112 pg/ml, also the anti-inflammatory Th2 cytokines such as IL-10 and not the humoral immunity may play a protective role to guard against severe manifestations in human scabies .According to the current study , IL-10 may be regarded a natural regulator of mast cells activator that reduces inflammation and irritability related to allergic reactions. ]9 [showed that the significant increase in levels of IL-10 when used extract mite CO8-stimulated PBMC from control subjects ,were it consistent with previous studies that used whole SM extract remarked that the significantly increased levels of IL-10]10 [ .

Finally ]10 [mentioned that the scabies mites are the source of substances that may delay the hosts primary immune response by stimulating the proliferation of regulatory T cells by their secretion of IL-10 and TGF-β which leads to inhibits an inflammatory/immune reaction to the parasite.

Studies revealed that those individuals may have a genetic predisposition that increasing susceptibility to ordinary scabies (OS), therefore, these genetic changes may not directly cause OS, but may play an important role in its development.

The results of present study found that a statistically higher IL-10 serum levels among carriers of the G allele (G/A heterozygotes or G/G homozygotes vs. A/A homozygotes) in the –1082 G/A IL-10 polymorphism in both scabietic patients and control groups.

The frequencies of genotypes GG and GA of IL-10 (1082 G/A) polymorphism were significantly increased, whereas genotype AA was decreased in scabietic patients than the healthy subjects.

There was no previous studies related with IL-10 (1082 G/A) polymorphism in scabietic patients, therefore, the data of current study of polymorphism of IL-10 (1082 G/A) was compared with the psoriasis and atopic dermatitis patients as dermatologic diseases. ]11 [and ]12 [ reported that the regulation of IL-10 gene, there exists a requirement of consideration of knowing genetic variation among patients or healthy subjects groups, in which the genetic variation can possibly effect the expression of the gene and can considerably act as a genetic marker in disease susceptibility or disease severity. The 1082 G allele of IL-10(−1082G/A) is reported to be associated with high IL-10 gene

expression, as shown in study.

The frequencies of genotypes GG and AA of IL-10 (1082 G/A) polymorphism were significantly increased, whereas genotype GA was decreased in AD patients than the controls, in which the IL-10 (−1082 G/A) polymorphisms are linked with the susceptibility of AD in Saudis and can be regarded a risk factor of IL-10 ]13 [. ]14 [ studied the IL-10 serum level and IL-10 (1082 G/A) polymorphism in patients with AD and suggested that a role of G allele in synthesis of IL-10 in the patients with moderate to severe AD. However, IL-10 being immunosuppressive cytokine inhibits the activity of Th1 and Th2 cell types in human subjects. ]15 [ reported that genotype IL-10 (−1082 AG) is susceptible, whereas IL-10 (−1082 AA) is protective to AD in population of Macedonians, while IL-10-1082 G allele has been considered to be associated with higher production of IL-10 from peripheral mononuclear cells ]16,17,18 [, also ]19 [ revealed that carriers of the IL-10 -1082G allele had higher mucosal IL-10 mRNA than -1082A allele carriers. The current study shows IL-10 having both immunosuppressive in first infestation and protective in re-infestation groups, also GG and GA genotypes with high production of IL-10 belong to gene expression people with G allele transcription factors association tight with mRNA, while to gene expression people with A allele transcription factors association weak with mRNA.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the College of Sciences and all experiments were carried out in accordance with approved guidelines.

# Assessment of Pregnant Women Knowledge and Practices Concerning Iron Deficiency Anemia at Al-Amara City/Iraq

**Ghazwan Abdulhussein AlAbedi [1], Aqeel Aziz Arar[2], Mustafa Salim Abdul Alridh[3]**

*[1] MSc. Academic Lecturer. Department of Community Health Nursing, College of Nursing/ University of Misan, Misan, Iraq, [2] MSc. Academic Lecturer, Department of Adult Nursing. College of Nursing/ University of Misan, Misan, lraq, [3] MSc. Academic Lecturer, Department of Pediatric Nursing, College of Nursing/ University of Misan, Misan, lraq*

## Abstract

**Objectives:** To assess knowledge and practices related to the prevention of iron deficiency anemia among pregnant women and to find an association between their knowledge; practices and socio-demographic variables. **Methodology:** This is an institutional descriptive study conducted on the random selection of six primary healthcare centers in Al-Amara city. A purposive sampling technique was used to select (280) pregnant mothers attending antenatal care service.

**Results**: Almost half of the sample belongs to the primary education level (50.3%) and most of them housewife (56.8%), with low monthly income (71.8%). Over three quarters of the sample had moderate knowledge (76.1%) and their unfavorable practices (75.5%) with regard to iron anemia. The results indicated a high relationship between the knowledge and practice of women with the variables under study (p= 0.000).

**Conclusion:** The study concluded that the majority of participants have insufficient knowledge with moderate practices towards preventing this type of anemia. Health education about foods with a high concentration of iron is an essential step towards reducing iron deficiency anemia in pregnant women.

***Key words:*** *Knowledge, Practice, Iron Deficiency Anemia, Pregnant Women.*

## Introduction

Iron deficiency anemia (IDA) is one of the most common problems between under-nutrition and public health problems worldwide with the highest prevalence in developing countries [(1)]. Anemia of iron means that without a sufficient amount in the blood, the body cannot produce enough red blood cell material to enable it to transport oxygen (Hemoglobin); as a result, the IDA may make women feel tired and restless [(2)]. Pregnant women are at increased risk for IDA due to increased blood volume during pregnancy resulting from increased support to the fetus and placenta. In general, women in childbearing stage suffer from the loss of large amounts of blood due to childbirth or menstruation, which are factors contributing to the development of iron anemia [(3)].

The World Health Organization (WHO) estimates showed in 2011, 32.4 million (38%) of pregnant women, while 496 million (29%) of those who are not pregnant between the ages of 15-49 years suffer from anemia. Moreover, previous studies on IDA have revealed a prevalence of 73.9% in Guyana, 22.1% in Egypt, 39.7% in Kuwait, 78.0% in Liberia, and 50.0% in Bahrain[(4)]. In Iraq, the Nutrition Research Institute showed, through a section of research and studies, the prevalence of iron deficiency among pregnant women 38% and non-pregnant 25%, respectively [(5)]. Iron deficiency in body leads to disorder in metabolism and reduced immunity in the pregnant women and become vulnerable to attack of infectious agents. Anemia is a major health problem but can be addressed through increased awareness and

**Corresponding author:**

ghazwanabdulhussein@uomisan.edu.iq

adherence to healthy eating practices [6]. The increased risk of developing IDA during pregnancy and lactation has prompted most ministries and governmental and non-governmental bodies in many countries to implement policies to provide iron supplementation for pregnant and lactating women [3].

Good knowledge and eating iron-rich foods when preparing food at home by women to prevent iron deficiency varies depending on the culture and awareness of women. While lower maternal education is associated with a higher incidence of low-birth weight, neonatal death in infants, and prematurity of women with severe iron deficiency [7].

Maintaining a woman's health through healthy behavior represented by eating healthy foods is among the most important protective factors in achieving optimal health [3].

## Objective

**1.** To assess the pregnant woman's knowledge towards Iron deficiency anemia.

**2.** To assess the woman's practices concerning Iron pregnancy anemia.

**3.** To found out relationship between the participants knowledge and practices with their socio-demographic data.

## Methodology

Quantitative design (A descriptive study) was applied in the study during the period 3rd November 2019 at 30th January 2020. A simple random sample is used to select (6) out of 16 primary health care centers PHCs at Al-Amara city. Convenient purposive sampling technique was adopted for (380) pregnant women visiting antenatal care units for preventive or therapeutic reasons, these women were collected from the six centers which include (63) women from Shaheed Al-Watan, (64) from AL-Askan, (63) pregnant women from Al-Quds, (62) Nahawnd center, (64) and (64) from Al-Aruba and AL-Ermuk PHCs respectively. The participants were selected according to predetermined criteria including which include pregnant women and more than one gravida. While the excluded criteria which include female non pregnant and non married. The interview technique was used to collect sample data through the use of constructive questionnaires by researchers to achieve the goals of this study through the use of the Arabic version, which contains three parts: The first part related to socio-demographic information which comprised of (6) items, and the second part to assess of knowledge for pregnant women toward Iron anemia it consists of (34) items. It comprises of (6) section which including (General information about IDA, the causes, symptoms of this type of anemia, the negative effects, the benefit of intake iron pills during pregnancy, and knowledge of pregnant women about food that contains a high concentration for iron. Finally, the section three it concerned with women's behaviors (practices) during the current pregnancy which contains (15) items related to IDA. The content validity of the tool was established by (8) experts. These items were rated according to the three likert scale: (Knowledge and practices) I know / or Always (3); Uncertain / or Sometime (2), and I do not known / or Never scored as (1). The measurement was scored by using cut-of-point intervals (1.00 - 1.66) low; moderate (1.67 – 2.33), and (2.34 – 3.00) high, as well as (L), (M), and (H) respectively. Data were analyzed using Statistical Package of social sciences (SPSS) version 20. Then the results were calculated using descriptive statistics such as percentage, frequency, and Mean of Score, standard deviation, and inferential statistics through ANOVA test to find out correlation between knowledge of the pregnant women and practices regarding IDA. The results were affirmed as significant at $P \leq 0.05$ and not significant at $P > 0.05$.

## Results

**T**here is a quarter of the participants 97(25.5%) of study sample within the age group (20 – 24 years), while 119(31.3%) of pregnant women had their first pregnancy. Concerning to the level of educational is showed half of pregnant women 191(50.3%) in the study sample were primary school graduate. Regarding the subject of occupational status represented the majority of pregnant were 216(56.8%) housewives. In relation to the monthly income the majority were 273(71.8%) have less than (< 700000 Iraqi Dinar). However sources of information concerning iron deficiency anemia the majority of pregnant women were 215(56.6%), they receive their information from health center / mother & child care.

**Table (1): Assessment of Participant Level toward the Knowledge and Practices Concerning IDA**

| Participants' Level | Knowledge. | | Practices | |
|---|---|---|---|---|
| | Frequency | Percent | Frequency | Percent |
| Low | 73 | 19.2 | 54 | 14.2 |
| Moderate | 289 | 76.1 | 287 | 75.5 |
| High | 18 | 4.7 | 39 | 10.3 |
| Total | 380 | 100.0 | 380 | 100.0 |
| $\bar{x} \mp S.D$ | $1.77 \mp 0.276 \mp 0.276$ | | $1.95 \mp 0.278 \mp 0.278$ | |

**$\bar{x} \mp S.D.\bar{x} \mp S.D.$=Arithmetic Mean ($\bar{x}$)$\bar{x}$) and Std. Dev. (S.D.), Participant Levels: (1.00 - 1.66) = Low ;( 1.67 – 2.33) = Moderate; (2.34 – 3.00) = High.**

This table reveals that the majority of women have a moderate level of knowledge and practices related to iron anemia (n=380; 289(76.1%), 287 (75.5%)) respectively.

**Table (2): Assessment of Main Domains Related to Pregnant Women's Knowledge**

| No. | Overall Main Domains | N | M. S. | S. D. | Ass. |
|---|---|---|---|---|---|
| 1 | What do you know about iron deficiency anemia? | 380 | 1.58 | 0.413 | **L** |
| 2 | The causes of IDA. | 380 | 1.61 | 0.367 | **L** |
| 3 | The symptoms of anemia for Iron. | 380 | 1.69 | 0.322 | **M** |
| 4 | The negative effects of IDA. | 380 | 1.73 | 0.438 | **M** |
| 5 | The benefit of intake iron pills during pregnancy | 380 | 1.69 | 0.322 | **M** |
| 6 | Food that contains a high concentration of iron. | 380 | 1.91 | 0.339 | **M** |

**n= sample size, S.D= Standard Deviation, M.S= Mean of Score, Ass.= Assessment, Assessment Levels: (1.00 - 1.66) Low; Moderate =( 1.67 – 2.33), and (2.34 – 3.00) = High.**

The results of the above table show the major domains related to pregnant knowledge regarding iron deficiency anemia have mean of score were moderate level, based on the answers of pregnant women, except domains (1&2) demonstrated mean of score were low level.

**Table (3): Assessment of Women's Practices Concerning IDA**

| No. | Items of Women's behaviors during the current pregnancy | Always | | Sometime | | Never | | M. S. | S. D. | Ass. |
|---|---|---|---|---|---|---|---|---|---|---|
| | | F | % | F | % | F | % | | | |
| 1 | You drink tea with meals | 55 | 14.5 | 289 | 76.0 | 36 | 9.5 | 2.05 | 0.487 | M |
| 2 | You take iron pills daily | 115 | 30.3 | 265 | 69.7 | — | — | 2.30 | 0.460 | M |
| 3 | You take iron pills with orange juice | 52 | 13.7 | 212 | 55.8 | 116 | 30.5 | 1.83 | 0.644 | M |

| | Within Groups | 71.962 | 377 | 0.191 | | |
| Monthly Income | Between Groups | 15.983 | 2 | 7.991 | 39.421 | 0.000 |
| | Within Groups | 76.425 | 377 | 0.203 | | |
| Sources of Information | Between Groups | 32.598 | 3 | 10.866 | 68.312 | 0.000 |
| | Within Groups | 59.809 | 376 | 0.159 | | |
| | Total | 92.408 | 379 | | | |

Data analysis in this table indicates a high correlation between the practices of women towards iron anemia and its demographic data at (p value= 0.00).

## Discussion

Our study is one of the few investigations that aim to collect special data related to the knowledge, and practices of pregnancy towards IDA in the city of Al-Amara / in southern of Iraq. Based on the results, the researchers concluded that the majority of pregnant mothers who visit pregnant care units have moderate or weak knowledge and behaviors in preventing iron deficiency anemia. Reports indicate that iron deficiency is the main cause of anemia that some pregnant women still suffer, and it is the most common nutritional disorder in many countries [(8)]. This reason may be the result of a high prevalence of anemia in developing countries, including the low socioeconomic situation that causes a lack of awareness of a diet containing high amounts of iron. AlAbedi et., al [(9)], who mentioned in their study that aimed To assess women's knowledge about pregnancy risks, the majority of participants does not have enough monthly income which is due to the poor financial situation in the country or most of the women are housewives with a low educational level.

As for women's knowledge and practices about causes and symptoms, negative effects of anemia and methods of prevention by taking iron pills or iron food supplement during pregnancy, it appears at a low to moderate level in our study. This result may be due to a low level of education because the majority have primary schools or because of a lack of experience resulting from the fact that most of them are in the first or second pregnancy. This result was supported by Ghimire and Pandey [(1)], who showed that more than half of the sample (51.3%) and (66.0%) had inadequate knowledge and poor practice in prevention of IDA. Also, AlAbedi et., al (2019) [9] who found in study which conducted in Iraq the majority of participants (35.3%) and (42.0%) have low and moderate knowledge respectively on risk factors during pregnancy, including iron-containing nutrients.

Practices and knowledge of the women for IDA has high significant relationship with increase of age, educational qualification, No. of pregnancies, employment, income status and sources of information at (p value > 0.01). This result was agree with a study conducted in India/Pune by Sivapriya and Parida (2015) [10] Who found that there is a great relationship between information and practices of participants about IDA with socio-demographic data for study participants.

## Conclusion

The results of our study concluded that pregnant women need to improve their knowledge, which in turn enhances their practices. Therefore, the bad and moderate practice towards the prevention of iron anemia is one of the main factors that contribute to an increased incidence of iron deficiency anemia in Al-Amara City.

## Recommendation

Based on the results of the study, primary health care nurses play a vital role by providing health education to women in pregnant care units that focuses on increasing their knowledge of the causes and symptoms of anemia and preventing it by taking iron supplements and eating iron-rich foods during pregnancy. Hence, the researcher emphasizes the need for more research to improve the knowledge and practices of mothers on anemia during pregnancy.

# Epidemiology of Burn Cases in Erbil Governorate

**Pakestan Hamadamin Yousif [1], Hoshyar Amin Ahmed[2]**

*[1]M.Sc., Department of Nursing, Soran Technical Institute, Erbil Polytechnic University, Kurdistan Region, Iraq,*
*[2]Assist. Prof. Dr. Dean of Erbil Health Technical College, Erbil Polytechnic University, Iraq*

## Abstract

**Background and Objectives:** Management and prevention of burns are done through epidemiological study. The mortality rate of burn injuries is seven times higher in the low income countries than the high income countries. The aim of this research was to study the epidemiology of burn injury cases through analysis of the cause, magnitude and profile of burn in Erbil governorate as a method for planning preventive and management strategies.

**Method**: A retrospective study was conducted on 593 burn cases to assess the epidemiology of burn injury cases in Erbil Governorate the capital of Iraqi Kurdistan Region from 2012 to the end of 2016. Descriptive and inferential statistics were used through the Microsoft Excel Database and the Statistical Package for Social Sciences (SPSS, Version 24). The P value of $> 0.05$ was considered as non-statistically significant. The P value of $\leq 0.05$ was considered as statistically significant. The P value of $\leq 0.01$ was considered as highly statistically significant.

**Results:** The total number of burn cases in Erbil governorate during the period 2012 to 2016 was 593 victims. The mean (±SD) age of the studied cases was 26 ± 10.9 years ranging from one to 82 years. The highest number 189 (31.9%) of registered burn cases was in 2013, while the lowest number 74 (12.5%) of cases was in 2015. The female to male ratio of the burn victims was 2.1:1. More than half (56.7%) of them were married, while the others (43.3%) were single. Husband and polygamy were the highest leading causes of the burn cases in a way that each of the causes had formed 18.4% of the cases. The highest number (44.35%) of the burn cases was among the age group 21 to 30 years. There was a significant correlation between the marital status of the studied cases with the causes behind the burn injuries at $p = 0.027$ and highly significant correlation of the marital status with the survival rates in. The correlation was highly significant between the gender of the studied samples and the cause of the burns. There was no significant correlation between the educational levels of the burn victims with the causes and the survival rates as well.

***Key words:*** *immortal, inflicted, burn, injury, Erbil.*

## Introduction

Study of the cause and the history of burn in any population can be done through an epidemiological research which is considered as the first step of management and prevention of burns [10]. The socioeconomic stability of any country is an influential factor for burn profiles [12] . About 11 million people were burnt severely in 2014 worldwide. All these cases required medical care. As a public health problem, annually burns lead to about 180000 deaths. Most of cases occur in the middle and low income countries including South East Asian and African regions. Burn death rates are decreasing in the high-income countries. This rate in the middle and low income countries is seven times higher than the higher income countries. Furthermore, the non-fatal burning injuries are considered as a leading cause for morbidity which includes disfigurement and disability which may result in stigma with rejection and prolonged hospitalization. Although burns are

Assist. Prof. Dr. Dean of Erbil Health Technical College Erbil Polytechnic University, Iraq;
E-mail: hoshyar@epu.edu.iq

preventable but mainly it occurs at the workplaces and homes (WHO, 2017). Burns treatment had improved from the primarily topical therapy including the strange and wonderful topical mixtures, concoctions consisting of cow dung, bees wax, ram's horn and barley porridge with resin-socked dressing of the tree shrub acacia with red ochre, and copper in ancient times to the role of joint scientific fields of topical therapy, antibiotics, fluid resuscitation, skin excision and grafting, respiratory and metabolic care and nutrition. The majority of the advances in burn management had occurred in the last 50 years, spurred on by wars and great fires [1]. The use of systemic antibiotics and topical silver therapy greatly reduced sepsis related mortality. These scientific changes jointly with the advent of antiseptic surgical techniques, burn depth classification and skin grafting allowed the excision and coverage of full-thickness burns which resulted in greatly improved survival rates. Advances in the methods of assessing the surface area of burns helped for more accurate fluid resuscitation, minimizing the effects of shock and avoiding fluid over-loading. The metabolic care, nutritional support and care of inhalational injuries further improved the outcome of burn patients [13].

## Subjects and Methods

A retrospective study was conducted on 593 burn cases to assess the epidemiology of burn injury cases in Erbil Governorate the capital of Iraqi Kurdistan Region from 2012 to the end of 2016. The inclusion criteria for the study sample were the burn cases that had been attended to the law department of the hospitals and police stations. Descriptive and inferential statistics were used through the Microsoft Excel Database jointly with the Statistical Package for Social Sciences (SPSS, Version 24). The P value of > 0.05 was considered as non-statistically significant. The P value of ≤ 0.05 was considered as statistically significant. The P value of ≤ 0.01 was considered as highly statistically significant.

## Results

The total number of burn cases in Erbil governorate during the period 2012 to 2016 was 593 victims. The mean (±SD) age of the studied cases was 26 ± 10.9 years ranging from one to 82 years.

Table 1 show that the highest number 189 (31.9%) of registered burn cases was in 2013, while the lowest number 74 (12.5%) of cases was in 2015.

**Table 1: Number of burn cases per year**

| Year | F | % |
|---|---|---|
| 2012 | 155 | 26.1 |
| 2013 | 189 | 31.9 |
| 2014 | 97 | 16.4 |
| 2015 | 74 | 12.5 |
| 2016 | 78 | 13.2 |
| Total | 593 | 100 |

Table 2 shows the socio-demographic characteristics of the studied burn cases. About two thirds (67.8%) of them were females and about one third (32.2%) of them were males. The female to male ratio of the burn victims was 2.1:1. More than half (56.7%) of them were married, while the others (43.3%) were single. The highest percentage (54.5%) of the victims were primary school graduates. The illiterates, intermediate school graduates and high school graduates had formed 19.9%, 23.8%, and 1.8% of the studied cases respectively.

**Table 2: The socio-demographic characteristics of the sample**

| Characteristics of the sample | Frequency (F) | Percentage (%) |
|---|---|---|
| Gender | | |
| Male | 191 | 32.2 |
| Female | 402 | 67.8 |
| Marital status | | |

***Cont...*** **Table 2: The socio-demographic characteristics of the sample**

| | | |
|---|---|---|
| Married | 336 | 56.7 |
| Single | 257 | 43.3 |
| Education | | |
| Illiterate | 118 | 19.9 |
| Primary school | 323 | 54.5 |
| Intermediate school | 141 | 23.8 |
| High school | 11 | 1.8 |
| Total | 593 | 100 |

Table 3 reveals the overall causes of the burn cases during the year 2012 to 2016. Husband and polygamy were the highest leading causes of the burn cases in a way that each of the causes had formed 18.4% of the cases. Interference of parents in law had formed only 1.2% of the leading causes of burn cases.

**Table 3: Causes of burn cases**

| **Cause** | **Frequency** | **%** |
|---|---|---|
| Husband | 109 | 18.4 |
| Forced marriage | 62 | 10.5 |
| Psychiatric disease | 82 | 13.8 |
| Bad hospital treatment | 59 | 9.9 |
| Premature marriage | 83 | 14 |
| Interference of parents in law | 7 | 1.2 |
| Polygamy | 109 | 18.4 |
| Unknown | 25 | 4.2 |
| Accident | 57 | 9.6 |
| Total | 593 | 100 |

Table 4 reveals that the highest number (44.35%) of the burn cases was among the age group 21 to 30 years and the lowest number of cases (1.01%) was among victims with > 60 years of age.

**Table 4: Distribution of the burn cases by their age**

| **Age / years** | **F** | **%** |
|---|---|---|
| 1 - 10 | 14 | 2.36 |
| 11 - 20 | 175 | 29.51 |
| 21 - 30 | 263 | 44.35 |
| 31 - 40 | 85 | 14.33 |
| 41 - 50 | 36 | 6.07 |
| 51 - 60 | 14 | 2.36 |
| > 60 | 6 | 1.01 |
| Total | 593 | 100 |

Table 5 indicates the burn size percentages of the studied sample. Unfortunately, the highest number (21.92) of the burn cases had suffered from 96% to 100% of burn size and the lowest number (1.01) of cases suffered from 31% - 35% of burn size.

**Table 5: The burn sizes by percentage**

| Burn size % | F | % |
|---|---|---|
| 5 - 10 | 32 | 5.40 |
| 11 - 15 | 53 | 8.94 |

| Total | 593 | 100 |

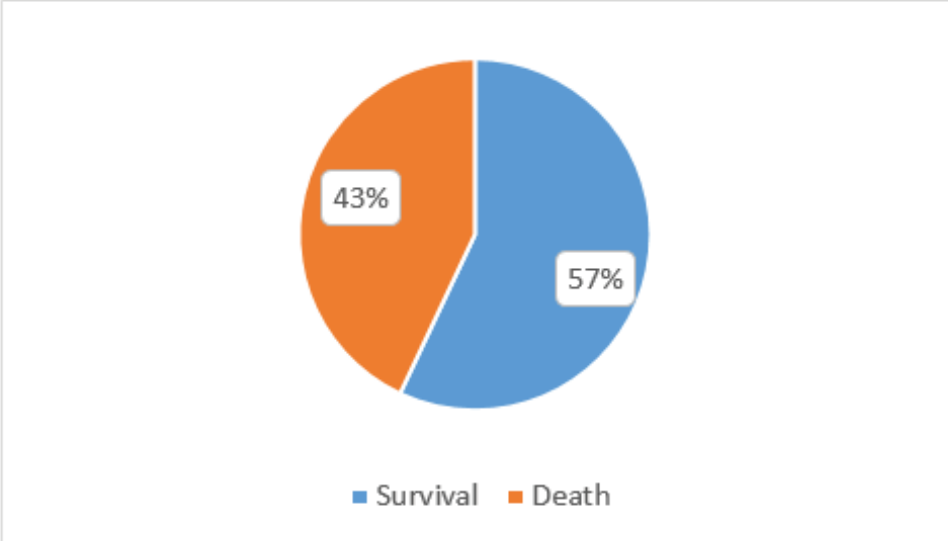

**Figure 1. Proportion of survival and death of the burn injury cases**

Figure 1 shows the proportion of survival and death of the burn injury cases.

The correlational statistical findings of this study had been calculated. There was a significant correlation between the marital status of the studied cases with the causes behind the burn injuries at p = 0.027 in one hand and highly significant correlation with the survival rates in another hand. The correlation was highly significant between the gender of the studied samples and the cause of the burns. There was no significant correlation between the educational levels of the burn victims with the causes and the survival rates as well.

## Discussion

This study has analyzed the burn profiles in Erbil City from 2012 to 2016. The gradual decrease of recorded annual burn cases can be attributed to the shifting from kerosene use to other resources such as electrical heating systems in the study region. In a study by [10] in Delhi, it has been concluded that economic uplift and shift from kerosene to safer LPG stoves has decreased the annual burn admission by 43% in a major burn unit of Delhi. The survival rate among all the burn cases during the 5 years was 46% and the death rate was 56%. An Indian study by [9] has reported 54.51% of death among the burn injury cases. They concidered the high mortality rate amongst burn patients as a major concern of health care towards burn injuries. The ratio of female to male among the currently studied cases was 2.1. Previous studies indicated that immolation and self burning is more common among young females than males in the Eastern Mediterranean region and South and Central Asia including Kurdistan Region. This phenomenon can be contributed to the social and psychological distresses arising from the male dominated society. Marriage is one of the common sources of conflict between genders and generations [9]. Another study in Iran by [1] indicated the higher number of self-immolation victims among females than males. The current study revealed that burn cases had been occurred mostly among primary school graduates. This result came in coincide with that of Ahmadi et al., 2014 [1] among the northern people of Iran which showed higher incidence of the self immollation among primary school graduates. In regard to the causes behind the self-immolation, it has beeen found that the social and psychiatric causes had formed the higher proportions than the bad hospital treatment and the accidental burn cases. Suicidal self-immolation is a terrible common method in Eastern societies. One study explored the leading causes to self-immolation in young Kurdish females. The latter study ralated the self-immolation attemts to absence of self-control over the personal life, family conflicts, to self-immolation attempts, including not having control over personal life, marital conflicts, looking for attention, seeking attention, feeling of guilt, and male domination among such communities [8]. Another study in Musil Teaching Hospital revealed that the self-inflicted burn cases had a significantly larger percentage of surface body area and this type of burning was the most common cause of hospital admissions among the burn cases which lead to the higher mortality in this patient group [7]. In a study on the syrian society, lower self-esteem, less life satisfaction, less marital satisfaction and more mental health symptomatology than monogamous marriages had been recorded. Many of the mental health symptoms were arised such as somatization, depression, hostility and psychoticism. Moreover, the latter wives reported less psychosocial problems than the second and first wives [6]. Premature marriage was one of the leading causes to self-immolation among the studied population of the current study. In many countries of the world, premature marriage before the age of 18 is a reality. This type of marriage is permitted according to the Universal Declaration of Human Rights for many young women who are encouraged by their families while they are still children aiming to get the financial and social benefits, although child marriage is considered as violation of human rights. Probably this will lead to early pregnancy and social isolation. Furthermore, it will lead to decrease the education ooportunity and poor training that will cause the gendered nature of poverty. The self-inflicted burn cases which had been detected by this study were resulted from the forced and/or the premature marriage that had been associated with the above mentioned socio-cultural and economical factors. Although, nearly one in 10 burn cases of the present study had been recorded as result of the bad hospital treatment, but it has not been medically supported. In a study from Iran, the risk factors for death of the burned patient had been attributed to the age of the patients, the gender, and the size of the burn. Directing more attention to the vulnerable patients had been required to reduce the mortality rate and improvement of the patient survival [11].

In regrd to the age of the most vulnerable age groups to burn injuries, the highest proportion of the

victims were within the young age group of 21-30 years. This situation differs from one to another country or culture. In our study, the mean age ± SD was 26 ± 10.9. According to a study in the United States of America the self-inflicted burn cases formed only 1% of the injury cases during 2011-2015. In Tabriz, Iran, among the 412 self-inflicted burns, the average age was 25.5 years and the majority (99%) of the cases were female. About two thirds (76.5%) were in the age groups of 15–19 and 20–29 years (Maghsoudi et al., 2004). In Tehran, Iran from 1997 to 1999, and among the 110 self-immolation patients, the mean age was 25 years.

## Conclusion

This study revealed that number of burn cases had been decreased from 2012 to 2016. Females burn cases was higher than males by two folds. More than half of the cases was among the primary school graduates. Spouse, polygamy, premature marriage and psychological diseases were the top risk factors of self-inflicted burns. The highest percentage of burn cases was associated with the larger sizes of the burn injuries. Legal, social, and educational efforts are needed to decrease the accidental and self-immortal burns among the community members.

# Changes of Some Environmental Factors in the Iraqi Coastal Waters

**Mohammed Faris Abbas[1] , Sabeeh H. Al-Mayah[2] , T. A. Khalaf[3]**

*[1]Lecturer, Marine Biology Department, Marine Science Center, Basra University, Basrah, Iraq,*
*[2]Prof., Dr., Biology Department, Education College for Pure Sciences, Basrah University, Basrah, Iraq,*
*[3]Prof., Dr., Al-Amanara College for medical Sciences, Maysan, Iraq*

## Abstract

Some environmental factors were studied in the areas near Umm Qasr Port and near Buoy 17 in addition to the Basra oil port area. Where the monthly study was conducted on the changes occurring in the water temperature, pH degree, salinity, conductivity, turbidity, light penetration, total suspended solids, total dissolved materials and alkalinity were studied. The current study showed that the temperature values were within their annual rates as they ranged from 14-34 °C, while the values of the acid function and alkalinity were that within the ranges prevailing characteristic of Iraqi coastal waters, while conductivity recorded low values during January in all study stations, also recorded low values of transparency for the first and second stations (14-40 cm) compared to the third station that recorded higher values as 200-250 cm, while the turbidity values in the third station decreased and high values were recorded in the first and second stations and this is the case in the TSS and TDS values as well.

***Key words:*** *environmental factors, Iraqi coastal waters.*

## Introduction

The marine ecosystem constitutes about two-thirds of the planet's surface. This system includes most of the water bodies on Earth, such as: seas, oceans, estuaries, and the tidal environment, which together represent environments for different types of organisms characterized by a dynamic interaction in which there is a continuous overlap between living and non-living components [1]. The Arabian Gulf forms an important part of the marine waters. It is an arm of the Arabian Sea that extends from the Gulf of Oman in the south to the north of the Shatt al-Arab. The Iraqi coast occupies an area of 64 km and is short when compared to the rest of the coasts of neighboring countries [2]. The Arabian Gulf is located between the º24 و º30 north circles and classified as a semi-closed sea surrounded by land from most of its sides, and has great political, economic and environmental importance [3] and it is considered as one of the busiest waterways with the movement of oil and commercial ships as well as ships carring Natural gas [4]. The importance of studying the coasts is evident throughout the Arab Gulf States, as it has a strategic coastal location and a distinct geo-economic location, including the Iraqi coast, which is characterized by special conditions such as shallow waters that determine its morphological appearance, as well as the problems of the marine confrontation represented by its limited breadth, while some other neighboring coasts extend to Several kilometers, but it does not exceed a few kilometers in the northern and northwest coasts of the Arabian Gulf. This increasing interest in the region comes as a result of its economic status in addition to several geological and biological aspects [5]. The marine ecosystem consists of non-living and living components that are in a state of continuous dynamic interaction, just like the wild ecosystem, and they provide the appropriate atmosphere for living organisms to continue their vital activity. Several studies were conducted in the field of marine chemistry in the Iraqi coast and the Arabian Gulf (Hartman et al. [6]; Brewer and Dyressen [7]; Kany, [8]; Al-Shawi, [9]; Al-Mahmood et al. [10] and Al-Imarah et al. [11].

## Method

The present study samples were collected monthly

from three station for the period from February 2018 to January 2019 at a depth of 10-20 centimeters from below the surface of the water by means of a plastic container. A medium-sized Tugboat was used in the collection process. A set of environmental characteristics were measured in the field.

The first station is located near the Port of Umm Qasr and represents the northern part of the creek and its coordinates N 30° 06′ 47.3″ and E °47 55′ 14.7″, the water depth ranges between 12-15 meters and this station is characterized by frequent movement of commercial ships to and from the port. The edges of this plant are characterized by loose clay, free of plants, and water recedes from large areas during the tidal period. With high water turbidity due to the speed of tidal currents. As for the second station, it is located at the bottom approaches of the Khor Abd Allah near Buoy 17, which is a navigational channel and its coordinates E ″48.9 ′19 °48, N ″26.2 ′53 °29 . This station is characterized by having large tidal areas with high turbidity water due to tidal currents.

Sampling was collected monthly for the period from February 2018 to January 2019. Water samples were taken from under the surface of the water at a depth of 10-20 centimeters by a plastic container and a medium-sized marine tug was used in the collection of samples. A US-made HORIBA U-5030 multimeter was used to measure water temperature, pH, salinity, electrical conductivity, field soluble solids.

Light penetration = (d1+d2)/2 (Stirling, [13])

The total suspended matter was measured by the method described by the American Public Health Association APHA [14]. The turbidity was measured using the TURBIDIMETTE LaMotte2020we type and were expressed in units NTU.

**Figure (1): A map showing the three study stations at the NW Arabian Gulf sampled for the period from February 2018 to December 2019.**

## Results and discussion

### Water Temperature

The water temperature ranged between 14 °C in January in the first and second stations and 34 °C during August in the third station (Figure 2). The first and second stations recorded values ranging between 14-31 °C, the with the highest values were recorded during August, September and October at the first station while it was at the second station during August and September, where as at station three the values ranged between 15 and 34 °C during January and September, respectively. The results of the statistical analysis showed that there were no significant differences ($p>0.05$) between the study stations.

### Hydrogen Ion Concentration (pH)

The pH values ranged between 7.7 and 8.49 in the first station during May and March, and in the second station they ranged between 7.9 during April and May and 8.47 during June, and in the third station they ranged 7.6 and 8.5 during May and February, respectively

(Figure 3). The results of the statistical analysis showed that there were no significant differences (p>0.05) between the study stations.

**Alkalinity**

The values of alkalinity for the first station ranged between 60 and 73 mg/l during July and February, which is the highest range among the three stations. The monthly changes in alkalinity values in the second station ranged from 62 to 71 mg/l during January and August, respectively. The alkalinity values for the third station recorded a ranged between 61 and 72 mg/l during December and September, respectively (Figure 4). The results of the statistical analysis showed that there were no significant differences (p>0.05) between the alkanity values in the study stations.

**Salinity**

The salinity values ranged between 40.3 and 49.3 parts per thousand, in April and June, respectively, in the first station, where as in the second station, their values ranged between 36.2 and 45. 1 parts per thousand in April and February, respectively, and in the third station between 37.5 and 44 parts per thousand in April and February, respectively (Figure 5). The results of the statistical analysis showed that there was a significant difference (p>0.05) between the first station and the second and third stations, while no significant difference was recorded between the second station and the third station.

**Light penetration**

The values of light transmittance showed ranges of convergence at the first and second study stations as their values ranged between 14-25 cm in the first station during April and July, while the second station recorded values that ranged between 25-40 cm during May and October, while the third station recorded high values for light transmittance ranged between 200-250 during July and December, (Figure 6). Statistical analysis indicate a significant difference (p>0.05) between the three study stations.

**Turbidity (NTU)**

The Turbidity values showed different ranges in the three study stations, as their values ranged between 0.64 and 81 NTU. Figure (7) shows the clear fluctuation in these values during time, as the lowest value of 0.64 NTU was recorded in January at the third station, while the second station recorded a low value of 3.7 NTU during August, while the first station recorded the lowest value of 31.6 NTU in September, and the highest in the three stations 75, 81 and 3 NTU during November, December and August respectively. Statistical analysis showed that there was a significant difference between the first and third stations only (p>0.05), and no differences were recorded between the other study stations.

**Total Suspended Solids (TSS)**

The values of the total suspended solids showed different ranges during the study, as their values in the first station ranged between 0.11 and 0.34 mg/liter during October and April, respectively, while they were in the second station between 0.09 and 0.32 mg/liter October and September, consequently, as for the third station, its values ranged between 0.04 and 0.13 mg/liter during August and January, respectively (Figure 9). The statistical analysis showed that there was a significant difference between the first and third stations only (p>0.05) and no significant difference was recorded between the other stations.

**Total Dissolved Solids (TDS)**

The values of total soluble solids were recorded level in all study lowest stations during January with values of 34.2 and 31.3; 25.3 mg/l, in the three stations respectively, as where higher values of 50 mg/l was recorded in the first station during December and 401.2 and 40 mg/l in the second and third during November and February, respectively (Figure 10). The results of the statistical analysis showed that there were no significant differences (p>0.05) between the study stations.

**Electrical Conductivity (ms/cm)**

The lowest level of conductivity values were recorded during January with values ranging from 53.4, 48.9 and 45.7 ms/cm at the first, second and third stations, respectively, the highest values were recorded in june in the first and third stations (77.1 and 66 ms/cm, respectively), While the second station recorded the highest conductivity values during September (67 ms/cm) (Figure 11). The results of the statistical analysis

showed that there were no significant differences ($p>0.05$) between the study stations.

**Figure (10). Monthly variation in the total dissolved solids values at the three stations of the NW Arabian Gulf during the period from February 2018 to January 2019.**

## Statistical Analysis

Using XLSTAT-Premium 2018.1 Multingual software to analyze the values of the environmental factors in the three studied stations. the value of the intrinsic vectors and the cumulative values of the studied values are shown in Figure (11), values and through which Figure (12), was extracted which in turn shows the PCA analysis of the factors of study stations association with the environmental variables studied during year.

The figure showed that in the third station the transparency was a limiting factor and to a lesser extent the pH is the next most influencing factor at this station, while in the first and second stations the rest of the factors as EC, TDS, Sal., Alkalinity, TSS, Turbidity and to a lesser extent WT are of greater influence on the environment of these stations. Also, through the tree drawing that were drawn by the above statistical program (Figure 13), we can see three groups that are most closely related to each other, the first group has included most of the months of the third station, while the second and third group has included most of the time of the second stations.

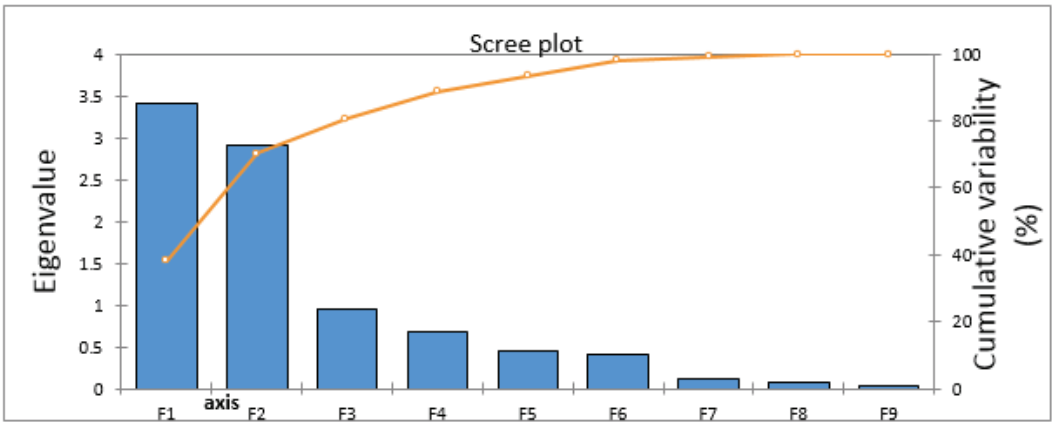

**Figure (11). Values of the vector and the cumulative values of the studied values at the three stations of the NW Arabian Gulf.**

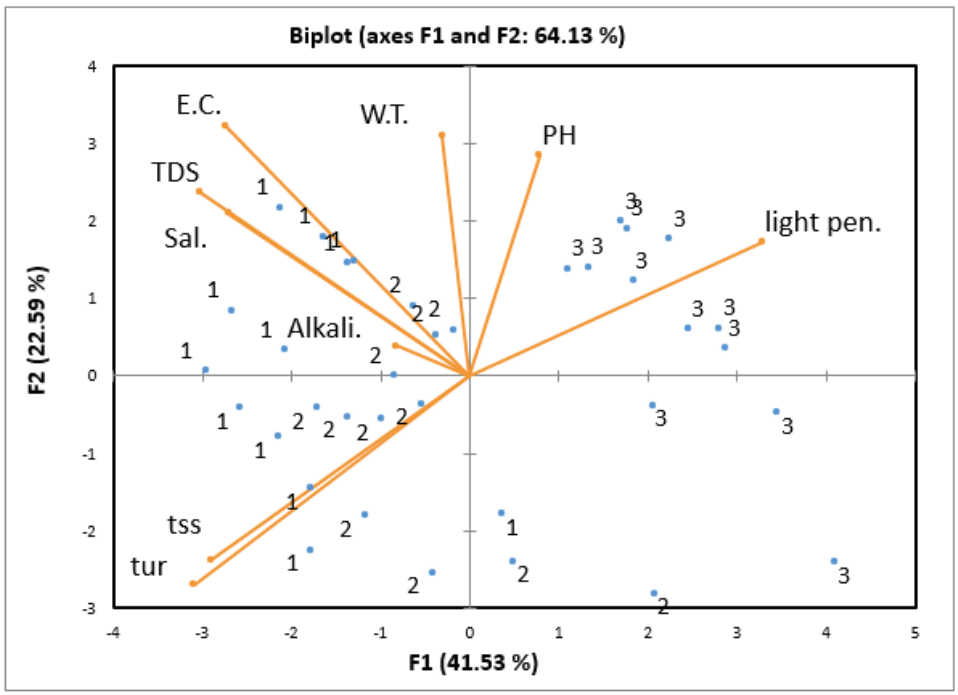

**Figure (12). Analysis (PCA) of the F1 and F2 vectors for the factors of association of the study stations with the environmental variables studied during the months of the year at the NW Arabian Gulf.**

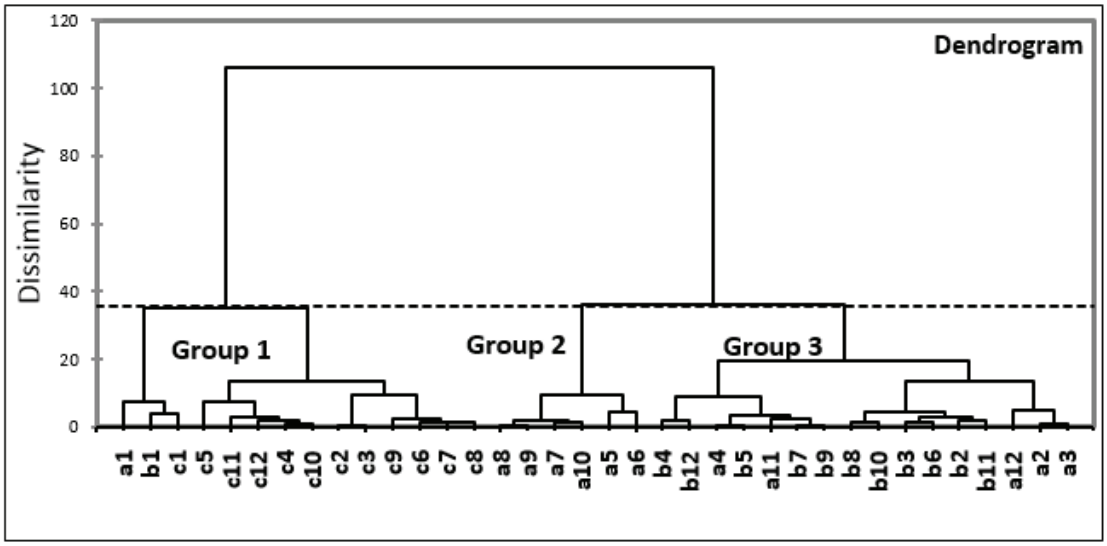

**Figure (13). Tree diagram for similarity and differences between the factors studied at the three stations during the period's February 2018-January 2019 of the year at the NW Arabian Gulf.**

a= first station, b= second station, c= third station. As for the numbers, they represent the months of the year.

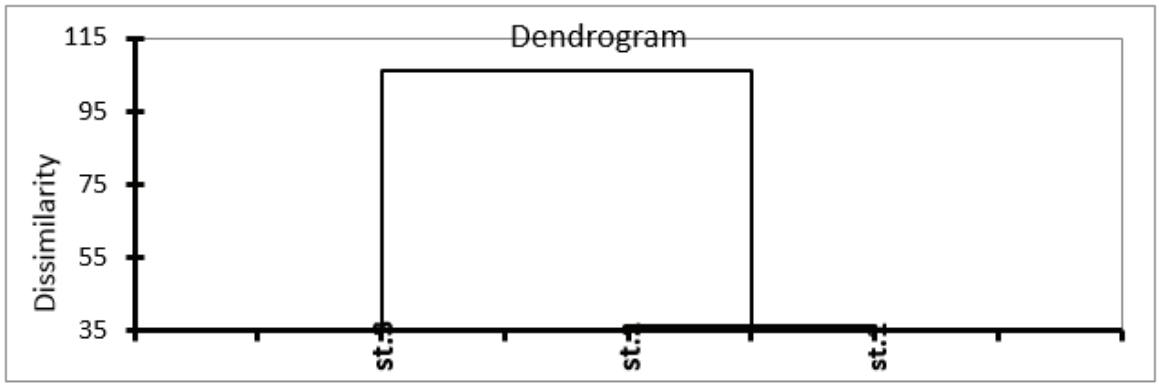

**Figure (14) shows a summary of the tree diagram for similarity and difference between the factors studied for the three stations of the NW Arabian Gulf.**

## Conclusionss

It was found through the current study that the temperature values were equal in all stations because the three stations are subject to the same climatic conditions. Whereas the pH and alkalinity values indicated the basic characteristic of this water. The values of transparency also showed that the third plant is less cloudy than the first and second stations, as the water has a deeper and lower speed for the current, and it is also an open water area. The salinity and conductivity values recorded relatively low values in the third station, while they were higher in the first and second stations, as the last two are subjected to the conditions of higher evaporation, which results in an increase in salinity values, and the TSS and TDS values were carved in the same direction.

# Primary School Teachers' Attitudes regarding Stuttering of School Age Children at First Al-Karkh Education Directorate in Baghdad City

**Rafea Qadri Meteab Al-Qaisi[1] , Eqbal Ghanim Ali[2] , Ali Kareem Khudhair, PhD[3]**

*[1]Academic Nurse, Ministry of Health, PhD, [2] Professor and Academic Supervisor, College of Nursing, University of Baghdad, [3] Professor and Academic Supervisor, College of Nursing, University of Kerbala*

## Abstract

**Objective(s)**: To assess primary school teachers' attitudes regarding the stuttering of school-age children at first al-karkh education directorate in Baghdad city, and find out the relationships between primary school teachers' attitudes regarding stuttering and their demographic characteristics

**Methodology:** The study started from the period of 20th September 2018 to the 1st of March 2020. Probability samples of 370 primary school teachers were chosen randomly. The questionnaire was designed and composed of two parts: the first part deals with the teachers' demographic data; the second part includes a stuttering attitude scale. Determined reliability of the questionnaire through a pilot study and determined validity through a panel of (31) experts. The data was collected through the self-administration method was used by asking the participants to complete the format of the questionnaire and fulfill the questions, and it described statistically and analyzed through the use of descriptive and inferential statistical analysis procedures**.**

**Results:** The findings of the present study indicate that (71.3 %) of the study sample has a neutral level of attitudes toward stuttering of school-age children.

**Conclusions:** The study concludes that most of the teachers' attitudes were neutral related to the stuttering of school-age children, and there are no effects of socio-demographic characteristics of teachers' on their knowledge about stuttering.

**Recommendations:** The study recommended an education program about stuttering for primary schools' teachers to improving their attitudes toward children who stutter (CWS) in the school environment, and there are no effect socio-demographic characteristics of teachers' on their attitude toward stuttering.

***Keywords:*** *Primary School Teachers, Attitudes, School Age Children, Stuttering*

## Introduction

Stuttering exists in all cultures and societies throughout the world (Al-Khaledi et al., 2009; Nicholls, 2013; Safwat & Sheikhany, 2014). It is a fluency disorder characterized by involuntary disruptions of the flow of speech, hindering the production of continuous, smooth and effortless speech (Silva et al., 2016), It is a communication disorder that interferes with a person's ability to speak fluently. It involves the repetition, prolongation, or blockage of sounds, syllables, or words (Scott & Guitar, 2010). Stuttering is a speech disorder that affects the fluency of speech, it is speech events that contain monosyllabic, whole-word repetitions, part-word repetitions, audible sound prolongations, or silent fixations or blockages; these may or may not be accompanied by accessory behaviors. Roughly 3 million Americans stutter. Stuttering affects people of all ages. It occurs most often in children between the ages of 2 and 5 years old as they are developing their language skills (Terry, 2015). It has been estimated that about one percent of the general population stutters. This would amount to almost three million stutterers in the

United States alone. Stuttering is about three or four times more common in males than in females (Nicholls, 2013). Stuttering can be classified into neurogenic is derived from brain damage vascular or traumatic origin and development stuttering that defined as the result of a dysfunction of the central nervous system with a genetic basis, which appears in the period of acquisition and development of language, between 18 months and seven years of age (Silva et al., 2016). Developmental stuttering is the most common type of stuttering usually develops of its own accord in childhood, although in rare cases it may begin much later. Approximately 5 percent of all children go through a period of stuttering that lasts six months or more. Three-quarters of those will recover by late childhood, leaving about 1% with a long-term problem (Scott & Guitar, 2010; Hobbs, 2012). The exact causes of stuttering are unknown (Jenkins, 2010). It can result from an interaction of factors including child development, family dynamics, genetics, and neurophysiology (Scott & Guitar, 2010). The evolution of developmental stuttering causes serious consequences in the life of a child, hampering their communication and may cause psychological impacts, generate negative emotions, shyness, fear related to speech and anxiety. Thus, the child is more exposed to errors of judgment and thus to improper attitudes of their teachers before his/her speech difficulty (Silva et al., 2016). For CWS, bullying and other forms of victimization such as teasing can be a problem and are common(Nicholls, 2013), Several studies have investigated the incidence of stuttering-related teasing or bullying, and have found between 44% and 83% of children who stutter (CWS) experience bullying or some other form of victimization from their peers(Nicholls, 2013; Blood et al., 2011). School-age children spend a considerable amount of time at school and there is little doubt that teachers are authority figures who can have a significant influence on their lives during these formative years (Abdalla & St. Louis, 2012; Placencia, 2014; Abrahams, 2015; Abrahams et al., 2016). Thus, educators play an important role in the educational development of CWS, their attitudes can significantly affect the performance of students in the classroom, as well as their progression (Jenkins, 2010; Silva et al., 2016), Many CWS testify that stuttering negatively impacted their self-confidence in school, academic capacity, and relationships with teachers and peers (St. Louis, 2011).

## Materials and Method

**Study Design:** Descriptive cross-sectional study design was conducted on teachers working in governmental primary schools at first Al-Karkh education directorate in Baghdad city, the study started from the period of 20th September 2018 to 1st March 2020 and aims to assess primary school teachers' attitudes toward stuttering of school-age children, and find out the relationships between primary school teachers' attitudes toward stuttering and their demographic characteristics.

**Study Sample:** Probability samples of 370 primary school teachers and currently works in government primary schools were selected from 30 primary schools at first Al-Karkh education directorate in Baghdad City they were chosen randomly from each school.

**The Study Instruments:** To measure the primary school teachers' attitudes toward stuttering, the instrument was designed and constructed by the investigators depending on the Arabic version of adopted and developed Public Opinion Survey of Human Attributes-Stuttering Scale (POSHA-S) (St. Louis, 2011; Abdalla & St. Louis, 2012), the questionnaire format consists of two parts:

**Part I: Teacher's Demographic Characteristics:** This section includes (6) items concerning the respondents' general characteristics: age of teacher, gender, residency, marital status, education level, and their teaching experience years.

**Part II: Stuttering Attitude Scale:** This part of the questionnaire is composed of 40 items concerned with the teacher's attitude toward stuttering, it includes beliefs and reaction sections. The questionnaire used a paper-and-pencil format and asked participants to respond to each statement by answering (Yes), (To some extent) or (No).

**Data collection:** The data collected by the investigators, Participants were asked to complete a self-administered questionnaire, after taking the initial consent of each teacher to participate in the study, the process started from the 20th of February until the 30th of May 2019.

**Rating and Scoring of the Questionnaire Format:** The items have been rated and scored according to the

following patterns: Three-point Likert scales are used for rating the items as yes =3, to some extent =2, no =1, except all negatively worded questions are reversing scored. The total score ranged between (40- 120). The lowest score indicated a negative attitude while the highest score reflects a positive attitude.

**Data Analyses:** This analysis was performed through the computation frequencies, percentages, arithmetic mean, standard deviation (SD), mean of the score (MS) and relative sufficiency(RS%). Contingency Coefficients (C.C.) test was used to the assessment of the relationship between overall attitudes of participants and other variables.

## Results

Most of the study sample were represented (34.1%) within age groups of (40-49) years, (83.8%) were females, the highest percentage (93.2%) of the study sample are living in urban residential area, (71.9%) of the study sample were (Married), (40.3%) were graduates from (Institute/2 year Diploma degree), and (35.9%) have (10-19) years' experience in teaching.

**Assessment by RS%: (33.33 – 55.55) Negative; (55.56 – 77.77) Neutral (77.78– 100) Positive**

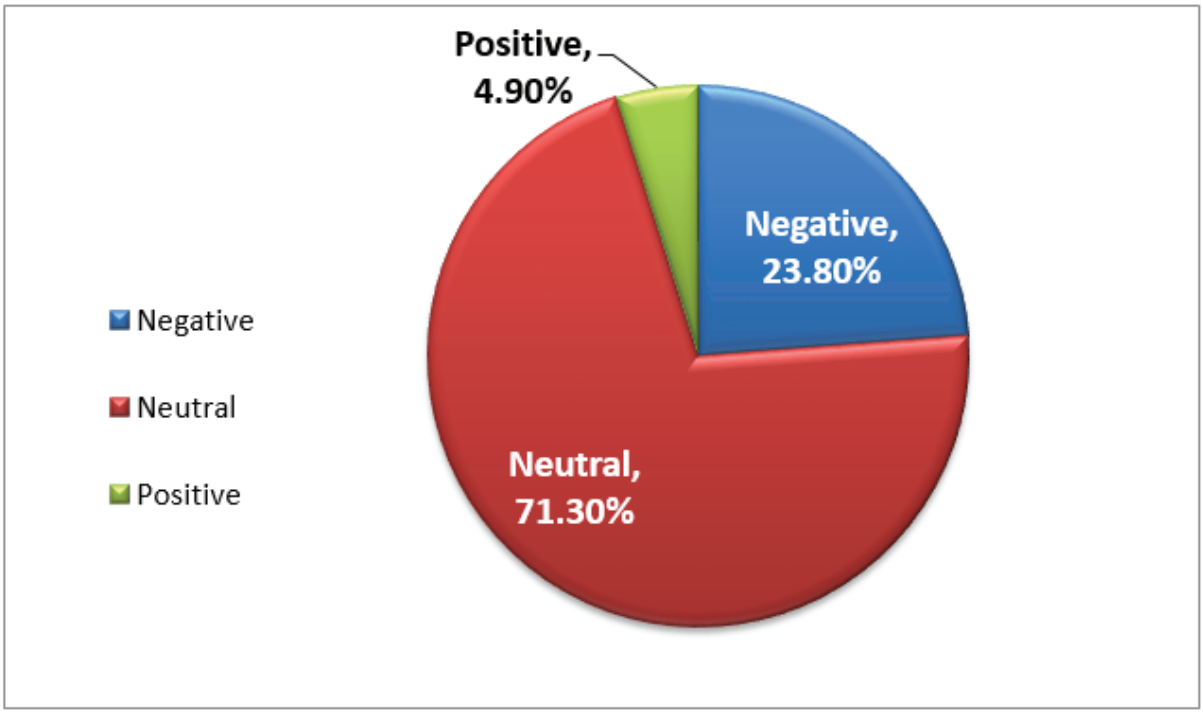

**Figure (1): Distribution of the Teachers' Attitudes toward Levels of Assessment.**

The results in figure (1) indicate that (71.30 %) of the study sample represents neutral level of attitudes, while only (4.90%) have positive attitudes toward CWS.

**Table (1): Association between Attitude of primary school teachers and their socio-demographic characteristics**

| No. | Socio-demographic characteristics | Attitude | | |
|---|---|---|---|---|
| | | C.C. | Sig. | C.S.(*) |
| 1. | Age Groups | 0.097 | 0.476 | NS |
| 2. | Gender | 0.099 | 0.056 | NS |
| 3. | Residence | 0.020 | 0.702 | NS |
| 4. | Marital Status | 0.097 | 0.316 | NS |
| 5. | Education level | 0.103 | 0.414 | NS |
| 6. | Number of teaching experience years | 0.142 | 0.054 | NS |

**(*)HS: Highly significant at P<0.01; S: significant at P<0.05; NS: Non-significant at P>0.05; Testing based on Contingency Coefficients (C.C.).**

This table shows no-significant relationship between socio-demographical characteristics and attitudes of primary school teachers toward stuttering.

## Discussion

The analysis of the (POSHA-S) scale showed that less than three-quarters of the study sample had neutral, and a little less than a quarter had negative attitudes toward CWS in the figure (1). The findings of this study agree with (Parasuram, 2006) who mention that a teachers had a neutral response to disability in general, and agree with (Irani et al., 2012) they mention that majority of Arab teachers reported neutral attitudes toward people who stutter (PWS) and, close to one-third of the Arab teachers reported relatively negative attitudes toward PWS. Also agree with (Abrahams, 2015) who reported that most of his study sample (62%) was in neutral level, and agree with (Abrahams et al., 2016) they mention that overall result indicates neutral attitudes towards stuttering.

## Conclusions

According to the findings of the present study, the researcher concluded that most of the study samples at age group (40 - 49 years), the vast majority of the primary school teachers were female, and, teachers' attitudes were neutral related to stuttering of school-age children. There is no significant association was found between teachers' attitudes toward stuttering and their socio-demographic characteristics.

## Recommendations

Education program about stuttering is essential to improve the teachers' attitudes toward stuttering, and using mass media and television for educating the community as a whole and not teachers only.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Ministry of Health and all experiments were carried out in accordance with approved guidelines.

# Synthesis and Antibacterial Evaluation of some New Pyrazole Derivatives

**Mohammad M.Al-Tufah[1], Saad Salim Jasim[2], Khalid A. Al-Badrany[3]**

*[1]Ph.D., Student, Directorate of Education, Kirkuk, Ministry of Education, Iraq [2]Assist. Prof., Chemistry Department, College of Education for Pure Sciences, University of Kirkuk, Kirkuk, Iraq.*

*[3]Prof., Dr., Chemistry Department, College of Education for Pure Sciences, University of Tikrit, Kirkuk, Iraq*

**Abstract**

Ten new chalcones were prepared in three steps, firstly phthalic anhydride reacted with 4- amino acetophenone to produce 2-(4-acetyl phenyl carbamoyl) benzoic acid ($A_1$), secondly [2-(4-acetyl phenyl carbamoyl) benzoic acid ($A_1$)] suffers from the loss of a water molecule via reaction with (anhydrous sodium acetate and acetic anhydride) to produce 2-(4-acetyl phenyl) isoindoline-1,3-dione ($A_2$), thirdly this compound condensed with various substituted benzaldehydes affording chalcones ($A_3$- $A_{12}$) were reacted with hydrazine hydrate to produce pyrazole compounds ($A_{13}$- $A_{22}$).

The prepared compounds were characterized by determination of melting point, FT-IR and some of the prepared compounds have been characterized by ($^1$H-NMR and $^{13}$C-NMR) techniques.

***Keywords****: Claisen 1,2-addition, chalcones, pyrazol, phenylcarbamoyl, isoindoline.*

## Introduction

Heterocyclic compounds are very widespread in the natural and in non-natural molecules, from this they are used as an essential compounds in the life, many compounds such as vitamins, essential amino acids, hormones and the synthetic drugs includes heterocyclic ring system.

Isoindoline-1,3-dione are very important compounds in the pharmacological and synthetic fields because they contain two amid bonds –CO-N-CO- which produce an imide ring [1- 2- 3] they are hydrophobic and neutral therefore cross biological membranes in vivo. These compounds possess considerable biological effects like anti-cancer [4] , antimicrobial [5] , anti-virals [6] , anxiolytics [7] , anti-inflammatory [8] and anticonvulsant [9] .

Chalcones and substituted chalcones are aromatic derivatives of α, β- unsaturated ketones with one unsaturated position [10] . the properties of chalcones depend on suitable substituted groups on the ring and the presence of α, β- unsaturated group [11] . Chalcones showed a biological activity such as anticancer [12] . antioxidative [13] , antimalarial [14] ,antiangiogenic [15] , antibacterial [16] , immunosuppress [17] , antiparasitic, antileishma [18] , antidiabetic [19] , anal-gesic [20] and anti-inflammatory [21] .

Pyrazole heterocyclic compound has a five-membered ring containing two nitrogen atoms and because they have two nitrogen atoms they are prepared by many methods, one of these methods is the condensation of hydrazine or substituted hydrazine with α, β- unsaturated carbonyl compounds [22] , pyrazole used as intermediates for the many syntheses of new compounds which have biological activity. They possess medicinal properties, like anti-inflammatory, antibacterial [23-24] antioxidant [25] , anti-diabetic [26] , antimicrobial [27] , antiviral [28] and antimalarial [29] .

**Experimental**

## Materials and Method

4–Aminoacetophenone, phthalic anhydride, hydrazine hydrate, acetone, glacial acetic acid, ethanol and all aromatic aldehydes are providing from Fluka, BDH and Aldrich, they used without further purification.

Melting points of the compounds were determined by using an electro-thermal digital device and were not corrected. FT-IR spectrum was recorded on Shimadzu FTIR-8400 spectrophotometer as KBr disc Tikrit University in Iraq. $^{1}$HNMR and $^{13}$CNMR spectra were registered on Bruker spectroscopic ultra-shield magnets 300 MHz instruments using tetramethylsilane (TMS) as an standard and Dimethyl Sulfoxide -d6 as a solvent.

## Preparation Methods

### Preparation of compound ($A_1$). [30]

(0.01 mol) 1.4g of isobenzofuran-1,3-dione was dissolved in (20 mL) of acetone in a round-bottom flask fitted with dropping funnel. The funnel continued supplied with (0.01 mol) 1.35 g of p-amino acetophenone dissolved in (10 mL) of acetone, the solution of amino acetophenone and acetone was added to the mixture of (isobenzofuran-1,3-dione and acetone) dropwise with stirring for (2) hours. The produced precipitate was purified by filtered and recrystallized from ethanol, some of the physical properties are given in table (1).

### Preparation of compound ($A_2$). [32]

Compound ($A_1$) (0.02 mol, 5.66 g) in (50 mL) of acetic anhydride was mixed with (0.25 g) of anhydrous sodium acetate and refluxed for 6 hours with stirring. The reaction mixture was refrigerated and poured into crushed snow together with stirring; the precipitate was filtered, dehydrated and recrystallized from acetone. The physical properties are showing in table (1)

### Preparation of chalcones ($A_3$-$A_{12}$). [32]

A mixture of compound $A_2$ (0.008 mol, 2.12g) and substituted benzaldehydes (0.008 mol) was dissolved in (30 mL) of ethanol, a solution of aqueous potassium hydroxide (15 ml, 40%) was added. The mixture was stirred for (6-8) hours at room temperature. The resulting mix kept in a good conditions until the morning of the next day at room temperature, poured into crushed snow and HCl has been added to equivalent the base. The produced precipitate was purified by filtered and recrystallized from ethanol, some of the physical properties are given in table (2).

| Comp. No | R | Molecular Formula | M.wt (g/mol) | M.p oC | Yield % | Color |
|---|---|---|---|---|---|---|
| A3 | H | C23H15NO3 | 352.997 | 86-88 | 87 | Yellow |
| A4 | 4- Br | C23H14NO3Br | 431.901 | 206-208 | 88 | Light Yellow |
| A5 | 4- Cl | C23H14NO3Cl | 387.45 | 196-198 | 81 | Light Yellow |
| A6 | 4-OH | C23H15NO4 | 368.99 | 214-216 | 71 | Light Yellow |
| A7 | 4- OCH3 | C24H17NO4 | 382.996 | 165-167 | 91 | Yellow |
| A8 | 2,4- DiCl | C23H13NO3Cl2 | 421.903 | 202-204 | 86 | Light Yellow |
| A9 | 4- NO2 | C23H14 N2O5 | 397.95 | 159-161 | 73 | Dark Brown |
| A10 | 4- N(CH3)2 | C25H20N2O3 | 395.97 | 108-110 | 89 | Reddish Orang |
| A11 | 2- Br | C23H14NO3Br | 431.901 | 112-124 | 84 | Yellow |
| A12 | 3,4- DiOCH3 | C25H19NO5 | 413 | 148-150 | 92 | Yellow |

**Preparation of pyrazole compounds ( $A_{13}$-$A_{22}$)** (33)

(0.004 mol) of hydrazine hydrate and (0.004 mol) of chalcones dissolved in 30 mL glacial acetic acid, the mix was refluxed for 8 h, then cooled and pour on 50 mL of ice water. The produced precipitate was purified by filtered and recrystallized from ethanol, some of the physical properties are given in table (3).

## Results and Discussion

The first step includes the synthesis of 2-(4-acetyl phenyl carbamoyl) benzoic acid from the reaction between phthalic anhydride and 4-aminoacetophenone. The second step includes the synthesis of 2-(4-acetyl phenyl) isoindoline-1,3-dione via reaction a mixture of 2-(4-acetyl phenyl carbamoyl) benzoic acid with (anhydrous sodium acetate and acetic anhydride). The third step includes the synthesis of chalcones **($A_3$-$A_{12}$)** via reaction of 2-(4-acetyl phenyl) isoindoline-1,3-dione with various substituted benzaldehydes, finally production of pyrazole compounds **($A_{13}$-$A_{22}$)** via condensation of chalcones **($A_3$-$A_{12}$)** with hydrazine hydrate. Structures of all compounds that prepared were diagnosed by FTIR, $^1$HNMR and $^{13}$CNMR techniques.

Identification of compounds ($A_1$), ($A_2$)

Compound ($A_1$) given a bands in FTIR spectrum at (3403)$^{cm-1}$ and (3233)$^{cm-1}$ denote to stretching vibration of (NH) group and stretching vibration of υ(OH) of amide group, other absorptions appeared at (1647)$^{cm-1}$ and (1708 )$^{cm-1}$ denote to υ(C=O) of amide group and υ(C=O) of carboxylic group. Note table (4). Compound ($A_2$) exhibit bands at (1708, 1663)$^{cm-1}$ denote to υ(C=O) bond of imide and at (1326)$^{cm-1}$ for υ(C-N) bond , Note and table (4).

**Table (4): Shows the IR data of compound ( $A_1$ , $A_2$)**

| Co.No | Compound Structure | IR (KBr) $cm^{-1}$ | | | | | |
|---|---|---|---|---|---|---|---|
| | | υ(O-H) Carboxylic | υ(N-H) Amide | υ(C=O) carboxylic | υ(C=O) imide | υ(C=O) amide | υ(C-N) imide |
| $A_1$ |  | 3233 | 3403 | 1708 | - | 1647 | - |
| $A_2$ |  | - | - | - | 1708<br>1662 | - | 1326 |

$^1$H-NMR spectrum for compound ($A_1$), (in Dimethyl Sulfoxide -d6 as a solvent) exhibit a singlet signal at δ(2.43) ppm denotes to $CH_3$ group, also noted a multiple signals at δ(7.56-7.98)ppm indicate to the protons of aromatic ring and singlet signal at δ(10.69) ppm denotes to N-H group, another singlet signal at δ(13.09) ppm for O-H carboxylic group, the singlet signal at δ(2.5) ppm indicate to two $CH_3$ groups in a solvent DMSO, , while compound ($A_2$) (in Dimethyl Sulfoxide -d6 as a solvent) exhibit a singlet signal at δ(2.75) ppm denotes to $CH_3$ group, also noted a multiple signals at δ(7.34 -8.18) ppm indicate to the protons of aromatic ring, the singlet signal at δ(2.5) ppm indicate to the two $CH_3$ groups in a solvent DMSO.

$^{13}$CNMR spectrum of compound ($A_1$), (in Dimethyl Sulfoxide -$d_6$ as a solvent) exhibit a signals at δ(26.91) ppm denotes to $CH_3$ group, at δ(168.36) ppm denotes to amide carbonyl group (N-C=O), at δ(167.73) ppm denotes to (C=O) carboxyl group, another signal at δ(198.02) ppm denotes to (C=O) ketone group and multiples signals at (119.15-144.32)ppm denotes the carbons of aromatic ring, while $^{13}$C-NMR spectrum of compound ($A_2$) exhibit an signal at δ(27.29) ppm denotes to $CH_3$ group, an signal at δ(167.09) ppm denotes to imide carbonyl group (C=O), an signal at δ(197) ppm denotes to carbonyl group (C=O) of ketone and multiple signals at δ(124-136.27) ppm denotes to the carbons of aromatic ring.

**Identification of Chalcones ($A_3$-$A_{12}$).**

Chalcones ($A_3$-$A_{12}$) were prepared via reaction of aromatic benzaldehydes with 4-(isoindolin-2-yl-1,3-dione) acetophenone in absolute ethanol in presence 40 % KOH. The reaction follows the following mechanism(34)

The Chalcones ($A_3$-$A_{12}$) were identification by melting point, FT-IR spectra, $^1$HNMR and $^{13}$CNMR. IR spectrum of compound ($A_6$) exhibited bands at (1681) $^{cm-1}$, ,(1655)$^{cm-1}$,(1583,1525)$^{cm-1}$, (1326)$^{cm-1}$ denotes to stretching vibration of υ(C=O) of ketone, υ(C=C) of aliphatic, υ(C=C) of aromatic, and υ(C-N) of imid group respectively.

# Bacteriological Study of Eye infection in Baghdad City

**Farah Ali Hameed**

*Lecturer, Middle Technical university, Institute of Medical Technology/ Baghdad/ Nursing Department, Iraq;*

## Abstract

The present study included 250 clinical samples during the period between December 2018 – April 2019 on 250 patients with ophthalmological infections of both sexes & different ages ( 3 days - 75 years old) , attend to ophthalmological clinic in hospital Ibn-AL-Hythem for eyes infection in Baghdad. The ophthalmological infections classified into 3 types according to the anatomical site of involvement. The first group was conjunctivitis(200)case, the 2nd was Blepharitis (35) case & the 3rd was Keratitis ( 15) cases. Isolation of the causative micro-organisms for the previous infections, culture & sensitivity test to different antimicrobial agents were done. The results showed that 200(229.4 )% are you giren significant growth of bacteria while 50(69.07% ) were no growth for bacteria . Include *Staphylococcus aureus*(77.6%),*Staphylococcus epidermidis* (13.6%) , *Streptococcus pneumonia*(6.4%) & *Streptococcus pyogenes*(2.1%) , while G-ve isolates 61(30.5%) include (7) species of bacteria ; *Haemophilus influenzae(81.9%), Klebsiella pneumonia(6.5%), Proteus spp & Pseudomonas aeruginosa*, the Same (3.2%) for each & finally *Neisseria gonorrhoeae*, *Moraxella spp, Acinetobacter* were the least(1.6%) for each. Antimicrobial (12 agents) susceptibility of the bacterial isolates revealed marked resistant of these isolates for most antimicrobial agents e.g. Penicillin (87.8%),amoxicillin/clavulanicacid(84.4%),cephalexien(83.9%),erythromycin(83.4%), ampicillin (71.3%) while the least resistant(8.2%) reported for ciprofloxacin.

***Keyword:*** *Eye infection, Bacteria, Resistance Antibiotics, Baghdad.*

## Introduction

The eye is the most exposed part in the body to the air which carries dust and microorganisms such as bacteria and fungi causing infections to the eye, especially when any scratch or wound occurs in the lining tissues of the eye, as these microorganisms quickly settle into the broken tissues, causing significant eye damage [1], including conjunctivitis which is called ‘’red eye’’ or ‘’pink eye’’ which involves inflammation of the soft layer that covers the sclera of the eye and this disease may affect one eye or may spread to the other eye [2]. Keratitis may form holes, most likely resulting from conjunctivitis and the spread of toxins produced by the microorganisms that cause these conditions [3]. While blepharitis caused by microorganisms, and the injury may be external if it is outside the line between the inside and outside the eye, or internal when it is on the inner surface of the eyelids [4]. These infections occur despite the eye’s resistance to external influences through various mechanisms such as wetting by tears containing the bactericidal lysozyme enzyme, mucous membrane and eyelid movement [5], as this resistance may weaken people suffering from certain diseases such as malignant tumors and organ transplantation, as well as people who take antibiotics or cortisones for long times, drug addicts, or diabetic and AIDS patients [6].

Bacterial types that may cause eye infections include *Staphylococcus aureus, Staphylococcus epidermidis, Bacillus subtilis, Bacillus cereus, Pseudomonas aeruginosa, Neisseria gonorrhea, Moraxella spp. , Streptococcus pneumonia, Hemophilus influenza and Acinetobacter etc*.[7]. Eye infections are often treated by antibiotics before performing the antibiotic sensitivity test, therefore, broad spectrum antibiotics such as ciprofloxacin, ofloxacin, chloramphenicol, tetracyclin, erythromycin and gentamycin are used for treatment [8]. As a result of the wide and random use of these antibiotics, the microorganisms showed resistance leading to the appearance of spontaneously mutated bacterial isolates with high ability to resist antibiotics [9], or due to the bacterial plasmids which are responsible for antibiotic resistance as there are conjugative plasmids

having the ability to transfer from one bacteria to the other within the same species or even from anβother bacterial genera, and their transmission will lead to the appearance of resistance characteristics among these isolates [10], or the reason for the resistance may be the change of the target location to the antibiotic so that the antibiotic loses its effect on the microorganism or as a result of the production of β-lactamase enzymes which destroy destroy the anti β-lactum antibiotics, including Penicillins and Cephalosporins. β-lactum antibiotics [11].

## Materials and Method

### Sample collection

From patients who visited the ophthalmic consultative clinic in hospital Ibn-AL-Hythem for eyes infection in Baghdad 250 clinical samples were collected from three parts of the eyes (the conjunctiva, the cornea and the eyelids). The patients included both males and females with less than 75 years of age for the period from December 2018 to April 2019. A special form was prepared for each patient in which some important information such as age, gender, type of work, residence and antibiotic use were recorded. All patients were clinically examined by specialist doctors. Samples were collected by sterile cotton swabs containing transport media, and transferred to the hospital's laboratory for culturing on blood, MacConkey and chocolate agars, then incubated for 24 hours at $37C^0$ [12]. Bacterial isolates were then diagnosed depending on morphologic al characteristics including( colony size, color, edge and height). After that, thin smears were prepared from these isolates and stained with Gram stain to observe bacterial ability to stain and study their shapes and arrangements, and diagnosed by using the biochemical tests as mentioned by [13]. The diagnosis was confirmed by using the Api 20 Staph for *Staphylococci*, Api 20 Strept. for *Streptococci* and Api 20 E for the diagnosis of Enterobacteriace.

### Antibiotic sensitivity test of bacteria

The disc diffusion method was used to perform the antibiotic sensitivity test for the bacterial isolates, by using 12 antibiotic discs according to the method of Brook, et al [14], as a part of the pure colonies was transferred into test tubes containing 5 ml of liquid Muller Hinton and incubated at 37C for 24 hours. The growth was diluted, when necessary, with normal saline until the turbidity became homogenous with the turbidity of the solution in McFarland tube, which gives approximate number of cells about ($1.5x10^8$) cells/ml. Then the cotton swabs were introduced into the tubes containing bacterial growth, and the excess was removed by pressure on the inner walls of the test tubes, and swabs were streaked on the surfaces of solid Muller Hinton media in different directions to ensure equal spread of bacteria, followed by placing 12 antibiotic discs including Vancomycin, Neomycin, Ciprofloxacin, Erythromycin, Cephalixein, Gentamycin, Amoxocillin/Clavulanic acid, Penicillin, Ampicillin, Chloramphenicol, Cefotaxim and Tetracycline) provided by Bioanalysis company (Turkey), on the surface of the culture media which was inoculated with the bacterial culture by using sterile forceps that were pressed gently on the antibiotic discs. The plates were incubated for 24 hours at 37C and the results were compared by measuring the growth inhibition area around the antibiotic discs, and results were explained according to CLSI [1].

## Results and Discussion

### Isolation and identification of bacteria

Results of this study showed that 200 (229.4%) samples yielded bacterial growth, while 50 (69.07%) samples showed no bacterial growth after clinical diagnosis by specialist doctor. All the studied patients were suffering from conjunctivitis, keratitis and eye inflammation as shown in table (1). Negative microbial infections may be attributed to bacteria and fungi other than those included in our study such as chlamydia, fungi, viruses and parasites or because of allergy [15],The all these samples were cultured on selective media and confirm identification by biochemical tests as shwn in table (1)that refer to growth bacteria indifferent percentage.

**Table (1): Percentage of bacterial growth in eye infeaction parts of the eye**

| Infected area | No. of samples | No. of samples which gave positive results to | | No. of samples which gave negative bacterial growth | Percentage |
|---|---|---|---|---|---|
| | | Bacterial growth | percentage | | |
| Conjunctivitis | 200 | 159 | 79.5 | 41 | 20.5 |
| Eyelid infection | 35 | 32 | 91.4 | 3 | 8.57 |
| Keratitis | 15 | 9 | 60 | 6 | 40 |
| Total | 250 | 200 | 229.4 | 50 | 69.7 |

The isolates involved 11 Gram positive and Gram negative bacterial types, as the Gram +ve bacteria were 139(69.5%) isolates distributed into 77.6% *S. aureus,* 13.6% *S. epidermidis*, 6.4% *St. pneumonia* and 2.1% *St. pyogenes*, while the number and percentage of Gram –ve bacteria were 61(30.5%) including 7 types of bacteria distributed as *Hemophilus influenza* (81.9%), while the percentage of *Klebsiella pneumonia* (6.5%), and each of *Pseudomonas* and *Proteus spp*. were (3.2%) While all of the bacteria *Neisseria gonorrhoeae*, *Moraxella. sppand Acinetobacter.spp* The lowest percentages were 1.6%as shown in table (2). Our results were almost close to those of Al-Sabaawi (2005) who isolated *S. aureus, S. epidermidis, Bacillus* subtilis, *Bacillus cereus*, *Pseudomonas aeruginosa, N. gonorrhea and Moraxella spp*. in the percentage of (51, 3.2, 19.8, 8.3, 5.2,1 and 11.5) respectively.

The increase of S. aureus infection may be attributed to their normal existence on the skin and air and even in the eyes as micronormal flora and they may become pathogenic under certain conditions such as immunocompromised patients with chronic diseases as these bacteria can cause infections to the conjunctiva, cornea and eyelids or they may be transmitted by contaminated hands as well as having virulence factors such as enzymes and toxins e.g. protease and lipase [16]. S. *epidermidis* is a normal flora of the skin but they can cause infection to immunocompromised hosts [17]. Streptococcus spp. also causes eye infections. In a study done by [4], they could isolate (9%) of *S. pneumonia* from conjunctivitis conditions. Both of *H. influenza* and *Proteus* vulgaris were found to cause eye infections, as well as *Pseudomonas aeruginosa* due to its widely-distribution in environment and its ability to adapt and secrete protease and collagenase enzymes causing conjunctivitis and secondary keratitis. Other causes of eye infection is *N. gonorrhea* bacteria which may lead to blindness. It infects newborns since it is transmitted from the infected mother to her baby because it infects the reproductive system [14,18].

**Table (2): Bacteria isolated from infected eyes**

| No. | Causative agent | No. of isolates | Percentage |

**Antibiotics sensitivity test**

Antibiogram test was carried out by using different types of antibiotics and results showed different levels of resistanceas shown in table(3). Gram +ve bacteria, represented by *S. aureus, S. epidermidis, St. pneumonia* and *St. pyogenes* showed different resistances to the antibiotics where S. aureus showed the highest resistance rate to the cephalexein and penicillin (92.5 and 91.6) respectively, while these bacteria showed the highest sensitivity rate to ciprofloxacin (7.4%). Regarding *S. epidermidis* bacteria, the results revealed that they showed the highest resistance rate to cephalexein (89.4%), while they showed the lowest resistance rate to the antibiotics ampicillin, ciprofloxacin and vancomycin (21%) for each one.

The result on the sensitivity of *S.aureus* to ciprofloxacein were close to the results of Barid [4] who found that the resistance of these bacteria was low to the antibiotic, however, they showed high resistance to Penicillin. Marlin [26], in his study, also found that ciprofloxacin was very active against *S. aureus* strains, because this antibiotic inhibits bacterial growth through the inhibition of DNA gyrase enzyme which is responsible for spiral recoiling of DNA and insures their being apart during transcription process.

While both *St. pneumonia* and *St. pyogenes* also showed different responses to these antibiotics. In table (3), it is observed that *St. pneumonia* showed the highest resistance rate (88.8%) to amoxocillin/clavulanic acid, penicillin, ampicillin and tetracycline, while it showed the highest sensitivity rate (100%) aginst ciprofloxacin. *Streptococcus pyogenes* showed (100%) resistance to Penicillin, while the lowest resistance rate (33.3%) was to the antibiotics ciprofloxacin, cefotaxime, chloramphenicol, neomycin, Gentamycin and vancomycin.

Gram negative bacteria isolated in our study showed different responses to antibiotics (table 3). *Hemophilus influenza* showed (100%) resistance to Amoxocillin/ Clavulanic acid, while the lowest resistance rate (7.4%) was to ciproflaxocin and cephotaxim, whereas *Klebsiella pneumonia* showed (100%) resistance to amoxocillin/ clavulanic acid, penicillin, Ampicillin, erythromicin, vancomycin, tetracyclin and chloramphenicol, but it was sensitive to ciprofloxacin.

Pseudomonas aeruginosa showed (100%) resistance to Amoxocillin/Clavulanic acid, but showed no resistance to Ciprofloxacin.

The result in table (3) demonstrated that *N. gonorrhea* were (100%) resistance to amoxocillin/ clavulanic acid, penicillin, ampicillin, vancomycin and cephalexein, and showed no resistance to penicillin, cephotaxime, Neomycin, gentamycin, ciprofloxacin, erythromycin, chloramphenicol and tetracycline. my results agreed with [4] in regard to the highly sensitivity of Erythromycin to all N. *gonorrhea* isolates.

*Moraxella spp*. showed (100%) resistance to amoxocillin, penicillin, ampicillin, cephalexin , cephotaxime and tetracycline, but showed no resistance to neomycin, gentamycin, ciprofloxacin, erythromycin,

vancomycin and chloramphenicol. my results agreed with [3] on the effectiveness of Chloramphenicol as a broad spectrum antibiotic with a high activity against *Moraxella spp*.

It was also shown that *Proteus spp*. showed (100%) resistance to penicillin, cephotaxime, tetracycline and chloramphenicol, but showed no resistance to ciprofloxacin, cephalexin and gentamycin, which agreed with [4] about the effect of cephotaxime, chloramphenicol and tetracycline on *Proteus spp.* which showed (100%) resistance to these antibiotics.

## Conclusion

The concluded from This study that Ciprofloxacin was the most effective antibiotic on the studied bacteria, and this may be explained by the fact that local isolates didn't develop high resistance to this antibiotic due to its limited use in comparison with Penicillin and also because Ciprofloxacin is a broad spectrum antibiotic.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Institute of Medical Technology and all experiments were carried out in accordance with approved guidelines.

# Effectiveness of an Instructional Program on Hypertensive Patients' Knowledge toward Prevention of Cerebral Vascular Accident at Al-Razi Center in Al-Basra City

**Khadija Mohammed Jassim [1], Suad Jassim Mohammed[2]**

*[1]M.Sc. Student, College of Nursing, University of Basra, [2]Prof Dr., College of Nursing, University of Baghdad*

## Abstract

**Introduction:** Stroke is a neurological condition that is one of the leading causes of death and disability in many low and middle income countries. However, many adjustable risk factors have become important. High blood pressure is the most common stroke risk factor globally as well as in our country, Basra.

**Objectives:** To assess knowledge of patients with hypertension concerning prevention of cerebral vascular accident. To construct an instructional program for patients with hypertension concerning prevention of cerebral vascular accident. To evaluate the effectiveness of an instructional program on the knowledge of patients with hypertension concerning prevention of cerebral vascular accident. To know the association between level of knowledge the association between level of knowledge concerning prevention of cerebral vascular accident and socio-demographic variables.

**Methodology:** : A quasi- experimental design (two group pre- test and post-test) was conducted in the present study which is carried out at

Al-Razi Center in Al-Basra City from 8th of September 2019, to 16th of March, 2020. A non – probability (purposive) sample of (60) patients with hypertension were selected.

**Conclusion:** There is significance need for educational program between (residency, type of family, duration of illness, habits and regularity of hypertension treatment) to prevention serious complication which stroke.

***Key words:*** *Hypertensive, Prevention, Cerebral Vascular Accident.*

## Introduction

High blood pressure is not a disease but it is an important risk factor for cardiovascular complications. It is known as a condition in which the blood pressure is raised to the point where signs and symptoms of hypotension appear. About 77.9 million American adults (one in 3 people) and a billion people worldwide have high blood pressure [(1)]. Also, high blood pressure is a serious problem in developing countries where there is a transition from infectious diseases to chronic non-communicable diseases. In addition, complications from high blood pressure increase with age (such as heart failure, stroke, and kidney failure). One in four people aged 18 years or over has high blood pressure in developed countries [(2)].

A cerebral vascular accident (CVA) or "stroke" is a rapid loss of brain function due to a disorder of blood flow to the brain part. The term stroke is used to describe to health-care and general practitioners that a stroke is an emergency situation similar to a heart attack [(3)].

As well as, A stroke is defined as a rapid onset (within minutes) of the focal central nervous system and signs and symptoms lasting 24 hours or more, and it occurs for an unknown or secondary cause of other diseases. In our time, it is caused by a neurological disease, (1.5 / 1000 / year) increases with age to (10/1000 / year at 75 years). It has caused the death of one person in every eight cases, and has caused a tremendous burden of powerlessness and sadness for patients, their relatives and the wider community [(4)].

## Methodology

**Design of the Study:**

A quasi- experimental design was used in the present study. Data collection was done at two times: baseline data (before any intervention was provided to the study group) and data that are collected 14 days after giving the instructional program for study group. The period of the study extended from 8th of September 2019, to 16th of March, 2020.

**Setting of the Study:**

The study was conducted at the Al-Razi Center, which treats high blood pressure and diabetes patients in Basra.

**Sample of the Study:**

Non – probability (purposive) sample of (60) high blood pressure patients were selected. They selection of patients was built on the following criteria:

**Method Data Collection:**

The data was collected through the use of A structured questionnaire, the researcher assumed full responsibility for interviewing the study sample after explaining and clarifying the objectives of the study for the adults, after obtaining the initial approval of each patient to participate in the study.

Data collection was carried out from 2nd January to 1st February, 2020.

Spend approximately (5-15) minutes with each patient to the interview and complete the questionnaire.

**The Study Instrument:**

The study tool is a questionnaire that was designed for the purpose of the study after extensive reviews of accessible literature and related studies. The study tool consists of five parts:

**Part I: Socio-demographic Characteristics of the Sample of the Study**

This part deals with demographic characteristics of the sample consists of age , gender, level of education , marital status, occupation, place of residence, duration of illness, habits, family history of hypertension, type of family, socioeconomic status, patient past history and taking antihypertensive treatment regularly.

**Part II: General information regarding Hypertension.**

This part was designed to include (14 items) that represented the information of patient related to hypertension.

**Part III: Assessment of Patient`s Knowledge Concerning stroke**

This part of the questionnaire consists of (11 multiple choice questions) of patient's knowledge concerning stroke.

**Part IV: Information regarding Prevention of Stroke among Hypertensive Patient**

This part of the questionnaire consists of (13 multiple choice questions) prevention of stroke.

**Part V: knowledge concerning hypertensive Medication**

This part was consists of (8 items) which include strongly disagree, disagree and agree.

**Data Analysis**

Data from this study were analyzed using SPSS version 24.0. The following statistical data analysis methods were used to analyze and evaluate the results of the study (Frequencies, percent Mean of score (MS), Pearson Correlation Coefficient, Standard Deviation and Chi-square, Paired sample T-test, Analysis of Variance (ANOVA), Independent t-test).

## Results

**Table (1) Distribute the sample according to their clinical characteristics**

| List | Characteristics | Study Group | | Control Group | | $X^2$ | df | P-value | Sig. |

f: Frequency, %: Percentage, $X^2$: Chi-square, df: degree of freedom, p: Probability, Sig: Significance, S: Significant, N.S: Not significant

This table indicates a duration of illness is (5≤ years) for patients among the study group (46.7%) and among the control group (63.3%).

Regarding daily habits, more than half of patients among the study group are nonsmokers (56.7%) and (30%) of them are doing exercise. Among the control group, the highest percentage of patients also show that (76.7%) of them are nonsmokers and only (13.3%) of them are doing exercise.

More of the patients among the both groups; the study and control showing that they having a family history of hypertension (70% and 80%); they also show that more of them are on regular treatment of hypertension (study group= 80% and control group= 73.3%).

Regarding suffering from other diseases, only (46.7%) of the patients among the study group and (40%) among the control group are suffering from other diseases.

**Table (2) Level of Patients' Knowledge about Prevention of Stroke**

| Levels of Knowledge | Study Group (N= 30) | | | | Control Group (N= 30) | | | |
|---|---|---|---|---|---|---|---|---|
| | Pre-test | | Post-test | | Pre-test | | Post-test | |
| | f | % | f | % | f | % | f | % |
| Poor | 27 | 90 | 0 | 0 | 29 | 96.7 | 29 | 96.7 |
| Fair | 3 | 10 | 0 | 0 | 1 | 3.3 | 1 | 3.3 |
| Good | 0 | 0 | 30 | 100 | 0 | 0 | 0 | 0 |
| Total | 30 | 100 | 30 | 100 | 30 | 100 | 30 | 100 |

f: Frequency, %: Percentage

Poor= 0-3, Fair= 4 -7, Good= 8-11

This table shows the level of patients' knowledge regarding prevention of stroke; the finding among the study group indicates that the patients during the pre-test time showing poor level of knowledge (90%). The level of knowledge is increased during the post-test time to good level among all patients (100%).

The patients among the control group showing poor level of knowledge during the pre-test and post-test time (96.7% and 96.7%).

## Discussion

The findings of the study underhand depict that (76.7%) of patients are females among both groups; the study and control. Kisokanth etal., [6] supported present study by the gender there were (59.0%) of samples females.

Regarding the educational level of patients; the results of the present study reveals that the highest percentage of patients are graduated from primary school, among the study group (26.7%) and control group (36.7%). This conclusion is supported by Tesha , [7] who concluded that (40.6%) of the sample were primary school.

As regards the occupation the results of the present study indicate that (43%) of patients are working and (40%) are housewives among the study group; among the control group, (46.7%) of them are housewives and (23.3%) of them are working. These findings come along with Jarelnape ,[2] who stated that (73%) of patients were working.

Beside the residence, the findings of the current study reveal that more of the patients are residents in an urban area among the study group (76.7%) and among the control group (86.7%). These results are consistent with Haghighi etal., [8] stated that (84.7%) of participant's resident in urban areas.

Concerning the marital status among both groups. the results of the present study depict that the study and control show that more of them are married with the highest percentages (study group= 76.7% and control group= 86.7%). These findings identical with Dar etal., [9] who have been found that (86.5%) of the sample were married.

Regarding family type, the results of current study describe that the majority of patients are living in extended families among both groups; the study and control groups (90% and 93.3%). These results incongruent with Jayalakshmi,[10] Who reported that the type of family 45 (75%) were comes under nuclear family and 22 (25%) were comes under join family.

Moreover, the social and economic level the finding of the present study depicts that patients among the study group associated with moderate socioeconomic level (76.7%), while those in control group refer that with

high socioeconomic level (76.7%). These results come along with Bollampally eta.,[1] stated that (66.25%) of participants with moderate socioeconomic levels.

Regarding duration of illness the results of current study indicate a duration of illness is (5≤ years) for patients among the study group (46.7%) and among the control group (63.3%).These findings harmonizing with Kilic etal.,[11] who reported that sample of study had duration of hypertension is more than 5 years (32.4%).

Regarding daily habits, the finding of the study under hand reveal that more than half of patients among the study group are nonsmokers (56.7%) and (30%) of them are doing exercise. Among the control group, the highest percentage of patients also show that (76.7%) of them are nonsmokers and only (13.3%) of them are doing exercise.

Regarding family history of hypertension, the results of the current study revealed that more of the patients among both groups; the study and control showing that they having a family history of hypertension (70% and 80%). These findings are congruent with Sadeq and Lafta,[13] who found that (63.9%) of a sample they having a family history of hypertension.

Moreover, the finding of the present study show that more of patients are on regular treatment of hypertension (study group= 80% and control group= 73.3%).These findings identical with James,[14] who indicated that duration of taking anti-hypertensive drugs, (45.0%) in the experimental group and (49.2%) in the control group had more than 1 to 5 years duration of taking antihypertensive medicine.

Beside Suffering from other disease, the findings of study underhand reveal that only (46.7%) of the patients among the study group and (40%) among the control group are suffering from other diseases. These results supported with AbdelSalam and El-SayedSoliman, [15] referred that majority of participants (80%) were hypertensive and about two thirds (65%and 66.7%) were diabetic and obese respectively.

The findings of present study reveal the level of patients' knowledge regarding prevention of stroke; the results among the study group report that the patients during the pre-test time showing poor level of knowledge (90%). The level of knowledge is increased during the post-test time to good level among all patients (100%).

These findings in same line with quasi experimental study conducted by Paul ,[16] who found levels of knowledge on prevention of cerebrovascular accident among hypertensive patients during pre-test show more than two third of the patients (71.67%) had inadequate knowledge.

## Conclusions

The present study concludes that there is significance need for educational program between (residency, type of family, duration of illness, habits and regularity of hypertension treatment) to prevention serious complication which stroke.

**Financial Disclosure:** There is no financial disclosure.

## Abstract

**Background:** Nearly 3 million babies die each year in their first month of life and a similar number die at birth. Notably, the first month of life of these children. That a quarter to half deaths occur in the first 24 hours and that 75% of them occur in the first week. The study aims: determine the causes of neonatal mortality in Kut City.

**Methodology:** A non-probability a convenience sample of (N=406) was collected through a review of NCUS records which were selected out from the main hospitals. The data were collected from a retrospective secondary data from death certificates, medical records and death records using the questionnaire deals with neonate age, gender, birth weight, and cause of death. Data are analyzed through the application of descriptive and inferential statistical data analysis approach that includes, frequencies and percentages; Chi-squared test. **Results:** The study results indicate that the (77.8%) of neonate aged less than five days and die. Regarding gender, most of them were male and their weight 1000-2000. There were a significant association between neonate age, and gender with the causes of their morbidity at p-value <0.05.

**Conclusion:** A less than five days of life male neonate weighted 1000-2000 kg die by respiratory distress syndrome affected by age and their gender. Health care providers need to be trained on neonatal resuscitation. All nurses and doctors involved in obstetrics and neonatal care should be trained in at least immediate care of the newborn.

***Key words:*** *Determination, Neonate, Morbidity, Al-Kut City.*

## Introduction

Newborn baby is the first live stage within 28 days after birth, which is considered the most important period of age as an indicator of physiological adjustment to life outside the womb. This period is very sensitive where comes the high rates of child mortality newborns from high susceptibility of exposure to disease and death in infants[1]. It was noted that the death of neonatal can be classified as an early age occur during the first seven days, while the late stage occurs after the seventh day but before 28 days of age, and therefore considered to be the most dangerous period due to the face of many diseases problems that lead to high rates of morbidity and mortality [2]. Wherever children who reported that prematurity, severely malformed, childbirth complications or bad hygiene practices were issues lead to inflammation, which ends with the death of the newborn die [3]. On the other hand, the large majority of newborns do not develop any problems or only serious difficulties requiring only the minimum, which can be provided by the parent with proper supervision by health workers take care of [2]. While mothers at high risk who were unsupervised and preterm or infants low birth weight is an experience to address where they are faced with a series of events likely to be life-changing as their children transition from fetal life newborn that the consequences could affect the health of the individual on their lives [4]. Pregnant women can be exposed innocently to the physical, psychological and behavioral conditions, or environmental harmful potential that can increase the risk of pregnancy. Even with optimal care

before birth, the fetus can suffer results in perinatal negative, such as premature birth, low birth weight, congenital malformations, and neonatal morbidity, or neonatal deaths. After birth, the risk factors related to the same mother to put newborns at risk of illness or injury may continue[6]. Preterm birth according to the World Health Organization, which referred to the birth before 37 weeks of termination of pregnancy. Is divided somewhat mildly that the completed pregnancy from 32 to less than 37 weeks, which includes late premature defined as 34 to less than 27 weeks of pregnancy [7]. Birth asphyxia also failed to start and maintain breathing at birth, can choke at birth resulting from inadequate O2 directly supply also before, during or after birth. It is estimated that the world be more important reason for the 2/3 neonatal death accounting for about 29% of deaths [8]. Birth weight less than 2.5 kg is called low birth weight is one of the most important determinants of neonatal mortality. It generates 15.5 per cent of all children with low birth weight, 95.6 per cent of them children in developing countries, all over the world [9]. Respiratory distress is the name applied to the weakness of the respiratory system in newborns, which are related to the delay in the growth of lung maturity. The death of nearly 20% of the deaths of newborn infants with 40,000of dye each year in the United States accounts [10]. Most deaths fall of neonatal sepsis in Eastern Europe, where between the ages of 0-6 days and 7-27 days.

## Methodology

**Study design:** A descriptive analytic study design aimed at determine the neonatal mortality during the last 3 years ago in Kut City.

**Study Sample:** A non-probability a convenience sample of (N=406) was collected through a review of NCUs records which were selected out from the main hospitals.

**Study Instrument:** Through a comprehensive review of the literature related to, the study design tool for the purpose of the study by the researcher, which were based on the causes of neonatal deaths. The instrument was examined by the supervisors and experts in the field who is knowledgeable about the issues around the care of the mother and newborn.

**Data Collection the Methods:** The data were collected from a retrospective secondary data from death certificates, medical records and death records using the questionnaire deals with neonate age, gender, birth weight, and cause of death.

**Statistical analysis:** The SPSS-ver.20 methodology is used to analyze and evaluate data from the study. A descriptive approach analysis of statistical data used to describe the study variables: frequencies and percentages; Statistical data deductive analysis approach: used by applying the Chi square test.

They obs. < crit. = insignificantly.They obs. > crit. = significantly,

Shortcuts for measuring important compared to the level, are used as follows:

(1) NS : Non significantly at probability-value>0.05.

(2) S : Significantly at probability-value <0.05.

(3) HS : Highly significantly at probability-value <0.01.

## Results

**Table (1): The Neonatal Characteristics**

| Variables | Rating | No. | % |
|---|---|---|---|
| Neonatal Age | <5 days | 316 | 77.8 |
| | 5-10 days | 67 | 16.5 |
| | 11-15 days | 12 | 3.0 |
| | 16-20 days | 6 | 1.5 |
| | >20 days | 5 | 1.2 |
| Gender | Male | 235 | 57.9 |
| | Female | 171 | 42.1 |
| Birth Weight | <900 | 39 | 9.6 |
| | 1000-2000 | 190 | 46.8 |
| | 2100-3100 | 142 | 35.0 |
| | 3200-4200 | 32 | 7.9 |
| | 4300-5300 | 2 | 0.5 |
| | >5400 | 1 | 0.2 |

This table indicate that the a male gender neonate death aged less than five days and weighted 1000-2000 kg.

**Table (2): The Causes of Neonatal Mortality During Last 3 Years ago**

| | Rating | No. | % |
|---|---|---|---|
| Causes of Neonatal Mortality | Congenital emphysema | 65 | 16.0 |
| | Sepsis | 84 | 20.7 |
| | Weight loss and age | 32 | 7.9 |
| | Congenital Anomalies | 37 | 9.1 |
| | Respiratory distress syndrome | 158 | 38.9 |
| | Jaundice | 3 | 0.7 |
| | Birth Defect | 1 | 0.2 |
| | Inhalation of uterine fluids | 1 | 0.2 |
| | Renal Failure | 1 | 0.2 |
| | Acute Weight Lose | 1 | 0.2 |
| | Pneumonia | 3 | 0.7 |
| | Heart abnormalities | 3 | 0.7 |
| | Brain Malformation | 9 | 2.2 |
| | Brian Hypoxia | 1 | 0.2 |
| | Congenital malformations of the respiratory system | 5 | 1.2 |
| | Platelet inflammation | 1 | 0.2 |
| | Underweight with low gestational age | 1 | 0.2 |

The respiratory distress syndrome were records the majority among causes of neonatal death.

" Chi-square observer, Chi-square critical, Df= Degree of freedom, "P-value= Probability value", "S= significant", "NS= non-significant", "HS= high significant"

This table depicts there were a non significant association between neonatal wieght and causes of their mortality at p-value >0.05.

## Discussion

The risk of neonate mortality peaks in the recent birth period, in the first 28 days of life. Therefore, it is essential to ensure the safety of childbirth and to provide effective care for newborns in order to prevent such deaths. It is noteworthy that about 44% of the deaths of children under the age of five occur during the recent birth. The findings of this study depicts that the a male gender neonate death aged less than five days weighted

1000-2000 kg. This results came in the same line with study conducted in Babylon governorate deals with causes of neonatal mortality.

Our findings depicts the respiratory distress syndrome were records the majority among causes of neonatal death. This results come in the same line with study conducted in Babylon Governorate as a (41.6%) of neonate die by the respiratory distress syndrome as considered the greatest causes of neonate mortality[16].

In Thi-Qar, Iraq studied reasons of newborn deaths in NICU, concluded that the most common reasons of neonatal mortality were RDS[20].

A descriptive-across sectional analytical and retrospective study and the population of the study involved whole babies hospitalized in NCU and neonatal intensive care unit of Sari Bu Ali Hospital. Entitled "A Study of Frequency and Causes of Neonatal Mortality", conducted by Zafari and others at (2012). He founds that there was "not significant relationship" between age at mortality and baby death, results consistent with the current study findings[21].

While the retrospective study which inconsistent with the present finding, conducted by (Azize et.al.,2017) at Sulaimani's Maternity Teaching Hospital, achieved in the NICU to investigate the effects of various danger factors such as (newborn gender, expected date of delivery, childbirth weight, mother's age and reasons of mortality. Found that there was no statistically "significant relationship" between neonatal cause and newborn weight because of p-value (> 0.05)[25].

## Conclusions

A less than five days of life male neonate weighted 1000-2000 kg die by respiratory distress syndrome affected by age and their gender. Health care providers need to be trained on neonatal resuscitation. All nurses and doctors involved in obstetrics and neonatal care should be trained in at least immediate care of the newborn.

## Abstract

(VAP) is defined as pneumonia that develops in mechanically ventilated patients after 48 hours or more of mechanical ventilator support, VAP increases the mortality and morbidity rates of patients and healthcare costs, This study was a descriptive cross-sectional survey. Sample a total sample of 126 nurses was collected for the current study,setting and Participants a convenience sample of graduate nurses was obtained from eight hospitals throughout Babylon. The study was approved by the ethics committees of the Babylon health department and the participating, Researcher used standard a questionnaire that integrated the assessment of nurse's knowledge for prevention of VAP from the Center of Disease Control and Prevention questionnaire was validated by a panel of four specialists in the disciplines of nursing, The questionnaire was administered to the participants in their hospitals by the principle investigator. Nurses were informed that their completion of the questionnaire would be considered as consent to participate.SPSS version 22 was used for data analysis, The study conclude that the mean age of participants in the study was young and female, the majority of the nurses didn't know that the mechanical ventilator humidifier must be changed weekly to prevent VAP. Researcher encourage all Iraqihospitals ICUs nurses to involve inclinical training to improve nurses acquisition and to evaluate the content of the nursing curricula to identify shortcomings in content. It is imperative that VAP-prevention guidelines be integrated in training and teaching within the nursing schools, and that the content and teaching strategies of infection control courses are updated.

***Key words:*** *Nurses knowledge, Ventilator-Associated Pneumonia.*

## Introduction

The Institute for Healthcare Improvement and the American Thoracic Society have developed evidence-based guidelines to prevent Ventilator Associated Pneumonia (VAP) which is a common nosocomial infection that is associated with increased length of hospitalization, VAP affects 10%-25% of patients who are treated in intensive care units for more than two days, Therate of VAP varies between countries, with higher prevalence and mortality rate reported in developing countries [1] (VAP) is defined as pneumonia that develops in mechanically ventilated patients after 48 hours or more of mechanical ventilator support, VAP increases the mortality and morbidity ratesof patients and healthcare costs Mechanically ventilated patients are at high risk for developing VAP owing to diverse reasons such as the presence of an endotracheal tube, altered sensorium oral inflammation, impaired mucociliary clearance, inhibition of cough response and micro aspiration of secretions [2]. In 2007, the Institute for Healthcare Improvement (IHI) created the Triple Aim, Which focused on "improving the experience of care providers, improving the health of populations and reducing per capita cost of healthcare." Since that time, healthcare systems across the country have ramped up efforts to reduce the incidence of hospital-acquired conditions (HAC), which account for some readmissions, declining health, and rising costs. To some degree, those efforts are paying off. The Department of Health and Human Services (HHS) reported approximately 87,000 fewer

inpatient deaths and a 17% decline in hospital-acquired conditions from 2010 to 2014, resulting in a reduction of almost $40 billion in healthcare costs [3]

VAP is account for the highest burden of nosocomial infection as well of health care which is of a serious concern today. It has been reported that the incidence of a nosocomial infections in intensive care unit is about 2 to 5 times higher than in the general in-– patient hospital [4]. A systematic literature review and meta-analysis undertaken the use of antiseptics lowers the risk of VAP, though it does not contribute to the reduction in mortality and duration of ICU stay. [2] The positive effect of preventive measures may decrease with length of time at risk. Moreover, continuous aspiration of subglottic secretions has a favorable effect on the incidence of early onset VAP, but the effects on late-onset VAP are less definite. [5] . Tracheal suctioning is one of the most common invasive procedures performed by nurses on ICU patients and is crucial to reducing the risk of VAP; Tracheal suctioning is traditionally performed using the open suction system which involves disconnecting the patient from the ventilator and introducing a single-use suction catheterconsists of a multi-use suction catheter included within the ventilation circuit, preventing the need for disconnection and the resultant loss of airway pressure. [6]

Knowledge about VAP prevention varied widely among physicians and nurses. Knowledge gaps affect the implementation and monitoring of VAP prevention practices. Continuing education remains imperative, Knowledge of guidelines for prevention of VAP among healthcare workers (HCWs) has been infrequently assessed and mainly in staff nurses only. The gaps between individual knowledge of VAP prevention and actual daily clinical practice have not been compared. [7]

Prevention of VAP is much more cost-effective than treatment which is an essential objective of health care delivery within ICUs. Care bundle protocols are different and controversial in different hospitals, Preventing infections is the daily work of nurses in every hospital. This applies to the critical unit as well where nurses are the forefront of infection prevention either VAP or other. They create and provide the safe environment, take responsibility for nursing care and play a pivotal role in preventing nosocomial infections. American Organization of Nurse Executives (2015) clinical operations, care management, quality and safety, the patient experience, performance improvement and workforce planning. In addition this role has business and financial expertise. The role of the system chief nurse executive (CNE

**Expected Nursing Practice**

Collaborate to identify patients where implementation of noninvasive positive pressure ventilation (NIPPV) may be appropriate to prevent the need for intubation

Assess readiness to extubate daily through combined spontaneous awakening trials (SATs: sedation interruption/minimization) and spontaneous breathing trials (SBTs), unless clinically contraindicated

Maintain and improve physical conditioning through early exercise and mobility

Elevate the head of bed (HOB) to 30º to 45º unless clinically contraindicated in patients receiving mechanical ventilation, as well as patients at high risk for aspiration

Minimize pooling of secretions above the endo-tracheal tube cuff by using an endotracheal tube with subglottic suction capability in patients with anticipated intubation greater than 48 to 72 hours Change ventilator circuits only if visibly soiled; do not change ventilator circuits routinely. [9]

## Methodology

Design: This study was a descriptive cross-sectional survey. Sample a total sample of 126 nurses was collected for the current study, the sample size determined by the Rawsoft sample size calculator. Based on an estimated response rate of 50%, ά =0.05, power =0.95; the estimated population of nurses in Iraq/ Babylon is 200, so the required sample size is estimated to be 120. The current study used a larger sample to enhance the results' external validity.Inclusion Criteria -Undergraduate nursingschool,setting and Participants a convenience sample of graduate nurses was obtained from eighthospitals throughout Babylon. The study was approved by the ethics committees of the Babylon health department and the participating.

Researcher used standard a questionnaire that integrated the assessment of nurse's knowledge for prevention of VAP from the Center of Disease Control and Prevention questionnaire was validated by a panel of four specialists in the disciplines of nursing and infection control. The questionnaire comprised two parts. Part one included demographic items such as gender and geographic, Part two comprised 20 multiple-choice questions, each containing four choices: the correct answer and three distracters. The four choices included "I don't know" as an option to prevent guessing. For scoring purposes, the questions were graded as 1 for the correct answer and 0 for other responses. Individual totals for the 20 could thus range from 0 to 20, a higher score indicating a better knowledge level and a score below 10 meaning that the nurses failed the test.(Aloush & Qadire, 2017)

**Data collection procedure:**

The questionnaire was administered to the participants in their hospitals by the principle investigator. Nurses were informed that their completion of the questionnaire would be considered as consent to participate. Nurses were assured that participation is completely voluntary and that their responses in the questionnaire were confidential. The nurses also were informed that they had the right to withdraw from the study any time. The nurses were subject for any emotional, physical or mental harm as a result of participation in the study. Data were collected in the period April -August 2018.

## Statistical Analysis

SPSS version 22 was used for data analysis. The mean scores and frequencies were calculated. An independent sample t-test was used to measure the difference in mean scores between male and female participants and between nurses with previous education in their training courses about VAP management and mechanical ventilators and those without. An ANOVA test was conducted and the difference in mean scores was compared among nurses according to the geographical location of the hospital.

## Results of the Study

Researcher distributed 140 questionnaires, of which only 126 were completed, a total response rate of 98%. Respondents were of different geographical locations and gender. Participating hospitals were of government affiliation. The mean age of participants in the study was 24.6 (SD=2.9) for females and 23.7 (SD=2.7) for males. (Table 1)

**Table 1. Nurses' characteristics**

| **Items** | | **Frequency** | **%** |
|---|---|---|---|
| 1 | Gender<br>Female:<br>Male: | <br>66<br>60 | <br>52<br>48 |
| 2 | Hospitals location<br>Center of Babylon:<br>Peripheral ofBabylon: | <br>78<br>48 | <br>61.9<br>38.1 |
| 3 | Received educational program and training on Mechanical ventilator in their undergraduate courses.<br>Yes:<br>No: | <br>64<br>62 | <br>50.8<br>49.2 |
| 4 | Received educational program and training on Ventilator Associated Pneumonia (VAP) management in their undergraduate courses<br>Yes:<br>No: | <br>65<br>61 | <br>51.6<br>48.4 |

**Table 2.Preferred guidelines and frequencies of correct answers Preferred:**

| | **Preferred guidelines and frequencies of correct answers:** | **n(%)/ n=126** |
|---|---|---|
| 1 | Which method of endotracheal tube insertion is preferred to decrease VAP? | 54(42.8%) |
| 2 | How often is it preferred the ventilator circuits be changed to decrease the risk VAP? | 61(48.4%) |
| 3 | Which type of humidifiers is preferred to decrease the risk of VAP? | 75(59.5%) |
| 5 | How often is it preferred the humidifier be changed to decrease the risk VAP? | 68(53.9%) |
| 6 | Which type of suctioning systems is preferred to decrease the risk VAP? (open vs close) | 45(35.7%) |
| 7 | How often is it preferred the suction systems be changed to decrease the risk VAP? | 69(54.7%) |
| 8 | Which type of endotracheal tube is preferred to decrease the risk of VAP? | 71(56.3%) |
| 9 | Which type of bed is preferred to decrease VAP the kinetic bed vs the standard bed? | 44(34.9%) |
| 10 | Which patient position is preferred to decrease the risk VAP? | 65(51.6%) |
| 11 | Which solution is preferred for oral care to decrease the risk VAP? | 61(48.4%) |
| 12 | How often oral care is preferred to decrease the risk VAP? | 47(37.3%) |
| 13 | How often is it preferred to assess patient readiness for extubation? | 75(59.5%) |
| 14 | How often is it preferred to perform spontaneous breathing trial with sedatives turned off? | 68(53.9%) |
| 15 | When is it preferred to wash hand to decrease the risk of VAP? | 45(35.7%) |
| 16 | When is it preferred to wear gloves to decrease the risk of VAP? | 69(54.7%) |
| 17 | At which level endotracheal tube cuff pressure should be kept to decrease the risk of VAP? | 71(56.3%) |
| 18 | To decrease the risk of VAP, which of the following practices related to antibiotics use is preferred? | 44(34.9%) |
| 19 | What is effect of giving peptic ulcer prophylactic (e.g. H2 blockers, Proton pump inhibitors, or sucral fate) administration on the risk of VAP? | 65(51.6%) |
| 20 | What is the effect of Deep Venous Thrombosis (DVT) prophylaxis on the risk of VAP? | 61(48.4%) |

The mean knowledge score for participants was 6.4 (32%) (SD=2.9), with a range of 16 (80%) to 0(0%).63 nurses (14.5%) answered more than half of the questions correctly. Weakness in the knowledge related to mechanical ventilator management was obvious. The majority of the nurses didn't know that the mechanical ventilator humidifier must be changed weekly to prevent VAP, the endotracheal tube's cuff pressure must be kept at the level of 20-30 H2O, and that the ventilator circuit must be changed only when it is visibly soiled or for every new patient's admission. Another topic of concern was oral care and suction. On the other hand, students showed a reasonable level of knowledge regarding hand washing and patients' positioning. (Table 2).

**Table3. Nurses' scores vs. baseline characteristics**

| | | Nurses Scores out of 20 | | |
|---|---|---|---|---|
| **Items** | | **Mean (SD)** | **t** | **p** |
| 1 | Gender<br>Female:<br>Male: | 6.42(2.8)*<br>6.44(2.9) | 0.2 | 0.93 |
| 3 | Received educational program and training on Mechanical ventilator in their undergraduate courses.<br>Yes:<br>No: | 6.9(2.8) 5.9(2.9) | 2.1 | 0.00 |
| 4 | Received educational program and training on Ventilator Associated Pneumonia (VAP) management in their undergraduate courses<br>Yes:<br>No: | 6.4(2.9) 6.6(2.9) | 1.9 | 0.014 |

There was a statistically significant difference in knowledge scores between nurses who had received education in VAP on their undergraduate courses and those who had not: t (432) =-3.5, p=0.00. However, both groups revealed poor knowledge, The former achieved higher scores (M = 6.9, SD =2.8) than the latter (M =5.9, SD =2.9 ). There was no statistically significant difference in the scores of male and female nurse, and no statistically significant difference between nurses who had been taught about mechanical ventilators and those others who had not (p >.05) (Table 3).

## Discussion

Participants had a poor knowledge of VAP-prevention can be compared with other nurses that showed poor overall knowledge about infection control guidelines among student nurses in India, Iran and Spain however, my study was more comprehensive as it focus only on VAP prevention guidelines also it provided a broader set of updated VAP prevention guidelines . Mechanical ventilator management, oral care and the endotracheal tube suction items were the major topics of concern among our nurses, again similar to the findings from another study with student nurses in Spain and with newly graduated nurses in United States. On the other hand, participants showed much better knowledge about hand hygiene and the Semi-Fowler position than about other topics, although their performance was still unsatisfactory.

## Conclusions

The study conclude that the mean age of participants in the study was young and female,the majority of the nurses didn't know that the mechanical ventilator humidifier must be changed weekly to prevent VAP,There was a statistically significant difference in knowledge scores between nurses who had received education in VAP on their undergraduate courses and those who had not. Researcher encourage all Iraqihospitals ICUs nurses to involve inclinical training to improve nurses acquisition and to evaluate the content of the nursing curricula to identify shortcomings in content. It is imperative that VAP-prevention guidelines be integrated in training and teaching within the nursing schools, and that the content and teaching strategies of infection control courses are updated. The findings from this study may be used as a reference to evaluate the effectiveness of educational interventions in the future

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the College of Nursing and all experiments were carried out in accordance with approved guidelines.

## Abstract

An optimal diet before and during pregnancy cannot *guarantee* a successful outcome of pregnancy; it can improve the chance of a healthy newborn baby, a healthy mom, and a healthy future for both. A woman who is well nourished and within her healthy weight range prior to conception provides an environment conducive to normal fetal growth and development during the critical first trimester of pregnancy. Study design and population. This study used data from the mothers and child care unit in health centers, a prospective cohort study in central Al.Hillah designed to investigate the maternal dietary patterns during the second trimester and risk factors for preterm birth. second trimester of pregnant women were recruited at 24–29 wk of gestation from prenatal clinics at the MCH Services Department.

Stratified and randomly selected out-patient clinics between Jan 2016 and April 2017. All participants gave written informed consent at the time of recruitment. Data were collected via interviews and self-administered questionnaires, including an MNA to collect dietary information. Socio-demographic information and health behaviors were collected via interviews. during the first 6 mo of pregnancy was collected from self-administered questionnaires. pregnancy BMI was based on height measured at the first prenatal clinic visit and self-reported pregnancy weight. Missing pregnancy weight was imputed on the basis of the first prenatal care visit (19). Total of (50) pregnant women were enrolled into the PIN study. Only pregnancies with complete dietary information were included in this study (n = 50).

Data analyses the related data by using SPSS 23.0 software program. A level of $P < 0.05$ was considered statistically significant. Characteristics of the intervention group and comparison group were compared using t-tests for continuous variables and $\chi 2$-tests for categorical variables. Most of the sample (44.9%) had (21-26) years aged,(36.7%) with (56-66 kg ) body weight and (42.9% ) had 140-150 cm ) body height

***Key words:*** *nutritional status, preterm birth, status*

## Introduction

An optimal diet before and during pregnancy cannot *guarantee* a successful outcome of pregnancy; it can improve the chance of a healthy newborn baby, a healthy mom, and a healthy future for both [1] . A woman who is well nourished and within her healthy weight range prior to conception provides an environment conducive to normal fetal growth and development during the critical first trimester of pregnancy. Recent studies suggest that nutritional deficiencies during this period increase the risk of certain chronic diseases later in the infant's life [1] . During pregnancy, the fetus cannot meet its genetic potential for development if the supply of energy and nutrients is inadequate. For the mother, adequate but not excessive weight gain reduces the risk of complications during pregnancy and delivery and lowers the risk of postpartum weight retention. An optimal diet provides enough, but not too many, calories and nutrients to optimize maternal and fetal health [1] . The maternal diet during pregnancy must provide sufficient energy to ensure the delivery of a full-term, healthy infant of adequate size and appropriate body composition. Ideally, a woman should enter pregnancy with a healthy weight and good nutritional status. The total protein requirement during pregnancy has been estimated to be approximately 925 g for a woman gaining 12.5 kg and delivering an infant of 3.3 kg. Protein is not gained at a constant rate, the rate at which

protein is deposited increases as pregnancy progresses. Estimates for the first, second, third and fourth quarters are 0.64, 1.84, 4.76 and 6.10 g of protein per day. The DRV panel did not give any specific values for additional fat requirements during pregnancy However, pregnant women and those planning a pregnancy need an adequate dietary intake of essential fatty acids and their longer-chain derivatives, DHA and AA which are necessary for the development of the brain and nervous system of the fetus, particularly in late pregnancy [2] . The best dietary source of long-chain n-3 fatty acids (EPA and DHA) is oil-rich fish. Carbohydrate Requirements for starch, sugar and non-starch polysaccharides (dietary fiber) during pregnancy are not increased. However, constipation, which may be party attributed to reduced motility of the gastrointestinal tract, is common at all stages of pregnancy. Women with low intakes of non-starch polysaccharides may benefit from increased intakes, to within a range of 12–24 g per day, along with increased fluid intakes to encourage regular bowel movement. The DRV panel established DRVs for nine vitamins, with increments during pregnancy for vitamins A, C and D, thiamin, riboflavin and folate. The DRV panel established DRVs for 10 minerals however; no increments were established for pregnancy as requirements are not considered to increase [2] . This is mainly because of the more efficient absorption and utilization of nutrients that occurs during pregnancy such as Calcium, The RNI for calcium for all adults is 700 mg per day and the DRV panel did not consider that any increment was necessary during pregnancy and Iron requirements are increased during pregnancy to supply the growing fetus and placenta and for the production of increased numbers of maternal red blood cells [2]. Preterm birth is one of the leading causes of neonatal morbidity accounting for nearly 35% of all neonatal deaths in the United States . Despite decades of research, the incidence of preterm birth remains close to 11% and the etiology is largely unknown. With regard to diet, maternal nutrition during pregnancy has an important role in providing the necessary nutrients for fetal growth; however, the relation between maternal dietand preterm birth is not well established. The failure to identify individually strong, modifiable causes of preterm birth is not due to insufficient research given numerous studies focused on psychosocial stress and health behaviors, particularly tobacco, alcohol, and illicit drugs . A number of suggestive associations have been reported for maternal pregnancy weight, gestational weight gain, diet, stress,depression, cocaine use, and physical activity, but because of the challenge in accurately assessing such factors, most studies collect detailed data or analyze only one realm at a time [4]. Recent global estimates suggest that more than 1 in 10 or an estimated 15 million babies born in 2010 were pre-term, of which more than 1 million died as a result of preterm birth and related complications . Although neonatal mortality rates have fallen globally between1990 and 2009 , the absolute numbers and rates of preterm birth have increased during this period. Pre-term birth complications account for 35% of the estimated 3.1 million global neonatal deaths,and are thesecond leading cause of death in children under 5 yearsof age [5].

## Method

Study design and population. This study used data from the mothers and child care unit in health centers, a prospective cohort study in central Al.Hillah designed to investigate the maternal dietary patterns during the second trimester and risk factors for preterm birth, Second trimester of pregnant women were recruited at 24–29 wk of gestation from prenatal clinics at the MCH Services Department. Stratified and randomly selected from health centers between Jan 2019 and April 2019. And purposive sample of mothers from each heath center, All participants gave written informed consent at the time of recruitment. Data were collected via interviews and self-administered questionnaires, including an MNA to collect dietary information. Socio-demographicinformation and health behaviors were collected via interviews. during the first 6 mo of pregnancy was collected from self-administered questionnaires. pregnancy BMI was based on height measured at thefirst prenatal clinic visit and self-reported pregnancy weight. Missing pregnancy weight was imputed on the basis of the first prenatal care visit (19). Total of (50) pregnant women were enrolled into the PIN study. Only pregnancies with complete dietary information were included in this study (n = 50). Dataanalyses the related data by using SPSS23.0 software program. A level of $P < 0.05$ was considered statistically significant. Characteristics of the intervention group and comparison group were compared using t-tests for continuous variables and $\chi 2$-tests for categorical variables.

## Results

**Table (1) indicates the demographics data about the samples.**

| **Age** | **Frequency** | **Percent** |
|---|---|---|
| 15-20 years | 10 | 4.1 |
| 21-26 years | 48 | 19.6 |
| **27-32 years** | **123** | **50.2** |
| 33 and more | 64 | 26.1 |
| Total | 245 | 100.0 |
| | | |
| **Weight** | **Frequency** | **Percent** |
| 45-55 kg | 40 | 16.3 |
| **56-66 kg** | **90** | **36.7** |
| 67-77 kg | 65 | 26.5 |
| 78-88 kg | 50 | 20.5 |
| Total | 245 | 100.0 |
| | | |
| **Height** | **Frequency** | **Percent** |
| **140-150 cm** | **105** | **42.9** |
| **151-161 cm** | **105** | **42.9** |
| 162-172 cm | 35 | 14.2 |
| Total | 245 | 100.0 |

Half the sample had (**27-32**) years aged,(36.7%) with (56-66 kg ) body weight and (42.9% ) had 140-150 cm or 151-161cm ) body height.

**Table (2) shows the BMI of the pregnant mothers**

| **BMI** | **Frequency** | **Percent** |
|---|---|---|
| Under weight | 30 | 12.2 |
| Normal | 120 | 49.0 |
| Overweight | 65 | 26.5 |
| Obese | 30 | 12.2 |
| Total | 245 | 100.0 |

This table showed the half of mothers(49.0%) had normal BMI.

**Table (3) identify the pregnant mothers nutritional status**

| **Nutritional status** | **Frequency** | **Percent** |
|---|---|---|
| Under weight | 80 | 32.7 |
| Normal | 90 | 36.7 |
| Overweight | 75 | 30.6 |
| Total | 245 | 100.0 |

This table showed the nutritional status, (36.7%)of pregnant mothers which had normal nutritional status.

## Discussion

Nutritional status for pregnant women has important starring role to produce preterm birthfor that reason they need to study nutritional status in prediction preterm birth. This study contacted atthe Creative Commons Attribution License (CCAL) (2015) by Maria Lorella Giannì . This finding probably reflects the time needed for the late preterm infants to develop adequate feeding skills, as indicated by the longer hospital stay of the late preterm infants requiring nutritional support compared with that of the late preterm infants who did not received any nutritional support. Another point of view by the property of RCN Publishing Company (2014) by Englund-Ogge L eta l(2014) A team of researchers in Sweden used a study of pregnant women in Norway to analyze births among 66,000 women between 2002 and 2008. Participants had completed a questionnaire on dietary habits during the first four to five months of pregnancy. Show that Among the 66,000 pregnant women, preterm delivery occurred in 3,505 (5.3%) cases The analysis showed that high scores on the prudent dietary pattern were associated with a significantly reduced risk of preterm delivery (hazard ratio 0.88, 95% confidence interval 0.80 to 0.97), as well as a reduced risk of spontaneous and late preterm delivery. Paola Roggero and et al (2015) stated that only infants who did not develop co-morbidities, birth weight ≤2000 g, GA of 34 weeks and possibly were being born SGA were independently associated with a higher risk of having

nutritional support during hospital stay. In addition, when including in the analysis the infants who have developed co-morbidities, not only birth weight ≤2000 g, GA of 34 weeks and being born SGA, but also having developed a respiratory distress syndrome and having required a surgical intervention resulted to be independently associated with a higher risk of receiving nutritional support. Indeed, out of the infants requiring. A nutritional support in the present study, 58 % and 25 % presented co-morbidity and were born SGA, respectively. Being born SGA is actually a recognized risk factor for very preterm infants for having a prolonged transition period from the beginning of oral feeding to full oral feeding. Chantel L Martin and et al (2015)mentionedthat following a dietary pattern that promotes inflammation may increase the possibility of preterm birth by limiting the transfer of nutrients for adequate fetal growth. Furthermore, we postulate that women with greater Adherence to the DASH diet, which was associated with higher amounts of folate, fiber, and vitamin A from foods such as fruits and vegetables, reduces the risk of preterm birth by reducing inflammation and promoting fetal growth, identified some nutrients and foods that could explain a biological mechanism for preterm birth.Infant mortality (deaths/1,000 live births) - 2015 estimatesin Iraq 37.41, Afghanistan 115.08 is the highest mortality and Monaco 1.82 is the lowest. The result of this study indicate that infant mortality rate is high in Iraq but not for reason of nutritional status of female

## Conclusion

The study concluded that most of new mothers in Babylon had no evidence for preterm infant because they had normal nutritional status for that reason Iraq has acceptable infant mortality rate (37.41/1000).

## Recommendation

The study recommended that a nutritional educational program should be conducted in the female secondary schools to maintain healthy nutritional status. And increase the awareness of exercises and activity in the secondary schools.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Babylon Health directorate and all experiments were carried out in accordance with approved guidelines.

# Immunological Aspects of Patients Infested with Scabies in Thi-Qar Province, Southern Iraq

**Zainab Abd Ali Mohammad[1], Nadia Ahmed Hadi[2], Ahmed Abdulhussein Kawen[3]**

*[1]Asst.Prof., [2]Lecturer Biology Department, College of Education for Pure Science, University of Thi-Qar, Iraq, [3]Asst. Prof., MBChB, FIBMS/ Department of Venereology and Dermatology, College of Medicine, University of Thi-Qar, Iraq*

## Abstract

Scabies is skin disease of human and many mammalian hosts caused by the important obligate parasites *Sarcoptes scabiei*, lives and reproduces in epidermis ,resulting a significant human and animal morbidity.

The current study aimed to determine the immunological responses in patients infested with scabies who attended a private clinic in Al-Hussein general hospital in Thi-Qar province. The total white blood cell count, differential counts (lymphocytes, monocytes, neutrophils, eosinophils and basophils), the serum levels of IL-5 and IL-13 in were evaluated in all patients with scabies and compared with non-infested healthy individuals as a control group.

The present study showed significant increase on the mean of total WBC in patients infested with scabies when compared with control ($P \leq 0.05$).

A significant differences ($P \leq 0.05$) were recorded in the absolute leukocytes counts for patient infested with scabies when compared with control group except that for monocytes and basophils which were non-significant ($P \leq 0.05$) in our study.

The results of study showed significant differences ($P \leq 0.05$) in the mean of IL-5 and IL-13 serum levels for the patient infested with scabies when compared with control.

***Keywords:*** *Scabies, WBC, IL-5, IL-13, Thi-Qar province, Iraq*

## Introduction

Scabies is skin disease of human and many mammalian hosts caused by the obligate ectoparasites *Sarcoptes scabiei* lives and reproduces in the epidermis that may lead to significant human and animal morbidity [1] .

Adult female of the mites reside in burrows within the stratum granulosum of the epidermis and caused many clinical manifestations appear after 4-8 weeks like itching, irritation, redness for the skin, and hypersensitivity reactions. The clinical rash and itch present as papules or vesicles that may contain individual mites, eggs, egg cases, mite fecal pellets, and debris present in the burrow [2] .

The sources of irritation are feeding activity of mite and host immune system response to its secretions and fecal matter that lead to scratching, scabbing, and subsequent secondary infections [3]. The infection with this ectoparasite caused stimulation humeral and cellular immune system of host [4].

The circulating antibodies in the skin and the cell-mediated immune reaction play a role in clearing of the mites and their eggs and debris.

The intensity of inflammatory response varied with combinations of histiocytes, lymphocytes, and polymorphonuclear leukocytes [2] .

The current study aimed to determine the immunological responses in patients infested with

scabies. The total white blood cell count, differential counts (lymphocytes, monocytes, neutrophils, eosinophils and basophils), the serum levels of IL-5 and IL-13 were evaluated in sixty patients with scabies with no secondary infection or other parasitic infestations and compared with sixty non-infested healthy individuals as control group.

## Materials & Method

The current study involved 60 patients with scabies had a clinical and microscopically feature of the disease, they attended a private clinic in Al-Hussein general hospital in Thi-Qar province during three months from July to september 2019. The epidermis over the suspected site of scabies infestation was scraped off and the skin scraping performed by placing a drop of microscope immersion oil. The specimen placed on a microscope slide and examined by light microscopy for the demonstration of mites or eggs . Sixty healthy persons were selected as control, with exclusion of any patient in both groups who gave a history of drug ingestion for the last two months.

Five ml of venous blood were collected from each scabies patients and control group, the blood sample divided into two parts, the first part was collected in tubes with ethylene diamine tetra acetic acid (2 ml) to estimate total white blood cell count (WBC) and differential leukocyte count. The second part (3 ml) were allowed to clot, then centrifuged to separate the serum which stored at -20 °C to be used for immunological investigations [5] .

The statistical package for social science (SPSS) version used in the current study to analyze data and the results expressed as (Mean ± S.E.). Independent sample T- test used to determine the statistical differences by consideration P-value ≤ 0.05 was statistically significant.

## Results

Results of this study showed significant increase ( P≤ 0.05) in the mean of total WBC for patients infested with scabies 11.95 ± 0 .18 ($10^3$/ml) when compared with control 5.91 ± 0.29 ($10^3$/ml).

The absolute leukocytes counts for patient infested with scabies recorded in current study: Lymphocytes 33.90 ± 1.31 (cell/$mm^3$), monocytes 2.10 ± 0.26 (cell/$mm^3$), neutrophils 71.95 ± 0.46 (cell/$mm^3$), eosinophils 0.41±0.21 (cell/$mm^3$) and basophils 0.096±0.03 (cell/$mm^3$), while for control group: Lymphocytes 20.00 ± 0.27 (cell/$mm^3$), monocytes 2.20 ± 0. .22 (cell/$mm^3$), neutrophils 59.00 ± 0.70 (cell/$mm^3$), eosinophils 1.90 ± 0.16 (cell/$mm^3$) and basophils 0.40 ± 0.11 (cell/$mm^3$).

A significant differences (P≤ 0.05) were recorded in the absolute leukocytes counts for patient infested with scabies when compared with control except that for monocytes and basophils which were non-significant (P≤ 0.05) in present study. Table 1.

**Table 1. Mean ± S.E of total and absolute leukocytes counts for scabies patients and controls.**

| Parameters | Patients No. 60 | Control No. 60 | P-value |
|---|---|---|---|
| WBC (103/ml) | 11.95 ± 0 .18 | 5.91 ± 0.29 | 0.000 |
| Lymphocytes (cell/mm3) | 33.90 ± 1.31 | 20.00 ± 0.27 | 0.000 |
| Monocytes (cell/mm3) | 2.10 ± 0.26 | 2.20 ± 0. .22 | 0.773 |
| Neutrophils (cell/mm3) | 71.95 ± 0.46 | 59.00 ± 0.70 | 0.000 |
| Eosinophils (cell/mm3) | 4.35 ± 0.36 | 1.90 ± 0.16 | 0.000 |
| Basophils (cell/mm3) | 0.25 ± 0.09 | 0.40 ± 0.11 | 0.324 |

Results showing significant differences ( P≤ 0.05 ) in the mean of IL-5 serum levels for the patient infested with scabies 330.05 ± 6.153 (pg/ml) when compared with control 171.92 ± 3.19 (pg/ml).

A significant differences (P≤ 0.05) were noticed in the mean of serum IL-13 levels for the patient infested with scabies 336.94 ± 9.74 (pg/ml) when compared with control 135.29 ± 4.62 (pg/ml). Table 2, Fig. 1 and Fig. 2.

**Table 2: Mean ± S.E of the IL-5 and IL-13 in serum for patients infested with scabies and controls.**

| Parameters | Patients No. 60 | Control No. 60 | P-value |
|---|---|---|---|
| IL 5 (pg/ml) | 330.05 ± 6.153 | 171.92 ± 3.19 | 0.000 |
| IL 13 (pg/ml) | 336.94 ± 9.74 | 135.29 ± 4.62 | 0.000 |

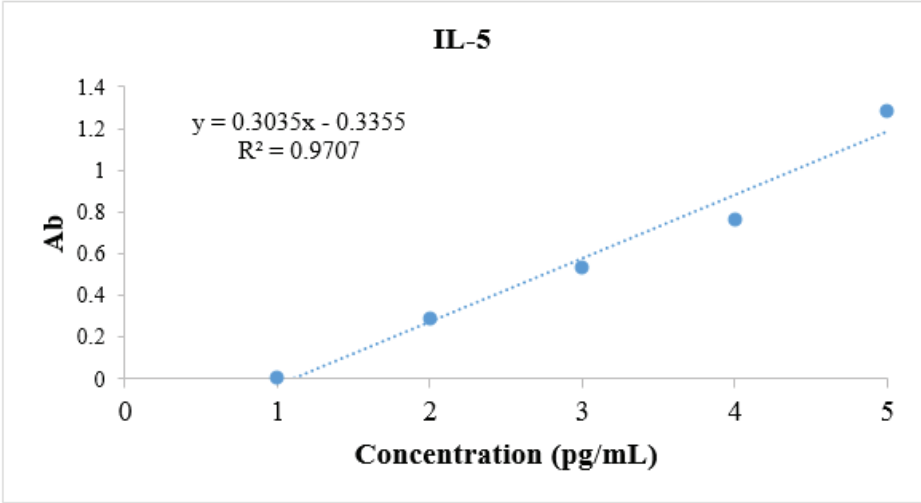

**Fig. 1. Concentrations of IL-5 in patients infested with scabies.**

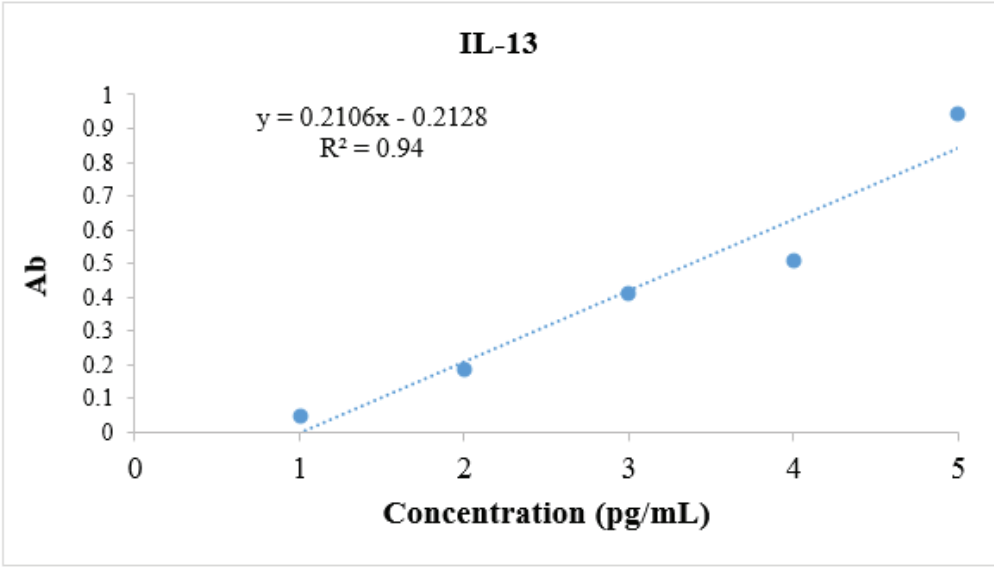

**Fig. 2. Concentrations of IL-13 in patients infested with scabies.**

## Discussions

Scabies is an important public health problem, not only for the individuals concerned, but also for their families and communities [6] . The manifestations of scabies are mediated through inflammatory and allergic-like reactions to mite products, leading to intensely pruritic skin lesions [7] . Both humoral and cellular immune responses against the mite antigens are developed [8] .

The mites hosting under the cuticle can produce soluble antigens via saliva, feces, and other secretions. In addition, various antigens can be released by dead and disintegrated mites. These antigens are probably more important and have greater pathogenic effects inducing immune and inflammatory responses of the human body than live mites. The antigens can spread to the dermis through subcutaneous intercellular fluid and stimulate immune and inflammatory responses [9] .

Results of the current study indicated a significant increasing in the mean of total WBC in patients infested with scabies; these lead to an increase in of lymphocytes, neutrophils, eosinophil and basophils because the infection with this parasite causes stimulation immune system of host humeral and cellular [10] .

Previous studies reported increased in total leucocytes counts in patients infested with scabies as Shelley and Bart [11] and Walton et al [8].

Cadman and Lawrence [12] noticed high numbers of lymphocytes, monocytes, eosinophils and basophils in patients with scabies. The granulocytes are innate effector cells in the host immune defense against many multicellular parasites.

The current study reported significant increase in mean of eosinophil count for scabies patients when compared with control, this observation maybe attributed to allergy disorder which is one of symptoms of *S. scabiei* infection and may be due to cellular respond due to the parasite infestation [8].

The extracts of dead or 1ive mites can influence the number of inflammatory cells in local tissues and blood circulation during immune or inflammatory responses of the host [13-15] .

The current study showed significant increase in the levels inflammatory mediators such as IL-5 and IL-13 in the serum of patient infested with scabies.

Arlian and Morgan [15] showed that the infestation with *S. scabiei* stimulates dermal microvascular endothelial cells to produce various inflammatory mediators, such as IL-1, IL-6 , IL-8 , IL-10 , and TNF-α, these mediators participate in the regulation of inflammatory and immune responses.

Cadman and Lawrence [12] noticed that the eosinophils, mast cells and basophils can be rapidly recruited to sites of infection and draining lymph nodes where they produce IL-4 and/or IL-13.. They acted as responsible for the initiation and ongoing regulation of Th2 responses.

## Conclusion

The results of current study showed that the scabies infestation caused immunological reactions includes both cellular and humoral immune response in patients when compared with control. They had an important role in change of total and differential leukocytes and effect on the levels of inflammatory mediators such as IL-5 and IL-13in patient when compared with control.

# Mother's Knowledge of Initiative Breast Feeding in Relation to Neonatal Jaundice

**Nuhad Mohammed Al Doori[1], Wafaa Ahmed Ameen [2] , Mohommed Talib[3]**

*[1]Assist. Prof. Dr. College of Nursing, University of Babylon, Iraq; [2]Lecturer, Dr. College of Nursing, University of Babylon, Iraq, [3]Assist. Lecturer, College of Nursing, University of Babylon, Iraq*

## Abstract

Jaundice is the greatest common situation that needs medicinal care in neonates, which present as yellow coloration of the skin and sclera related to accumulation of unconjugated bilirubin which was considered a neurotoxic to cause brain death (Kernicterus). The Aim of this study to identify the effect of successful breast feeding on neonatal hyperbillirubinemia. Material & method: Design a descriptive design was conducted through a period of study .The sample & setting: were taken accidentally from (250) mothers who had children under one year from practicing breast feeding from Babel maternity and pediatric hospital. Data collection were collected through structured interview and application of the questionnaire with mothers regarding their early achievement of breast fed their jaundiced .Self-administered instrument which takes about 30 minutes. Data analysis: data analyzed the equal number of mother's age were (43.2%) who were aged (26 - 31) ,with majority (47.2%) of the sample were not educated , therefore that (92.0%) were not working . The researchers recommend educational booklets construction concerning the ten steps of successful breast feeding.

***Keyword:*** *Neonatal Jaundice, Initiative Early Breast Feeding*

## Introduction

Newborn jaundice is the most widespread situation affecting neonatal babies particularly throughout the first week of life. Approximately fifty percent to sixty percent of the neonatal babies become affected with jaundice in the first week of life besides, global, around 14.1 million neonatal babies requirement phototherapy to treat jaundice [(1)] .Moreover, [(2)] mentioned that global, there are approximately 0.5 to 4 percent of term, early term and late preterm children from 135 million yearly live births, before discharge from the nursery obtain phototherapy. Jaundice, a common situation in neonates, refers to the whites of the eyes , and yellow color of the skin that occurs when there is excessively bilirubin in the blood. Bilirubin (bill-uh-ROO-bin) is made by the normal breakdown of red blood cells(RBCs). Normally, it passes through the liver, which releases it into the intestines as bile (a liquid that helps with digestion).[(3)]

Newborn jaundice is the most common problem in full-term babies throughout the immediate post-natal period . Nurses' breastfeeding beliefs, knowledge , and behaviors can significantly affect mothers' breastfeeding success. However, mothers of infants admitted to hospital with jaundice experience feelings of failure, guilt and inadequacy. Maternal confidence is known to be a strong predictor of breastfeeding duration, with absence of confidence in breastfeeding skills leading to a higher likelihood of weaning in the first 6 weeks post-partum [(4)]. The affiliation concerning newborn jaundice and initial breast feeding initiation has acknowledged much consideration, as long as, it is a result of numerous factors which may be maternal or fetal related. Jaundice can be either maternal or fetal related , in most cases treatment is not essential just as continuity on breast feeding. [(1)] .To improve the growth, overall health of children, and nutritional status, the World Health Organization and the United Nations Kids' Fund stimulate a worldwide strategy for baby and young kid feeding, which involve the Baby- Friendly Hospital Initiative and ten steps for successful breast-feeding, which has a important effect on the grade of jaundice, [(4)].

Breastfeeding confers many advantages to infants, mothers, families, and society and is the normal nutrition for the newborn infant. Human milk infant feeding decreases the incidence of infectious diseases and enhances the immunologic status of the newborn , exclusive breastfeeding is therefore recommended for the first six months of life [(4)].

Notwithstanding of "many advantages of breast-feeding, previous medical reports revealed that dehydration, poor body weight gain, and hyperbilirubinemia in breast-fed infants are more common. These problems were often preventable and generally did not result in long-term harm to the infants; however, in recent years, serious consequences, such as hypernatremic dehydration and kernicterus have been reported in exclusively breast-fed infants. The causes may be attributed to inappropriate breast-feeding and to early discharge practices".[(3")]which includes breast-feeding classes, 24-hour rooming-in, and exclusive breast-feeding. In Since many years ago, our hospital has been promoting the Baby- Friendly Hospital Initiative, our experience; many mothers have concerns about breast-feeding, including breast-milk insufficiency, decreased infant urination, poor body weight gain, and jaundice". [(5)]

Baby-Friendly practices are based on the foundation that individual attitudes toward breastfeeding are largely influenced by breastfeeding education during the early prenatal period, positive birth and initial breastfeeding experiences, and continued provider support [(6)].

## Objectives of the Study

The main objective of this research is listed in the following points:

**1)** To determine the mother's knowledge concerning initiative breast feeding .

**2)** To identify the relationship between initiative breast-feeding with neonatal jaundice and such demographic data.

## Methodology

**Design of the study:** Correlation design conducted to study the association between the neonatal jaundice with initiative breast feeding through the period Dec.2017-Feb.2018.

**Sample of the study:** probability (purposive sampling) was selected which consists of" (250) mothers who were admitted to pediatric words at Babylon hospital for maternal and children.

**Setting of the study: the study carried out at Babylon hospital maternal and child.**

The study carried out at Babel maternity and pediatric hospital

**Instruments**: The questionnaire was assembled for the purpose of the study. The Instruments consisted"

**Part 1: Demographic Date Sheet:** This part concerned with personal information include"

**Part 2: items related to Mothers knowledge according to WHO instructions for Initiative Breast Feeding**

**Statistical Analysis:** Data were analyzed using the Statistical Package for Social Sciences" (SPSS) "version 19. Through the application of descriptive statistical data analysis include" (Frequencies and Percentage).

## Results

(43.2%) of mothers age where between 26-31, concerning level of education about (47.2%) where not educated , in regarding type of delivery (52%) from them where normal vaginal delivery, concerning disease 82% have not any chronic disease, according to medication 85% where no, in regarding sex 58% where female, concerning gestational age 84% where less than 37, according to Age newborn 35.2% where between 1-5 days, concerning Weight at birth (46.8) where weight between 2600-3100 gm, in regarding Type of feeding (65.2) where breast feeding. Concerning Child order (41.2) where first child. In regarding to jaundice (76) their children with jaundice, according to Type of management (56.8) where with phototherapy. Initiative successful breast feeding ( 78) where No , according to Initial first feeding within first half an hour( 56) were No. concerning Lactate my baby on demands (63.2) where No, in regarding to Lactate my baby on schedule(63.2) where No. according to Exclusive breastfeeding under 6 month (62.4) where No, concerning Take lessons about importance of breast feeding through pregnancy (63.2)

where No. in regarding to Begin with sugar & water support breast feeding (63.2) where No. concerning Evacuate one side on each time of feeding (66.4) where No. according to Lactate baby from both sides equal time (60.8). concerning Using my nipple areola on sucking (64) where No. in regarding I used to keep may baby on pacifier between breast feeding (55.2) where No, according to -I gave my baby such remedies between Br. Milk (63.2) where No, concerning Remedies used once a day in addition to breast milk (64) where No and in regarding Continue on breast feeding with elevation of bilirubin(62.4) where No.

## Discussion

The present study has reported that the highest percentage (43.2%) of the study sample is at age group ranged" (26 - 31) "years old . This study is disagrees with [7] study that found the age range" (20-30)years. "On other side , it agree with [6] study which done in Nigeria when reported that the highest percent" (58.5 %) of the study sample is at age group ranged (≤ 30) years old. [4][3] Concerning level of education (47.2%) of the sample were not educated Which likely to be inconsistent with (Pound,2015) study that who revealed that (57.1) & (56.0) of mothers were Completed university. The highest percent of the respondents (92.0%) were not working , which disagree with [7] study done in Nigeria that showed high rates of awareness of EBF among working class mothers. In regarding type of delivery (52%) from them where normal vaginal delivery ,study [9] present that (62.5%) of neonates with normal vaginal delivery Concerning disease (82%) of sample were not have any chronic disease. [8] and [11] present their sample with no disease through gestation, which reliable with the present study outcome when the respondents have no disease as antenatal. The present study shows that 85% where not taking medication , while in a study of [8] who found that the highest percentage (89.0%) of mothers were oxytocin infusion during labor which may be related to absence of chronic disease .The gender of neonate (58% )where female. as the same output of [11] who found that the highest percentage (48.3) of neonate were

female . Majority of the babies included were (84.0%) were gestational age less than 37 weeks, with(35.2% ) where between 1-5 days age begin to complain from yellowish discoloration. it looks like not the same result of [9] study who present his sample as (78.0) of full term were gestational age. Type of feeding among the babies of the mothers included were the highest percentage (65.2) with breast feeding, which dis agreement with [10]found that increase infant enteral intake There is a positive association between number of breastfeeds a day and lower TSB. According to type of management (56.8) where management with phototherapy , as well as [11]found that (82.9%) received phototherapy . Also in agreement with [12] found that when TSB levels rise above the thresholds stated in guidelines, despite adequate lactation support, phototherapy is recommended as the most effective treatment. Concerning weight at birth (46.8) where weight between 2600-3100 gm., which is alike of [10] study who found that the highest percentage (71.3)of neonate were normal weight. The present study found the child order were the first , which in agreement with [15] "who found that The primi para mother is the one of the risk factor of neonatal jaundice. The primi para mother have totaly 23 present the total case. that is the 30 % neonatal jaundice effected in the case of primi para mother".[15] stated that some herbal remedies taken by the lactating mother may apparently exacerbate jaundice in the infant.

**Association**

This study reveal that no relationship between mothers age and jaundice at p-value (0.61)., which incongruent with (Tavakolizadeh,2018) who found that the maternal age was significantly associated with different levels of bilirubin (p = 0.02), indicating a significant correlation of maternal age with incidence of jaundice.

"Moreover, there is no statistical significant relationship between mother's level of education and jaundice at p-value" (0.61) "This result is in agreed with [10] who found that the level of education was found that not significant relationship with Jaundice p-value"( 0.176).

Scientifically and logically which based on literatures, highly significant relation should be between mother's occupation, type of delivery and jaundice, as mentioned by [10], even though the present results was no statistical significant relationship.

This present study result reveal that no statistical significant relationship between mother's chronic disease and jaundice at p-value (0.75), which congruent with [14] who found that found that there is no significant relationship *found in the familiar history of diabetes, anemia ,thalassemia ) among neonates with different levels of bilirubin (P = 0.2, 0.3, P = 0.06)*

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved and all experiments were carried out in accordance with approved guidelines.

## Abstract

**Background:** The stressful consequences of burns included physical injury, psychological trauma and financial problem not only for the victim himself but also to his family. Burn victims may pass through painful experience until getting improved or unfortunately die from a number of burn associated complications; in addition some of them remain crippled for the rest of their lives. Variations among sociodemographic and cultural characteristics of different nations have variable effects of the outcome of burn injuries.

**Aim of the Study:** The current study was carried out in order to identify demographic characteristics of burn patients in association with outcome of burn injuries in terms of morbidity and mortality during the year 2019.

**Patients and Method:** Burns Specialty Center lies in Al-Diwaniyah province, mid-Euphrates region of Iraq. This region is located southern to Baghdad. It is an agricultural Province with a population of approximately 1.5 million. The Burn center is a referral point for burn victims from this region as well as from other mid-Euphrates regions such as Najaf, Babel, Nasiriyah and Simawa. The total number of burn patients admitted to the center during the year 2019 was 411

**Results:** The present study revealed that the age group 7 to 30 was the most frequently affected group accounting for 42.3 %. With respect to gender, children in the current study showed comparable male and female distribution, but, patients above 6 years of age were more likely to be female than to be male; however, statistical wise the difference was not significant. With respect to circumstances, in the current study home accidents were the most frequent situation of burn injury in which patients were mostly children or adult females. In the current study, the most frequent agent was flame, followed by scald, then electrical and chemical injuries. Mortality rate in the current study was 13.6 %.

**Conclusion:** domestic injuries dominated the circumstances of burn, adult patients were most likely women, flame and oil were the most commonly encountered agents and occupational injuries were mainly seen in adult males.

***Key words:*** *Epidemiology, outcome, burn, Iraq, Al-Diwaniyah Province*

## Introduction

Burns are still among the most frequent kinds of injury, in spite of substantial reduction in its incidence in developed nations, being responsible for a significant proportion of traumatic injuries globally and they are responsible for considerable morbidity and mortality worldwide [1,2]. It is estimated, according to WHO reports, that 5 to 10 % of injuries worldwide are due to burns [3]. Medical authorities have recognized the distressing outcomes of burns and a substantial health budget has been allocated for research works worldwide aiming at reducing or modifying these consequences. The adoption of effective preventive strategies by health authorities

in developed countries has greatly reduced the rate of burns as well as morbidity associating traumatic burn [4-6]; however, burn injuries continue to represent great proportion of trauma in developing countries including Iraq [7-9].

Some forms of burns are accidental and others are intentional; however, deciding the intentional nature of burn injury is often challenging [3]. The stressful consequences of burns included physical injury, psychological trauma and financial problem not only for the victim himself, but also to his family [10-12]. Burn victims may pass through painful experience until getting improved or unfortunately die from a number of burn associated complications; in addition some of them remain crippled for the rest of their lives [13,14].

Variations among sociodemographic and cultural characteristics of different nations have variable effects of the outcome of burn injuries [15,16]. Household setting is by far the most frequent form of burn site because of use of fire in a number of home activities such as cooking or the use of fire for purpose of warming in cold weather or other home related activities in which the misuse of inflammable equipments and tools leads to catastrophic burn injuries; not to forget that some form of home related burns are self inflicted [17,18].

The current study was carried out at Burn Specialty Center at Al-Diwaniyah province, Iraq, in order to identify demographic characteristics of burn patients in association with outcome of burn injuries in terms of morbidity and mortality.

## Patients and Method

Burns Specialty Center lies in Al-Diwaniyah province, mid-Euphrates region of Iraq. This region is located southern to Baghdad. It is an agricultural Province with a population of approximately 1.5 million. The Burn center is a referral point for burn victims from this region as well as from other mid-Euphrates regions such as Najaf, Babel, Nasiriyah and Simawa. The total number of burn patients admitted to the center during the year 2019 was 411. Reported data included age, gender, residency and occupation. In addition, circumstances of burn injury were also reported including place of injury, time of injury, cause, agent (scald, oil, fire) and brief description of events (accidental or suicidal). Clinical assessment of burn wound included: site, surface area, degree, depth, severity, complications and final outcome. These data were collected according to a questionnaire form and interview was made with patients themselves or their relatives in children and severely injured patients. Extent of burn injury in adults was done according to Wallace's rule of nine [19] whereas, lynch and blocker was applied to children. The depth of burn was classified into partial and full thickness burn.

## Results

The current study included 411 patients with an age range of 6 month to 80 years and mean age of 23.95 years.The most frequent age group was 7 to 20 years followed by 21 to 30 years ,as shown in table 1.Children under 7 years have almost equal gender frequency, however,women dominated cases above 7 years, as shown in table 2. Most of cases were from rural residency as shown in figure 1.Regarding circumstances, children and women were mostly affected at home while occupation injury as mostly seen in adult men, as shown in table 3.Fire and oil were the most common causative agents, as shown in table 4. Partial thickness was the most frequent type of burn, figure 2 and the most common outcome was cure ,figure 3.

**Table 1: Frequency distribution of burn patients according to age**

| Age (years) | Number of cases | % |

## Discussion

Burn injuries and their related morbidity and mortality represent a public health problem of increasing importance in developing countries (20). Epidemiological studies of morbidity are essential for effective burn prevention programs because each population seems to have its own epidemiological characteristics and knowledge of the epidemiology of burns is needed to select target groups for preventive measures. Initial management of burn is very important. First aid measures, like wound cleaning and removal of source of injury significantly improve outcome and reduce mortality and health cost. Age and gender are important epidemiologic determinants of burn injuries. The present study revealed that the age group 7 to 30 was the most frequently affected group accounting for 42.3 %. This high rate among young adults and adolescence may be explained by the fact that they are generally active and exposed to hazardous situations both at home and at work. The second most common age was children under 6 years of age accounting for 36.7 %. This may be attributed to unawareness about the dangerous nature of objects they are playing with. The least frequent age group was >40, and this may be explained by their long stay with their families at home which limits their exposure to hazardous situation and this represents a socio-cultural determinant of burn injury. The frequency distribution of burn patients in the current study is comparable to that obtained by other researchers in Egypt and Pakistan [22,23]. The most frequently affected age group in the Egyptian study was 11 to 30 years and that in the Pakistani study was 10 to 30 years, 47.0 % and 55.3 %, respectively. The occurrence of burn injury in a particular age group more frequently that other groups can be attributed to variation in behavioral aspects dominant in that particular age group. In the present studies, most of patients were from rural inhabitants and this may be due to low socioeconomic status, poor education and less availability of safety measures during cooking. With respect to gender, children in the current study showed comparable male and female distribution, but, patients above 6 years of age were more likely to be female than to be male; however, statistical wise the difference was not significant. The predominance of female patients in burn injuries is a common observation by a number of authors [23,24]; however, other authors denied such predominance. Cooking and other domestic activities are the main blamed reason for adult women to outnumber adult men in burn injuries [22]. On the other hand socio-cultural characteristic plays an important role in determining gender variation in incidence of burn injuries in developing countries such as Iraq.

With respect to circumstances, in the current study home accidents were the most frequent situation of burn injury in which patients were mostly children or adult females. This finding agrees with the findings of other previous studies in developing countries [22,23].

Occupational burn injury accounted for a minority of patients in the current study and victims were mostly men. On the other hand, burn due to suicidal attempt of unknown reasons and other causes accounted for small fraction of patients' sample in accordance with some previous studies [23].

In the current study, the most frequent agent was flame, followed by scald, then electrical and chemical injuries. Similar approximate results were recorded by previous authors in developing countries [25,26].

Mortality rate in the current study was 13.6 %. Indeed, the mortality rate in our study is less than that recorded by some previous authors [22,24]. On the other hand, significant proportion of our patients has left the hospital against doctor recommendations which may be explained by poor socioeconomic status or by low level of education. The cure rate in the current study was relatively acceptable.

### Conclusion

Domestic injuries dominated the circumstances of burn, adult patients were most likely women, flame and

oil were the most commonly encountered agents and occupational injuries were mainly seen in adult males. Therefore, measures such as early and proper medical intervention and wear of flame resistant cloths may reduce both the mortality and morbidity associating burn injuries in our country.

# The Effect of Fixed Force Exercises by Using Different Tools in the Values of Some Bio Kinematics Variables to the Hit/Spike Skill in Volleyball for Young People

**Hussein Ali Kadhim[1], Ali Naeem Sultan[2], Amjad Abd Kadhim[3]**

*[1] Faculty of Education for Girls University of Thi-Qar, [2] Ministry of Education – General Directorate for Education / Thi-Qar, [3] University of Thi-Qar*

## Abstract

The muscular training by adopting fixed foundations is a modern training methods which is concerned with the development of muscle strength, in fullest stretch This is due to the quality of the exercises that selected and designed according to the requirements of skill performance which performance is subject to a set of variables that determine the characteristics of this technical performance of the hit/spike skill, it causes production of the kinetic system, needed by good skill performance as well as the appropriate correct compatibility that occurs between the variability in the kinematic and kinetic variables determined by the stress used is the best way to success performance as well as the stabilization and orientation of muscle groups to serve skill performance, so the researchers used the experimental method using experimental design of one group appropriate to the nature of the research, the The study sample was chosen by the researchers in purposive method, numbering 6 athletes, The researchers were keen to apply the stationary strength training using different tools for the purpose of some Bio kinematics indicators and the development of muscle strength for sample members (8) weeks and included (24) training units (3) units per week, The results of the research was the most important that all the exercises used to develop the fixed force, whether the muscles of the legs, torso or arms, increased the efficiency of the internal force, the strength of ligaments in the production of torque force.

***Keywords:*** *Bio kinematics, hit/spike, skill, volleyball, young people*

## Introduction

The great developments in volleyball today in all its skills [1], including the skill of hit/spike led to achieve advanced results in the level of achievement at the Arab and global level because it is one of the skills covered by this development as a result of the competition of the countries of the world in the innovation of modern scientific foundations of training through conducting studies and research, which mixes two or more sciences of Physical Education Sciences [2]. Fixed strength is one of the physical characteristics should developed for volleyball players, which is related to the ability of the athlete and efficiency on the production of muscle strength related to rapid performance. Where the training of musculature by adopting the foundations of the fixed strength of modern training methods [3], which is concerned with the development of muscle strength in the most elastic, this is due to the quality of the exercises selected and designed according to the requirements of skill performance in which the performance is subject to a set of variables that determine the characteristics of this technical performance of the skill of hit/spike , be the cause of the production of the kinetic system, which needs good skill performance as well as the appropriate compatibility [3] that occurs between variance in variables Kinematics and kinetics determined by the stress used is the best way to success performance as well as stabilize and guide muscle groups to serve skill performance and thus develop the level of muscle strength because these exercises put a relatively large muscle effort which leads to Stimulating muscle groups [4] to mobilize as many muscle fibers as possible and possessing the ability of rapid muscle contraction and stimulate them to work with great capacity, in turn contribute to the achievement of effective dynamic and

effective work during the sections of the skill, and in a way that serves the goal of performance is to achieve the farthest distance, [5] whether horizontal during the last step or vertical distance During the final payment, this is a real indicator in the development of the ability of the coach to understand and analyze the skill performance of the players in the light of the information that may help him in determining [6] the kinetic procedures required to accomplish the performance as efficiently as possible with the least effort.

**Research methodology and field procedures**

Research Methodology

The researchers used the experimental approach using a one-group experimental design appropriate to the nature of the research.

**Research Sample**

Six players were selected from the Iraqi volleyball team and deliberately in order to carry out the study and achieve its objectives, and table (1) shows the characteristics of the research sample.

**Table 1. It shows the homogeneity of the sample in the variables of height, age of training and apparent weight**

| NO. | Properties | Arithmetic mean | Standard Deviation | Coefficient of variation |
|---|---|---|---|---|
| 1 | Length (cm) | 188 | 0.72 | 1.96 |
| 2 | Age of training (Year) | 4.83 | 0.35 | 11.16 |
| 3 | Outside weight | 77 | 3.15 | 3.12 |

**Exploratory trail**

Researchers made exploratory trail On Saturday, (1/6/2019) on (3) players from the sample members were photographed to identify the location of the power measurement platform and make the cameras far and high and the clarity of the image and the time required for each shooting and the appropriate time to make the shooting as well as to identify the following:

- Height of cameras

- Identify the difficulties and obstacles that will appear during the implementation of tests and their progress.

- Identify the time to take the tests and how long it takes.

- The possibility of imaging and analysis of the results of mechanical variables.

- The ability of the sample to carry out the tests and their suitability.

- Identify the devices and tools necessary to carry out the experiment and tests.

- The possibility of measuring the strength of the device used.

- The total time required by the experiment and the definition of the team and the nature of the experience and requirements.

**Main trail**

Exercises were prepared after reviewing a set of sources of sports training related to the subject of the research and after presentation to the gentlemen experts have been the application of exercises, the exercise method was (Repeat contraction) in order to improve the fixed strength of the research sample members using different training tools on 5/6/2019 to 6 / 9/2019 in (8) weeks and includes (24) training units, some solid resistances have been used, some of which are manufactured, which allow the player to use technical conditions similar to the technical performance of the skill to develop the fixed muscle strength and muscle

at its maximum elongation and is a new training trend because it focuses on the development of iso-metric contraction which is the boundary between the central and decentralized contractions which contributes to increase The values of muscle strength and thus maintain the momentum of muscular and kinetic momentum at the highest efficiency possible according to the limits of the muscular moment allowed anatomically and technically and thus increase the strength and speed of the costly part of the performance and high efficiency by fixing the tension on the muscle with the Changes and differences in the angles of muscular work during the performance of muscle exercises using fixed resistances, rest was given between iterations according to the time of effort to rest .

The researchers used the method of repetitive training by three training units per week at the time of one training unit (35 - 45 minutes). Below is a summary of how to use the intensity of different exercises:

• For fixed workpiece workouts with fixed solid resistances, the maximum contraction time for a specific time is determined and the training intensity is determined accordingly.

**Statistical means**

The researchers used the SPSS statistical program to process the results.

**Presentation, discussion and analysis of results**

Presentation and discussion of the results of differences in the values of some Bio kinematics indicators for the hit/spike of the pre- and post-test of the research group .

**Table 2 shows the values of the arithmetic media, the standard deviations and the calculated value (T) of the values of some Bio kinematics indicators of the pre- and post-tests of the research group.**

| NO. | Processors Variables | Measuring unit T | Pre-test | | Post test | | Calculated time value | Significance level 0.05 | result |
|---|---|---|---|---|---|---|---|---|---|
| | | | from | s± | from | s± | | | |
| 1 | Approaching speed | m/sec | 3.30 | 0.07 | 0.07 | 3.88 | 18.014 | 0.000 | moral |
| 2 | Cruising speed | m/sec | 2.73 | 0.13 | 0.06 | 3.16 | 8.861 | 0.000 | moral |
| 3 | Angle of advancement | min | 76.62 | 0.74 | 0.53 | 87 | 32.031 | 0.000 | moral |
| 4 | Maximum height | m | 1.34 | 0.01 | 0.01 | 1.48 | 29.238 | 0.000 | moral |

The researchers attribute the reason for this development to the nature of the exercises applied by the research sample using muscle groups to perform in the same general direction to perform the same skill led to the development of the strength of the strength in the muscle groups working in a way that helps the player to complete the kinetic duty in the best technical style, as well as the impact of this positive In developing the efficiency of muscle strength according to the internal and external forces that were consistent with the size of the force generated during the performance, the muscles were stimulated to work with a high force, starting with the change in their length before their shrinking. As the moral differences that appeared in the approach speed variable researchers attribute to the nature of the exercises applied by the research group contributed to

the development of muscle strength and adaptation of muscle groups to shrink strongly and high speed as well as the adaptation of the feet to take the right positions when touching the ground with a little contact area, and to take the situation Appropriate for the method of performance of the skill to be the force projected on the surface of the foot is highly effective and rated time according to the intensity used in training led to sizes or reduce the time touching the ground during the movement and thus increased the speed of the player's thrust towards the ball in a vertical and smooth Good muscular consistency had a great impact on the development of cruising speed as the positive output obtained by the research sample enabled them to push the maximum intraday moment associated with full stretch in a joint and in an ideal manner, which means that the level of progress was faster and better than the level of special force not to mention that it helped On reducing the distance between the center of gravity of the body and the gravitational line, which in turn contributed to the formation of a base or a suitable starting position contributed to positioning the center of body mass at the highest possible point, an effective indicator of its efficiency to shrink as quickly as possible.

| No | | Variables | Measuring unit | Pre-test Experimental group | | Post-test Experimental group | | Calculated time value | Significance Level 0.05 | result |

**Presentation and discussion of the results of the differences in the values of some power-time indicators for the hit/spike of pre- and post-tests of the research group**

**Table 3.** It shows the values of the arithmetic media, the standard deviations and the calculated (T) value of the values of some power-time indicators for the pre- and post-tests of the research group.

The researchers attribute the reason for this development as a result of the impact of stationary strength exercises using various tools applied by the research group on the scientific basis associated with Bio kinematicss, contributed to the development of internal strength and external strength as a result of the players to achieve a high muscle strain or contraction after the change in muscle length as a result of pulling or pushing, Greater than the muscles show in the case of shrinking or kinetic tension, as the player during this exercise works on the use of high strength against the weights are unable to move them and thus reflected positively on the technical performance of the skill and this was evidenced by the increase in the values of momentary mechanical strength This is reflected in the appropriate linear or angular momentum and the possibility of retaining this value during the performance stages because it represents a good flow of movement, as the development in the values of maximum absorption force as it positively affected the maximum force values of the final push because the preparatory section serves the section The main objective is to create the necessary force for the performance of the kinetic , as the preparatory section is directly related to the goal of the skill, while the time achieved indicates the impact of the exercises on the development of strength and increase during the preparatory phase and the player's push towards the ball, As for the time variable power, the researchers believe that the time variable is one of the mechanical variables that play a big role in the variables of power and speed., so it can be important for this variable in achieving linear speed.

## Conclusions

1. The emergence of a clear development in the level of technical performance of the skill of the hit/spike as a result of the development of fixed force using different tools and resistances.

2. All the exercises used to develop the fixed force, whether the muscles of the legs, torso or arms, increased the efficiency of the internal force, the strength of the ligaments in the production of torque force.

3. There was a continuation of the speed between the steps of the rhythm and the last step without any hindering forces that would occur if the jogging was a full contact with the foot as the forces of gravity, weight or friction.

4. The positioning on the lower foot area gives the positive feedback in increasing the momentary momentum and decreasing the relative base of the final base at the moment when the striker prepares him and provides him with a smooth and fast performance that allows to exert the required strength and speed to achieve a good speed and starting angle.

5. Static force training using various tools enhanced the reduction of the contact area of the foot with the ground, which facilitated the application of instantaneous force correctly according to absolute performance angles during the technical performance stages of the hit/spike skill.

6. The diversity in the training load configuration and the methods used in its application, and the nature of the fixed muscle contractions have had a significant impact in the development of mechanical strength of the stages of performance, and the spirit of competition among members of the research group.

## Recommendations

1. Emphasis on conducting fixed strength exercises, especially for muscles working on the joints of the hips, knees and ankles, as well as on the muscles working on the joints of the shoulders, elbows and wrists, as applied in the research to its importance in achieving speed approach approaching and positioning the center of body mass at the highest possible height due to the development of muscle strength During performance.

2. Conducting strength exercises with fixed resistances, can contribute to the integration of performance and increase the efficiency of muscles and adapted to the goal of the required movement.

3. Conducting complementary studies aimed at studying other Bio kinematics variables (kinetic energy, angular power, etc.).

4. Emphasis on the application of various fixed strength exercises to develop the strength of the muscles stretching responsible for the maintenance of skill performance and integration.

# Nurses' Knowledge, Attitude and Practice Towards Preparedness of Disaster Management in Emergency of Mosul Teaching Hospitals

**Nasir M. Younis[1], Mahmoud M. Ahmed[2], Ahmed A. Hussein[2]**

*[1]Assist.Prof, MScN. CH.N, University of Mosul/ College of Nursing. Iraq, [2] Instructor, MScN. CH.N, University of Mosul/College of Nursing. Iraq, [3] Instructo, MScN. CH.N, University of Mosul/ College of Nursing. Iraq*

## Abstract

**Background:** Disasters define as event everywhere in the world every day and have a significant impact on individuals, families, group and communities.

**Objectives**: The aim of the study was to assessment the nurses' knowledge, attitude and practice about preparedness of disaster management in emergency of Mosul teaching hospitals/Iraq

**Materials and Method:** In a cross-sectional analysis. The questionnaire consists of (4) main sections: section one demographic date e.g: (age, sex, experience, education level, marital status, and hospitals). Section two included: (47) items related to level of knowledge among nurses about disaster preparedness. Section three consists of (11) elements concern attitude about disaster management. Section four related to practice of regarding disaster management.

**Results:** indicated the finding of the study nurses' knowledge, attitude and practice about preparedness of disaster management in emergency department of Mosul teaching hospitals are highly significant.

**Conclusion:** Through the findings of the study concluded that the awareness or knowledge of nurses is high with a neutral level of attitude, also practice with respect to disaster preparedness was satisfactory.

***Keywords**: Knowledge, Attitude , practice, Disaster Management.*

## Introduction

Disaster is the main functional degradation or loss of resources such as life, economy and buildings [(1)]. Disasters event everywhere in the world and have influence on people, families, group and communities [(2)] . The first decade of the 21century had increased consciousness of the possible danger posed by disasters, both natural and manmade, to modern society [(3)]. Disasters can be categorized to natural and manmade natural disasters occur from natural causes which include volcanic eruptions, hurricanes, burning, which tornadoes. Infectious catastrophes may also be marked as pandemic [(4)] .While (Hassmiller and Stanley, 2013) stated the disasters can be three categorized group included: natural disasters such as floods, droughts, earthquakes, disease epidemics, technical incidents such as fires, structural failure, radiological accidents, civil / political events such as attacks, terrorism and biological warfare[(5)]. Approximately 48% of all disasters occurred in 2014 in asia had an area that was largely disaster-induced, reporting that (90.13percent) of worldwide disasters came through asia [(6)]. In Iraq[(7)] , an epidemiological study between years (2008-2012) indicate that the highest death rate due to disasters, including terrorism, was in 2008 due to sectarian conditions at a rate of (24.36%). Disaster preparedness, risk assessment and multidisciplinary management of all levels of the system, is essential to providing

successful solutions to a disaster stricken population's short and long term health needs[8]. The World Health Organization has recommended that all countries must be prepared for crisis they face crisis and most nurses have ineffectively trained for disasters [9]. The recovery mechanism is structured to handle disasters and help those who are at risk of catastrophe and recover after the crisis has been caught up to allow the individuals who have been impact to benefit from the catastrophe [6]. Nurses 'role in and recovery of disaster management includes emergency preparedness, prevention, response and recovery from emergencies and after disasters [10] In Iraq the last fifteen years the frequency of disasters has increased, especially terrorism and traffic accidents.The aim of the study to assess of KAP of nurses' in disasters management at teaching hospitals in Mosul City.

## Methodology

This study employed a questionnaire to evaluate the awareness, attitude and practice of nurses in Mosul's teaching hospital / Iraq about disaster management preparedness. The research sample conducted at Mosul teaching hospital included: (Ibu-Sena Teaching hospital, Al-Jumhoury teaching hospital, General Mosul hospital, Al-khansia teaching hospital and Abu-ather teaching hospital) only, nurses workers in emergency department . In the present analysis a cross- method was applied and Consisting of nurses (76). Data obtained since December 10, 2019 extended to December 30, 2019. This instrument adapted by (Miller,2011; and Moabi,2008). Consists of (4) main sections: section one demographic date e.g: (age, sex, experience, education level, marital status, and hospitals). Section two included: (47) items included: MCQ , True and False, protected information disaster management and preparedness questions with each question listed as correct (=1) and incorrect (=0). Section three consists of eleven elements classified as agree, disagree and unsure for determining the checklist of attitudes about disaster management. Four section practice of regarding disaster management current procedures included concerns about emergency exercises conducted at their healthcare facilities, what types of exercises are undertaken, ongoing preparation, how frequently, updating the emergency plan .The data were analyzed using the SPSS (V:22) and descriptive statistics and inferential statistics (means of score , standard deviation and frequency) between nurses, awareness or knowledge , attitude and practice on disaster management preparedness in Mosul hospital teaching

## Results

## Discussion

The present study was aimed to investigate nurses' KAP regarding preparedness of disaster management in emergency of Mosul teaching hospitals/Iraq. Table (1): showed that the study respondents were aged between (22-32) years with a mean score of (28.40±7.67).The educational standard for approximately (64.5 percent) nursing diploma. There was almost (85.5 per cent) married, the present study found that two thirds of emergency nurses were female, this could be attributed to the large number of female nurses who were frequently present during the morning shift, almost (39.5%) male, female were (60.5%) this result was accepted with [(1)], found the majority of the sample were women. Table (2): show that the level of disaster knowledge fell between two-thirds of the study sample in the group of (13-24) degree of 47 degree with average score of (22.35±5.95) by very significant differences in value t=(55.82) and P≤ (.001). study in Jordanian by (Khalaileh,2012) were investigated of awareness, and preparedness for disaster management.The results suggested that knowledge need to be continually improved in order to change the efficacy for disaster response, and an Integrated emergency Preparedness Program to raising awareness about disaster management. Table 3: shows the percentages of the research participants 'agreement on disaster preparedness attitude that were as follows: (64.5%) agreed on the need for awareness of emergency plans,(72.4%) appropriate preparation should be prepared in the event of a catastrophe,(52.6%) emergency readiness should be planned for all people in the hospital environment,(75%) possible disaster threats should be recognized and addressed, (81.6%) preparation is required for all healthcare management, (79%) emergency planning is important, (71%) emergency plans should be revised regularly,(43.5%) accidents are likely to occur in every hospital setting,(54%) emergency management is for all healthcare teams,

(69.7%) catastrophe scenarios should be routinely conducted in hospitals and (77.6%) exercises should be conducted in hospitals. A highly significant difference of attitude was found (t value = 64.289, and P≤.001). Several KAP studies on disaster and emergency preparedness for nurses were performed. A research conducted by Hong Kong nurses found that nurses are not sufficiently trained for disasters, but are mindful of the need for such preparedness. Furthermore, emergency management instruction will be included in nurses basic education [(14)]. Table 4: reveals that 44.5 percent of the participants in the study were conscious that emergency drills are being performed at their healthcare settings. 21 percent said they weren't done and 14.5 per cent said they didn't. 15.8 percent did not know what kind of drills were done. They reported code blue and fire evacuation of the remaining 56.5 per cent. 42.1 per cent claimed their healthcare facilities had ongoing preparation. 31.6 percent reported that the training was conducted quarterly, 29 percent had not been completed and 39.4 percent had not. There was a highly important difference in the degree of activities as t value = 43.23 and P≤ .001.This research in Egypt (Khalil, et al., 2019) disagreed with the present report, showing that there was no substantial difference between the activities of nurses regarding disaster preparedness and their demographic characteristics.

## Conclusion

Through the findings of the study concluded that the

awareness or knowledge of nurses is high with a neutral level of attitude, also practice with respect to disaster preparedness was satisfactory.

## Recommendation

Based on the findings of this report, the researchers suggested that emergency nurses need to incorporate explicitly named theory and practice; teaching disaster and emergency preparedness courses in nursing curricula is important and appropriate in terms of their preferences for training.

# Molecular detection of Virulence Factors genes Associated with Immune Resistance in Klebsiella *pneumonia*

**Nihad Jawad Kadhim [1], Hayder Shkhair Al-Janabi [2], Mohanad Jawad Kadhim[3]**

*[1] M.Sc.,[2] Prof. Dr., [3] Assist.Prof. Dr., Department of Biotechnology, College of Biotechnology, Al-Qasim Green University, Babylon, Iraq*

## Abstract

The current study was aimed to genotypically detection of genes encode outer membrane proteins related with human serum resistance. A total of 33 isolates were identified as Klebsiella *pneumonia* according to the manual cultural characteristics and biochemical tests and then confirmed by Vitek -2 system. The number of isolates according to site of infection were 14 (42.4%) isolates from wound infection, 15(45.4%) isolates from urine, 1(3.03%) isolates from blood, 1(3.03%) isolates from vagina,1(3.03%) from ear swab and finally 1(3.03%) isolates from stool. The present study demonstrated a positive relationship between the ability of bacterial isolates to antibiotics resistance and the occurrence of some virulence genes. The molecular detection of some virulence genes (*htrA, rmpA, mrkA and iss*) was done by conventional PCR technique. It was found that ,high occurrence of *htrA* gene was observed among *Klebsiella pneumonia* isolates which was found in 26(78% ) of isolates at 1071bp , then 17(51%) isolate were positive for *rmpA* gene at 967 bp,whereas *mrkA* gene was recorded in 5(15.15%) isolates at 862 bp , and only 4(12.12%) isolates gave positive result for *iss* gene at 450bp.

***Key words**: Klebsiella pneumonia, molecular detection, virulence gene.*

## Introduction

*Klebsiella pneumonia* is commonly dispersed in the gastrointestinal, urinary, and respiratory tracts of healthy people [1]. It causes opportunistic infections and nosocomial infections; it is a popular hospital-acquired pathogen causing severe respiratory infections such as pneumonia. Other infections caused by this organism include urinary tract infection, wound infection, abscesses, sepsis, inflammation, and diarrhea [1]. *K. pneumonia* have different virulence factors which provide bacteria the capacity to invade the host, such as capsular polysaccharide, lipopolysaccharide, serum resistance, siderophores production, fimbriae and other factors such as the production of urease and enterotoxin [2,3]. However, antibiotic resistance properties are the major factor in its pathogenicity that it resists for a wide spectrum of antibiotics and specially β-lactam antibiotics ,particularly those involved in nosocomial diseases [4,5]. The *mrk*A gene encodes the fimbrial subunit, which is polymerized to form the helical fimbrial shaft the adhesive subunit, with the ability to bind to collagen molecules, is encoded by *mrk*D and located at the tip of the fimbriae [6]. *Iss* gene has been localized to gain virulence plasmids and shares sturdy similarities with the bor gene from bacteriophage [7]. *htr*A gene is now of interest because *htr*A mutant strains of several gram-negative bacteria have been shown to be attenuated in animal models and can also be used as vaccines [7]. *rmp*A gene the regulator of the mucoid phenotype A (*rmp*A) is a mucoid factor which is responsible for the regulation of the capsular polysaccharide biosynthesis Cheng (2010). Wide spreading of K. *pneumonia* infections and antibiotic resistance properties for a large spectrum of antibiotics appeared among K. *pneumonia* isolates were a cause to study the prevalence of some virulence genes associated with serum resistance among K. *pneumonia* isolates in Babylon province, Iraq as indicator for distribution of the bacterial infections.

## Materials and Method

### Isolation and Identification

Thirty-three isolates of Klebsiella *pneumonia* were

collected from different clinical sources (urine, blood, stool, vagina, ear swab and wound) from patients were admitted to Hilla teaching hospital, AL-Hashimia general Hospital and medical city of Merjan in Babylon province during the period from July 2019 to December 2020. Each specimen was inoculated on selective media and identified by biochemical reaction according to the diagnostic procedures recommended in (Forbes *et al.*, 2007). Diagnosis was established by the automated method Vitek® 2 (BioMérieux).

**Molecular Detection of Some Virulence Factors**

We using PCR technique for detection of some virulence gene include (*htrA, rmpA, mrkA and iss*)

**Extraction of Bacterial DNA**

The whole bacterial DNA was extracted from bacterial isolates by using Genomic DNA Mini Bacteria Kit that provided by the company favrgen, tiwan). The DNA solution was stored at -20°C till used in PCR.

**PCR Amplifications**

Recognition of virulence genes in *Klebsiella pneumonia* isolates was achieved by amplifying PCR. The PCR primers were provided by (Techne (UK). The product size and sequences of the PCR primers are showed in Table 1.

**Table 1: The size and sequences of primers used in current study**

## Results and discussion

The distribution of bacterial genes according to the site of infection

The study showed that *K. pneumoniae* isolates were distributed regarding different site of collection as the following: 14(42.4%) isolate from wound, 15(45.4%) isolates from urine, 1(3.03%) isolate from blood, 1(3.03%) isolate from ear swab,1(3.03) from stool and also 1(3.03%) isolate from vagina (Table 2, 3). The prevalence of, *htrA*, *rmpA* (42.4%) (21) wound *mrkA* and *iss* genes was (9%), *htrA* (27%) *rmpA* (21%), *mrkA* (21%), *iss* (0%) urine. The total of gene *htrA* (78%), *mrkA* (21%), rmpA (18%) and iss (12%) (table 2).

The virulence-associated phenotypes including complement resistance, adhesion and invasion, and

maintenance within macrophagesThese result was agreed with several previous studies like that established by Ravichitra et al. (2014) and Biradar et al. (2015), whose found that K. pneumoniae was the most typical member of Klebsiella spp. Which will cause severe infections.

**Table 2: Distribution of *Klebsiella pneumonia* isolates according to the site of infection (N=33)**

| Site of infection | No. of K. pneumoniae | Percentage (%) |
|---|---|---|
| Wound | 14 | 42.4 |
| Urine | 15 | 45.4 |
| Blood | 1 | 3.03 |
| Vagina | 1 | 3.03 |
| Stool | 1 | 3.03 |
| Ear swab | 1 | 3.03 |
| Total | 33 | 100% |

**Table 3: The distribution of virulence factors genes among bacterial isolates according to site of infection**.

| Source of isolate | htrA (%) | rmpA (%) | mrkA (%) | iss (%) |
|---|---|---|---|---|
| Wound | 14/33(42.4%) | 7/33(21%) | 3/33(9%) | 3/33(9%) |
| Urine | 9/33(27%) | 7/33(21%) | 1/33(3%) | 0/33(0%) |
| Blood | 1/33(3%) | 1/33(3%) | 1/33(3%) | 1/33(3%) |
| Vagina | 0/33(0%) | 1/33(3%) | 1/33(3%) | 0/33(0%) |
| Stool | 1/33(3%) | 0/33(0%) | 0/33(0%) | 0/33(0%) |
| Ear swab | 1/33(3%) | 1/33(3%) | 0/33(0%) | 0/33(0%) |
| Total | 26(78%) | 17(51%) | 6(18%) | 4(12%) |

Phenotypic detection of Virulence factors:

Virulence factors of *Klebsiella pneumoniae* demonstrated in this work included production of capsule, serum resistance and biofilm formation.

Capsule production:

The results all *Klebsiella pneumoniae* isolates(100%) were positive for capsule production These results in the present study agreed with power *et al.,*(2004), who found that capsule production is considered as an important virulence factors in bacterial pathogenicity because capsular material forms thick bundles of fibrillous structures covering the bacterial surface in massive layers.

**Biofilm Formation ability by *Klebsiella pneumoniae*:**

Biofilm formation ability of *K. pneumoniae* was investigated in this study and the results showed that 2 isolates (10%) strong, 9 isolates (30%) had moderate capacity of biofilm formation, while only 15 isolates (40%) were weak producers of biofilm, and non 7isolates (20%).

Biofilm formation capacity of *Klebsiella pneumoniae* in the current study was tested on ELISA plate as an inanimate object. *K. pneumoniae* has a tendency to form biofilms on biotic and abiotic surfaces, including catheters and other medical devices, which is a contributing factor to their antibiotic resistance (Van Laar *et al*.,2014). Several factors required for biofilms formation have been identified in *K. pneumoniae* clinical isolates from the gastrointestinal tract and in strains that are associated with pneumonia and urinary tract infection (Wu *et al*.,2011).

The bacterial isolates were also tested for serum resistance at an absorbance of 630 nm. The results showed that 15% of *Klebsiella pneumonia,*

**Molecular characterization of *K. pneumoniae* isolates:**

**Detection of *rmpA*, *iss* and *mrkA, htrA* genes:**

four selected genes were investigated in this study to explore their role in the pathogenesis of *Klebsiella pneumoniae* associated diseases. These genes were *iss* gene (4) positive, *mrkA* gene (5) positive, and *htrA* gene (26) positive, *rmpA* gene (17) by PCR technique.

In this study *mrk*A (Mannose resistant *Klebsiella* polypeptide A) gene 862BP five represent positive isolates disagree with ( Nathalie *et al*;2003) Twenty-three (69.7%) of the 33 type strains tested type 3 fimbriae may provide different functions for the bacteria, one enabling a specific receptor-ligand interaction with host cells and tissues and the other facilitating attachment to abiotic surfaces and then outgrowth of the bacteria as an efficient biofilm in several environments. Type 3 fimbriae-dependent adherence may be the first step in *K. pneumoniae* colonization of non-biological surfaces and biofilm development and thus could be a major virulence determinant in nosocomial infections. However, since some highly adherent strains (Nathalie *et al*;2003)

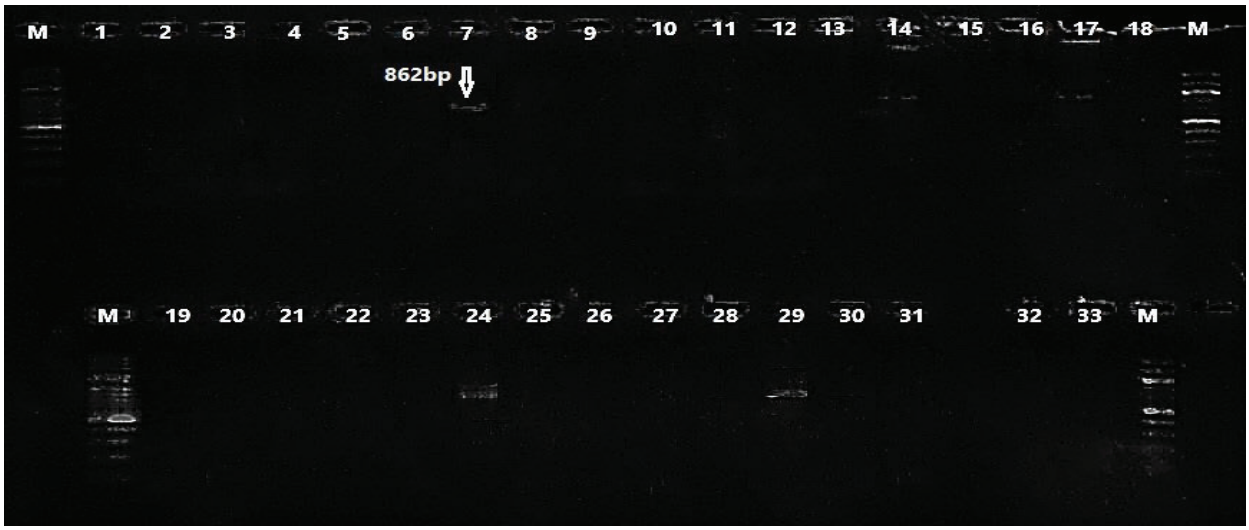

**Figure 1: performed of polymerase chain reaction with mrkA gene of *K. pneumoniae* isolates, 1.5 agarose. 72volts 60 min: M:100bp DNA marker Lane (7,14,17,24,29) Amplified PCR product of *mrk*A gene.**

The presence of *rmp*A gene has been associated with the hypermuscoviscosity phenotype in K. pneumoniae, and was found to be more prevalent in liver abscess strains than in bacteremia isolates (Yu *et al*., 2006).

In this study *mrk*A (Mannose resistant *Klebsiella* polypeptide A) gene 862BP five represent positive isolates disagree with ( Nathalie *et al*;2003)Twenty-three (69.7%) of the 33 type strains tested type 3 fimbriae may provide different functions for the bacteria, one enabling a specific receptor-ligand interaction with host

cells and tissues and the other facilitating attachment to abiotic surfaces and then outgrowth of the bacteria as an efficient biofilm in several environments. Type 3 fimbriae-dependent adherence may be the first step in *K. pneumoniae* colonization of non-biological surfaces and biofilm development and thus could be a major virulence determinant in nosocomial infections. However, since some highly adherent strains (Nathalie *et al*;2003)

It was first reported in 1989 by (Nassif *et al*., 1989) and is the first one explained that remove of the *rmp*A gene can decrease about 1000 fold of virulence in mouse lethality tests, in spite there was a positive relationship between virulent *K. pneumoniae* and the presence of *rmp*A gene, but this gene remained unknown for many years.

The *rmp*A gene is the most frequently occurring ones, the latter being associated with *K. pneumoniae* hypermucoviscosity and high virulence (Chang *et al*.,2013). The *rmpA* gene is located on a 180-kilo base of multi copy plasmid, is a strong virulence plasmid and it has an important role in expressing the mucoid phenotype of *K. pneumoniae* (Suescun *et al*., 2006).

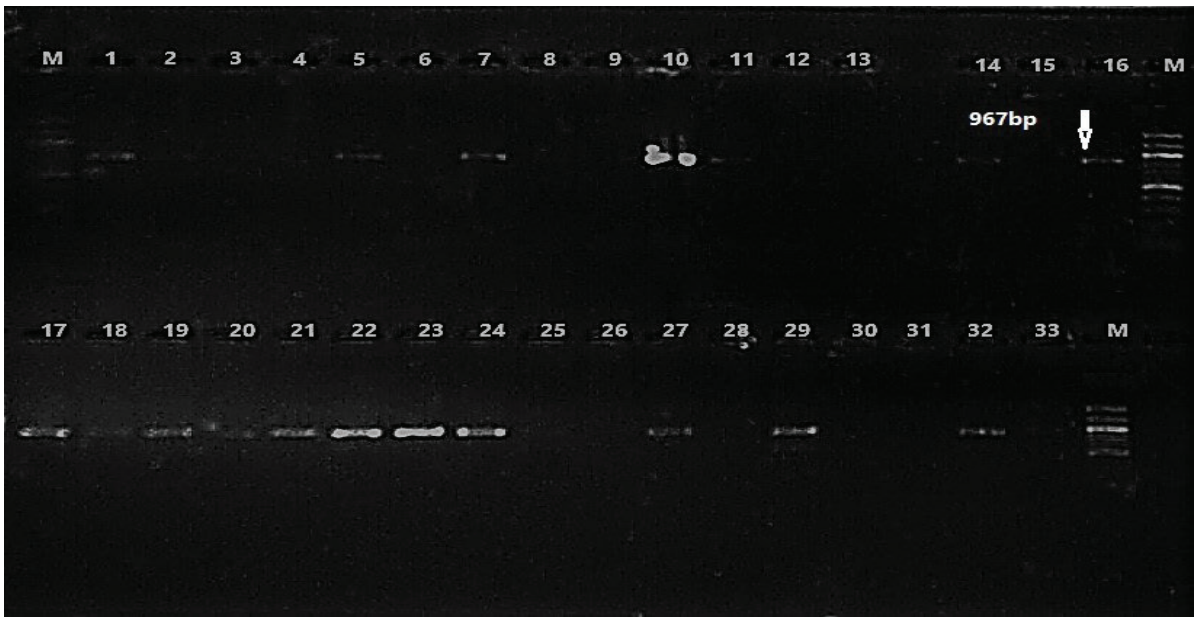

**Figure 2: performed of polymerase chain reaction with rmpA gene of *K. pneumoniae* isolates, 1.5 agarose. 72 volts 60 min: M:100 bp DNA marker Lane (1,5,7,10,14,16,17,18,19,20,21,22,23,24,27,29,32) Amplified PCR product of *rmp*A gene.**

*Htr*A: *htr*A (high temperature requirement A) gene is now of interest because *htr*A mutant strains of several gram-negative bacteria have been shown to be attenuated in animal models and can also be used as vaccines [7]. In this study *htr*A gene1071BP **(**26) represent positive isolates.

Downregulation of bacterial transmigration by *H. pylori htr*A mutations. Polarized monolayers of MKN28 cells were infected by *H. pylori* wild-type or mutant strains. The mutant strains (N6 Δ*htr*A, N6 Δ*htr*A/*htr*AN6 and N6 Δ*htr*A/*htr*AS221AN6 encode the same SecAR837K mutant variant). Transmigrated bacteria were quantified by counting CFUs. All experiments were done in triplicates (Anna Zawilak *et al*.,2019).

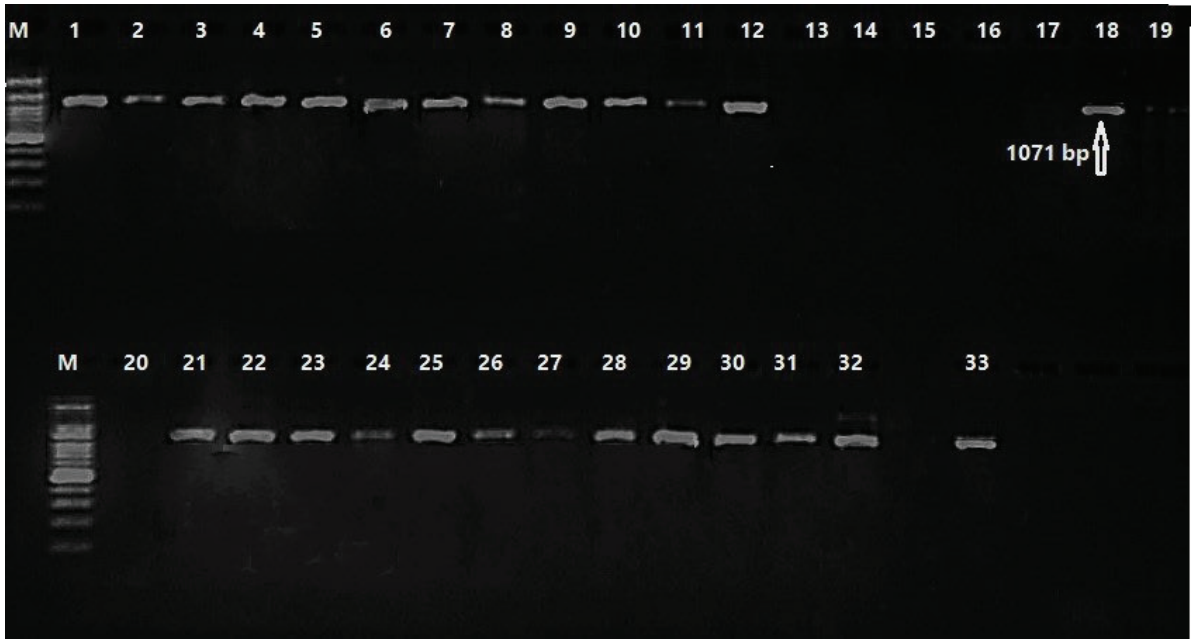

**Figure 3: performed of polymerase chain reaction with hrtA gene of *K. pneumoniae* isolates, 1.5 agarose. 72 volts 60 min: M: 100 bp DNA marker Lane (1,2,3,4,5,6,7,8,9,10,11,12,18,21,22,23,24,25,26,27,28,29,30,31,32,33) Amplified PCR product of *htr*A gene.**

The increased serum survival protein (*iss gene*) has an action in defense to serum complement Nolan, (2003). The *iss* has been known for its activity in virulence of extraintestinal pathogenic *Escherichia coli* strains (ExPEC) Hassan, (2011). The *iss* gene is recognized as one of the most common virulence genes in extraintestinal pathogenic strains in poultry. The occurrence of immune resistance among Enterobacteriaceae family was a cause to study the prevalence of genes associated with serum resistance among Enterobacteriaceae

Among all patients diagnosed with *K. pneumoniae,* Lin *et al.,* (2015). The prevalence of, *htrA*, *rmpA* (42.4%) (21) wound *mrkA* and *iss* genes were (9%), *htrA* (27%) *rmpA* (21%), *mrkA* (21%), *iss* (0%) urine. the total of gene *htrA* (78%), *mrkA* (21%), rmpA (18%) and iss (12%).

The virulence-associated phenotypes including complement resistance, adhesion and invasion, and maintenance within macrophages These results was agreed with several previous studies like that established by Ravichitra *et al*. (2014) and Biradar *et al*. (2015), whose found that K. pneumoniae was the most typical member of Klebsiella spp. Which will cause severe infections.

# Evaluation of Technical Quality and Procedural Errors of Root Canal Treatment Performed by Undergraduate and Postgraduate Dental Students: A Retrospective Radiographic Analysis

**Ahmed H. Ali [1], Noor H. Fadhil [2], Ahmed G. Al-Maroof [1]**

*[1]Lecturer, [2] Assistant lecturer, BDS., MSc., Department of aesthetic and restorative dentistry, College of Dentistry, University of Baghdad, Baghdad, Iraq*

## Abstract

**Aims**: To assess and compare the technical radiographic quality of root canal fillings (RCF) and the occurrence of procedural errors in the endodontic treatment performed by 5th grade undergraduate and postgraduate students in the College of Dentistry/University of Baghdad- Baghdad- Iraq.

**Materials and methods**: Records and periapical radiographs of 216 and 143 root-filled teeth treated by 5th year undergraduate and postgraduate students, respectively during 2018-2019 were collected. Periapical radiographs of 35 (16.2%) and 15 (10.4%) teeth, respectively excluded because of inadequacy in the radiographs. A final total periapical radiographs/records of 181 and 128 root-filled teeth were used to evaluate the technical quality of the root fillings in 197 and 275 root canals treated by 5th year undergraduate and postgraduate students, respectively. Outcome variables categorized as acceptable and not acceptable quality depending on the absence/presence of overfilling, underfilling, voids in the fillings and the absence/presence of ledges, root perforation, transportation, and fractured instruments. Chi-square and 2 sample z tests were used for statistical analysis, significance level set at $\alpha=0.05$

**Results**: Acceptable RCF were in 49.3% and 63.3% of the canals treated by 5th year undergraduate and postgraduate students, respectively with a significant difference between them ($z=2.99$, $p<0.05$). 55.1% and 44.9% of RCF treated by undergraduate students were in anterior and premolars, respectively. 70.9%, 20.7% and 8.4% of RCF treated by postgraduate students were in molars, premolars and anterior teeth, respectively. Significantly more voids, ledges were observed in RCF performed by undergraduate compared to postgraduate students ($z=4.6$ and 2 respectively, $p<0.05$). In contrast, significantly more instrument separations were observed in RCF treated by postgraduate compared to undergraduate students ($z=2.09$, $p<0.05$). However, there was no significant difference in proportions of underfilling, overfilling, perforations, transportation between the two academic levels.

**Conclusion**: Overall technical quality of RCF performed by postgraduates was better than that of 5th year undergraduate students, however, improvement in preclinical and clinical training is needed.

## Introduction

Prognosis of the root canal treatment strongly affected by the technical quality of the coronal restoration and the root canal filling in order to preserve the functionality of the root filled teeth [1]. There are several factors that affect the technical quality of root canal treatment including the density and length of the filling material from the radiographic apex as well as the occurrence of iatrogenic procedural errors that happens during different stages of root canal treatment such as ledge formation, perforations, instrument fractures and transportation [2]. Although, measuring different technical

quality variables of root canal treatment do not measure its outcome, but greater probability of successful outcome associated with good technical quality of the root canal treatments [3]. A study found that the only predicting factor fortooth survival was the technical quality of the root canal filling not the presence of pretreatment periapical pathology [4].

Density of root canal filling (i.e. presence/absence of voids in the filling materials) represent a significant variable in determining the technical quality of root canal filling. It has been reported that unfavorable treatment outcome of root canals is correlated with low dense and non-homogenous root fillings. Also, it was demonstrated that homogenous voids free root fillings are associated with lower risk of post treatment pathology [5,6]. Extent of the length of the root filling materials in the root canal similarly can be correlated with the outcome of the treatment. It has been found that distance of 0-2 mm between the root filling and the radiographic apex is associated with lower risk of post treatment disease than those underfilled (with more than 2mm distance between filling materials and the radiographic apex) [2,7,].

Canal cleaning and shaping can be compromised by incidence of procedural errors that result in inadequate filling of the root canal which risk the prognosis of the treatment [8]. There is always possibility of failure when procedural errors occur during root canal treatment of infected teeth [9]. Perforations of the root can impair the healing process as it is associated with infection of periodontal ligaments and bone [10]. On the other hand, transportation associated with leakage in the root filling and inadequate cleaning of the canal, both may result in apical pathosis persistence [11]. Also, ongoing periapical pathosis after root canal treatment can results frequently after ledge formation because it prevent complete chemomechanical debridement of the canal to the full working length [8]

Many previous epidemiological studies evaluated the technical quality of root canal treatment performed by dental students in different academic institutions with variable results [12,13,14]. However, to authors knowledge, there is no previous study investigated the technical quality and incidence of procedural errors in root canal filled teeth performed by undergraduate and postgraduate students in the College of Dentistry/ University of Baghdad. The aims of the present study are to evaluate and compare the density and length of the root canal fillings and the incidence of procedural errors (perforations, transportation, ledge formation and instrument separation) by reviewing the radiographs of root canal treatments performed by 5th year undergraduate and postgraduate students in the authors' institute.

## Materials and Method

Dental record and periapical radiographs of 216 and 143 teeth received root canal treatment performed by 5th year undergraduate and postgraduate students in the year 2018-2019 in the College of Dentistry/University of Baghdad were collected for analysis of the technical quality and incidence of the procedural errors.

Three periapical radiographs for each tooth including diagnostic, working length estimation and post obturation periapical radiographs were utilized for this purpose. Post obturation PA radiographs that do not provide adequate information because of poor processing or unclear image were exclude from the analysis. Therefore, periapical radiographs and records of a total 309 (181 and 128 teeth root filled by 5th year undergraduate and postgraduate students, respectively) teeth were utilized in this study. Data analysis was based on the number of the filled canals not on the number of teeth, therefore 309 teeth yielded 473 root canal fillings. Radiographs examined with magnification lens (3X magnification) in a dark room under even illumination by two experienced endodontists. All teeth treated by the 5th year undergraduate students were instrumented with step-back technique using stainless steel hand instruments and obturated with gutta-percha and sealer (Zinc Oxide eugenol based), using a cold lateral condensation technique. Teeth treated by the postgraduate students were instrumented with either NiTi rotary instruments or hand instruments and obturated with either cold or hot techniques according to student discretion.

Root canal filling quality classified acceptable if the filling materials end within 0-2 mm from the radiographic apex and there were no voids within the filling materials and no space between the filling material and the canal wall. If the filling materials end shorter than 2 mm from the radiographic apex then the root canal filling classified as underfilled, if the filling materials end beyond the radiographic apex, the root

canal filling classified as overfilled. Both underfilled or overfilled root fillings classified as not acceptable root canal filling. [13,14]

Similarly, evaluation criteria for the procedural errors classified the root canal fillings into acceptable/ not acceptable based on the absence/presence of the followings:

1- Ledges: a ledge was identified in the radiograph if the path of the filling materials deviated from the original curvature of the canal in the working length radiograph.

2- Perforation: a perforation was identified if the filling materials was extruding through the lateral walls of the canal away from the radiographic apex.

3- Transportation: a transportation was identified if the filling materials located on the outside curve of the canal.

4- Instrument separation: an instrument separation was identified if fractured instrument piece was detected in the canal.

Statistical analysis of data performed using Statistical Package for the Social Sciences (Version 24; SPSS Inc., IBM, Chicago, Illinois, USA), descriptive statistics were used to describe the data and inferential statistics included Chi square and two samples z-test for 2 population proportions, significance level set at $\alpha$=0.05

## Results

Total number of acceptable root canal fillings was 272 out of 473 (57.5%) for both academic levels. Acceptable root canal fillings were found in 49.3% and 63.3% of the canals treated by 5$^{th}$ year undergraduate and postgraduate students, respectively with a significant difference between them (z score=2.99, $p<0.05$), as shown in Table 1.

**Table 1: distribution of acceptable and not acceptable root canal fillings among 5th year undergraduate and postgraduate students.**

| Academic level | Acceptable RCF N (%) | Not acceptable RCF N (%) | Total N (%) |
|---|---|---|---|
| 5th year undergraduates | 98 (49.3) a | 100 (51.7%) | 198 (100%) |
| Postgraduates | 174 (63.3) a | 101 (36.7) | 275 (100%) |
| Total N (%) | 272 (57.5%) | 201 (42.5%) | 473 (100%) |

RCF= Root canal fillings, N=number of root canal fillings, %=percentages and identical superscript represent statistical significance among relevant groups.

In root canal treatments performed by 5$^{th}$ year undergraduate, 133 (67.2%) and 65 (32.8%) of root canal fillings were in maxilla and mandible, respectively. Insignificantly, more acceptable root canal fillings occurred in the maxilla (50.4%) compared to the mandible (47.7%) ($p>0.05$). 55.1% and 44.9% of RCF treated by 5$^{th}$ year undergraduate students were in anterior and premolars teeth, respectively, as shown in Table 2. Acceptable root canal fillings were 52.3% and 46.1% in anterior and premolar teeth, respectively, with no significant difference between anterior and premolars ($z=0.8$, $p>0.05$). Procedural errors, voids, underfilling and overfilling in root canal fillings performed by undergraduate students were as follow, perforations were in 2 root canal fillings (1%), ledge was in 3 root canal fillings (1.5%), transportation was in 1 root canal fillings (0.5%), instrument separation was in zero root canal fillings (0%), voids were in 51 root canal fillings (25.7%) and underfilling was in 31 root canal fillings (15.6%) and overfilling was in 24 root canal fillings (12.1%).

**Table 2: distribution of root canal fillings performed by 5th year undergraduate' students in arches according to tooth type.**

| Arch | Anterior | Premolars | Total n(%) |
|---|---|---|---|
| Maxilla n(%) | 92 (46.5%) | 41 (20.7%) | 133 (67.2%) |
| Mandible n(%) | 17 (8.6%) | 48 (24.2%) | 65 (32.8%) |
| Total n(%) | 109 (55.1%) | 89 (44.9%) | 198 (100%) |

n=number of root canal fillings.

In root canal treatments performed by postgraduate students, 53.8% and 46.2% of root canal fillings were in mandible and maxilla, respectively. Insignificantly more acceptable root canal fillings occurred in the mandible (67.6%) compared to the maxilla (58.3%) ($p>0.05$). 70.9%, 20.7% and 8.4% of root canal fillings treated by postgraduate students were in molars, premolars and anterior teeth, respectively, as shown in Table 3. Acceptable root canal fillings were 67.2%, 56.1% and 47.8% in molars, premolars, and anterior teeth, respectively, with no significant difference between molars, anterior and premolars ($z=1.8$ $z= 1.5$, $p>0.05$, respectively). Procedural errors, voids, underfilling and overfilling in root canal fillings performed by postgraduate students were as follow, perforations were in 2 root canal fillings (0.7%), there was no ledge in any root canal filling, transportation was in 1 root canal filling (0.3%), instrument separation were in 6 root canal filling (2.1%), voids were in 27 root canal fillings (9.8%) and both underfilling and overfilling were in 35 root canal fillings (12.7%) each.

**Table 3: distribution of root canal fillings performed by postgraduate students in arches according to tooth type.**

| Arch | Anterior | Premolars | Molars | Total n(%) |
|---|---|---|---|---|
| Maxilla n(%) | 21 (7.6%) | 41 (14.9%) | 65 (23.6%) | 127 (46.2%) |
| Mandible n(%) | 12 (0.7%) | 16 (5.8%) | 130 (47.3%) | 148 (53.8%) |
| Total n(%) | 33 (8.4%) | 57 (20.7%) | 195 (70.9%) | 273 (100%) |

n=number of root canal fillings.

Significantly more voids, ledges were observed in root canal fillings performed by 5th year undergraduate compared to that performed by postgraduate students ($z=4.6$ and 2.0 respectively, $p<0.05$). In contrast, significantly more instrument separations were observed in root canal fillings treated by postgraduate compared to 5th year undergraduate students ($z=2.09$, $p<0.05$). However, there was no significant difference in proportions of underfilling, overfilling, perforations, transportation between 5th year undergraduate and postgraduate students, as shown in Table 4.

**Table 4: Distribution of acceptable and not acceptable (voids, underfilling and overfilling and procedural errors) root canal fillings among 5th year undergraduate and postgraduate students.**

| Academic level | Acceptable root canal fillings | Not Acceptable root canal fillings | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | Voids n(%) | Underfilled n(%) | Overfilled n(%) | Ledges n(%) | Perforations n(%) | Transportation n(%) | Instrument separation n(%) |
| 5th year undergraduate | 98 | 51(25.7)a | 31(15.6) | 24(12.1) | 3(1.5)b | 2(1) | 1(0.05) | 0(0)c |
| Postgraduates | 174 | 27(9.8)a | 35(12.7) | 35(12.7) | 0(0)b | 2(0.7) | 1(0.03) | 6(2.1)c |
| Total n* | 272 | 78 | 66 | 59 | 3 | 4 | 2 | 6 |

n= number of root canal fillings. numbers in parenthesis are percentages. identical superscript letters represent significant difference between relevant groups. *some of the canals show two technical problems.

## Discussion

Materials used for this study consisted of dental records and periapical radiographs of teeth received root canal treatment by the 5th undergraduate and postgraduate students. In total 473 root canal fillings were selected in both jaws with no significant difference between the number of root canal treatments performed in the maxilla or in the mandible. In this sample, it was found that postgraduate students treated more root canals in molars than in any other tooth group in comparison to undergraduate students who treated only anterior and premolar.

Previous studies reported different rates of acceptable technical quality of root canal treatments performed by dental students ranging from 23%-74% Our results are within the middle range 57.5% for both academic levels. However, acceptable technical quality of root canal treatment was lower in the treatments performed by the 5th year undergraduate student compared to that performed by the postgraduate students (Table 1), this can be attributed to the greater experience accumulated in the postgraduate students and the use of advanced endodontic tools such as NiTi rotary instruments and developed obturation techniques that help in performing root canal treatments with better technical quality.

Our results show that voids of root canal fillings were numerous among treatments performed by 5th year undergraduate students compared to that performed by postgraduate students (25.7% vs 9.8%) with significant difference between both academic levels (Table 4). This can be attributed to techniques difference in instrumentation and obturation of root canals utilized by both academic levels. Undergraduate use step back and cold lateral condensation techniques for instrumentation/ obturation of root canals compared to using NiTi rotary instruments and thermal compaction by the postgraduate students. It has been reported that cold lateral condensation was associated with more voids compared to thermal compaction (Kierklo et al., 2015). Figures of voids or density problems reported by previous studies evaluated the technical quality of root canal treatment performed by dental undergraduate students were 65.1%, 15% and 7.34% in [13, 14]. Presence of voids can significantly be associated with unfavorable outcome of the treatment and post treatment disease, Denser and more homogenous filling materials associated with better outcome. # Studying the Problems of Attracting Attention in the Physical Education Lesson for the Preparatory Stasge from the Female Teachers Point of View

**Jihan Karim Amana[1], Mohssen Ali Musa[2]**

*[1]M.Sc., Student, [2] Prof. Dr., College of Physical Education and Sports Science*

## Abstract

The lesson of physical education is more vulnerable to the problems of attracting attention as it is in a wider area and includes freedom of movement and flexibility in dealing in the classroom and sometimes the distraction in the physical education school increases due to the large number of female students, thus providing the opportunity to practice such behavioral problems, since the practice of sports activity, especially the physical education lesson, is appropriate for free behavior and from it turns into an abnormal behavior as a result of being affected by the family circumstances to which the female students belong, Hence the importance of this research shows that the problems of attracting attention If the professors, educators, and researchers do not work with research to determine it, which leads to female students' personal and social maladjustment in and outside the school, then when these problems are left without supervision, it may lead to their increase and the difficulty of dealing with them, In addition to the inability of female students to agree in the school, and therefore, a barrier between them and benefiting from the school's educational and educational services that achieve integrated and balanced growth for all aspects of personality, to qualify them for the right citizenship in line with the goals of society, As for the research methodology, the researcher used the descriptive approach in the survey method to suit the nature of the research problem. As for the research sample, the research community was identified as physical education female teachers in Dhi Qar Governorate for the preparatory stage as shown in table (1) so the number of schools reached (50) schools, while the number Female teachers reached (235) Female teachers. As for the research findings, the most important of them is the scale that was prepared by researchers as a tool to uncover problems of attracting attention in the lesson of physical education for the preparatory stage from the point of view of female teachers. They resort to attract the attention of others With negative behavior.

***Keywords:*** *problems, physical education lesson, preparatory stage, female teachers*

## Introduction

The lesson of physical education is more vulnerable to the problems of attracting attention as it is in a wider area and includes freedom of movement and flexibility in dealing in the classroom and sometimes the distraction in the physical education school increases due to the large number of female students [1], thus providing the opportunity to practice such behavioral problems, since the practice of sports activity, especially the physical education lesson, is appropriate for free behavior and from it turns into an abnormal behavior as a result of being affected by the family circumstances to which the female students belong, And their social and cultural level and the lesson of physical education [2], therefore, attention to behavioral problems is one of the important pillars of education and its importance comes from the fact that education means a change in the behavior of female students towards the best under the influence of conditions, experiences, knowledge and skills that students pass in educational and educational situations, so the impact of education and education is evident In the positive behavior of female students [3], as what appeared to be unwanted behavior among female students was worthy of study and research, Hence the importance of this research shows that the problems of attracting attention If the professors, educators, and researchers do not work with research to determine it,

[4] which leads to female students' personal and social maladjustment in and outside the school, then when these problems are left without supervision, it may lead to their increase and the difficulty of dealing with them, In addition to the inability of female students to agree in the school, and therefore, a barrier between them and benefiting from the school's educational and educational services that achieve integrated and balanced growth for all aspects of personality, to qualify them for the right citizenship in line with the goals of society [5]. Therefore, the two researchers decided to go into this study to find out the reasons that contributed to the existence of these behavioral problems and identify them as a contribution from us in determining these behaviors in an accurate scientific way through building and applying [6] a scale of attention-grabbing problems in the lesson of physical education for the preparatory stage from the viewpoint of female teachers in Dhi Qar Governorate .

**Research methodology and field procedures:**

**Research methodology**

The researchers used the descriptive approach in the survey method to suit the nature of the research problem. "Descriptive research" aims to determine the conditions and relationships that exist between the facts and appearances and the survey method seeks to collect data from community members to try to determine the current state of society in a particular variable or two variables.

**Populations and research sample**

The research community was identified as physical education teachers in Dhi Qar Governorate for the preparatory stage, as shown in Table (1), as the number of schools reached (50) schools, while the number of female teachers reached (235)

**Table (1) Number of female teachers, surveying personnel, and construction and implementation samples**

| | Administrative Unit | Populations | Study sample | ratio | Construction sample | ratio | implementation samples | ratio |
|---|---|---|---|---|---|---|---|---|
| 1 | Nasiriyah | 50 | 2 | | 36 | | 12 | |
| 2 | Shatra | 43 | 1 | | 30 | | 12 | |
| 3 | Gra'af | 40 | 1 | | 21 | | 18 | |
| 4 | Batha'a | 20 | 2 | | 13 | | 5 | |
| 5 | Souq Al-Shouokh | 35 | - | 4.25 % | 18 | 67.5 % | 17 | 45 % |
| 6 | Al-Fadhliyah | 12 | 1 | | 4 | | 7 | |
| 7 | Al-Islah | 15 | 3 | | 7 | | 5 | |
| 8 | Syed Dakhil | 20 | - | | 6 | | 14 | |
| 9 | Total | 235 | 10 | | 135 | | 90 | |

**Devices that used in the research**

- Laptop (Acer)
- Manual calculator (kenko)

**Tools that used in the research**

- Arabic and foreign sources and references.

- International Information Network (Internet) .
- Auxiliary Work Team.
- Pens and pencils.

**Main research procedures**

The researchers prepared a questionnaire to measure the problems of attracting attention in the lesson of physical education for the preparatory stage (for female students) from the viewpoint of female teachers of physical education in a manner appropriate to the scientific foundations from which the subject of its research was launched.

**Final implementation for scale**

The researchers applied a questionnaire to measure attention problems in the physical education lesson on a sample consisting of (90) female teachers of physical education from the research community, and this sample is called (sample application scale) and their percentage reached about (45%) of the parent community, and that was on the corresponding Tuesday 20/2/202.

**Presentation, analysis and discussion of results**

**Display the results of the mea arithmetic mean and standard deviation and the value of the hypothetical mean and the lowest and largest value of answers to the field of Attract attention to the implementation sample and discuss it.**

| Field | Sample | Arithmetic mean | Standard deviation | hypothetical mean | Lowest value | largest value | (t) Value | Significance level | result |
|---|---|---|---|---|---|---|---|---|---|
| Attract attention problems | 90 | 90.544 | 10.798 | 90.544 | 88.282 | 92.806 | 79.545 | 0.000 | moral |

Table (2) Arithmetic mean and standard deviation and the value of the hypothetical mean and the lowest and largest value of answers to the field of Attract attention

In light of the results extracted for the individuals of the research sample in Table (14), it shows the value of the arithmetic mean for the field of attention-attracting problems (90,544) and with a standard deviation (10.798) and the hypothetical mean value was (90,544) while the calculated value of T was (79,545) at the level of significance (0,000) less than (0.05).

This indicates that female students have the desire and need for physical education teachers or their colleagues to accept them and have a special status, through their attempt to attract their forced attention, but some of them fail to achieve this with desired behavior in it, and perhaps we find that female students use verbal or other behavior Verbal to attract the attention of the rest of the students or the school of physical education leaving the motor duties assigned to them and this of course greatly affects the educational and educational goals, so when the student finds an overwhelming pleasure to come up with some movements and behaviors that everyone laughs inevitably, this behavior will affect the time of hers Unless there are efforts made to prevent them to curb such behavior and drive the wheel in the direction previously planned, which made them search for praise and praise with unacceptable behaviors.

Indeed, female students who are unable to achieve standing among others in a socially acceptable way resort to using unacceptable behavioral patterns to attract attention in order to achieve basic personal goals, perhaps the most important of which is related to achieving social status for students among their peers, which enhances their social identity, and gives them the opportunity to impose control, and gain Power and influence, and hence challenge existing power and ultimate immersion in love for adventures.

The researcher stresses that the problems of attracting attention (the search for status) are the main behavioral problems after the aggressive behavior

faced by physical education teachers during the lesson educational institutions with the accompanying methods of silver or material to disturb the system within the lesson, which in turn affects the concept of physical education and its status as an educational system has His goals which seek to improve the general human performance through the chosen sporting activities as an educational mediator characterized by educational and educational characteristics in preparing students for a comprehensive and integrated preparation to be good citizens who benefit themselves and their country.

The researcher believes that such behavior is predominant in the nature of psychological disorder, whose phenomena are kinetic or silvery of an abnormal, it appears that it arises from the imbalance between the tendencies and impulses of students and the adjustment system, and when the adjustment is inappropriate, they resort to compensation in another field for their academic failure, and this What "Suhair Ahmed 2001" referred to by saying: Compensation is the individual's tendency towards another behavior as compensation for behavior that he has failed and failed in order to reduce the tension resulting from the severity of frustration that he is exposed to. Therefore, the behavior of female students becomes aggressive, dispersed and unpredictable, and when the adjustment is very strict, the student tries to stop her behavior continuously and is unable to express herself, therefore, the intervention tactics help female students to develop appropriate control of their tendencies, and the researcher adds that such Such behaviors do not happen by chance or by force, but are the results of past experiences.

**Inferences and recommendations**

In light of the research results and the statistical analysis of data obtained from the behavioral problems scale in the physical education lesson, the researcher reached the following inferences :

- The scale that has been prepared by researchers is a tool for detecting attention-grabbing problems in a physical education lesson for middle school from the teachers' point of view.
- Middle school students at age experience difficulties in proving themselves, so they resort to attracting the attention of others through negative behavior.
- Middle school students seek to compensate for their feelings of dissatisfaction with themselves, a lack of some aspect of their personality, or a lack of self-confidence motivating them to work to attract attention.
- The preparatory stage students do not have the ability to coordinate between the satisfaction of their needs and the requirements of the school environment, forcing them to lead to improper behavior.

**Recommendations**

Use the research tool to measure the problems of attracting attention to the preparatory stage for students to identify the problems that teachers face in implementing physical education lesson activities.

- Overcoming the difficulties and behavioral problems, such as the problems of attracting attention that face prep students, by holding workshops or training courses for psychological counseling.
- Study factors affecting behavioral problems such as methods of socialization, cultural, economic and social level of the family and other factors.
- Using the proposed methods to address behavioral problems in the physical education lesson for primary school students and middle school students.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved and all experiments were carried out in accordance with approved guidelines.

# Study the Correlation between Serum level of Interlukin 6 and Lactate Dehydrogenase in Myeloma Patients at Stage III with Serum Creatinine and Calcium Level

**Shaymaa Obaid Abdullah[1], Hussein Jasim Al-Harbi[2]**

*[1] Department of biology, College of Science for women, University of Babylon, Iraq,*
*[2] Department of biology, College of Science, University of Babylon, Iraq*

## Abstract

Multiple myeloma (MM) still an incurable disease that require better recognition and more research. Many previous studies shown the interaction between myeloma cells and bone marrow stromal cells for the initiation and progression of multiple myeloma . Many chemokines and their receptors including interleukin-6 (IL-6) an play important roles in this interaction. The main purpose of this study is assess the serum level of IL-6 and Lactate dehydrogenase on stage-III of MM patients and healthy controls then Finding the correlation with creatinine and calcium levels. Serum level of IL-6 , Lactate Dehydrogenase , creatinine and calcium levels of (30) MM patients diagnosis at stage –III according to International staging System (ISS) were measurement. The results for these parameters compare with (30) age- and sex-matched healthy controls groups. The results were showed that the mean levels of IL-6 , Lactate dehydrogenase , creatinine and calcium (increased or decreased)high significant ($p \leq 0.001$) when compared with healthy controls . The results of the study suggested the important role of chemokines including IL-6 in the progression of the disease and its relationship with some biochemical parameters , especially in the stage-III of the disease.

***Key Word** : Multiple Myeloma , Interleukin 6 , Lactate Dehydrogenase . stage III*

## Introduction

Myeloma or multiple myeloma (MM) are referred as a cancer of antibody producing cell (plasma cells) which derived from B-cells in the bone marrow [1]. it is a incurable malignant disorder characterized by a multifocal proliferation of clonal, long-lived plasma cells within the bone marrow (BM) and associated skeletal destruction, serum monoclonal gammopathy protien, immune suppression, in addition MM is a debilitating disease with features including hypercalcaemia , renal impairment, anemia and bone disease (summarized in the mnemonic CRAB)) causing a wide variety of complications leading to organ [2] dysfunction and eventually death [3].

IL-6 is a major pro inflammatory a soluble mediator cytokines with a pleiotropic effect on immune response , inflammation and hematopoiesis [4]. When it was detected functions of IL-6 were studied and given several names based on their biological activity. For example, the name B-cell stimulatory factor 2 (BSF-2) was based on the ability IL-6 to induce differentiation of activated B cells into plasma cell ( antibody (Ab)-producing cells , the name hepatocyte-stimulating factor (HSF) on the effect of acute phase protein synthesis on hepatocytes, the name hybridoma growth factor (HGF) on the enhancement of growth of fusion cells between plasma cells and myeloma cells, or the name interferon (IFN)-b2 owing to its IFN antiviral activity [5]. in 1986 Hirano and his Colleagues successful in cloned of BSF-2 c DNA [6], and, it was found that the molecules with different names studied by various research teams were in fact identical, resulting in the single name IL - 6 (Rossi *et al* , 2015). Human IL-6 is made up of 212 amino acids, including a 28-amino-acid signal peptide [4]. The research that dealt with in the biology of MM has shown new insights into the factors that control the growth and survival of myeloma cells. Among the growth factors, interleukin-6 (IL-6) has an essential role where it is involvement in the development of normal plasma cells [7]. also it now

is clear that IL-6 is a potent myeloma cell growth factor involved not only in vitro but also in vivo [8]. Because the essential role of IL-6, it could serve as a target for new therapeutic interventions. Neutralizing the effect of IL-6 may result in a regression of tumor progression [9].

## Subjects and Method

**1-Patients & Healthy** : The study subjects comprised of 30 MM patients( 17 male and 13 female) , age (mean ± SD) = 62.34 ±5.68 (ranging from 45 to 80 years) These patients were suffered from MM diagnosis at stage III according to ISS where the level of Beta2microglobulin ≥ 5.5 mg/L , and were referred to the Hematology Consultation Clinic in each of the teaching hospitals at Baghdad governorate (medical city) , Babil governorate (Marjan city) . Those MM cases then have been diagnosed by a specialized haematologist . Diagnosis was based on bone marrow aspiration, biopsies reports and other diagnostic criteria included complete blood counts (CBC) , serum protein electrophoresis and renal function (urea and creatinine) .. The healthy group included 30 individual (15 male, 15 female) age (mean± S.D) = (55.96 ± 4.7) (range 45 to 60), not suffer from any disease, served as a control group and this group matched with patient group. All subjects in this study were taken consent before participation in this study.

**2-Biomarkers analysis** : Venous blood samples were drawn from patients and control subjects by using disposable syringes . (5) ml of blood was obtained from each subject , pushed slowly into disposable gel containing tubes , allowed to clot at room temperature for 15 minutes and then centrifuged at 3000 rpm for approximately 10-15. minutes , after that sera was obtained and stored at -20˚C until used (Lipppi *et al* ,2007). Quantitative detection of IL-6 in serum was done according to the industrial company (Bioassay Technology Laboratory (China) , that depended on the technique of the quantitative sandwich enzyme immunoassay (ELISA) and Blood chemistry (Lactate dehydrogenase , creatinine and calcium) was assayed in serum using a clinical chemistry analyzer (kit from Shanghai Fosun Long March Medicine and Science co., Ltd.)

## Statistical Analysis

Analysis of data was made by using Statistical Package for Social Science (SPSS) system/ version 23 Results expressed as mean ± Standard division S.D . The analysis of variance (ANOVA),the independent sample T- test, and correlate bivariate were used for this purpose.

## Results

Demographic data and clinical characteristics of MM patients and healthy controls are summarized in Table 1. The mean serum level of IL-6 in stage-III MM patients was 123.57±17.22 ng/L , where it was higher than the mean of controls, which is 58.8± 294.61ng/L , A similar results was observed of biochemical parameters ( Lactate Dehydrogenase , Calcium , creatinine ) record significant rise in MM patients compared with healthy controls figure (1) B, C, D. The mean of all parameters that measured in current study in females patient was higher from male patients . The result of the correlation and linear regression of IL-6 and LDH with calcium and Creatinine are follow: There were significant positive correlations ($p < 0.05$) between IL-6 with calcium and creatinine level also there were positive correlation between LDH with calcium and creatinine Figure (2), (3) respectively.

## Discussion

The pathogenesis of multiple myeloma was complex. The change of the level of cytokines took effect in its occurrence and development the disease [20] . Increased secretion of cytokine by bone marrow stroma often plays a main role in the pathogenesis of some of the clinical signs of multiple myeloma, such as bone disease and renal dysfunction. In our current study, a statistically significant higher level IL-6 was observed in the blood serum of myeloma patients at stage III according to ISS groups as compared to the healthy control group. Many studies have shown that serum levels of IL-6 are elevated in patients with MM and correlate with the severity of the disease as [11] other study as Bataille *et al* (2008) . showed that in patients with stage III MM, based on the Durie and Salmon classification, levels of IL-6 were significantly higher compared to patients with stage I and II disease. In addition, it was noted that elevated levels of IL-6 in serum was a good predictor of the severity of the disease . IL-6 is a pleiotropic cytokine that was originally identified as a T cell-derived lymphokine inducing final maturation of B cells into (plasma cell) antibody-producing cells [18] also has been shown to regulate cell growth and It stimulates the growth of myeloma cells [15]. it has been reported that IL-6-induced lymphoblastoid tumorigenicity due possibly to the inhibitory effect on tumor immunity of very high concentrations of this cytokine [12]. Therefore, it seems possible that IL-6 stimulates the growth of myeloma cells

via autocrine and/or paracrine mechanisms and might contribute to tumor escape from immune surveillance, resulting in disease progression through the increased production of IL-6. Also patients with metastatic renal cell carcinoma have higher serum IL-6 levels than those without disseminated disease [23] . also , Alexandrakis *et al*. (2003) [10] have reported that the levels of cell factors of MM patients such as serum IL-6 and angiogenine were increased significantly. And the increase degree was parallel to clinical staging and severity of diseases. It indicated that the level of IL-6 was concerned with MM progression and the severity. Renal impairment (RI) and osteolytic is one of the most common complications of MM [13] indicates a higher tumor burden and consequently more aggressive disease Heher (2013) . Also In our current work, we found a positive correlation between the level of IL-6 with the level of creatinine and calcium while Singh *et al* , (2015) [22] found elevated in IL-6 in MM patients also there is positive correlation between IL-6 and creatinine level and no correlation between IL-6 with calcium. High levels of LDH are associated with advanced disease and poor survival where our results record significant increase in LDH level in stage III MM patient in addition the result of study Proven presence the positive correlation between LDH with creatinine and calcium level in MM patients. This indicates the progress of the disease where LDH is a cytoplasmic enzyme and may have been observed in nearly all major organ cells. If cells lysis occurs, or cells and membranes are damaged, cytoplasmic enzymes, such as LDH are released into the extracellular area. therefore serum LDH levels are as useful markers like beta-2microglobulin and monoclonal immunoglobulin. During the observation of the patients with MM at stage III, if the LDH levels are abnormally high, the progression of the disease should be considered .

# Direct Vision Comparison of Lip Curvature between Genders in Fully Edentulous Patients

**Zahraa S. Karkosh**

*M.Sc. prosthodontics, University of Babylon, Iraq*

## Abstract

Upper lip Curvature is a location of the oral commissure relative to the center of upper lip lower border. The aim of this study was to find the relation between gender and lip curvature. A special tool had been made to help in measurement of lip curvature. There was no significant relation between gender and curvature, however upward group was the highest one followed by straight then downward group.

***Keywords:*** *lip curvature, gender, patients, Direct vision*

## Introduction

Smile of human being is a complex expression, result from combined effect of facial musculature [1]. A smile express itself mainly in oral and eye region [2]. However, lip curvature define as the position of the corners of mouth relative to the center of lower border of upper lip influenced by the age and gender [3-6]. Upper lip curvature can be divided into three categories according to the positioning of the oral commissure relative to the center of the upper lip lower border, Upward when the oral commissure is higher than the center of the upper lip lower border , straight when the oral commissure and the center of the upper lip lower border at the same level and downward when the oral commissure is lower than the center of the upper lip lower border [6,10-12], There are higher rate percentage of expressing downward curvature of their lips in both cuspid and gummy smile , and upward curvature in spontaneous smile [3], however; Upward and straight curvatures are considered more esthetic than the downward curvature 6. In past a study done by Tjan AH, 1984 to evaluate the aesthetic and smile by visual examination. Many investigations for study lip curvature depended on esthetics of smile used a static pictures or direct measurements [4-7]. while in classical mode, photography captures only photos of fixed smile at certain points that made the smile appear unnatural, even during a posed smile [4-5]. With the development of imaging and the emergence of digital imaging, studies conducted with digital photography showed that smile could be achived in more noticeable and less patient interfering way [8,9]. Another research was conducted to determine ways for calcalate dyanimic smile process and for classification spontaneous smile and upper lip curvature in Chinese Han-nationality youths.

## Materials and Method

This study based on the examination of edentulous patient in the prosthodontic department of Babylon university collage of dentistry. The Study had been compared the curvature of lip line between male and female of edentulous patient. The number of the examined patients were 52 patients who divided into two groups (26 male and 26 female), those patients have no any systemic disease and their ages range from 45-65years old.

Group number1: edentulous male patient

Group number2: edentulous female patient

A special device had been constructed in this study that consist of three parallel horizontal rulers connected by two vertical rods; the upper and lower rulers are fixed. The upper part was parallel to the interpapillary line, the middle ruler that can move vertically up and down while the down ruler was parallel to the lower border of upper lip line (figure 4&5). The patient set on dental chair in upright position. The examination done by stabilization the middle ruler on the

Lower border of the upper lip without smile and then asked the patient to smile and said (cheese) to determine the lip curvature.

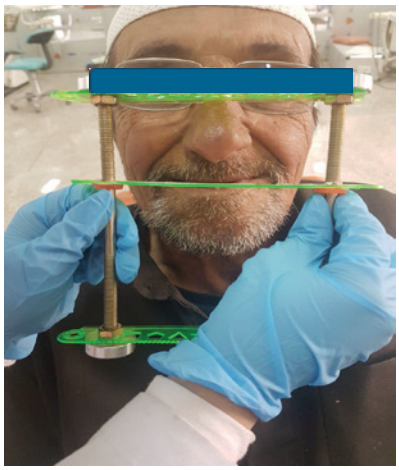

**Fig 1 In this picture the position of corner of the mouth upward to the lower border of the upper lip line during smile when patient say cheese or just smile and take the picture at this moment**

**Fig 2 In this picture the position of the corner of the mouth parallel to the lower border of the upper lip line during smile**

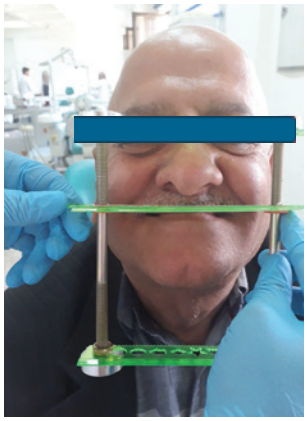

**Fig 3 In this picture the position of the corner of the mouth down to the lower border of the upper lip line during smile**

**However;** The primary results that I had, leading me to develop the previous simple device into more developing and complicated device that will give more precise results and multi-uses purpose.

The purpose of this device is to measure:

1- Midline of face.

2- Lip curvature

3- Comparing the distance of upper 3rd , middle 3d and lower 3rd of face.

Component of device:

1- Upper horizontal ruler must be parallel to interpapillary line

2- Middle horizontal ruler parallel to the lower border of upper lip line

**3- Lower horizontal ruler.**

4- Ruler in midline.

Benefit of device

It help to measure the symmetry of face, lip curvature (upward, straight or downward) and comparing the different parts of face . This idea based on idea of trubyte device that consist of transparent plate, drawn on it eyes, nose and mouth that help to measure the symmetry of face and choosing artificial teeth, however; the trubyte has fixed drawn parts but this device has adjustable ruler that give different measurement special for each patient .

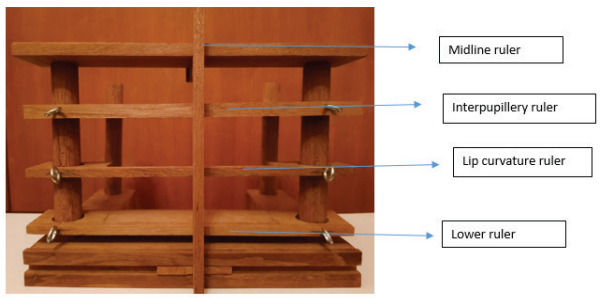

**Fig: modified device.**

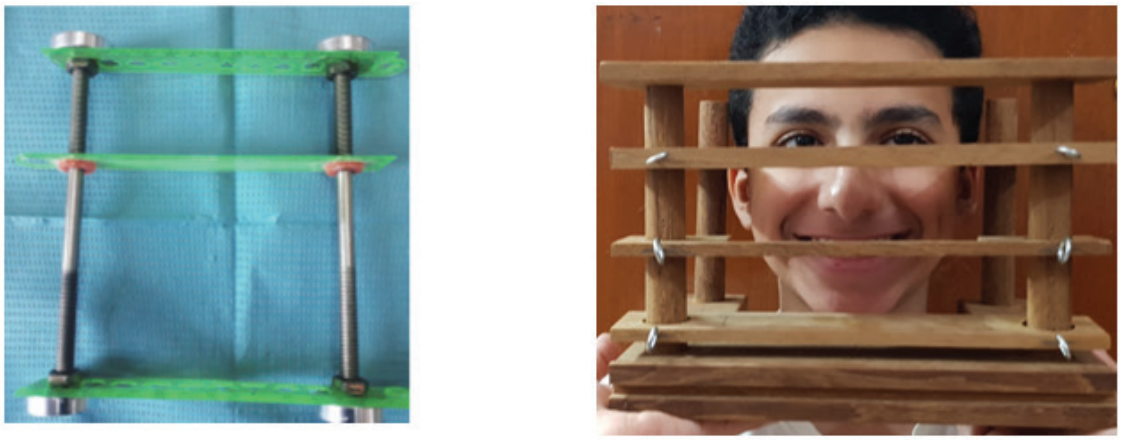

**Fig 4 1st model had been used for lip curvature measurement**

## The Results

In Table 1 reveal relation between the number of male and female. Table 2 reveal the relation between gender Frequencies for upper lip curvature in this study. Figure 5 express the Distribution pattern between types of upper lip curvature in male and female in this study while in Table 3 the Chi-Square Tests showed that there is no significant correction between arc smile & gender.

**Table 1 this table showed the frequency of the number of male and female.**

| Gender | Number |
|---|---|
| Male | 26 |
| female | 26 |

**Table 2 this table showed the frequencies with gender.**

| Gender | Smile arc | | | Total |
|---|---|---|---|---|
| | Upward | Straight | downward | |
| Male | 12 | 6 | 8 | 26 |
| Female | 10 | 8 | 8 | 26 |

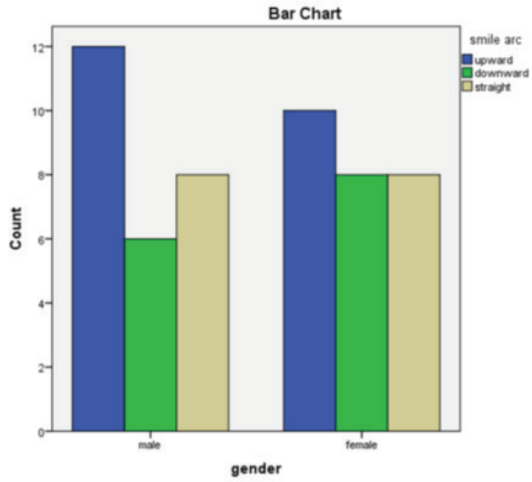

**Figure 5 Distribution of different types of upper lip curvature in male and female in this study.**

| Table 3: Chi-Square Tests that appears there is no significant correction between arc smile & gender. | |
|---|---|
| | Asymp. Sig. (2- sided) |
| **Pearson Chi-Square** | .792 |

## Discussion

Smile is the most complex and sophisticated facial expression, formed from synergic action of facial expression muscles [1]. During smile evaluation and anterior esthetic construction, the anatomic and racial variations should be considered in order to achieve better matching results [1] .

In this study table No.2 & figure 6 the result was the highest number in upward groups followed by straight while the lowest were in downward group of the upper lip curvature, This result disagree with Hulsey 10 that had been found the highest number were in straight group.

In table No. 9 had been found there is no significant relation between arc smile & gender, however; there were no theory agree or disagree with the results of this study.

This result may be probably due to age of patients (45years) who seek for dental consultation immediately after losing of their teeth so this patients maintain the activity of the muscle that it responsible for movement of the lip. This agree with (American orthodontics Samir E. Bishara) which found no significant relation between male and female for age groups (15_ 25 years) and similar trends continued between 25 and 45 years old of age [15].

However with respect to the ageing of soft tissues there is continual decrease in facial skin elasticity and formation of skin folds and wrinkles due to loss of subcutaneous fat hence this decrease the total facial volume [14] .

## Conclusion

In this study, it had been found that there is no significant relation between arc smile & gender; however, the upward groups had the highest number. The reason may return to age or duration loosing of teeth.

# Evaluation of Nurses' Evidence-based Practice at Primary Health Care Centers in Baghdad City

**Ali Hadi Muosa[1], Mohammed Fadhil Khalifa[2]**

*[1]M.Sc., Academic Nursing Specialist, High Institute of Health Vocations, Ministry of Health and Environment, Iraq; [2]Prof. Dr., Department of Community Health Nursing, College of Nursing, University of Baghdad;*

## Abstract

**Objectives:** The study aims at evaluating the nurses' evidence-based practices at primary health care centers in Baghdad City.

**Methodology:** A descriptive design is carried out at Baghdad City's primary health care centers from January 2en 2019 to June 1st 2020. One instrument is developed for the purpose of the study. A Non-probability, multi-stage purposive sample of (52) staff nurses, who are working at primary health care centers in Baghdad City**.** The instrument is concerned with the evaluation of nurses' evidence-based practices through (43) items which are divided in to five main domains of attitudes, knowledge, beliefs, readiness and applications of evidence-based practices. Content validity of the questionnaire is determined by panel of (10) experts and Internal consistency reliability, Split-half technique, is obtained through Cronbach alpha correlation coefficient. Data are collected through the use of the study instrument and the interview technique as means of data collection. Data are analyzed through the use of descriptive statistical data analysis approach of frequencies, percentages, total scores and ranges.

**Results:** The study findings indicate that the majority of the staff nurses have experienced poor level of knowledge, attitudes, beliefs, readiness and application as dimensions of nurses' evidence-based practices.

**Conclusion:** The study findings depict that staff nurses have experienced inadequate evidence-based practices at primary health care centers.

**Recommendation:** Planned training sessions can be designed, constructed and implemented to staff nurses at the primary health care centers relative to evidence-based practices.

***Keyword:*** *Staff Nurse; Evidence-based Practice; Primary Health Care Centers*

## Introduction

The effect of evidence-based practices (EBP) has reverberated crosswise nursing practice, education, and science. The call for evidence-based quality improvement and healthcare transformation underscores the need for redesigning care that is effective, safe, and efficient. In line with multiple direction-setting recommendations from national experts, nurses have responded to launch initiatives that maximize the valuable contributions that nurses have made, can make, and will make, to fully deliver on the promise of EBP. Such initiatives include practice adoption; education and curricular realignment; model and theory development; scientific engagement in the new fields of research; and development of a national research network to study improvement [(1)].

Evidence-based nursing care is informed by research findings, clinical expertise, and patients' values, and its use can improve patients' outcomes. Use of research evidence in clinical practice is an expected standard of practice for nurses and health care organizations, but numerous barriers exist that create a gap between new knowledge and implementation of that knowledge to improve patient care. To help close that gap, the American Association of Critical-Care Nurses has developed many resources for clinicians, including practice alerts and a hierarchal rating system for levels of evidence. Using

the levels of evidence, nurses can determine the strength of research studies, assess the findings, and evaluate the evidence for potential implementation into best practice. Evidence-based nursing care is a lifelong approach to clinical decision making and excellence in practice [2].

The nursing research pyramid, or nursing research hierarchy of evidence, provides a visual and systematic depiction of forms of research from the least reliable (base) to the most reliable (apex). The pyramid includes both qualitative and quantitative paradigms. Pyramids vary slightly from source to source which can be confusing. To further add to the varying hierarchies "there is currently no universally agreed upon hierarchy of evidence for study types that seek to answer questions about patient's experiences and concerns [3].

## Methodology

A descriptive design, using evaluation approach, is carried throughout the present study to evaluate the evidence-based practices in primary health care centers for the period of January 2nd 2019 to June 1st 2020.

The present study is conducted on (20) primary health care centers which are distributed as (5) main and (5) family medicine at Al-Russafa Health Directorate in Baghdad City and (5) main and (5) family medicine at Al-Karkh Health Directorate in Baghdad City.

A Non-probability, multi-stage purposive sample of (52) staff nurses who are working at primary health care centers in Baghdad. These nurses are selected based on the following criteria:

1. Staff nurses, of all nursing educational background, who are working at the primary health care centers.

2. Staff nurses of both genders.

A questionnaire is developed for the purpose of the study. It is presented as follows [4]:

**Part I: Socio-Demographic Characteristics:** Such characteristics include age, gender, education and years of employment.

**Part II: Evaluation of Nurses' Evidence-Based Practices:** It is comprised of (46) item that measure staff nurses' knowledge, attitudes, beliefs, readiness and application of evidence-based practices.

A pilot study is conducted for the determination of the questionnaires' internal consistency reliability and content validity for the period of 15th January 2019 to 25th February 2019. Content validity of questionnaire is determined by panel of (10) experts. Internal consistency reliability, Split-half technique, is employed for the Nurses' Evidence- based questionnaire. Cronbach alpha correlation coefficient is computed on responses of (10) staff nurses and it indicates that (r= 0.86) which is adequate.

Data are collected through the use of the study questionnaires as means of data collection. Each interview takes approximately (5-10) minutes to be completed.

The data are analyzed through the use of descriptive statistical data analysis approach of frequencies, percentages, total scores and ranges.

## Results

**Table (1): Overall Evaluation of Dimensions of Staff Nurses' Evidence-based Practices**

| List | Overall Evaluation | | |
|---|---|---|---|
| | Scale | F | % |
| 1 | Poor (44-68) | 50 | 96.15 |
| 2 | Fair (69-93) | 2 | 3.846 |
| 3 | Good (94-118) | 0 | 0 |
| | Total | 52 | 100% |

Results out of this table indicate that the majority of the nurses have poor level of overall evaluation of the dimensions of nurses' evidence-based practices (96.15%).

**Table (2): Evaluation of Nurses' Knowledge as Dimension of Evidence-based Practices**

| List | Knowledge | | |
|---|---|---|---|
| | Scale | F | % |
| | Poor (14-18) | 47 | 90.38 |
| 2 | Fair (19-23) | 3 | 5.769 |
| 3 | Good (24-28) | 2 | 3.846 |
| | Total | 52 | 100 |

Results out of this table reveal the majority of the nurses have poor level of knowledge evaluation as dimensions of nurses' evidence-based practices (90.38%).

**Table (3): Evaluation of Staff Nurses' Attitudes as Dimension of Evidence-based Practices**

| List | Attitudes | | |
|---|---|---|---|
| | Scale | F | % |
| 1 | Poor ( 4-6 ) | 45 | 86.54 |
| 2 | Fair ( 7-9 ) | 6 | 11.54 |
| 3 | Good ( 10-12 ) | 1 | 1.923 |
| | Total | 52 | 100 |

Results out of this table show the majority of the nurses have poor level of attitudes evaluation as dimensions of nurses' evidence-based practices (86.54%).

**Table (4): Evaluation of Staff Nurses' beliefs as Dimension of Evidence-based Practices**

| List | Beliefs | | |
|---|---|---|---|
| | Scale | F | |
| 1 | Poor ( 14-23 ) | 50 | 96.15 |
| 2 | Fair ( 24-32 ) | 2 | 3.846 |
| 3 | Good ( 33-42 ) | 0 | 0 |
| | Total | 52 | 100 |

Results out of this table indicate the majority of the nurses have poor level of beliefs evaluation as dimensions of nurses' evidence-based practices (96.15%).

**Table (5): Evaluation of Staff Nurses' Readiness as Dimension of Evidence- based Practices**

| List | Readiness | | |
|---|---|---|---|
| | **Scale** | **F** | |
| 1 | Poor ( 7-11 ) | 50 | 96.15 |
| 2 | Fair ( 12-16 ) | 2 | 3.846 |
| 3 | Good ( 17-21 ) | 0 | 0 |
| | Total | 52 | 100 |

Result out of this table present the majority of the nurses have poor level of readiness evaluation as dimensions of nurses' evidence-based practices (96.15%).

**Table (6): Evaluation of Staff Nurses' Application as Dimension of Evidence-Based Practices**

| List | Application | | |
|---|---|---|---|
| | **Scale** | **F** | **%** |
| 1 | Poor ( 5-8 ) | 49 | 94.23 |
| 2 | Fair ( 9-11) | 3 | 5.769 |
| 3 | Good (12-15 ) | 0 | 0 |
| | Total | 52 | 100 |

Results out of this table depict the majority of the nurses have poor level of application evaluation as dimensions of nurses' evidence-based practices (94.23%).

## Discussion

### 1. Overall evaluation

Analysis of overall evaluation of such practices reveals that most of staff nurses have poor level of evidence-based practices (Table 1). This finding provides evidence that such poor level of evidence-based practices has emerged due to their insufficient background and training relative to this issue.

A cross-sectional study aimed at measure the evidence-based practice beliefs and implementation among Saudi nursing students enrolled in the bridge program, and also sought to identify the factors that influence evidence-based practice beliefs and implementation. A convenience sample of (188) nursing bridge program students at Saudi university is selected. The findings of the study depict that very low overall mean score of (22.57) is reported by the respondent in the implementation of evidence-based practice [(5)].

### 2. Evaluation of Staff Nurses' Knowledge

Analysis of such evaluation depicts that most of staff nurses have poor level of knowledge about evidence-based practices (Table 2). Such finding presents evidence that these staff nurses do not pursue sufficient knowledge about this issue.

A quasi-experimental study conducted to determine the effect of an educational program on nursing interns' EBP attitudes, knowledge and skills. A convenience sample of (40) nursing interns is selected. The finding of the study indicates that less than half of the study subjects have fair level of knowledge about EBP in the pretest. However, in the post test, the majority of the study subjects have good level knowledge about EBP after implementing the program [(6)].

### 3. Evaluation of Staff Nurses' Attitudes

Analysis of such evaluation indicates that most of

staff nurses have poor level of attitudes (Table 3). This finding can be interpreted in a way that these nurses are not well oriented toward the issue of evidence- based practices.

A quasi-experimental study is carried out to determine the effect of an educational program on nursing interns' EBP attitudes, knowledge and skills. A convenience sample of (40) nursing interns is selected. The finding of the study depicts that the majority of the study subjects have positive attitudes toward EBP post the program execution [6].

3. **Evaluation of Staff Nurses' Beliefs**

Analysis of such evaluation presents that most of nurses have poor level of beliefs (Table 4). This can be interpreted in a way that staff nurses have experienced lack of beliefs concerning the evidence- based practices.

A descriptive comparative design conducted. A sample of (185) nurses is selected to evaluate EPB belief and implementation. The finding of the study depicts that the nurses have positive beliefs toward EBP, but only practiced it to a small extend. There is a positive correlation between beliefs towards evidence-based practice and implementation of evidence-based practice ($r=0.59$, $p=0.001$) [7].

4. **Evaluation of Staff Nurses' Readiness**

Analysis of such evaluation depicts that most of nurses have poor level of readiness (Table 5). This can be interpreted in a manner that the nurses have no readiness towards evidence-based practices.

A cross-sectional survey conducted to evaluate safety climate and readiness for implementation of evidence and person centered practice. A sample of (726) nurses who work at surgical words in Swedish university hospitals is selected. The finding of the study reveals that the safety climate is positively related to readiness for evidence-based and person centered care [8].

5. **Evaluation of Staff Nurses' Application**

Analysis of such evaluation indicates that most of staff nurses have poor level of application of evidence-based practices (Table 6). This can be interpreted in a way that these nurses have no ability to easily apply the evidence-based practices.

A cross-sectional study conducted on Quota "non-probability" sample of (220) nurses who work at teaching hospital in Kuala Lumpur is selected to assessment attitudes towards knowledge for nurses who are use EBP. The finding of the study indicates that the application of EBP in clinical setting increase the quality of patient care. Clients' outcome and nurses' job satisfaction and retention, nursing managers and authorities have an important role in providing supports [9].

## Conclusion

**1.** The majority of the staff nurses have misplaced the opportunity to be involved in training sessions on evidence-based practices. So, their performance has been adversely influenced.

**2.** The study findings depict that staff nurses have experienced inadequate evidence-based practices at primary health care centers.

**3.** Few staff nurses have readiness to apply evidence-based practices, but unfortunately they experience lack of orientation on how to seek it.

**4.** Primary health care centers nurses thought that the evidence-based practices require time frame and resources.

## Recommendations

1. Planned training sessions can be designed, constructed and implemented to staff nurses at the primary health care centers relative to evidence-based practices.

2. Staff nurses can be encouraged and supported to be engaged in special training sessions about evidence-based practices.

3. Nursing Curriculums can encompass courses that address issues related to evidence-based practice.

4. The Evidence-based practices' policies can be activated and developed by the health authority in the Ministry of Health and Environment.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Ministry of Health and Environment and all experiments were carried out in accordance with approved guidelines.

# The Effect of Competitive Antigen on Some Cytokine in Rabbits

**Aseel Hashim Neama[1], Ibrahim M. S. Shnawa[2], Frial G. Abd [3]**

*[1] M.Sc., Student, [2] Prof. Dr., Department of Biotechnology, College of Biotechnology, University of Qasim, Qasim Babylon, Iraq, [3] Prof. Dr., Department of Biology, College of Science, University of Babylon*

## Abstract

Bacterin can be divided into dead bacterin and live bacterin. Dead bacterin is a virulent strains which have a good immunogenicity .the aim of this study to know competitive between two bacterin *E.coli* and *P.aeruginosa* in different concentrations .The rabbits were used as model for this study and the rabbits were divided into six groups each groups composed 5 rabbits , After immunized programs .the blood were collected . The sera were separated and used to determine TNF-α ,IL-2 and IL-10 by enzyme linked immunosorbent assay .the results appeared .The results appeared different count of bacteria increased (54.09, 68.33)TNF-α compared with control(42.55) . the concentrations of Il-2 were increased with increased dose of *E .coli* (16.90, 20.29)also the same occurred with *P .aeruginosa* (in *P aeruginosa* alone was15.14 while combined with *E.coli* 15.56 and15.38 ,the results appeared the means of IL-2 concentrations were higher, Interleukin 10 were showed its mean was increased in same concentrations of bacterin but decreased in different count . The present findings seems to be novel since combined bacterins have the potential for use as an autogenous bacterins in therapy for cases of complicated multi-drug resistant infections like that of urinary tract.

***Keywords:*** *Competitive antigen, Cytokine, Rabbits, Effect*

## Introduction

Antigenic competition occurs as a result of competition for the limited number of immune cells with multiple capabilities already present and, on the other hand, Humoral theory believed humoral [1] factors were responsible for antigenic competition and states: (Antigenic competition occurs as a result of competition for the limited amount of basic humoral factors in the immune response [1]. combination vaccines are composed of two or more antigens in same preperation. This method has been used in many vaccines like DTwP and MMR for over 50 years. Combination products ease the administration of vaccines and facilitate the introduction of new vaccines without requiring additional visits and injections from the health clinic.

Possible benefits of the combined vaccines include:

- Reducing the cost of storage and administration of individual vaccines
- Reducing costs for additional visits to hospitals,
- More cost-effective in vaccine delivery
- Increase immunization safety by decrease the number of needles and syringes needed
- Improving the timeliness of vaccination (some parents and health care providers object to more than two or three injectable vaccinations being given during a single visit due to a child's fear of needles and pain and safety concerns);
- Facilitating the addition of new vaccines to programmes of immunization.

The production of combination vaccines for multiple disease protection began with the combining of individual vaccines for diphtheria, tetanus, and pertussis (DTP) into one single product, this combination vaccine was first used in 1948 to vaccinate children and infants [2]. It has become the fundamental of adult and pediatric immunization, over the years, has strengthened its reactogenicity profile by adding other vaccines to the mix and removing components.

Cytokines are small secreted proteins (<40 kDa), which are produced by nearly every cell to regulate and influence immune response [3]. The release of pro-inflammatory cytokines will lead to activation of immune cells and production as well as the release of further cytokines [4]

Heat-killed *Brucella abortus* promotes secretion of Th1-inducing cytokines such as interleukin-12 (IL-12) and IFN-γ and has been used as a carrier to induce Th1 responses to vaccines. To explore which bacterial constituents could mediate this response and how it is regulated, murine spleen cells were cultured with *B. abortus* derived DNA, lipopolysaccharide (LPS), or whole killed organismsheat-killed *Brucella abortus*can also be used to stimulate Th1-like responses in mice [5]. The aim of this study to determine the effect of two killed bacterial antigen on TNF-alpha ,IL-10 and IL-2 concentrations in rabbits.

## Material and method

### Preparation of Whole Heat Killed Antigen

*Escherichia coli* and *Pseudomonas aeruginosa* isolates were obtained from Urinary tract infection patients and confirmed diagnosis of bacteria was done according to [6].

The heat-killed total antigen was prepared for both bacteria when grown in a complete culture medium (mean in the heart and brain infusion broth) or a lower culture medium according to [7] as follows:

1) *E. coli* and *P. aeruginosae* are grown in 100 ml conical flasks, in which 50 ml of the culture medium are placed and the implants are incubated in a Shaker Water Path vibrating bath at a temperature of 37 ° C and its tremors adjusted at a rate of 60 shake / minute and for 18 hr.

2) Discard growths are discarded at 5,000 rev / min for 15 mints, leaving the clearance and the precipitate taken.

3) The precipitate is suspended by a fixed volume of normal saline &treated at 60 ° C for one hour in the water bath, the precipitate is taken and the clearance is left.

4) The precipitate was washed with functional saline and of the same original size, two washings at 5000 rpm for 10 min.

5) Calculate by opacity tube, the equivalent of 5 and 10 international units (by comparing the concentration of the prepared antigens with the concentration of the aforementioned tube by relying on the same degree of opacity when observed in kind).

6) It is ensured that these prepared antigens are free of bacteria that have not been killed after being treated with heat as mentioned above, where a carrier campaign taken from these antigens is grown on the feeding nest center and incubates at a temperature of 37 ° C for 18-24 hr. and then the growth of the colonies is observed or not. After the incubation period ends

The Immunization programs

Different concentrations & mixtures of *E. coli & P. aeruginosae*Whole Heat Killed Antigens were used to immunize animal groups(table 1)

**Table (1): Experimental animal groups**

| Groups | Immunization antigens | Animals number | Describe |
|---|---|---|---|
| 1 | *Ec1.5*10$^8$* | 5 | Injection by Only 1.5*10$^8$ IUs of *Ec* are considered to be positive control |
| 2 | *Pa1.5*10$^8$* | 5 | Injection by Only 1.5*10$^8$ IUs of *Pa* are considered to be positive control |
| 3 | *Ec1.5*10$^8$+ Pa1.5*10$^8$* | 5 | injection with equal concentration mixture from *Ec* and *Pa* antigens (1.5*10$^8$ IUs of each antigen) |

***Cont...*** **Table (1): Experimental animal groups**

**EC*: E.coli* antigen Pa: *P. aeruginosa***antigen **U:Internationalunit**

**Blood samples**

By using disposable syringe, Five ml of blood were withdrawn from heart of the rabbits in a way of stab heart ( heart puncture), two ml of the samples of blood were placed in EDTA tubes as anticoagulant, while threeml of the samples of blood were placed in test tubes without anticoagulant and it was left at room temperature till being clotted, and then was centrifuged at 2500 rpm for 5 minutes, after centrifugation the serum was separated from the blood using sterilized pasture pipette, then the serum was divided into 0.5 ml and placed in sterilized Eppendorf tube (Frei*et al*.,1995) and stored at freezing till testing time.

**IL2,IL10,TNF Alpha**

The test was used for serum of rabbits immunized with *E.coli* and *P. aeruginosa*e.Bacteria in in different combination to determine the concentration of IL2, IL10, TNF Alpha . This test was achieved according to the manufacturing company (Bioassay Technology Laboratory) as follows:

1- All reagents were prepared, standard solutions and samples as instructed. All reagents brought to room temperature before use. The assay was performed at room temperature.

2- The number of strips required for the assay were determined. The strips was inserted in the frames for used .

3- Fifty µl added from standard well.

4- Forty µl sample was added to sample wells and then added 10µl anti-IL-2 or anti-IL-10 anti-TNF Alpha (according to kit used) antibody to sample wells, then added 50µl streptavidin-HRP to sample wells and standard wells(Not blank control well). Well was mixed . The plate was covered with a sealer. Then it incubated for 60 minutes at 3$^{7o}$C

5- The sealer was removed and washed the plate 5 times with wash buffer. wells was soaked with at least 0.35 ml wash buffer for 30 seconds to 1 minute for each wash. For automated washing, aspirate all wells and wash 5 times with wash buffer, overfilling wells with wash buffer. Blot the plate onto paper towels or other absorbent material.

6- Fifty µl substrate solution A was added to each well and then added 50µl substrate B to each well. plate covered with a new sealer and incubated for 10 minutes at 37$^{o}$C in the dark.

7- Fifty µl Stop solution was added to each well, the blue color would change into yellow immediately.

8- The optical density(OD value) was determined for each well immediately using a microplate reader set to 450 nm within ten minutes after adding the stop solution.

## Statistical Analysis

Data were processed and analyzed with oneway ANOVA using statistical program social (SPSS 23) and the results were expressed as (Mean± S.D). P-values below 0.05 were considered to be statistically

significant[8].

## The Results and Discussion

IL-2, IL-10and TNF-Alpha cytokines were estimated by using Enzyme Linked Immunosorbent assay (ELISA) were used for quantification of rabbit IL-2, IL-10, and TNF-Alpha the result of this test were calculated by using standard curve fit equation in ELISA system instrument . The Means of TNF-Alpha in sera of rabbit immunized with antigen(different antigen) .Its mean in Groups that immunized with *E.coli* alone was 50while significantly decreased when combined with *P .aeruginosa* at1.5*10 was 29.24 while increased when combined in different count of bacteria was 54.09 .In Groups of rabbits that immunized with *P .aeruginosa* alone its mean was35.49 while significantly decreased when combined with same count of *E.coli* 34.01 but its increased significantly when combined with different count of *E .coli* it was 68.33 .The results appeared different count of bacteria increased (54.09, 68.33)TNF-α compared with control(42.55) . The cytokine tumor necrosis factor-α (TNF-α) functions as an endogenous alarm signal that coordinates gene expression and cellular activity, driving inflammatory responses to infection, injury, or irritation. In addition to stimulating host cell responses, the results appeared TNF-α in E.coli was higher than control while opposite with P.aeruginosa this agree with Lee and coworkers (2003) studied the in vitro and in vivo effects of TNF- on two gram-negative bacteria that cause pneumonia in patients with compromised host defenses ,*Escherichia coli* and *Pseudomonas aeruginosa* .*E. coli* responded to recombinant soluble TNF-with increased growth in vitro. This effect of TNF-on bacterial growth was dose-dependent and inhibited by blocking antibodies against TNF-. In contrast, the in vitro growth of *P. aeruginosa* was not affected by either TNF-or anti–TNF-α antibodies. That is, recombinant TNF- α in vitro stimulated the growth of *E. coli* but not *P. aeruginosa.*

**Table(2): The means of TNF-Alpha in serum samples of Rabbits Groups Immunized with Different Types of Antigens**

| NO. | Groups of rabbits immunized with whole killed antigen | Mean ± SD | P value |
|---|---|---|---|
| 1 | E .coli 1.5*108 | 50.00±9.37 | 0.000 |
| 2 | P. aeruginosa 1.5*108 | 35.49±3.05 | |
| 3 | E.coli(1.5*108)+P.aeruginosa(1.5*108) | 29.24±1.12 | |

# Estimation of Vitamin D Levels in Women with Carpal Tunnel Syndrome (with and without Diabetes)

**Ghadeer hamid AL-Ardhi[1], Adil Mohammed AL-Maamory[1], Ali Mohammed Abd- Alameer[1]**

*[1]Assist. Lecturer, Department of biology, DNA Research center, University of Babylon, Al- Hila, Iraq*

## Abstract

**Objective:** Vitamin D is a an important vitamin which is effect on several system of human body, in this study we determination serum levels of vitamin D in women patients with carpal tunnel syndrome (CTS) and investigation the relation between vitamin D and diabetes on CTS patients.

**Materials and Method:** Subjects of this study enrolled 53 women (33 patients and 20 control), their aged range between (30-50) year. The patients were selected from attendee of out- patient Neurology clinic of Al- Imam Sadiq teaching Hospital, Hilla city, Iraq, in the period from December 2018 to April 2019**.** Blood samples were taken from subject to determination vitamin D levels.

**Results:** The present study shows a significant ($p<0.05$) decrease in the mean of vitamin D level in women patients with CTS comparison with control women (15.6±10.2) , (32.7±16.7) respectively. No significant difference was found between vitamin D and diabetes regarding the CTS.

**Conclusion:** The role of vitamin D is the one potential cause of CTS, this study revealed low serum vitamin D level in patient with CTS compared to control .

***Keywords****: vitamin D, carpal tunnel syndrome, diabetes.*

## Introduction

Vitamin D (1,25- dihydroxyvitamin D3) is an extremely important vitamin that has powerful effects on several systems throughout the body[1]. It is a fat soluble vitamin stored in the body tissues and it is the only vitamin that can be synthesized by the human body from the cholecalciferon in the skin from the cholesterol through a chemical reactions when exposed to sunlight, especially the ultraviolet B radiation (UVB) [2], and also its found in certain food such as fatty fish and fortified dairy products, though it's very difficult to get enough from diet alone [3]. Vitamin D should be considered for immune system, cell growth, protein synthesis, muscle function [4,5] and musculoskeletal pains [6]. Receptors of vitamin D is found in bone, kidney, gonads, pancreas, breast, cardiovascular system, brain and immune cells such as macrophages and lymphocytes B and T and monocytes, all these target tissues can convert 25-hydroxy vitamin D to 1,25- dihydroxyvitamin D [7,8]. Vitamin D deficiency in adults is a common problem worldwide(9), low level of this hormone related to neuropathy in patients with diabetes and other neurodegenerative disorders [10]. Also, it has been reported to play a potential role in non-specific persistent painful conditions [11], on the other hand, many researches suggests that vitamin D could play a role in prevention and treatment of many different conditions, including type 1 and type 2 diabetes, hypertension, glucose intolerance, and multiple sclerosis [11]. Carpal tunnel syndrome (CTS) is a medical condition due to compression of the median nerve as it travels through the wrist at the carpal tunnel [12]. It is more common in women and usually begins in adulthood its causes pain, numbness, dysesthesia and loss of strength in hands [13]. The etiological factors of CTS is systemic diseases, such as diabetes mellitus, thyroid function disorders, rheumatoid arthritis, and the most common risk factors for the development of its pregnancy, obesity and recurrent wrist movements [14,15]. The CTS occurs due to increased pressure in the carpal tunnel on the median nerve inducing marked changes in intraneural microcirculation and nerve fiber

structure, impairment of axonal transport, and alterations in vascular permeability, with edema formation and deterioration of nerve function [16]. This study was aimed to investigate the effect of vitamin D on the patients with CTS and comparison with control and examine if a possible association could be found between vitamin D and diabetes in CTS patient.

## Subjects and Method

The current study included 53 subjects (33 patients and 20 control), their aged range between (30-50) year. The patients were selected from attendee of out- patient Neurology clinic of Al- Imam Sadiq teaching Hospital, Hilla city, Iraq, in the period from December 2018 to April 2019. We included patients with diagnosis of CTS based on both clinical symptoms and positive neurophysiology, then taken 5 ml venous blood to determination vitamin D levels. The control group included 20 volunteer with negative neurophysiology and also taken 5 ml venous blood to measuring vitamin D level. Each group of (patients and control) were divided into two groups with and without diabetes. Serum level of vitamin D was determined by Enzyme Linked Fluorescent Assay (ELFA). A questionnaire was designed to collect data including: age, chronic diseases, drug history, smoking, quality of life and type of work. Serum levels less than 20 ng/ml are considered as deficiency, 20 to 30 ng/ml insufficient , and over 30 ng/ml are sufficient amount of vitamin D [17].

## Statistical Analysis

Data were analyzed with SPSS software version 25, Independent T- Test used to calculate mean and SD for vitamin D levels and age between case and control groups and the relation between vitamin D and diabetes were tested by Chi- square test.

## Results

Data of the current study show a low significant differences at ($p>0.05$) of vitamin D levels in patient with CTS comparison with control (15.7± 10.2), (32.7± 16.7) respectively. As well, there was no significant difference in mean age of patients and control women (43.8± 6.7), (41.6± 6.03) respectively as show in table 1.

**Table 1. Average vitamin D levels and age of control and case groups.**

| Parameters | Mean ± SD | Mean ± SD | P- Value |
|---|---|---|---|
| | **Control** | **Case** | |
| | **(n= 20)** | **(n= 33)** | 0.002 |
| Vitamin D | **32.7± 16.7** | **15.7± 10.2** | |
| Age | **41.6± 6.03** | **43.8± 6.7** | |

- Significant at 0.05 level.

On the other hand, there was no significant association in normal and CTS group between vitamin D and diabetes in this study as shown in the figure 1.

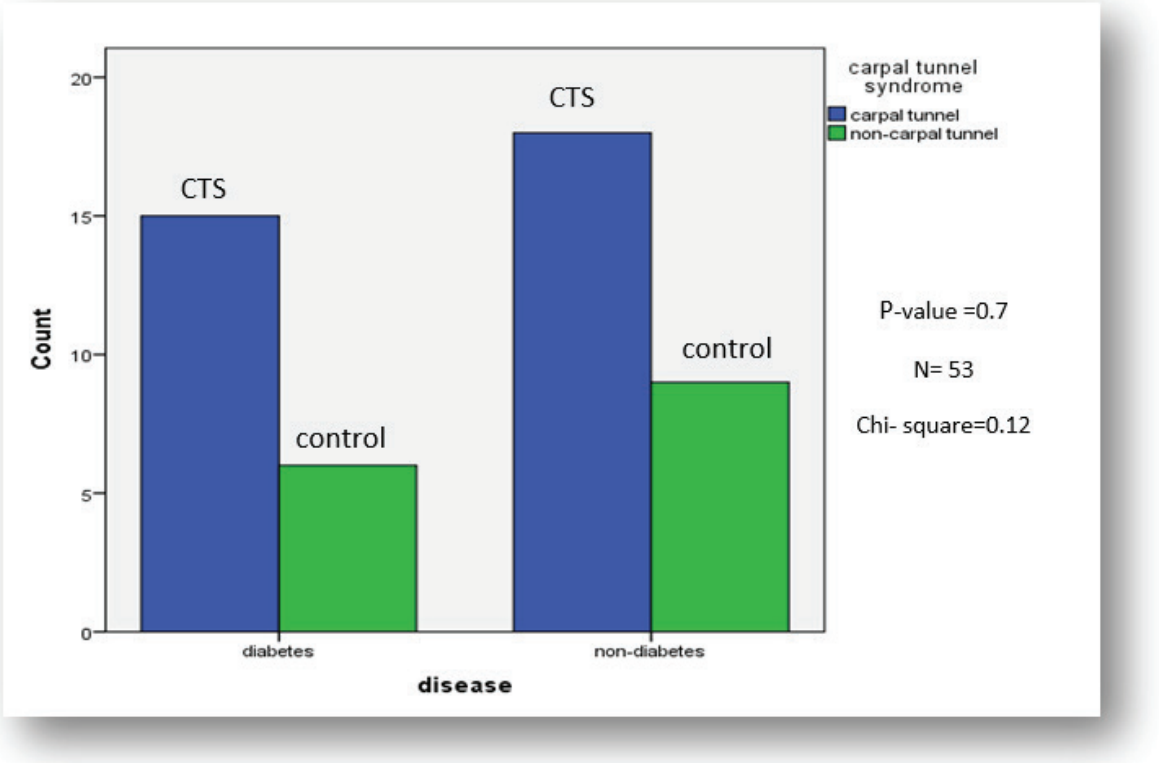

**Figure 1. vitamin D level in control and CTS patients with and without diabetes.**

## Discussions

For decades, the role of vitamin D was recognized as calcium and phosphate homeostasis, the growing evidence suggesting that the role of vitamin D effected on other target organs especially peripheral nervous system(18).

The data of present study showed that CTS patients had a significantly low vitamin D levels than control. This observation was in agreement with recent study that was found the CTS may be triggered by vitamin D deficiency, and that the severity of CTS was correlated with vitamin D levels in the deficiency group (19,20).

Vitamin D is considered as a neuroactive steroid, it was recorded previously that vitamin D induces nerve growth factor and hence could help in the prevention of neurotrophic deficits(21). Furthermore, vitamin D influences the myelination through the activation of several myelin- associated genes as demonstrated by Chabas 2013(22). In addition, data from animal studies showed that vitamin D deficiency was associated with induced nerve condition abnormalities. Acceptable with these results, animal data and basic research studies demonstrated that vitamin D receptors exist on peripheral nerves and Schwann cells, and consequently, vitamin D could promote production of nerve growth factor and axon regeneration in peripheral nerves(23, 24). Notable effect of vitamin D in reducing musculoskeletal pain and numbness, therefore, vitamin D may be used as improvement and treatment of CTS patients(25).

The previous studies which were conducted on a group of patients with diabetic neuropathy showed a relevant association between vitamin D and the development of diabetic neuropathy

Atherton *et al* 2009 found vitamin D levels related to chronic widesgread pain [26]. Similarly, Knutsen*et al* 2010, notice a higher prevalence of hypovitamin D among those with nonspecific musculoskeltal pain, fatigue, or headache [17]. As for, the results of this study refers there is no significant association in normal and CTS group between vitamin D and diabetes and this disagreement with several studies which is suggested there is an association between diabetic neuropathic pain, diabetic neuropathy and vitamin D levels [28,29], the

small samples size did not give a clear indication. also we can explain this case for a low level of vitamin D is tightly related with CTS in both groups (with and without diabetes) as Moon *et al* 2015 explained low vitamin D is related to neuropathy in patients with diabetes and other neurodegenerative disorders(10). On the other hand, we can expect the nature of work and stress may trigger symptoms of CTS by sever and recurrent use of hand , we found most young women without diabetes and suffering from CTS this may be related to the nature of domestic work , especially housewives and this agreement with Swanson *et al* 2013(30), as for women with diabetes and CTS, diabetes may have contributed to the development of CTS and possibly genetics or another factors [31].

# Hematological Study of Spleenctomized Dog in Iraq

**Ali Hussein Fadhil[1], Mohammed Assad S. Alkabi[1], Ihab Ghazi Mahdi AL, Shemmari[2], Ameer Sachet Atta AL-Saigh[1]**

*[1]Lecturer, [2]Assist. Prof., Department of Veterinary Medicine/ Veterinary Medicine College, Iraq*

## Abstract

The effect of total and partial splenectomy on hematological value was studied on 12 healthy dogs, divided into two groups (A and B). The total splenectomy (group A) exhibited significant reduction ($P < 0.05$) in Hb, PCV, and total RBC count but increase in ESR values. It also resulted in persistent increase in total leukocyte, neutrophil, and lymphocyte counts. In partial splenectomy produced non-significant effects on hematological parameters. No significant alteration in serum glucose or total protein concentration was observed after total or partial splenectomy.

***Keywords:*** *hematological value, splenectomy, dog, Iraq*

## Introduction

Spleen is a part of hemopotic and immune system, it is play a vital role in the lifespan of erythrocytes, and it is consider a major lymphoid organ and is located in the left cranial abdomen [1]. The function of spleen are storing and element the old red blood cells from blood stream as well as antigen surveillance of the blood and antibody production [2]. The surgical removal of the spleen is called Splenectomy which is performed for animals whose spleen has been affected by trauma or damaged by disease such as cancer, infections or some autoimmune diseases [3]. The most reasons of medical indication for splenectomy is a disease of hemopotic system .Splenectomy is carried out in dog with hemolytic anemia such as hereditary spherocytosis and autoimmune hemolytic anemia [4]. Camacho et al.,(2010) [8] have been mentioned dogs undergo to splenectomy candidate to Babesia canis infection so that must be considered emergency clinical cases and often it was considered fatal in these animals therefor must be given preventive medications. Splenectomy has been identified as a one of important risk factor for the development of serious illness due to natural Babesiaosis in dog [22] Post splenectomy infections and sepsis, due to decrease the level of antibodies and phagocytes activity or thrombosis, due to rises of platelet production in blood have been reported as sides effect of Splenectomy [7,12] [2] The regenerative anemia reveled due to elevate of reticulocyte count and exist of nucleated red blood cells [8]. Marques et al (2003) [12] have been reported autologous spleen transplantation is a batter procedure after complete removed of spleen for maintenance the immune and hematopoietic functions of spleen. Mortimar. (2017) has been showed there was no abnormal postoperative decrease of erythrocyte, hemoglobin or hematocrit values, and regeneration occurred at the same level as in the control dogs. The differences in number of white blood cells with subsequent leukocytosis is showed in dog with splenectomy [7,11] Initially transient neutrophilia is followed by the persistent lymphocytosis and monocytosis. The animals showed highly percentage of leukocytes parallel to the significant left shift, the myelocytes or other cells progenies of granulocytes often exist in blood circulation [14,21,25] . A many researches on laboratory animals mentioned the amounts of spleen tissue aid to increase the ability of recovery function of spleen in auto transplantation of spleen [11,16]

## Material and Method

### A- Animals

Twelve healthy male's dogs aged 8$^{th}$ months included in that study. A physical examination was made in all animals to chick their health status. All dogs were administrated antihelemantics and housed indoors in individual cages and kept under management and nutritional. The animals were randomly divided into two

groups include of six dogs for each group, designated as group A and B.

**Surgical Operations**

Total and partial splenectomy were performed in animals of group 1 and 2, respectively in surgical lab in collage of veterinary medicine\ Kerbala University following the standard anesthesia and surgical procedures [5].

**Hematological Samples**

Blood samples with EDT A for complete blood analysis and without anticoagulant for serum chemistry profile were collected. A one sample was drawn from each animal. The first blood sample was drawn prior to surgical operation to obtain baseline values. The other samples were obtained weekly, starting on week 1st to week 12th post-operative.

## Result and Discussion

**Results of hematological study.**

**Results of erythrocytes**

All dogs in the study remained apparently healthy during the trial period. None of the dogs in both groups suffered any post-surgical complication, such as hemorrhage or peritonitis. Several changes in blood components was identified that persisted for a variable periods following total or partial splenectomy (Table 1). A persistent anemia was observed in animals of group A, as noted by a significant reduction ($P < 0.05$) in RBC count, Hb cone. and PCV values on3 th, 4th ,5th and 6th week post-surgery, as compared to their control values and with group B . The anemia in total splenectomized dogs could be related to loss of the spleen-iron regulatory function as reported in man by earlier workers ,this agree with Sipka et al( 2006) which mentioned the significant decrease of red blood cells values and long postoperative recovery after total splenectomy have been recorded in dog.

A significant ($P < 0.05$) increase in ESR values was observed in animals of both groups, respectively, compared to their control values. However, among groups there was non-significant difference . this higher ESR values might be associated with persistence anemia and has also been explained by Benjamin (2000).

**Table 1. The latter's referred to differences in erythrocytes parameters between group (A) and group (B) at P=≤0.05.**

**Results of leukocytes**

A significant (P < 0.05) increase in total leukocyte, neutrophil, lymphocyte, and eosinophil counts, a transient increase in monocyte, were observed post-operatively in group A dogs compared to control values and with group B dogs (Figs.3). Modifications in these blood cells could be coupled with total splenectomy and its predisposition for transient and intermittent type of nonspecific bacteremia or septicemia 23.

**Table 2. The latter's referred to differences in leukocytes parameters between group (A) and group (B) at P=≤0.05.**

In healthy individual's bacteria are cleared off from circulation rapidly and effectively through phagocytosis by fixed tissues macrophages in the spleen and liver. Persistent bacteremia can occur when bacteria can multiply at a rate that exceeds the ability of the reticuloendothelial system to remove them (Dow and Jones, 2009). In addition, non-infectious factors such as corticosteroid excess caused by fear or other stresses, anesthesia,

laparotomy, or exercise may also be associated with moderate changes in leukogram [17]. In the present study all animals apparently remained clinically healthy throughout the study period and therefore, alteration in leukogram could be a normal body response. This is also supported by earlier reports indicating that a WBC count between 10,000 and 30,000/ µl represents a moderate response to inflammation in dogs [18].

The presence of mild eosinophilia in dogs of group A has been a unique observation in the present study. Eosinophils are known to be an integral component of hypersensitivity and defense against certain parasites. In cat, eosinophilia has been reported to occur along with polycythemia and pernicious anemia after splenectomy [9]. Similarly, leukocytosis has been reported in man and dog as a result of splenectomy and were attributed to an increase in neutrophils, lymphocytes, and eosinophils [24]

Therefore, it seems as the eosinophilia in the present study was either due to splenectomy or might have occurred as an influx of bone marrow reserve as seen in man. [19]

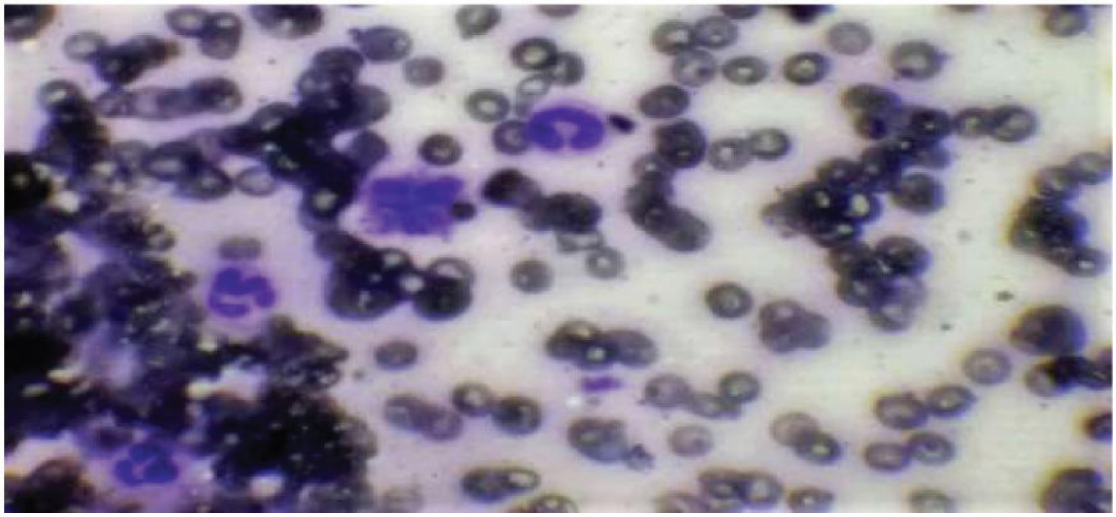

**Fig (1) Band neutrophil in blood film of total spleenactomized dog**

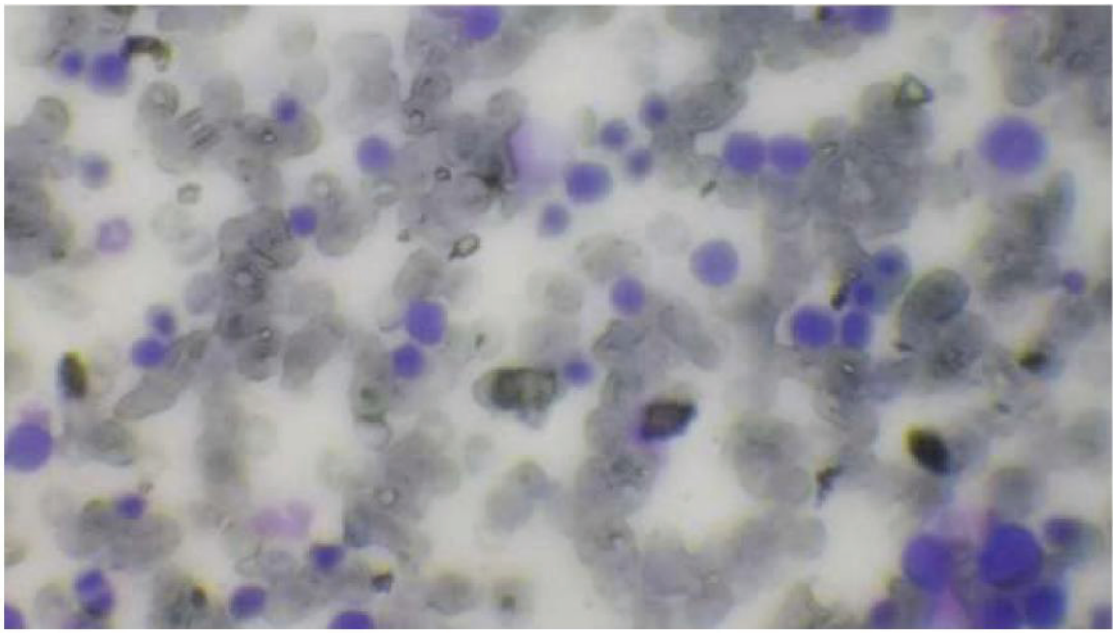

**Fig (2) Lymphocytosis in blood film of total spleenactomized dog**

From these results were concluded there was many significant differences in hematological parameters in erythrocytes and leukocytes in spleenactomized dog.

# The Effect of Using the Cognitive Strategies on the Achievement and Practical Performance of Physiology (Modeling / Reciprocal teaching)

**Miade Nazim Rashid**

*Assistant Professor. Middle Technical University, Technical medical Institute –Baghdad*

**Abstract**

The research aims to know the impact of using the strategies of cognitive perception on the achievement and practical performance of physiology, and to achieve the goal of the research under the formulation of zero hypotheses: There is no statistically significant difference at the level of (05.0) between the average grades of students in the achievement of students of the three groups of physiology. There is no statistically significant difference at the level of (05.0) between the average grades of students in the practical performance of the students of the three groups of physiology. The research community consisted of the students of the first stage in the Technical Institute. The sample was randomly tested as it reached 45 students. The equivalence between the research groups was confirmed through the following variables: (Age, Intelligence). As for practical achievement, (15) objective test items were drafted covering the subject, and to ensure the validity of the test was presented to a number of experts specialized in education and teaching methods, and the validity and consistency of the discrimination factor and the difficulty factor and the effectiveness of alternatives to the test were calculated.

***Keywords:*** *Cognitive strategies***,** *Modeling, Reciprocal teaching*

## Introduction

Recent studies emphasize that the student is the focus of the educational process and the adoption of work and experience a cornerstone of education [1], and the Institute as one of the educational institutions provide a service to the community and seeks to develop and keep [2] pace with technological development to educate the student to sound thinking and equipped with basic knowledge and skills. Physiology is one of the important subjects of life sciences, and despite its importance, this article is still taught by dumping and recipients by the teacher, and this is consistent with a lot of research and studies, but the use of regular methods in the field of education leads to poor understanding and correct perception, and weak Students have different thinking skills to solve the daily problems they face in the study [4]. Therefore, the development of mental abilities has become the main objective of the educational process in all countries of the world, as the progress of countries is measured by their ability to develop the minds of their children. To achieve this, many countries have made strenuous efforts and conducted many practical research aimed at regulating student thinking. [25]

Teaching methods are not the same but are the result of social needs and circumstances and demands are changing educational goals and concerns to meet the requirements of society [7]. And the importance of teaching methods and to achieve educational goals and the adoption of modern methods of teaching, including a symposium held at the University of Baghdad (1993), where recommended to contribute to the development of the educational process.

Therefore, studies and researches turned to metacognition theory, which cares for the student to monitor, control and learn. This helps to acquire different learning processes that encourage students to think and be able to solve their scientific problems [7]. This supra-cognitive strategy means thinking and helping the student positively in gathering, organizing, following up and evaluating information during the learning process. This supra-cognitive strategy contributes effectively to

the learning and problem-solving process as it helps to achieve learning objectives and helps students to access cognitive processes.

**Laboratory and practical performance:**

**Genesis of laboratory work:**

Scientists in the field of laboratory work, such as Avicenna in medicine and optics, and Ibn Hayyan in chemistry, became famous in the field of chemistry. The idea of experiments began in Britain and Germany, and the teaching of science in the United States in 1874 was questioned.

Laboratories were set up in high schools and colleges in the late 18th century, believing that students would learn better by repeating the original experiences of Newton, Priestley and others.

**The performance:**

Performance is the unit of measurement of knowledge that the student shows in the situation and is the product of interaction, understanding and thinking that the student employs in the situation. What the student shows is the product of a comprehensive mental work that includes a response to the world and the knowledge system in an integrated environment.

**Performance includes:**

1. Performance Tasks: They are direct and realistic and require:

Performing a series of activities or performing a particular work.

Compound products (products) that achieve certain quality levels or present these products as an integrated unit separate from performance.

Performance Requirements:

The skill has three components and can even achieve practical performance: -

1. Information, knowledge and concepts.

2. Movements and coordination between movements.

3. Values and trends adopted by the student who is trained to perform the skill.

**Laboratory performance evaluation:**

The laboratory work falls under four aspects or aspects of laboratory activity:

1. Planning and design: involves students doing laboratory activities - forming questions - predicting results.

2. Performance: It includes students' laboratory achievements on experiments - observation, recording of data and drawings.

3. Analysis and interpretation: Data processing, interpretation of relationships, ask new questions.

4. Application: The student to make scientific predictions in new situations. (Zeitoun, 2007, 668)

**Research Procedures**

**Determine the research community:**

Determining the study population is one of the important methodological steps in educational research.

The research community was identified by the Technical Medical Institute / Baghdad for the academic year (2018-2019).

**The research sample:**

Research sample testing is one of the most important factors that influence experimental research. The research sample was selected from the students of the first stage of the Technical Medical Institute/ Baghdad. The sample was divided into (a) taught by supra-cognitive strategies (modeling), (b) taught by (reciprocal teaching), and (c) taught routinely.

**Table 1. Distribution of research sample among groups and number of students**

| Groups | Group Name | Number Of Students Before Exclusion | Number of Students After Exclusion | Final Number |
|---|---|---|---|---|
| First Experimental Group | A | 19 | 5 | 14 |
| Second Experimental Group | B | 18 | 2 | 16 |
| Control Group | C | 17 | 2 | 15 |

**Experimental design test:**

Experimental design is of great importance, as it ensures scientific accuracy

This study had two factors: the cognitive strategy (cognitive) (modeling) and (interactive teaching), so the experimental design was adopted three groups of two experimental groups and a control group.

**Table 2. Experimental design was adopted three groups of two experimental groups and a control group.**

| Groups | Equivalence | Independent Variable | The Dependent Variable |
|---|---|---|---|
| First Experimental Group | Age | Strategy Of Cognitive Supra-Cognitive Modeling | Collection |
| Second Experimental Group | Intelligence | Interactive Teaching | Practical Performance |
| Control Group | | Normal Way | |

## Equal groups:

(A) Chronological Age in Months:

The mean age of the students was calculated in months, and extracted the mean of

**B- Intelligence:**

To find out the intelligence of the research sample. The Raven test is applied because it is characterized by honesty, consistency, usability and age group. After finding IQ scores (60), the mean was calculated for all the research groups, where the ratio was (73.44, 00.46, 00.45).

**External safety of experimental design:**

Although groups were randomly tested, non-experimental variables that affect the safety of the experiment were attempted.

1. Adjust the contrast tools: Achievement test was used for the three research groups.

2. Duration: The duration of the research was determined (the first course).

3. Quotas: Quotations were distributed two hours each week to ensure equal time allocated to the laboratory.

Search Requirements:

1. Determination of scientific material: The scientific material of physiology (course I) was determined.

2. Preparing the teaching plan.

3. Study Plan: It is a framework or set of procedures or are the steps organized to make the teaching process a success. (Abdulsalam, 2001, 72)

4. Preparation of experimental work guide: Then prepare experiments for conducting in the laboratory.

**Test stability:**

The stability of the test was calculated by Alfa Kronbach, where the stability was (83.0).

**Statistical means:**

1. Analysis of monotonous variance:

Variance analysis was used for the equivalence of the three research groups.

**2. Difficulty Coefficient:**

The difficulty factor for the objective paragraph was used for achievement test.

$$P = \frac{n_u + n_L}{2n} \frac{n_u + n_L}{2n}$$

3. The power of discrimination:

$$D = \frac{P_u + P_L}{\frac{1}{2}(n)} \frac{P_u + P_L}{\frac{1}{2}(n)}$$

4. Alpha-Cronbach equation: Achievement test coefficient.

5. Tukey Method: Indicates the difficulty of the differences between the results.

$$Q = \frac{X_1 - X_2}{\sqrt{MSW}} \frac{X_1 - X_2}{\sqrt{MSW}}$$

## Results

**1. The first hypothesis:**

To achieve the first zero hypothesis (there are no statistically significant differences at the level of 0.00 between the average scores of students of the three groups studied by modeling and the second group by interactive teaching and the control group by the normal method) and the arithmetic mean of the three groups was calculated in the achievement test as shown In the table.

**Table 3. Results of mono-variance analysis to show significant differences in achievement**

| Contrast Source | Total Squares | Degree of Freedom | Average Squares | Calculated Value | Tabular Value | Statistical Significance |
|---|---|---|---|---|---|---|
| Between Groups | 43,513 | 2 | 22,256 | | | |
| Within Groups | 13,366 | 42 | 77,7 | 35,28 | 1503,3 | 0.05 |
| Total | 58,880 | 2 | | | | |

The above table shows that the calculated Y-value was (35.28) and the tabular Y-value (1503.3), that is, the calculated Y-value is greater than the tabular Y-value, which affects the existence of statistically significant differences in the achievement of the three research groups. There was a statistically significant difference, so the T method was used to compare two equal media to identify the differences. (Al-Bayati, 2008, 264). Therefore, the tabular value (Q) (38.0) was calculated, as well as the calculated (Q) value (43.3) between the two media. This indicates that there is no statistically significant difference between the first and second experimental groups in the collection.

**Table 4. The results of the analysis of comparison between the differences of the average of the three groups**

| the group | Averages | The difference between averages | The calculated Q value | The Q value is | tabular Significance at 0.05 |
|---|---|---|---|---|---|
| Total Experimental 1 | 3,20 | 3,0 | 38,0 | 43,3 | NonFunction |
| Total Experimental 2 | 6,20 | | | | |
| Total Experimental 1 | 6,20 | 0,7 | 2,9 | 43,3 | Function |
| Total Controls | 3,13 | | | | |
| Total Experimental 2 | 6,20 | 2,7 | 6,9 | 43,3 | Function |
| Total Controls | 3,13 | | | | |

The table shows that the value of (Q) calculated between the first and control groups (2.9) is greater than the table value (Q) of (43.3), and this shows a statistically significant difference between the first experimental and control groups in favor of the experimental group. First.

In addition, the value of (Q) calculated between the first and control groups of (6.9) was greater than the tabular value of (Q) of (43.3). This indicates that there is a statistically significant difference in the achievement between the second and control experimental group. In favor of the second experimental group.

2- The second zero hypothesis: which provides (the absence of statistically significant differences at the level of 0.0.0 between the average degrees of practical performance of students of the three groups).

**Table 5. The results of the analysis of unilateral variation to show individual differences in practical performance among students of the three groups**

| Contrast Source | Total Squares | Degree of Freedom | Average Squares | Calculated Value | Tabular Value | Statistical Significance |
|---|---|---|---|---|---|---|
| Between Groups | 40,371 | 2 | 20,185 | | | 0.05 |
| Within Groups | 60,204 | 42 | 89,4 | 04,37 | 1503,3 | |
| Total | 00,576 | 2 | | | | |

The table shows that the calculated Y-value was (04.37) and the tabular Y-value (1503.3), that is, the calculated Y-value is greater than the tabular Y-value. This indicates that there are statistically significant differences at the level of (05.0). In the practical performance of the three research groups. Using T method to identify differences between groups. Table (8) illustrates this.

**Table 6. The results of the comparison analysis between the mean differences for the three groups in the practical performance**

| The Group | Averages | The Difference between averages | The Calculated Q value | The Q value is | Tabular Significance at 0.05 |
|---|---|---|---|---|---|
| Total Experimental 1 | 6,16 | 2,3 | 6,5 | 43,3 | Function |
| Total Experimental 2 | 8,13 | | | | |
| Total Experimental 1 | 6,16 | 0,7 | 2,12 | 43,3 | Function |
| Total Controls | 6,10 | | | | |
| Total Experimental 2 | 8,13 | 2,4 | 3,7 | 43,3 | Function |
| Total Controls | 6,10 | | | | |

The table shows that the calculated value of Q (6.5) is greater than the tabular value (Q) of (43.3). This indicates that there is a statistically significant difference between the first and second groups in practical performance and for the benefit of the first experimental group.

The table also shows that the value of (Q) calculated between the first experimental group and the control group of (2.12) is greater than the value of the (Q) tabular value of (43.3). First experimental group.

## Conclusions

The researcher reached the following conclusions:

1. Teaching according to the strategy of cognitive supra-cognitive has had an impact in increasing students of the Technical Technical Institute

2. Teaching according to supra-cognitive strategies of practical performance has had an effective effect in raising the level of students.

3. Teaching according to this strategy requires more time and effort for the teacher and student than is required when using other teaching methods.

4. Teaching according to supra-cognitive strategies has affected students who have awareness of their knowledge and are more organized in their performance of experience than students who do not.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Technical medical Institute –Baghdad and all experiments were carried out in accordance with approved guidelines.

# Effectiveness of Instructional Program for Nurses' Knowledge regarding Oxygen Administration Methods at Pediatric Teaching Hospitals in Mosul City

**Mohammed Ahmed Sultan Al-Wily [1], Afifa Radha Aziz, PhD [2]**

*[1] Assist Lect., College of Nursing. University of Mosul, Iraq,*
*[2] Prof. College of Nursing. University of Baghdad, Iraq*

## Abstract

**The Objective:** To evaluate the effectiveness of instructional program for nurses' knowledge regarding oxygen administration methods at pediatric teaching hospitals in Mosul City.

**The Methodology:** A quasi-experimental study was applied at pediatric teaching hospitals in Mosul City from 21 of October/ 2018 till 17 of July / 2019. The selection of the sample was using the non- probability (Purposive) sample that chosen for the current study. The total study sample consisted of (52) nurses, (26) nurses working in the Al-Kansaa Teaching Hospital and (26) nurses working Ibn Al-Atheer Teaching Hospital from Mosul City. The program lectures and questionnaire were constructed and provided for nurses to evaluate the effect of the instructional program on nurse's knowledge. The Pearson's coefficient of correlation result are ($r= 0.756$) and are significant at $p \leq 0.05$ level was used to estimate the scale (test – retest) by using SPSS version 25.

**Results** shows that statistical differences (paired samples t-test) of the knowledge for the study and control group concerning the oxygen administration methods for pediatric. There are high significant relationships between pre-test and post-test result for study group. But are not significant relationships between pre-test and post-test result for control group at P.value $\leq 0.05$ levels.

***Keywords:*** *Instructional Program, Nurses' knowledge, Oxygen Administration Methods.*

## Introduction

The oxygen is fundamental for living. Barely any organs like heart, mind, and kidney need high measures of oxygen for their survival dependent on their cell necessity, the condition of oxygen may be deferent in many cases such as infection, exercises, increase metabolism and injury; the body well not has a store of oxygen[1]**.** Undoubtedly, O2 treatment could be a very important tool and has saved many lives and improved others, however, number eight treatment risk, cost, and edges have to be compelled to be thought-about inside an equivalent suggests that as medicine and titrated to a measured end purpose to avoid excessive or inadequate dosing, withholding number eight can have a damaging effect; nevertheless continuing to produce O2 treatment once it's not indicated will prolong hospitalization and increase the value of care, this comprehensive review begins with complete assessment and evaluation the effects of physiological, toxicities potential, and customary delivery procedures[2]. Also that represents as a routine treatment procedure in pediatric hospitals, has principal objectives such as reducing the child patient's respiratory and cardiac workload, also increasing heart rate, alveolar pressure and hemodynamic competence, preventing hypoxia or hypoxemia and mortality[3].

**Material and Methods:**

**Design of the study:** An experimental study design for two groups, study and control group (pretest-posttest) carried out at medical ward of pediatric teaching hospitals in Mosul city to evaluate the effect of the instructional program on nurse's knowledge regarding oxygen administration methods at pediatric teaching hospitals from 21 of October/ 2018 till 17 of July / 2019

**Sample of the study:** the selection of the sample was using the non- probability (Purposive) sample that chosen for the current study. The total study sample consisted of (52) nurses, (26) nurses working in the Al-Kansaa Teaching Hospital and (26) nurses working Ibn Al-Atheer Teaching Hospital from Mosul City.

Study tool: The program lectures and questionnaire were constructed and provided for nurses to evaluate the effect of the instructional program on nurse's knowledge regarding oxygen administration methods. The program lectures was contain five lecture, two lecture each week, and The questionnaire was contain two parts, first part concerns the demographic information, while another part was contained the nurses' knowledge regarding oxygen administration methods and contains five sections. The estimate evaluation of the nurses' knowledge are failure = (0-1) answer knowledge score, not acceptable = (2) answer knowledge score, acceptable = (3) answer knowledge score, good = (4) answer knowledge score, Excellent = (5) answer knowledge score. But the estimate for total knowledge are failure = (0-5) answer knowledge score, not acceptable = (6-10) answer knowledge score, acceptable = (11-15) answer knowledge score, good = (16-20) answer knowledge score, excellent = (21-25) answer knowledge score.

**Validity of the study:** The validity of the program lectures and questionnaire tool was established through a panel of experts whom specified the content clarity, relevancy, and adequacy.

**Data collection:** The data were collected from pediatric teaching hospitals in Mosul City. The study sample consisted of (52) nurses, (26) nurses working in the Al-Kansaa teaching hospital and (26) nurses working Ibn Al-Atheer teaching hospital, the period from 13 of January till 26 of February / 2019.

**Failure** = (0-1) answer knowledge score, **Not acceptable** = (2) answer knowledge score, **Acceptable** = (3) answer knowledge score, **Good** = (4) answer knowledge score, **Excellent** = (5) answer knowledge score. **F**=Frequency, **%**= percentage

The table (1) shows the statistical knowledge results for study group nurse's in concerning the oxygen administration methods for pediatric, that general knowledge and purpose or aim of use in pre-test are 57.7% (15) of them at not acceptable level, Post-test are 57.7 % (15) of the at excellent level. The normal values and nursing consideration in pre-test are 69.2% (18) of them at fail level, post-test are 65.4% (17) of them at good level. The clinical manifestation of the children during oxygen administration in pre-test are 46.2% (12) of them at not acceptable level, post-test are 53.8% (14) of them at good level.

Relationship is significant at P.value ≤ 0.05 level

The table (5) presents statistical relationships of the study between the demographic variables of nurses and results of the constructional program. There are not significant relationships between study group result (pre-test and post-test) with all demographic variables except the pre-test with the period of working in the current hospital and not significant relationships with other demographic variables. The control groups in pre-test are significant relationships with age and general employments period only, but the post-test are significant relationships with general employments period only and not significant relationships with other demographic variables.

## Discussion

The table (1) shows the statistical knowledge results for study group nurse's in concerning the oxygen administration methods for pediatric, that general knowledge and purpose or aim of use in pre-test are 57.7% (15) of them at not acceptable level, Post-test are 57.7 % (15) of the at excellent level. The normal values and nursing consideration in pre-test are 69.2% (18) of them at fail level, post-test are 65.4% (17) of them at good level. The clinical manifestation of the children

during oxygen administration in pre-test are 46.2% (12) of them at not acceptable level, post-test are 53.8% (14) of them at good level. The Influencing factors and methodology for selecting the appropriate method in pre-test are 69.2% (18) of them at fail level, post-test are 61.5% (16) of them at good level. The oxygen humidification and complications of oxygen using in pre-test are 57.7 % (15) of them at not acceptable level, post-test are 42.3% (11) of them at good level. This result disagree with Kanaka R and Padma K (2016) that shows among 30 sample of nursing students 5 (16.7%) have inadequate knowledge, 15 (50%) have moderately adequate knowledge regarding and, 10 (33.3%) have adequate knowledge regarding pediatric oxygenation[11]. The table (2) shows the statistical total knowledge results for study and control groups in concerning the oxygen administration methods for pediatric. That the study group at pre-test are 80.0% (21) of them at not acceptable level, post-test are 50.0% (13) of them at excellent and good level. But the control group in pre-test is 88.5 % (23) of them at not acceptable level, post-test are 69.2% (18) of them at not acceptable level.

The table (3) presents the statistical differences (paired samples t-test) of the knowledge for the study and control group concerning the oxygen administration methods for pediatric. There are high significant relationships between pre-test and post-test result for study group. But are not significant relationships between pre-test and post-test result for control group at P.value $\leq$ 0.05 levels. The table (4) shows the statistical differences (ANOVA - pairwise comparison) for constructional program (pre-test, post-test) between the study and control groups concerning the oxygen administration methods for pediatric. There are not significant relationships between study group and control group result for pre-test. But there are high significant relationships between study group and control group result for post-test at P.value $\leq$ 0.05 levels. The table (5) presents statistical relationships of the study between the demographic variables of nurses and results of the constructional program.

## Conclusion

1. The nurses of the pediatric teaching hospital in Mosul city do not have appropriate and adequate knowledge regarding the oxygen administration methods.

2. There is a significant relationship between the pre-test and post-test results of the study group regarding the oxygen administration methods knowledge.

3. Effectiveness of the Instructional program is proved through the high significant relationship of the nurse's knowledge between the study and control groups regarding the oxygen administration methods knowledge.

4. There is no significance correlation between the nurses' knowledge and all demographic characteristics except the general employments period and age of the study group nurses

**Financial Disclosure:** There is no financial disclosure.

## Abstract

(VAP) is defined as pneumonia that develops in mechanically ventilated patients after 48 hours or more of mechanical ventilator support, VAP increases the mortality and morbidity rates of patients and healthcare costs, This study was a descriptive cross-sectional survey. Sample a total sample of 126 nurses was collected for the current study,setting and Participants a convenience sample of graduate nurses was obtained from eight hospitals throughout Babylon. The study was approved by the ethics committees of the Babylon health department and the participating, Researcher used standard a questionnaire that integrated the assessment of nurse's knowledge for prevention of VAP from the Center of Disease Control and Prevention questionnaire was validated by a panel of four specialists in the disciplines of nursing, The questionnaire was administered to the participants in their hospitals by the principle investigator. Nurses were informed that their completion of the questionnaire would be considered as consent to participate.SPSS version 22 was used for data analysis, The study conclude that the mean age of participants in the study was young and female, the majority of the nurses didn't know that the mechanical ventilator humidifier must be changed weekly to prevent VAP. Researcher encourage all Iraqihospitals ICUs nurses to involve inclinical training to improve nurses acquisition and to evaluate the content of the nursing curricula to identify shortcomings in content. It is imperative that VAP-prevention guidelines be integrated in training and teaching within the nursing schools, and that the content and teaching strategies of infection control courses are updated.

***Key words: Nurses knowledge, Ventilator-Associated Pneumonia.***

## Introduction

The Institute for Healthcare Improvement and the American Thoracic Society have developed evidence-based guidelines to prevent Ventilator Associated Pneumonia (VAP) which is a common nosocomial infection that is associated with increased length of hospitalization, VAP affects 10%-25% of patients who are treated in intensive care units for more than two days, Therate of VAP varies between countries, with higher prevalence and mortality rate reported in developing countries [1] (VAP) is defined as pneumonia that develops in mechanically ventilated patients after 48 hours or more of mechanical ventilator support, VAP increases the mortality and morbidity ratesof patients and healthcare costs Mechanically ventilated patients are at high risk for developing VAP owing to diverse reasons such as the presence of an endotracheal tube, altered sensorium oral inflammation, impaired mucociliary clearance, inhibition of cough response and micro aspiration of secretions [2]. In 2007, the Institute for Healthcare Improvement (IHI) created the Triple Aim, Which focused on "improving the experience of care providers, improving the health of populations and reducing per capita cost of healthcare." Since that time, healthcare systems across the country have ramped up efforts to reduce the incidence of hospital-acquired conditions (HAC), which account for some readmissions, declining health, and rising costs. To some degree, those efforts are paying off. The Department of Health and Human Services (HHS) reported approximately 87,000 fewer inpatient deaths and a 17% decline in hospital-acquired

conditions from 2010 to 2014, resulting in a reduction of almost $40 billion in healthcare costs [3]

VAP is account for the highest burden of nosocomial infection as well of health care which is of a serious concern today. It has been reported that the incidence of a nosocomial infections in intensive care unit is about 2 to 5 times higher than in the general in-– patient hospital[4]. A systematic literature review and meta-analysis undertaken the use of antiseptics lowers the risk of VAP, though it does not contribute to the reduction in mortality and duration of ICU stay. [2] The positive effect of preventive measures may decrease with length of time at risk. Moreover, continuous aspiration of subglottic secretions has a favorable effect on the incidence of early onset VAP, but the effects on late-onset VAP are less definite. [5] . Tracheal suctioning is one of the most common invasive procedures performed by nurses on ICU patients and is crucial to reducing the risk of VAP; Tracheal suctioning is traditionally performed using the open suction system which involves disconnecting the patient from the ventilator and introducing a single-use suction catheterconsists of a multi-use suction catheter included within the ventilation circuit, preventing the need for disconnection and the resultant loss of airway pressure. [6]

Knowledge about VAP prevention varied widely among physicians and nurses. Knowledge gaps affect the implementation and monitoring of VAP prevention practices. Continuing education remains imperative, Knowledge of guidelines for prevention of VAP among healthcare workers (HCWs) has been infrequently assessed and mainly in staff nurses only. The gaps between individual knowledge of VAP prevention and actual daily clinical practice have not been compared. [7]

Prevention of VAP is much more cost-effective than treatment which is an essential objective of health care delivery within ICUs. Care bundle protocols are different and controversial in different hospitals, Preventing infections is the daily work of nurses in every hospital. This applies to the critical unit as well where nurses are the forefront of infection prevention either VAP or other. They create and provide the safe environment, take responsibility for nursing care and play a pivotal role in preventing nosocomial infections. American Organization of Nurse Executives (2015) clinical operations, care management, quality and safety, the patient experience, performance improvement and workforce planning. In addition this role has business and financial expertise. The role of the system chief nurse executive (CNE

**Expected Nursing Practice**

Collaborate to identify patients where implementation of noninvasive positive pressure ventilation (NIPPV) may be appropriate to prevent the need for intubation

Assess readiness to extubate daily through combined spontaneous awakening trials (SATs: sedation interruption/minimization) and spontaneous breathing trials (SBTs), unless clinically contraindicated

Maintain and improve physical conditioning through early exercise and mobility

Elevate the head of bed (HOB) to 30º to 45º unless clinically contraindicated in patients receiving mechanical ventilation, as well as patients at high risk for aspiration

Minimize pooling of secretions above the endo-tracheal tube cuff by using an endotracheal tube with subglottic suction capability in patients with anticipated intubation greater than 48 to 72 hours Change ventilator circuits only if visibly soiled; do not change ventilator circuits routinely. [9]

## Methodology

Design: This study was a descriptive cross-sectional survey. Sample a total sample of 126 nurses was collected for the current study, the sample size determined by the Rawsoft sample size calculator. Based on an estimated response rate of 50%, ά =0.05, power =0.95; the estimated population of nurses in Iraq/ Babylon is 200, so the required sample size is estimated to be 120. The current study used a larger sample to enhance the results' external validity.Inclusion Criteria -Undergraduate nursingschool,setting and Participants a convenience sample of graduate nurses was obtained from eighthospitals throughout Babylon. The study was approved by the ethics committees of the Babylon health department and the participating.

Researcher used standard a questionnaire that integrated the assessment of nurse's knowledge for prevention of VAP from the Center of Disease Control and Prevention questionnaire was validated by a panel of four specialists in the disciplines of nursing and infection control. The questionnaire comprised two parts. Part one included demographic items such as gender and geographic, Part two comprised 20 multiple-choice questions, each containing four choices: the correct answer and three distracters. The four choices included "I don't know" as an option to prevent guessing. For scoring purposes, the questions were graded as 1 for the correct answer and 0 for other responses. Individual totals for the 20 could thus range from 0 to 20, a higher score indicating a better knowledge level and a score below 10 meaning that the nurses failed the test.(Aloush & Qadire, 2017)

**Data collection procedure:**

The questionnaire was administered to the participants in their hospitals by the principle investigator. Nurses were informed that their completion of the questionnaire would be considered as consent to participate. Nurses were assured that participation is completely voluntary and that their responses in the questionnaire were confidential. The nurses also were informed that they had the right to withdraw from the study any time. The nurses were subject for any emotional, physical or mental harm as a result of participation in the study. Data were collected in the period April -August 2018.

## Statistical Analysis

SPSS version 22 was used for data analysis. The mean scores and frequencies were calculated. An independent sample t-test was used to measure the difference in mean scores between male and female participants and between nurses with previous education in their training courses about VAP management and mechanical ventilators and those without. An ANOVA test was conducted and the difference in mean scores was compared among nurses according to the geographical location of the hospital.

## Results of the Study

Researcher distributed 140 questionnaires, of which only 126 were completed, a total response rate of 98%. Respondents were of different geographical locations and gender. Participating hospitals were of government affiliation. The mean age of participants in the study was 24.6 (SD=2.9) for females and 23.7 (SD=2.7) for males. (Table 1)

**Table 1. Nurses' characteristics**

| Items | | Frequency | % |
|---|---|---|---|
| 1 | Gender<br>Female:<br>Male: | <br>66<br>60 | <br>52<br>48 |
| 2 | Hospitals location<br>Center of Babylon:<br>Peripheral ofBabylon: | <br>78<br>48 | <br>61.9<br>38.1 |
| 3 | Received educational program and training on Mechanical ventilator in their undergraduate courses.<br>Yes:<br>No: | <br>64<br>62 | <br>50.8<br>49.2 |
| 4 | Received educational program and training on Ventilator Associated Pneumonia (VAP) management in their undergraduate courses<br>Yes:<br>No: | <br>65<br>61 | <br>51.6<br>48.4 |

**Table 2.Preferred guidelines and frequencies of correct answers Preferred:**

| | Preferred guidelines and frequencies of correct answers: | n(%)/ n=126 |
|---|---|---|
| 1 | Which method of endotracheal tube insertion is preferred to decrease VAP? | 54(42.8%) |
| 2 | How often is it preferred the ventilator circuits be changed to decrease the risk VAP? | 61(48.4%) |
| 3 | Which type of humidifiers is preferred to decrease the risk of VAP? | 75(59.5%) |
| 5 | How often is it preferred the humidifier be changed to decrease the risk VAP? | 68(53.9%) |
| 6 | Which type of suctioning systems is preferred to decrease the risk VAP? (open vs close) | 45(35.7%) |
| 7 | How often is it preferred the suction systems be changed to decrease the risk VAP? | 69(54.7%) |
| 8 | Which type of endotracheal tube is preferred to decrease the risk of VAP? | 71(56.3%) |
| 9 | Which type of bed is preferred to decrease VAP the kinetic bed vs the standard bed? | 44(34.9%) |
| 10 | Which patient position is preferred to decrease the risk VAP? | 65(51.6%) |
| 11 | Which solution is preferred for oral care to decrease the risk VAP? | 61(48.4%) |
| 12 | How often oral care is preferred to decrease the risk VAP? | 47(37.3%) |
| 13 | How often is it preferred to assess patient readiness for extubation? | 75(59.5%) |
| 14 | How often is it preferred to perform spontaneous breathing trial with sedatives turned off? | 68(53.9%) |
| 15 | When is it preferred to wash hand to decrease the risk of VAP? | 45(35.7%) |
| 16 | When is it preferred to wear gloves to decrease the risk of VAP? | 69(54.7%) |
| 17 | At which level endotracheal tube cuff pressure should be kept to decrease the risk of VAP? | 71(56.3%) |
| 18 | To decrease the risk of VAP, which of the following practices related to antibiotics use is preferred? | 44(34.9%) |
| 19 | What is effect of giving peptic ulcer prophylactic (e.g. H2 blockers, Proton pump inhibitors, or sucral fate) administration on the risk of VAP? | 65(51.6%) |
| 20 | What is the effect of Deep Venous Thrombosis (DVT) prophylaxis on the risk of VAP? | 61(48.4%) |

The mean knowledge score for participants was 6.4 (32%) (SD=2.9), with a range of 16 (80%) to 0(0%).63 nurses (14.5%) answered more than half of the questions correctly. Weakness in the knowledge related to mechanical ventilator management was obvious. The majority of the nurses didn't know that the mechanical ventilator humidifier must be changed weekly to prevent VAP, the endotracheal tube's cuff pressure must be kept at the level of 20-30 H2O, and that the ventilator circuit must be changed only when it is visibly soiled or for every new patient's admission. Another topic of concern was oral care and suction. On the other hand, students showed a reasonable level of knowledge regarding hand washing and patients' positioning. (Table 2).

**Table 3. Nurses' scores vs. baseline characteristics**

| | | Nurses Scores out of 20 | | |
|---|---|---|---|---|
| **Items** | | **Mean (SD)** | **t** | **p** |
| 1 | Gender<br>Female:<br>Male: | 6.42(2.8)*<br>6.44(2.9) | 0.2 | 0.93 |
| 3 | Received educational program and training on Mechanical ventilator in their undergraduate courses.<br>Yes:<br>No: | 6.9(2.8) 5.9(2.9) | 2.1 | 0.00 |
| 4 | Received educational program and training on Ventilator Associated Pneumonia (VAP) management in their undergraduate courses<br>Yes:<br>No: | 6.4(2.9) 6.6(2.9) | 1.9 | 0.014 |

There was a statistically significant difference in knowledge scores between nurses who had received education in VAP on their undergraduate courses and those who had not: t (432) =-3.5, p=0.00. However, both groups revealed poor knowledge, The former achieved higher scores (M = 6.9, SD =2.8) than the latter (M =5.9, SD =2.9 ). There was no statistically significant difference in the scores of male and female nurse, and no statistically significant difference between nurses who had been taught about mechanical ventilators and those others who had not (p >.05) (Table 3).

## Discussion

Participants had a poor knowledge of VAP-prevention can be compared with other nurses that showed poor overall knowledge about infection control guidelines among student nurses in India, Iran and Spain however, my study was more comprehensive as it focus only on VAP prevention guidelines also it provided a broader set of updated VAP prevention guidelines . Mechanical ventilator management, oral care and the endotracheal tube suction items were the major topics of concern among our nurses, again similar to the findings from another study with student nurses in Spain and with newly graduated nurses in United States. On the other hand, participants showed much better knowledge about hand hygiene and the Semi-Fowler position than about other topics, although their performance was still unsatisfactory.

## Conclusions

The study conclude that the mean age of participants in the study was young and female,the majority of the nurses didn't know that the mechanical ventilator humidifier must be changed weekly to prevent VAP,There was a statistically significant difference in knowledge scores between nurses who had received education in VAP on their undergraduate courses and those who had not. Researcher encourage all Iraqihospitals ICUs nurses to involve inclinical training to improve nurses acquisition and to evaluate the content of the nursing curricula to identify shortcomings in content. It is imperative that VAP-prevention guidelines be integrated in training and teaching within the nursing schools, and that the content and teaching strategies of infection control courses are updated. The findings from

this study may be used as a reference to evaluate the effectiveness of educational interventions in the future

# Skill and Capacity of Women through Social Mobilization: Analysis of Urban Women Self Help Groups in Coimbatore City

**Kanagaraj S[1], Priya V[2]**

*[1]Ph.D. Scholar, [2]Assistant Professor, Dept. of Social Work, Amrita School of Engineering, Coimbatore, Amrita Vishwa Vidyapeetham, India*

## Abstract

The study attempts to understand and anlayse the skill and capacity of women through social mobilisation. It is proved that the Self Help Groups (SHGs) played a key role in mobilizing the poor towards developing the habit of saving and avail credit from financial institutions. Social Mobilisation has been adopted as an appropriate approach to mobilise the local communities which is essential to carry out any intervention. The main objective of the study is envisioned to identify the enhancement of skill and capacity of the women through social mobilization. The methodology for the study is Survey research and describes the skills and capacities of the women of Urban SHGs. Multi stage sampling was employed to collect data from 14 SHGs comprising of 156 SHG members. The results revealed that participation of group members in SHGs increase their literacy skills, communication skills, banking skills and vocational skills. Also it is evident that a vast majority of the women (77.6%) do not have any vocational skills which indicates there is huge need of training women in vocational as well as entrepreneurship skills to generate income.

***Keywords:*** *Self-help groups, social mobilisation, skills and capacity of women, urban women*

## Introduction

The idea of social mobilization, is bringing together people from all sections of the community to increase awareness and plea for specific development programme and support the community for sustainability and self-reliant[(1)]. It can be categorized as community development approach which involves the people actively to address basic reasons of mal development. In the process it gives opportunity to fight for their rights and increase their potential to mobilise resources, network and connect for their betterment[(2)]**.** There are number of studies how social mobilization influences women empowerment. [(3,4)] Particularly on how the self-help groups(SHGs) for women living in urban slums can be an effective tool for social mobilization and eventual empowerment. SHGs main purpose is to enable economic empowerment by imparting skill development to gain power and improve their personality to tackle challenges in life [(5)]

Moreover, women need to avail credit facilities, making avenues for political participations; equal educational opportunities alone would not automatically empower them but they play a major role in women empowerment[(6)]. SHGs alone will not be the solution to women empowerment, additionally the secondary level SHGs Federations ensures the sustainability of the SHGs[(7)]. In certain cases, it is proved that the financial stability has a key role in economic development which results in social well-being. Moreover, there is no single way or panaceas to empower women; it is a different facet which necessitates a variety of approaches for empowering women[(8)]. Empowerment of women and poverty alleviation is generally facilitated by various institutions such as bank, SHGs and NGOs[(9)]. When income inequality becomes more pronounced it creates adverse effects on physical and mental health. Inequality creates an adverse view on one's health and

**Corresponding author:**

creates deterioration in mental health[10]. SHGs are predominantly considered as agencies of empowerment of weaker sections especially women in India; it helps improve livelihood and resolve various health issues[11][12].

In most cases, it is proved that the SHGs played a key role in mobilizing the poor towards developing the habit of saving and avail credit from financial institutions[4]. Also in the recent few decades SHGs promote social mobilization and social accountability aimed to improve the health and nutrition[13]. Social Mobilisation has been adopted as an appropriate approach to mobilise the local communities which is essential to carry out any intervention[14]. There are strong evidences on SHGs having positive effects on social, economic and political empowerment[15][16]. Though there is a visible way forward for women empowerment we still have a long way to head towards empowerment. Women are a part of the society and they play a significant role in determining the future of the nation[17]. The sustainability of the group is prime concern among stake holders of organizing SHG[18]. Moreover the federations of SHGs promotes sustainability and resolves issues in terms of financial provisions[19].

Social mobilisation has to provide a platform for open dialogue, conduct negotiation and reach a consensus on the means of action for sustained living and self –reliance. It deals with probing the felt needs of the community, addressing the real issues than focusing on a slice of reality. This study is an attempt to understand the improvement in skill and capacity of women; resulting in a specific process of change while at the same time resulting in acquisition of material benefits[1].

## Objective

The research is envisioned to identify the enhancement of skill and capacity of the women through social mobilisation. The results of the process of social change consequential to social mobilization in terms of residence, occupation, roles and capacities has also been identified.

## Method

The present research is carried out by Survey research method and describes the skills and capacities of the women of Urban SHGs. The primary data is collected through field survey from Women Self-help groups of Coimbatore urban limit. Multi stage sampling was employed to identify the SHGs that met the objectives of the research. The process of multi stage sampling was carried out by dividing Coimbatore city into 5 zones namely East, West, South, North and Central. In the next stage, SHGs were classified into three stages based on the number of years such as young, middle and old groups and SHGs were selected proportionately representing each zone which resulted in 14 SHGs.

## Findings

The study aims to understand the skill and capacity of women through social mobilization. The data was collected between May 2019 and October 2019 from 14 SHGs comprising of 156 SHG members. The findings of the study reveals that more than half (60.9%) of the respondents' are from single families while one fourth (25.6%) of the are from Nuclear family and 13.5% are joint family. The dwindling rates of joint family system is indicative of the characteristic of the urban areas. 78.8% of the respondents are from Backward class, 14.7% belong to the Scheduled caste whereas 5.8% of the respondents are from the most backward class and only 0.6% belong to other castes. More than half (58.3%) of the respondents have their own house and 41.7% respondents live in rented houses. A good majority, i.e., 89.1% of the respondents 'are residents of Coimbatore city, 5.8% of the respondents live within the limits of Coimbatore district, 3.8% of the respondents are from other district in Tamil Nadu and only 1.3% of the respondents are from other state. Nearly three fourth (74.4%) of the respondents live in Semi Pucca house [Semi Pucca refers to a house which is roofed with tiles or Asbestos sheet], 7.7% of the respondents live in Kutcha house [Kutcha house means hut, damaged house with improper roofing, tent, tin roofing etc.,] and 17.9% of the respondents live in Pucca house [Pucca refers to a modest concrete roofed house]. Majority of the (83.3%) respondents are Hindus, 12.2% are Christians and only 4.5% are Muslims. Most of the SHGs have people belonging to different religion in their group.

## Discussion

Several studies have proved that the SHGs have the potential that goes past not merely access to credit but various other avenues to improve their skills in terms of literacy, communications skills, banking skills and vocational skills. The SHG approach promotes conditions to improve the status of women as group[20].

*Skills and capacity of women:*

Majority of the women (73%) are highly literate (Reading and writing Skills) and 27% of the respondents are literate (signature only) and only 1% is illiterate. As the women get opportunity to become literate after joining Self Help Groups, a good percentage of women become literate after joining SHGs while very less percentage of women do not try to improve their writing and reading skills because the feel that they have aged and it is not required now. Communication skills have been classified based on their ability to meet government officials, political leaders and to speak in public meetings to express your views and opinions. The study revealed that 60.9% respondents have high communication skills, 32.7% have poor communication skills and 2.6% of the respondents have moderate communication skills and only 3.8% of respondents do not have any communication skills. In the modern era the banking skills are very important, the banking skills has been classified as ability to open an account in a bank/post office, deposit money, withdraw money and borrow loan from bank. The study revealed that 73.1% of the respondents have high banking skills, 1.9% respondents have moderate banking skills, 2.6% of the respondents have low banking skills and only 22.4% of the respondents do not have any banking skills. Vocational skills are essential for income generation which is a major responsibility of the mobilization process. In this study woman having any one kind of vocational skill has been categorized as having vocational skills and those who have no skills as no vocational skills. In this study majority of the women were skilled in Tailoring, while a meager percent was skilled in toy making and beautician. The study shows that 77.6% of the respondents do not have any vocational skills and only 22.4% of the respondents have vocational skills.

Table number 1 shows the detailed frequency and percentage of the respondent's skills and capacity of SHG members.

**Table 1: Skills and capacity of SHG members**

| S.No | Contents | Frequency | Percentage |
|---|---|---|---|
| i) Literacy | | | |
| 1 | Illiterate | 2 | 1 |
| 2 | Literate | 40 | 26 |
| 3 | Highly literate | 114 | 73 |
| | Total | 156 | 100.0 |
| ii) Communication Skills | | | |
| 1 | No Communication skills | 6 | 3.8 |
| 2 | Poor Communication skills | 51 | 32.7 |
| 3 | Moderate communication skills | 4 | 2.6 |
| 4 | High communication skills | 95 | 60.9 |
| | Total | 156 | 100.0 |
| iii) Banking Skills | | | |
| 1 | No banking Skills | 35 | 22.4 |
| 2 | Low Banking Skills | 4 | 2.6 |
| 3 | Moderate Banking Skills | 3 | 1.9 |
| 4 | High Banking Skills | 114 | 73.1 |
| | Total | 156 | 100.0 |
| iv) Vocational Skills | | | |
| 1 | Having vocational skills | 35 | 22.4 |
| 2 | No vocational skills | 121 | 77.6 |
| | Total | 156 | 100.0 |

The table number 2 shows the association between ownership of house, poverty status and type of house of the respondents. There is a significant relationship between the ownership of the house and the type of house that they live in. The table conveys that majority of the respondents live in semi pucca houses. 94.5% of the respondents who own their house live in Semi pucca and pucca houses. There is significant association between poverty status and the type of house in which they live. 78% of the respondents living below poverty line live in semi pucca houses. This indicates that in spite of the respondent's habit of saving money and depositing it monthly or weekly, they still find it difficult to build a good habitable house. The money that they save might be from the income of their husband or children. The women who go to work also have been employed in low paid jobs and jobs which are not stable. In addition to the savings habit the women need to be trained in various income generating activities which will enable them to come out of the poverty cycle and eventually improve their standard of living.

**Table 2: Association between Ownership of House, Poverty status and the type of house they reside**

| S. No | Ownership of house | Type of house | | | Total | Significance X2 |
|---|---|---|---|---|---|---|
| | | Kutcha | Semi Pucca | Pucca | | |
| 1 | Owned | 5 | 62 | 24 | 91 | 11.147 |
| 2 | Rented | 7 | 54 | 4 | 65 | Df = 2 |
| | Total | 12 | 116 | 28 | 156 | P = .004 |
| | Poverty status | | | | | |
| 1 | Below Poverty Line | 12 | 111 | 19 | 142 | 22.671 |
| 2 | Above Poverty Line | 0 | 5 | 9 | 14 | Df = 2 |
| | Total | 12 | 116 | 28 | 156 | P = .000 |

The table number 3 shows that there is no association between poverty status and their vocational skills. Though a majority of the poor have skills in vocational trade, the individuals are not willing to pursue their goals. The individualistic principle advocates that the interests of the individual have to achieve precedence over the state. Hence the individuals though belonging to a particular self-help group has to be ruled by a set of self-driven goals. This may be a reason for the lack of economic growth among poor, in spite of being trained in vocational skills[10]. Also merely vocational skills training would not help to improve the livelihood but in addition it should earn income through vocational skills. Most of the women SHG members have tailoring skills which is not sufficient to earn livelihood. This indicates that SHG members are required to be given viable business entrepreneurship skills through which they can improve their livelihood. There are several opportunities for vocational training but still women choose tailoring as an option for vocational training, which has very less potential to generate income; unless they start a garments unit to scale their business.

**Table 3: Association between Poverty status and their vocational skills**

| S.No | Poverty status | Vocational Skills | | Total | Significance X2 |
|---|---|---|---|---|---|
| | | Having vocational skills | No vocational skills | | |
| 1 | Below Poverty Line | 30 | 112 | 142 | 1.558 |
| 2 | Above Poverty Line | 5 | 9 | 14 | Df = 1 |
| | Total | 35 | 121 | 156 | P = .212* |

*Not Significant

## Conclusion

The present study suggests that the participation of group members in SHGs increase their literacy skills, communication skills, banking skills and vocational skills. The process of group meeting, attending various awareness training programmes increases their confidence in communication skills. The banking skills are indispensable to every member in the SHG to claim financial benefits from the Banks; financial transactions by group members deliver greater chances of acquiring the banking skills. Vocational skills play a vital role in improving the livelihood of women. From the study it is evident that a vast majority of the women (77.6%) do not have any vocational skills which indicates there is huge need of training women in vocational as well as entrepreneurship skills to generate income and improve their material conditions of living.

# Fluorosis: An Endemic Disease

**Sakshi Chaturvedi[1], Chakrapani Chaturvedi[2]**

*[1]Assistant Prof., Banasthali Vidyapith, Niwai, Dist. Tonk (Raj), [2]Associate Prof. cum Principal, B.V.M Nursing College Gwalior*

## Abstract

A study is conducted to assess the cases of fluoride affected person in selected gram panchayat ,Tonk ,Rajasthan. This study is conducted as perspective to conduct action research after wards. In This study symptoms of fluoride has been categorized in three type of fluorosis skeletal( SKF ),non skeletal fluorosis (NSKF ) and dental fluorosis (DF).In this study villagers between the age group 10-70 years were observed for the presence of fluorosis symptoms by researchers. Conclusion of the study is level of fluoride in the water or food and crops grown in that majorily has caused non skeletal fluorosis ,50% people are affected severely ,2% population study sample has developed severe skeletal fluorosis ,56% sample is affected with dental fluorosis at moderate level among which children are more affected .after conducted assessment of fluorosis symptoms in fluoride endemic district ,researcher has given health education to study sample and discussed many nutritional and environmental manipulations which can decrease the level of fluoride in human body as well as in ground water level

***Key Words:*** *Dental Fluorosis, Skeletal Fluorosis, Non Skeletal Fluorosis, Fluoride*

## Introduction

Fluorosis is a disease of oral, skeletal and non skeletal dysfunction which arises due to increase fluoride **level >1.5mg /liter** in ground water and increase fluorine gas in atmospheric air[3] . In North India **Rajasthan** and Gujarat and in South India Andhra Pradesh are **highly endemic** areas. Punjab, Haryana, M.P, Maharashtra are moderately endemic areas. Tamilnadu, West Bengal, Uttar Pradesh, Bihar and Assam are mildly affected endemic area of fluorosis . Fluorosis is essentially Hydrofluorosis except in parts of Gujarat and UP where industrial fluorosis also seen Which is due to fluoric acid compounds. The food and crop which is grown locally among fluoride endemic area is also found to have very high fluoride level (Richa Miglani ,2018). **WHO** has classified FLUOROSIS among 3 categories DENTAL FLUOROSIS, SKELETAL FLUOROSIS, NON SKELETAL FLUOROSIS, In **Non Skeletal Fluorosis** GIT system shows Acute abdominal pain, Diarrhea,Constipation , blood in Stool , Bloated feeling (Gas) , Tenderness in Stomach, Feeling of nausea. Nervous system when affected with high fluoride concentration shows **NERVOUSNESS & DEPRESSION,** tingling sensation in fingers and toes, Excessive thirst and tendency to urinate ,Frequently Polydypsia and polyuria control by brain appears to be adversely affected. Some studies reported infertility in humans and menstrual disturbance in women is also observed due to effect of high fluoride level on thyroid gland.

Research Reviews suggests that high fluoride more than 10mg/liter in drinking water and daily activity for prolong period of time can also affect skeletal system which is termed as **Skeletal Fluorosis[3]** causing multiple bone and joint pain, tingling ,burning and pricking sensation in limbs ,chronic fatigue ,muscle weakness. Changes can be observed in spinal column and pelvis. In later stages osteoporosis and bone spur can be developed and crippling Skeletal Fluorosis is also observed due to fusion of vertebra and bones. Dental fluorosis occurs

**Corresponding Author:**

due to exposure to fluoride during mineralization; fluoride replaces the hydroxyapatite crystals in teeth and gets deposited as fluorapatite crystals, which becomes clinically visible as dental mottling. Mottling of the teeth is usually seen in younger children who are developing their front teeth. Excessive fluoride also replaces the hydroxyl groups present in the hydroxyapatite crystal of the bone, forming fluorapatite. This has large crystal size due to which the bone becomes brittle and susceptible to fracture risk. Moreover, young bones retain more fluoride than older bones. Clinical manifestations of fluorosis may be aggravated by malnutrition, specifically calcium and vitamin D nutrition status which is evident from the high incidence of crippling deformities in poor residents from endemic fluorosis zones [5] in dental fluorosis tooth enamel starts

## Material and Method

The Research Design study for the present study is descriptive in nature which emphasize on prevalence of symptoms of Fluorosis among the person who are consuming fluoride water for more than 10 years regularly. Multi stage sampling is done. Village is divided in to Dhani non randomly and then 3 Dhanis are selected randomly among that all person in the age group10-70 years are interviewed from self structured questionnaire checklist for identification of fluorosis in an endemic area. Privacy of all participants is maintained as part of ethical consideration while interviewing. 100 persons were observed for presence of symptom related to fluorosis on the basis of pre validated self structured questionnaire check list given below. A health talk program was organized in which caused of fluorosis, identification of fluorosis, environmental manipulation such as tulsi (osmium) plant [2],diet modification such as antioxidant rich food, vitamin C rich diet and treated water benefits are discussed .

Findings- Descriptive Statistics reveals that among all type of **Fluorosis Non Skeletal Fluorosis** has affected severely to 50% villagers, 24%villagers are moderately affected ,18% villagers are mildly affected with NSKF and 8% have no problem related to NSKF. The Picture of skeletal fluorosis is seen severely in 2% cases which are already diagnosed for fluorosis,17%villagers showed moderate level ,73% showed mild level of SKF which is for pain some joints some time and sound coming after movement of those joint and 8% do not have any problem in skeletal system. **Dental Fluorosis** was seen moderately among 56% sample especially in age group 31-50, 25% were mild Cases, 19% were having no dental problems.

## Discussion

Data Suggests That NSKF is more prevalent among villagers. adults in age group 31-50 have developed dental fluorosis as well as non skeletal fluorosis .skeletal fluorosis is seen in elderly in complicate stage .only a few persons after leg deformity diagnosed with history of fluorosis. Significance related to consumption of fluoride drinking water more than 20 years and source of water well and pond suggests that these are the major contributory risk factor for fluorosis.

## Conclusion

Researcher conclude that people who are drinking fluoride water more than 10 years will develop fluorosis symptoms which will turn in to life threatening issues paraplegia, sclerosis, osteoporosis. .use of filtered water, supplied water and environmental manipulation [2] can decrease the fluoride level in ground water.

**Conflict of Interest** –None

# Family Interaction Pattern in Wive's of Alcohol Dependents

**Chinnu Sebastian[1], Suja M.K[2]**

*[1]PhD Scholar, [2]Associate Professor Department of Social Work, Amrita School of Engineering, Coimbatore, Amrita Vishwa Vidyapeetham, India*

## Abstract

Introduction: Alcoholism is a disease which affects the individual and their family hence it is known as a family disease. Alcoholism reflects on the family bonds and it often leads to the complete breakdown of the entire family. The most affected persons are the wives of alcoholics because of their commonly nature and the intimacy in their relationships. The spouses of alcoholics facing severe domestic, financial and emotional violence which leads major psychological problems like anxiety, depression and poor self-esteem. Family interaction pattern (FIP) is defined as methods by which members of the family relate to each other through various mechanisms binding them in the bond of family.

Aim: This research work has made an attempt to study the Family interaction pattern in wive's of alcohol dependents. This study to measure the level of family interaction pattern and significant factors associated with wive's of alcohol dependents of Kottayam district of Kerala, India. Result: Nearly half of the respondents (37%) have medium level of Family interaction pattern. 33% have high family interaction pattern and 30% have low level of family interaction pattern. The study reveals that FIP Score has significant difference with the variables like age, area of residence, education and duration of drinking habit in spouses. The post hoc test indicates that respondents between the age group of 31-40 years, rural area of residence, educated below $10^{th}$ standard and above 10 years of drinking habit in spouses have better FIP. Religion, type of family, occupation and family monthly income has no significance. Conclusion: This study inspires in realizing the mental, social, marital and family relation among wive's of alcoholics and it will be a great help in promoting family counselling programmes in de- addiction centres.

***Key words:*** *Alcoholism, Alcohol dependents, Wives, Family interaction pattern*.

## Introduction

Alcoholism is one of the major health and social problems around the world, which results in 3.3 million deaths in every year (WHO, 2018)[1]. Alcohol consumption is the world's third largest risk factor for several disease and disability in the world today. Since India has the second largest population in the world the magnitude of the problem of "Alcoholism" is also very high in India, and as per WHO 33% of India's population is alcoholics. It is also seen an annual rise in the number of people who use alcohol (WHO, 2010)[2]. Alcoholism is a major cause of mental, social, family and health problems in Kerala. The state of Kerala has the highest per capita alcohol consumption in India, at over 8 litres per person per year[3].

Alcohol addiction can be considered as a family problem and this contributes to the increased stress in the family. Family failure and breakage due to alcoholism is a serious pervasive social issue. Alcohol is connected with domestic violence, low satisfaction in the relations, relationship conflicts, under care of children, legal and economic issues, disrupted family interaction etc. and some also results in physical and psychological illness[4]. Researcher observed that the

actual sufferers are the members of family who depends upon the alcoholic, particularly the spouse. The wives of alcoholics often shows many mental and physical problems, their social involvement will be very low and low level of marital satisfaction. Even these people have very bad communication level also[5]. The spouses of alcoholics have psychological issues in various adaptive and maladaptive coping mechanisms, to restore the equilibrium and to relieve stress.

Family is the basic and fundamental part in the society. And several families contribute to form a society. The health of a nation can be measured only in terms of health of a family. Addiction affects mostly the spouse in the family as the family income is spent on liquor and the spouse is compelled to manage family finance and needs. There exist fear and uncertainty which leads to lack of self- esteem and self- confidence. Spouses of alcohol dependent person may have feelings of guilt, shame, anger, fear, grief, avoidance of social contacts and isolation due to the presence of an alcohol dependent in the family. They are often subjected to moderate to severe form of harassment. Conflict and tense atmosphere arises when they confront the drinking behaviour of their alcohol abusing family member. The problems that arise as a result of alcohol abuse is numerous, which includes long absences from home, destroying house hold and domestic items, no communication, isolation, domestic violence etc. these people are least bothered of the happenings in their family.

Alcoholism of husband results in the change in the interaction patterns of the wife and causes an alteration the complexion of family environment by financial resources of the family which intern results in the dysfunction of several other areas. The heavy stress experienced by wife in dealing with the pressure of her husband will always influence their marital life negatively. Almost all of the alcoholic dependents and their spouses agree that the main factor of marital happiness is related to family interaction and interpersonal relationship[6].

**Family interaction patterns** are defined as those socio-psychological transactions occurring in the family as system to evolve processes for decision making, emotional expression, personal views, assigning tasks and social status, enabling the family members to contribute to the growth of the family by generating morphogenesis at emotional, intellectual, and social levels by manipulation of external and internal milieu of the family as a whole. From the evolutionary point of view, every family has patterns of leadership, communication, role, reinforcement, cohesiveness and social support constituting its functioning.

Reinforcement: process adopted by the family to enable the members to imbibe socially approved behaviour. Social support system: manipulation of internal and external social milieu of the family for its existence and growth. Role: socio culturally prescribed and ascribed tasks to be performed by different family members according to their age and sex. Communication: Communication within the family is extremely important because it enables members to express their needs, wants, and concerns to each other. Cohesiveness: processes adopted by the family for a firm degree of mutual trust and interpersonal commitment. Leadership: A family member engaged in decision making through consensus for growth of the family, as a system is the leader of the family[7].

The researcher visited various De-addiction centres in Kottayam district, Kerala and interacted with the spouse of alcoholics during the Al-anon programme (Al-anon group is a worldwide fellowship that offers a programme of recovery for the families and friends of alcoholics, whether or not the alcoholic recognizes the existence of a drinking problem or seeks help)[8] and family counselling. The interaction with spouses and discussion with family counsellors of the de-addiction centres helped the researcher to find out the family interaction pattern of the respondents. Researcher came to know that the impact of alcoholism on marital family functioning and influences the family interaction.

## Methodology

This paper is based on standardized scale and the data was collected with an interview schedule from wives of alcoholic attending family counselling and Al-anon meeting in a De-addiction centre of Kottayam district of Kerala. An interview schedule was used to collect data. Family interaction Pattern Scale (FIPS) developed by Bhatti et al (1986) is used for the study. The research is descriptive in nature. Census method used to collect

the samples. The researcher collected data's from all the respondents who were willing to participate in the study during the period of data collection (July2019 – December 2019). The criterion for selection of the respondents was the wives living with the alcoholics who are under treatment at de-addiction centres in Kottayam District. 200 respondents were included in the study.

**Major Findings:**

The simple percentage of socio demographic data reveals the following information. It is seen that 30% of the respondents are in the 20-30 years age group. Nearly half of the respondents (49%) are Christian. More than half of the respondents (55%) are from rural area. More than half of the respondents (56%) are from nuclear family. Nearly half of the respondents (29%) have Under Graduate education. Nearly half of the respondents (29%) are unemployed spouses (housewives). Majority of the respondents (64%) have family monthly income above Rs.20000. Half of the respondents (50%) have above 10 years of drinking habit in spouses. **Level of Family interaction pattern**

Nearly half of the respondents (37%) have medium level of Family interaction pattern. 33% have high family interaction pattern and 30% have low level of family interaction pattern.

Evidences show that severe alcoholism leads to marital problems and family conflict, and negative emotions and interpersonal interactions often lead to relapses among alcoholics. Stress from family and other relations will motivate them for more drinking. Family members of the alcoholic have medium level of communication as either of the spouses, children or parents is afraid to talk to each other. This is mainly due to the violent nature of the alcoholic where the family members limit their communication so as to avoid problems.

**Factors affecting the Family interaction pattern**

**Table No. 1: ANOVA Test to compare Family Interaction Pattern (FIP) and Socio demographic profile**

| S.No. | Variables | F -value | Table value | Significant/Not |
|---|---|---|---|---|
| 1 | Age | 4.230 | 3.883 | ** |
| 2 | Religion | 0.196 | 3.048 | NS |
| 3 | Area of residence | 4.052 | 3.048 | * |
| 4 | Type of family | 0.946 | 3.042 | NS |
| 5 | Education | 3.482 | 3.113 | ** |
| 6 | Occupation | 0.662 | 2.418 | NS |
| 7 | Family monthly income | 0.915 | 3.042 | NS |
| 8 | Duration of habit in spouse | 4.144 | 3.883 | ** |

NS-Not significant, * -Significant at 5% level, ** -Significant at 1% level

1) FIP Score has significant difference with age. The post hoc test indicates that respondents are between the age group of 31-40 years have better FIP.

This study revealed that the family interaction pattern is more significant in spouses of alcoholics with age groups of 31-40 years than other age group. It is because couple's given more concentration to their young children and when the child grown to teenage or above they leaves the home for studies, job.

2) FIP Score has significant difference with Area of residence. The post hoc test indicates that respondents who are from rural area of residence have better FIP.

The National Family Health Survey 2015-16(NFHS-4) reveals that the consumption of alcohol is higher in rural area than urban area in Kerala[9]. The study revealed that the FIP is significant in rural area than urban and sub urban areas. The significance is due to the influence of social support and interaction among the neighbours is higher in rural area than urban and sub urban areas. The women in the rural areas are gathering together once in a week for the "Kudumbashree Meeting" (a poverty eradication mission by Government of Kerala) which help them to share their problems with the peer group and find the solutions for the same.

There is a need of detailed study among the rural populations, mainly family centered people in order to have in-depth knowledge. On their particular needs and to contribute more to adopt public health measures for preventing these issues and promoting health and psychological rehabilitation. The problem of excessive alcohol consumption is a major cause of public health concern both in urban and rural areas.

3) FIP Score has significant difference with education. The post hoc test indicates that respondents were educated up to 0-9 standard (below 10$^{th}$ standard) has better FIP.

The FIP is higher in respondents below 10$^{th}$ standard education than the educated wives. As most of the respondents are from rural area, the culture of the society is more family oriented. The less educated respondents are more flexible to adjust with alcoholic habit of their spouses than the educated respondents. Hence the FIP is higher in this category. Some of the high income individuals are not highly educated. They are into business and earn lakhs of rupees and hence were found to lead a comfortable life with the satisfaction given by money[10].

4) FIP Score has significant difference with Duration of habit in spouses. The post hoc test indicates that respondents whose husband's are drinking above 10 years have better FIP.

Analysis of the research shows that the FIP is higher in wives of alcoholics whose spouse's drinks alcohol for more than 10 years. On interaction with the respondents the researcher identified that most of the respondent's spouses who drinks alcohol for more than 10years have more responsibility towards the family and spouses gives mental support to the alcoholics as they were adjusted with habit of the spouses. This helped them to reduce domestic violence and quarrels among them.

## Discussion and Conclusion

Family education and family therapy will lead to solve the problem to a certain extent and other important is to educate the community. Adjustmental problem of wives of alcoholics affect their future generation. Mass media- information should be given about the ill effect of alcoholism. Family counselling or 12 steps therapy (Al-anon) will help the wives to recover from adjustmental problem, marital dissatisfaction and family interaction. De-addiction centres suggest a need to study the stress perceived by spouses of alcoholics and these centres recognized spouse of alcoholic's as an important components in the development of personality, marital conflict, maintenance relationship and treatment of psychological problems. Changes in the attitude and behaviour of the wives of alcoholics can be bought through various therapies like individual, family, musical, occupational etc. and also methods like yoga, meditation and relaxation techniques may contribute to their psychological improvement.

## Conclusion

Nearly half of the respondents (37%) have medium level of Family interaction pattern. The study reveals that FIP Score has significant difference with age, area of residence, education and duration of drinking habit in spouses. The post hoc test indicates that respondents between the age group of 31-40 years, rural area of residence, below 10$^{th}$ standard education and above 10 years of drinking habit in spouses have better FIP.

Researcher observed that the social consequences of the wives of alcoholics at the individual level significantly impact on personal life, work related area and family relationship. They experience physical, social, economical and psychological problems like socially isolated, lost status in the society, anxiety, depression, loneliness, worthlessness, fear of being rejected etc. because of their husband's drinking. So many negative social consequences like very low self-esteem, disturbed family, social problems, recreational problems etc. are reported from the wives of alcohol

dependents. It is the responsibility of social workers to use social work intervention techniques and methods (psychotherapy for couples & family members, group therapy, counselling etc.) for improving their self esteem and better family interaction pattern.

· Marital satisfaction and stability is negatively affected because of excessive drinking.

· Discordant alcohol consumption is a prime factor in marital dissatisfaction.

· Treatment for the couples for alcoholism has given better outcome and greater satisfaction in marital life. This has also resulted in less partner violence.

· After family therapy, the openness, warmth, support and relationships became more effective and sharing of responsibilities is seen in the family.

· Practising problem-solving skills and additional behavioural skills help the couples to cope up with relapse episodes[11].

# Experiencing Foster Care-Happiness and Wellbeing of Institutionalised Children

**Saleena.M[1], Suja M.K[2]**

*[1]PhD scholar, [2]Associate Professor, Department of Social Work, Amrita School of Engineering, Coimbatore, Amrita Vishwa Vidyapeetham India*

## Abstract

The institutionalised children are the most vulnerable group in our society and they show many problems.To improve institutionalized children's protection there is an urgent need to understand the various issues faced by them and find out remedial measures.To ensure the care and protection of institutionalised children,the Kerala state government has launched foster care scheme under the department of women and child development.This study is based on the group discussion by researcher with the institutionalised children who are experiencing foster care.

The objective of the study is to understand the foster care experience of institutionalised children and also understand their happiness and wellbeing during the period of foster caring.The researcher selected focus group discussion method for collecting data.Researcher made two focus group discussion with institutionalised children who are experiencing foster care.The group include six girls and another group contain seven boys. Hence the total respondents were thirteen in number

**Result and Conclusion:**The experience of foster care children from foster families are very positive.They are satisfied with the care,love and facilities which are provided by their foster parents and sibilings.The children can transform their lives during the foster care period.Many children have the wish to return their foster family.

***Keywords:*** *Experience, foster care,happiness,wellbeing,institutionalised children.*

## Introduction

Children's home is an institution established for the protection,education,training and rehabilitation of children in need of care and protection as defined in section 2(D) of the Juvenile Justice Act 2015. These institutions are the home to the children who are in need of care and protection.The children from socially,economically and educationally backward family in our society, homeless children, children released from child labour,street children, children whom were saved by child line are in need of care and protection.The institutionalised children's admission is permitted by the order of the Child welfare committee. These children are most marginalized and vulnerable group in our society. Adequate support and care is an essential component for emotional, mental and physical wellbeing of institutionalised children. During vacation period an alternate care provided for the wellbeing of children .These alternate care is provided in India as per the guidelines of Ministry of women and child development. It is carried out by District child protection unit and the foster care children were placed for foster care by the individual case assement of child welfare committee.

Foster care is the alternate care for children in need of care and protection in the family environment other than the child's biological family. Care giver of foster family is referred as foster parent and they are approved by the state government under the guidelines of foster care system. Foster parents has been selected by child welfare committee. Family has vital role in the behavior modification of children. It is important for the overall development of children. The National Policy for children 2013 said that all children have right to grow

in a family atmosphere which provide love,warmth,care ,happiness and understanding[1].

Fostering is a temporary residential care system for institutionalised children.They live with unrelated or extended family. In this System their biological parents do not lose their parental rights. Foster care is the placement of child till he or she is able to return to their own family. The maximum duration of foster care is one year[2].foster care can provide more opportunity and a better quality of life.

The children who are placed in a foster home shows transformation in their lives. This transformation happens not only in children but also in foster parents. Becoming a foster parent is rewarding and it is a calling for the majority of carers more than a job.Obiviously there are lows and highs, but the positive side of both partners overcome the negatives ones[3].

Foster care provides stability and secure environment,Acadamic stability, family life and strong family contact to the children .Children under foster care intervention had higher level of wellbeing, Attention and positive effect when compared to children who remain in institution[4].Children's future wellbeing only happen within a family environment which provides care, love and affection,happiness.Lack of care caused many behavioural problem in children. The institutional children shows growth suppression, impairement in psychological, emotional and social development when compared to non institutionalized children. The children who are experiencing the foster care can recover from these developmental impairements.A well designed foster care programme can make high quality improvement in institutionalised children[5].

Foster care may be short term or long term depending upon the needs of the child. The duration of the foster care has been based on the individual case assessment by child welfare committee. Based on the individual care plan, institutionalized children in the age group of six to eighteen years shall be placed in foster care. The age group zero to six years will not be considered for placement.They should be considered for permanent adoption.According to the report of U S Department of Health and Human service children's beauro ,In 2015 22 percent of total foster care children were adopted by their foster parents.The parents who are terminally ill couldn't take their children. In this situation also the children should be provided foster care with their permission of their biological parents[6].

In 2018, there are approximately 140 couples and in 2019 approximately 200 couples in Kerala were approved as foster parents by District child protection unit and child welfare committee. The children who are wishing to foster family are sent to different families under the guidelines of Juvenile Justice Act 2015.Foster care can be two month summer vacation programme. But the child and foster parents are interested to extend the period of staying ,the child welfare committee will give permission to extend the duration.Wellbeing is not the state of merely the absence of diseases and also an individual can lead his life with satisfaction. Wellbeing is associated with an individual's physical health ,mental health and resilence,that is the ability to cope with unfamiliar situations.The pleasurable and enjoying moments directly leads to the transformation of institutionalised children.The psycho social intervention method has great influence in the behavioural change of children. Hence the foster care programme helps the wellbeing of children in need of care and protection.

## Methodology

This study was conducted in two children's home under the department of women and child development of Kerala government.One children's home was for boys and another children's home was for Girls.In this qualitative study, focus group discussion was used for understanding the experience of foster care among institutionalized children. Two focus group discussions were held .One group include six girls and another group contain seven boys.Thus the total number of respondents were thirteen in number. The collected opinion from all respondents are reviewed for this study.

From the words of Sukanya (name changed for privacy) thirteen year old girl,researcher understood that she enjoyed the vacation with caring parents and siblings. She experienced the love and warmth of the family during the two month vacation period.Sukanya said that she did not feel loneliness and she got brother and sister from there."when Mom and Pappa went for outings and family functions they protected and loved me as their own child" she said.Foster family provide warmth and moments of enjoyment to foster care children.Because

of their love and affection many children told that they wished to go their foster family again.

Akash (name changed for privacy) eight year old boy said that Mom and Pappa gave him gifts,new school bag ,chapel and dresses .And also they provide enjoying moments during beach trip.“I got a loving elder sister” he said.Appukuttan, (Name changed for privacy) five year old boy came to the orphanage 1year back and his father was a drug addict.Mother abandoned him.The boy was very happy to be with a family.He said,“I like the new house and the new parents promised that they will take me if I study well”.The boy was studying well as he wants to go from children home to the family.“I got new shirt and shoes.My father gave me chappals”.The boy was curious of the things given by the new family.He was in a wonder world seeing all the new facilities and comfort which he never got from his biological parents. Because of the strong bond between the foster care and foster child,some times they couldn’t be separated.The memories of the happy moments make them feel to go back to their foster families.In this situation foster care period may be extended.Foster family also provide academic stability.

Lakshmi(name changed)12 year old girl was sent to teacher’s family who have no children, She liked the place very much and her only concern is that there is no one to play with. She liked the puppy and pussy cat in that home and said.“Teacher dad and Teacher mom got a new pet, and that is me”.Lakshmi is very much attached to the teacher couple and wish to stay back as she has not experienced a familial atmosphere.Lakshmi is a born orphan and she was raised in an orphanage later she was handed over to the children’s home.Lakshmi for the first time in her life came to know what is a “home”and how she would be feeling good and comfort if she had a family.

Selva Kumar (name changed,14 yrs)is a boy from Tamil Nadu who came with his uncle and aunt for coolie works.His biological parents are alcohol addicted and uncle took him with him for manual labour.The child line people saw the boy and was given to the orphanage.“I want to go with a Tamil family.I like Tamil food.The new malayalee parents are good,but I want Tamil People”.Selva Kumar Said.The children home people have promised him to find a Tamil family during the next time.Selva Kumar felt this is a fresh experience where he was fully mingled with a malayalee family consisting of father, mother and two children.There were also grand parents who were strict and asked him to take bath twice a day and also to do prayers in the morning and evening.Keeping this aside Selva Kumar is so happy to have a big house and family and to travel in a car like other children. Foster parents ensured care and security to the children.

Rani(name changed ,6yrs) is the charming beauty of the children’s home. She went with a family having three male children. The parents were longing for a female child and happened to see Rani and they sent their readiness to accept Rani as their foster child, Rani is still in the wonder world. She always wears the dress given by the new parents. From the words of Rani “I got three new friends to play with and the elder brother take me outside in the car”.Rani is so exited to be in the family and she wished to get more brothers like these.“I like the two new brothers,so that I don’t want to do any work”.Foster care helped the institutionalised children to become have a sense of belonging and the feeling of lonliness cleared up in their mind.They experienced the pleasing moments,individual care and learned moral values from their foster family.

Rahman (name changed) fourteen year old boy wished to drive cars and bikes and his dream was fulfilled when his new parents taught him the basic lessons of driving “I want to be eighteen years very soon so that I can get license and my new parents will give me the car”. Now they allowed him to take the car in the courtyard only. “I will study very well and will buy a benz very soon.I want to take my new parents for a ride”.He said this innocent words.Rahman was sent with a family who don’t have a family who don’t have male children. They only had a daughter and she is married and settled in America. They wished to have a child in their home and so they happily agreed to take Rahman with them.Rahman is always explaining how he was treated by the new parents and all other friends wished to see his new parents.He also bought sweets and gifts for his orphanage friends.These parents visit Rahman and also they often call him.They have also promised a trip soon.Through the focus group discussion many of the children told that they want to go back to their foster family again.from their words researcher understood

that the foster care provide the children physical,social ,emotional and psychological wellbeing.The foster parents and sibilings lives in the heart of the children who were taken into foster family.Every pleasurable moments were in their mind. "I got a good family ,next time I wish to go another family ,because I want to experience the happiest moments of various families". Neenu ,eight year old girl said.

## Findings

Foster care is provided to the children who are of the age group between six to eighteen.During these period all children pass through some maladjustment and difficulties.Children's emotional, physical and mental difficulties may clear up completely only with an adequate support system.From the stand point of the child's physical, psychological and social wellbeing proper supportive relationships and environments are very important. Reviewing all cases in this study researcher understood that all children who are experiencig foster care got an opportunity to spend happiest moments with good family.These children got these effective parental care because of the screening of foster family by child welfare committee.when the screening is not carried out,it will negatively affect the children's mental health and over all well being.only when foster parents do their responsibility in effective manner,the children are satisfied to stay with them

The adequate support of child hood has great influence in the wellbeing and health of a person. Children's wellbeing is related with the environment which they live in.The social relationships are also of great importance in the holistic wellbeing of children. The parental care and housing conditions have the vital role in the development of children.

Foster care programme help the homeless children to get housing ,emotional support,and to acquire life skills.Every child deserve a chance at belonging ,safety,happiness and love.Children who are the victim of natural disasters,substance use,trafficked children from economically and socially backward family,street children etc belongs under the umbrella of children in need of care and protection.Providing residential care system such as foster care is a great exposure to the holistic development of these children.It also provide happy moments to foster parents.Through foster care the children got safe,happy,comfortable and healthy atmosphere.The foster parents ensures the safe and comfortable zone to foster children.Thus the level of happiness and wellbeing was higher in foster care children during their fostering period.Many of the children had a desire to return back to foster family rather than their biological family."I can't leave my mother and father,even if my biological mother come back to me,I like to stay with them one more year"sithara(name changed for privacy) said.From her words researcher realized that the warmth, love and affection of foster parents leads the children to become more happy.Foster family gifted the new clothes ,school materials,books and bags to the academic year for children. It gives a lot of pleasure to children and they acquire academic stability. During the conversation with the district child protection officer the researcher reached at the conclusion that there is no bad experience faced by foster children with their foster parents because the DCPCU placed the children only after the detailed enquiry about foster family.

Through these vaccation family, children learn the moral values, sense of belonging and they have an opportunity to know more about how a family function, how to behave while interacting with others and adjust with unfamiliar situations. The warmth of the family provide them all these qualities.In Kerala foster care system is known as "sanadha bhalyam".Sandha bhalyam is very fruitful programme for the happiness and wellbeing of institutionalised children.

## Discussion and Conclusion

Childhood experience is the root of the future health and wellbeing of a person.Institutionalised children face lot of problems.One of the intervention programme is Foster care system.Through foster care children got shelter,clothing and adequate food.Foster care parents provided warmth, love and affection,support,care and gave opportunities for child's over all physical,emotional and mental health development.They ensure vocational training and education based on the interests of the child.Foster family protected the children from abuse ,maltreatment and exploitation.They also provide treatment in emergency situation.Foster care system in Kerala had a great impact on the development of foster children as well as foster parents.Both parties got a lot of pleasure and enjoyment.

# Empathy and Interpersonal Relationship among Institutionalized Children

**Jincy V.V[1], Suja M.K[2]**

*[1]PhD Scholar, [2]Associate professor, Department of Social Work, Amrita School of Engineering, Coimbatore, Amrita Vishwa Vidyapeetham , India*

## Abstract

**Background:** The arena of child vulnerability is taking complex shapes in the new socio-cultural situations .Institution children are those who deserve special care and attention in order to fulfil their basic and secondary needs both with equal importance, which later on make an impact if it's not satisfied. As humans are called as social being there are some expected qualities which makes us to be connected with each other in appositive way both in family and society. Empathy thus makes the people to be connected which further leads to form an interpersonal relationship.

**Aim:** The aim of the study was to assess the level of empathy among the participants and to assess the level of interpersonal relationship also the correlation between empathy and interpersonal relationship among institutionalised children,

**Materials and Methods:** A total of 214 subjects aged 12-18 years were selected for study based on lottery method of Simple random sampling. The study was based on the Questions pertaining to socio-demographic profile of age, gender, mother tongue ,good friendship in the institution, educational qualification, situation before being in the institution ,interest in education and time period for being in the institution. The data collection was done in an interview schedule. The standardised tool used in the study was, the Self-esteem scale developed Life Skills Assessment Scale (LSAS) by A.Radhakrishnan Nair, R.Subasree & Sunitha Rajan. **Results:** The result shows that there is significant difference between the variable, having good friendship in the institution and Empathy also there is a positive correlation between Empathy and Interpersonal relationship.**Conclusion:** The result led to a conclusion that both empathy and interpersonal relationship has a common feature as both has difference in level of measurement among children by analysing its level through different socio demographic variables also there is a correlation between Empathy and Interpersonal relationship.

***Key words:*** *Empathy, Interpersonal relationship, Institutionalized children.*

## Introduction

A study with focus on child institutionalization deserves higher research attention due to the fact that there are a growing number of children who are being seeking this service. The arena of child vulnerability is taking complex shapes in the new socio-cultural situations .Institution children are those who deserve special care and attention in order to fulfil their basic and secondary needs both with equal importance, which later on make an impact if it's not satisfied. Interpersonal relationship is a process which grow and develop throughout our life which forms its basement during the first few years of child's life and later enrich in different stages of developments .Interpersonal relationship is a process which extends in wide range which has to start from ones very close circle such as family, dears and nears, and extends to society. As humans are called as social being there are some expected qualities which makes

us to be connected with each other in appositive way both in family and society. Empathy and interpersonal relationship can be called as the basic element among them .Empathy always helps to be connected with others and as a result the tendency of caring will also be developed[1].Empathy thus makes the people to be connected which further leads to form an interpersonal relationship.

## Materials and Method

This is a descriptive research conducted among 214 children from different Institutions for Children at Kannur district .Kerala ,India. The samples selected for the study were under the age group of 12-18 years. The sampling technique adopted for the selection of the respondent subjects was by lottery method under Simple random sampling method.

The tool of data collection used for the study was an interview schedule that included questions pertaining to socio-demographic profile and standardised Life Skill Assessment scale developed by A.Radhakrishnan Nair, R.Subasree & Sunitha Rajan[2]. Among the 10 components of life skill the components empathy and interpersonal relationship was assessed, the component empathy and interpersonal relationships have 11 items each.

## Statistical Analysis

ANOVA Test for Comparing Empathy and interpersonal relationship score is based on educational qualification, situation before being in the institution, interest in education and time period for being in the institution. The independent sample T-test was used to compare Empathy and Interpersonal relationship with age, gender, mother tongue and about good friendship in the institution. Chi-Square Test was used to test the correlation between Empathy and Interpersonal relationship.

## Result

The Empathy score was compared by with educational qualification, situation before being in the institution, interest in education, and time period for being in the institution by using ANOVA (Table-1). The independent sample T-test was used to compare Empathy with age, gender, mother tongue and about good friendship(Table-2).The empathy score was high among male children ,children who are 12-15 years old , children who are in secondary schools, whose mother tongue is Malayalam ,those who were studying before being in the institution and those who are interested in studies, also among the children those who are being in the institution for1-5 years and the children those who are having good friendship in the institution. There is a significant difference between the variables having good friendship in the institution and Empathy

Interpersonal relationship was compared with educational qualification, situation before being in the institution, interest in education and time period for being in the institution by using ANOVA (Table-3). The independent sample T-test was used to compare Interpersonal relationship with age, gender, mother tongue and about good friendship in the institution (Table-4). There is no significant difference between any of the variables and interpersonal relationship. But the interpersonal relationship score was high among children under the age group12-15, among boys, those who are in secondary school, children whose mother tongue is Malayalam, those who were studying before being in the institution and those who are in interested in studies, also the interpersonal relationship is high among the children those who are being in the institution for1-5 years and the children those who are having good friendship in the institution.

The correlation test also agrees that there is a positive correlation between empathy and interpersonal relationship.The children who have low level of empathy are also having low level of interpersonal relationship. Those who are having moderate level empathy shows moderate level of interpersonal relationship and children having high level of empathy shows high level of interpersonal relationship, which is significant at 1% (Table-5).

## Discussion

Mathies Allemand et al in their study states that during adolescent years there is a tendency of increase in empathy ,the present study shows that there is no significant difference between empathy and age even though among 1-18 years old children who are 29% among total respondents and other children who are below that also having same level of empathy[3].

The present study shows that female children are empathetic than male children, which comes only 45% among total respondent ,Loren Toussaint and Jon R.Weeb In their study among 127 respondents states that females are more empathetic than males[4].

Suk Chun Fung in his study states that education is a significant factor of humans empathy same as this in the present study also the respondents having empathy are secondary school children (53%) comparing with primary school children[5].

The present study shows that the empathy is comparatively less among the children who were wandering(13%) before being in the institution than those who were working(2%) and studying (84%) ,this result shows that the children who are not getting proper parental care ,love and attention without fulfilling their basic needs are lacking empathy as emphasised in the study of Paulina Akpan-Idiok and Aniebietabasi in their study which states that family type , good parenting and home atmosphere influences child's social adjustment[6] .

Ravneet Kaur et al in their study states that the children who were being in the institutionalised for 1-5 years have more empathy but in the present study the children who are having empathy are those who are institutionalised for above 10 years, the respondents who are being in the institution more than 10 years are only 18% among total respondents[7].

Aarti Thakkar et al in their study states that compared to the attachment of institutionalised children between their inmates, care givers and mentors, it shows that the

children are more attached and have understanding with their inmates as like in the present study the children those who don't have good friendship in the institution have empathy than those who have good friendship in the institution, that's only 2% among total respondents[8] .

According to the present study all the children are having moderate level of Interpersonal relationship, which can be supported by the study of Kim Maclean et al which states that even though less optimal development which includes intellectual, physical, behavioural and social development, which is one of the risk factor of institutionalisation, it may not lead a child to psychopathology during their process of development[9].

The present study shows that both male(55%) and female(45%) children have, interpersonal relationship ,Rebecca A .Colman and Cathy Spatz Widom in their study states that that during adulthood both males and females are incapable to form a healthy interpersonal relationship as they were exposed to physical abuse or neglect during their childhood[10.]

The present study shows the result , higher secondary school students (30% of the respondent)have interpersonal relationship than secondary and primary school students ,which can be supported by the study result of R.Steve Mc Callum and Bruce A,Bracken which states that there is a increased risk of dropping out of school ,criminality and even marital maladjustment among children who are having poor interpersonal relationship which means once the interpersonal relationship is developed the rate of adjustment problems also decrease thus they continue the education[11].

The present study says that the children who were wandering and working before coming to the institution have interpersonal relationship than the children (84%) who were studying before being institutionalised have interpersonal relationship but in the study of S.N .Madu et al which states that as the street children have lower purpose in life the quality of interpersonal relationship is also low than non-street and part –time non street children[12].

David Zandvliet et al in their studies concluded that the self-interest of the students in learning is promoted by among students once they feel they are connected with their teachers which makes them to believe that they are competed and experience and thus they experience a substantial support of autonomy from their teachers, in the present study also as mentioned in the above study majority the children who are interested in studies or to get training in any type of vocation have interpersonal relationship than those who are not interested in studies[13].

Robert Winston and Rebecca Chicot in their study reported that if children have insecurity feeling about their attachment to their primary caregivers which effects the child to form and maintain healthy relationship throughout life ,in the present study it states that for children who are being in the intuition for 1-5(64% of respondents) years and 6-10(18%) years have low level of interpersonal relationship as it is said in the above study as they are comparatively younger than others[14]. The present study states that even if the children don't have good friendship in the institution the interpersonal relationship is high among them (2% of the respondents), but on the other hand in the study of Kwame S.Sakyiand et al in their study they concluded that the psychological difficulties in later stage of development is associated with childhood friendship such as those who are having at least one good friend may reduce the psychological difficulties in young adulthood[15].

The present study shows that there is a positive correlation between empathy and interpersonal relationship, also the study of Ruiying Li,Tao Jiang et al states that selfless concern about others is the outcome of good interpersonal relationship[16].

## Conclusion

The research states that many of the socio demographic variables have influence on both empathy and interpersonal relationship among institutionalised children even though it's very slight. The study also reveals that there is relationship between empathy and interpersonal relationship.

**Ethical Clearence**: Ethical clearence was obtained before commencing the study.

## Call for Papers / Article Submission

Medico-Legal Update invites articles, case reports, newspaper clippings, report medico legal activities to update the knowledge of readers in scientific disciplines such as Forensic Medicine, Forensic Sciences, Environmental Hazards, Toxicology, odontology, Anatomy and law etc.

**The following guidelines should be noted:**

- The article must be submitted by e-mail only. Hard copy not needed. Send article as attachment in e-mail.
- The article should be accompanied by a declaration from all authors that it is an original work and has not been sent to any other journal for publication.
- As a policy matter, journal encourages articles regarding new concepts and new information.
- Article should have a Title
- Names of authors
- Your Affiliation (designations with college address)
- Abstract
- Key words
- Introduction or back ground
- Material and Methods
- Findings
- Conclusion
- Discussion
- Acknowledgements
- Interest of conflict
- References in Vancouver style.
- Please quote references in text by superscripting
- Word limit 2500-3000 words, MSWORD Format, single file

All articles should be sent to: **medicolegalupdate@gmail.com**
